Amongst the terrestrial carnivora hibernation appears to be practised, with one possible exception, only by species belonging to the group Arctoidea. In north temperate latitudes both in Europe and Asia, as well as in the Himalayas, brown bears (*Ursus arctos*) hibernate, so also does the North American grizzly bear (*U. horribilis*), at least in the more northern districts of its range. The smaller black bear of the Himalayas (*U. tibetanus*) appears to lapse into a state of semi-torpor during the winter, only emerging from his retreat to hunt for food when occasional breaks in the weather occur. In the case of the American black bear (*U. americanus*) the female seeks winter quarters comparatively early in the season in preparation for the birth of her progeny soon after the turn of the year; but the males remain active so long as plenty of food is to be found. In the case of all bears, except the Polar bear (*U. maritimus*), the site chosen as the hibernaculum is either a cave or hole or some sheltered spot beneath a ledge of rock, or the roots of large trees, more or less overgrown with brushwood which holds the snow until it freezes into a solid roof over the hollow where the sleeping animal lies. In the hibernating brown and black bears the intestine is blocked by a plug commonly called "tappen" and composed principally of pine leaves, which is usually not evacuated until the spring. There is much diversity of opinion on the subject of the hibernation of Polar bears. Their absence during the winter from particular spots in the Arctic regions where ice-bound ships have spent the winter, and the occasional discovery of specimens buried beneath the snow, have led to the belief that these animals habitually retire to winter quarters through the cold sunless months of the year. This may possibly be the true explanation at least for certain districts. But it has been alleged that bears, both adult and half-grown, may be seen throughout the winter; and it is known that pregnant females bury themselves in the autumn under the snow, where they remain without feeding with their newly-born young until the spring of the following year. Hence the absence of bears in the winter from the neighbourhood of icebound ships may be explained on the supposition that the adult females alone hibernate for breeding purposes, while the full-grown males and half-grown specimens of both sexes migrate in the winter to the edges of the ice-floes and to coast lines, where the water is open. Before retiring to winter quarters the pregnant females store up sufficient quantity of fat in their tissues not only to sustain themselves but also to supply milk for their cubs. In the Adirondack region and probably in other districts of the same or more northern latitudes in North America, raccoons (*Procyon lotor*) retire in the winter to some sheltered place, such as a hollow tree-trunk, and pass the severest part of the season in sleep, emerging in February or March when the snow has begun to disappear. In the same country, the skunks (*Mephitis mephitica*), a member of the weasel family, also seek shelter during the coldest portion of the winter. Merriam believes that the hibernation of this animal is determined by cold, and not by failure of food-supply, for he observes that skunks may frequently be seen in numbers on snow lying 5 ft. deep at a time of the year when they feed almost entirely upon mice and shrews which do not hibernate even when the thermometer registers over twelve degrees of frost. In British North America the badger (*Taxidea americana*) is said to hibernate from October till April; but the duration of the period probably depends, as in the case of its European ally (*Meles meles*), upon the length and severity of the inclement season. In the last-named species the winter repose is not as a rule sufficiently profound to prevent a break in the weather rousing the animal from sleep to sally forth in search of food. This interrupted hibernation takes place at least in England and even in Scandinavia; but in countries where frost is continuous throughout the winter it is probable that the badger's sleep is unbroken.

The one exception to the general rule that hibernation in the carnivora is restricted to the Arctoidea, is supplied by the raccoon dog (*Nyctereutes procyonoides*) of Japan and north-eastern Asia, which is said by Radde to hibernate in burrows in Amurland if food has been sufficiently plentiful in late summer and autumn to enable the animal to lay on enough fat to resist the cold and sustain a long period of fast. If, however, food has been scarce, this dog is compelled to remain active all through the winter. The Arctic fox (*Vulpes lagopus*), although considerably more northern in range than the raccoon dog, does not hibernate. It was long a mystery how these animals obtained food in winter, but it has been ascertained that in some districts they migrate southwards in large numbers in the late autumn, whereas in other districts apparently they lay up stores of dead lemmings or hares, for food during the winter months. In Australia the porcupine ant-eater (*Echidna aculeata*) hibernates; and the habit is retained by specimens imported to Europe if exposed to the cold in outdoor cages.

Instances of quasi-hibernation have been recorded in the case of man. For example, in the government of Pskov in Russia, where food is scarce throughout the year and in danger of exhaustion during the winter, the peasants are said to resort to a practice closely akin to hibernation, spending at least one-half of the cold weather in sleep. From time immemorial it has been the custom when the first snows fall for families to shut themselves up in their huts, huddle round the stove and lapse into slumber, each member taking his turn to keep the fire alight. Once a day only do the inmates rouse themselves from sleep to eat a little dry bread.

Reptiles in which the body-temperature falls with that of the surrounding medium pass the winter in temperate countries in a state of lethargy; and specimens exported from the tropics into northern latitudes become dormant when exposed to cold in virtue of their inability to maintain their temperature at a higher level than that of the atmosphere. The common land tortoise (*Testudo graeca*) of South Europe buries itself in the soil during the winter in its natural habitat, and even when imported to England is able, in some cases at least, to withstand the more rigorous winter by practising the same habit, as Gilbert White originally recorded. In Pennsylvania the box-tortoise (*Cistudo carolina*) passes the winter in a burrow; and *Testudo elegans*, which inhabits dry hilly districts in north India, takes shelter beneath tufts of grass or bushes as the cold weather approaches and remains in a semi-lethargic state until the return of the warmth. The European pond tortoise (*Emys orbicularis*) also hibernates buried in the soil; and the North American salt-water terrapin (*Malacoclemmys concentrica*), abundant in the salt-marshes round Charleston, S. Carolina, retires into the muddy banks to spend the cold months of the year. In certain parts of the tropics tortoises protect themselves from the excessive heat by burrowing into the soil which afterwards becomes indurated. When drought sets in with the dry season and the tanks become exhausted and food unobtainable, crocodiles and alligators sometimes wander across country in search of water, but more commonly bury themselves in the mud and remain in a state of quiescence until the return of the rains; and according to Humboldt, large snakes, anacondas or boa constrictors are often found by the Indians in South America buried in the same lethargic state. Snakes and lizards in all countries where there is any considerable seasonal variation in temperature become dormant or semi-dormant during the colder months.

Batrachians, like reptiles, hibernate in Europe and other countries situated in temperate latitudes. Frogs bury themselves in the mud at the bottom of tanks and ponds, often congregating in numbers in the same spot. Toads retire to burrows or other secluded places on the land, and newts either bury themselves in the mud of ponds, like frogs, or lie up beneath stones and pieces of wood on the land. According to Mr G. A. Boulenger, however, European frogs and toads do not pass the winter in profound torpor, but merely in a state of sluggish quiescence. In tropical countries, where wet and dry seasons alternate, frogs which, like the rest of the batrachians, are for the most part intolerant of great heat, especially when accompanied by dryness of atmosphere, bury themselves deep in the soil during the time of drought and emerge from their retreats in numbers with the breaking of the rains.

SpinSmart Software http://www.spinsmart.com

This habit of passing the dry season in the hardened mud forming the bottom of exhausted pools and rivers is practised by several species of tropical freshwater fishes, belonging principally to the family *Siluridae*. The members of this group are able to exist and thrive in moist mud, and can even support life for a comparatively long time out of water altogether. The instinct is exhibited by species occurring both in the eastern and western hemispheres, as is shown by its record in the case of species of *Callicthys* and *Loricaria* in Guiana and by *Clarias lazera* in Senegambia. It is also met with, according to Tennent, in a species of climbing perch (*Anabas oligolepis*) found in Ceylon and belonging to the family *Anabantidae*, all the species of which are able to live for a certain length of time out of water, and may sometimes be found crawling across land in search of fresh pools. The habit is also common to some species of mud fishes of the order Dipneusti, in which the air bladder plays the part of lungs. *Protopterus*, from tropical Africa, for instance, burrows into the mud and remains for nearly half the year coiled up at the bottom in a slightly enlarged chamber. The walls of this are lined with a layer of slime secreted from the fish's skin, and the orifice is closed with a lid the centre of which is perforated and forms an inturned tube by means of which air is conducted to the fish's mouth. The aestivating burrow of the Brazilian mudfish (*Lepidosiren*) is similar, except that the lid is perforated with several apertures. The Australian mudfish (*Ceratodus*) is not known to hibernate or aestivate.

In countries where winter frosts arrest the growth of vegetation terrestrial mollusca seek hibernacula beneath stones or fallen tree trunks, in rock crannies, holes in walls, in heaps of dead leaves, in moss or under the soil, and remain quiescent until the coming of spring. Amongst pulmonate gastropods, most species of snails (*Helix*, *Clausilia*) close the mouth of the shell at this period with a membranous or calcified plate, the epiphragm. Slugs (*Limax*, *Arion*), on the contrary, lie buried in the earth encysted in a coating of slime. Similarly in the tropics members of this group, such as *Achatina* in tropical Africa and *Orthalicus* in Brazil, aestivate during the dry season, the epiphragm preserving them against desiccation; and examples of two species of *Achatina* from east and west Africa exhibited in the Zoological Gardens in London remained concealed in their shells during the winter, although kept in an artificially warmed house, and resumed their activity in the summer.

Freshwater Pulmonata do not appear to hibernate, such forms as *Limnaea* and *Planorbis* having been frequently seen crawling about beneath the ice of frozen ponds. During periods of drought in England, however, they commonly bury themselves in the mud, a habit which is also practised during the dry season in the tropics by species of Prosobranchiate Gastropods belonging to the genera *Ampullaria*, *Melania* and others, which lie dormant until the first rains rouse them from their lethargy. Freshwater Pelecypoda (*Anodonta*, *Unio*) spend the European winter buried deep in the muddy bottom of ponds and streams.

In cold and temperate latitudes a great majority of insects pass the winter in a dormant state, either in the larval, pupal or imaginal (reproductive) stages. In some the state of hibernation is complete in the sense that although the insects may be roused from their lethargy to the extent of movement by spells of warm weather, they do not leave their hibernacula to feed; in others it is incomplete in the sense that the insects emerge to feed, as in the case of the caterpillar of *Euprepia fuliginosa*, or to take the wing as in the case of the midge *Trichocera hiemalis*. Others again, like *Podura nivalis* and *Boreus hiemalis*, never appear to hibernate, at least in England. The insects which hibernate as larvae belong to those species which pass more than one season in that stage, such as the goat-moth (*Cossus ligniperda*), cockchafers (*Melolontha*), stagbeetles (*Lucanus*) and dragon-flies (*Libellula*), &c.; and to some species which, although they only live a few months in this immature state, are hatched in the autumn or summer and only reach the final stage of growth in the following spring, like the butterflies of the genus *Argynnis* (*paphia*, *aglaia*, &c.) in England. As an instance of species which survive the winter in the pupal or chrysalis stage may be cited the swallow-tailed butterfly of Europe (*Papilio machaon*); while to the category of species which hibernate as perfect insects belong many of the Coleoptera (Rhyncophora, *Coccinellidae*), &c., as well as some Hemiptera, Hymenoptera, Diptera and Lepidoptera (*Vanessa io*, *urticae*, &c.). In the case of the social Hymenoptera it is only the fertilized queen wasp out of the nest that survives the frost of winter, all the workers dying with the onset of cold in the autumn; the common hive bees (*Apis mellifica*), although they retire to the hive, do not hibernate, the numbers and activity of the individuals within the hive being sufficient to keep up the temperature above soporific point. Ants also remain actively at work underground unless the temperature falls several degrees below zero.

Spiders, like nearly all insects, hibernate in cold temperate latitudes. Burrowing species like trap-door spiders of the family *Ctenizidae* and some species of *Lycosidae* seal the doors of their burrows with silk or close up the orifice with a sheet of that material. Other non-burrowing species, like some species of *Clubionidae* and *Drassidae*, lie up in silken cases attached to the underside of stones or of pieces of loose bark, or buried under dead leaves or concealed in the cracks of walls. Other species, on the contrary, pass the winter in an immature state protected from the cold by the silken cocoon spun by the mother for her eggs before she dies in the late autumn, as in the "garden spider" (*Aranea diadema*). Commonly, however, when the cocoons are later in the making, or the cold weather sets in early, the eggs of this and of allied species do not hatch until the spring; but in either case the young emerge in the warm weather, become adult during the summer and die in the autumn after pairing and oviposition. Some members of this family, nevertheless, like *Zilla x-notata*, which live in the corners of windows, or in outhouses where the habitat affords a certain degree of protection from the cold, may survive the winter in the adult stage and be roused from lethargy by breaks in the weather and tempted by the warmth to spin new webs. Typical members of the Opiliones or harvest spiders, belonging to the family *Phalangiidae*, do not hibernate in temperate and more northern latitudes in Europe and America, but perish in the autumn, leaving their eggs buried in the soil to hatch in the succeeding spring. During the early summer, therefore, only immature individuals are found. Other species of this order, belonging to the family *Trogulidae*, spend the winter in a dormant state under stones or buried in the soil. False scorpions (*Pseudoscorpiones*) also hibernate in temperate latitudes, passing the cold months, like many spiders, enclosed in silken cases attached to the underside of stones or loosened pieces of bark. Centipedes and millipedes bury themselves in the earth, or lie up in some secluded shelter such as stones or fallen tree trunks afford during the winter; and in the tropics millipedes lie dormant during seasons of drought.

What is true of the dormant condition of arthropod life in the winter of the northern hemisphere is also true in a general way of that of the southern hemisphere at the same season of the year. This is proved—to mention no other cases—by the observations of Darwin on the hibernation of insects and spiders at Montevideo and Bahia Blanca in South America, and by Distant's account of the paucity of insect life in the winter in South Africa; by his discovery under stones of hibernating semi-torpid Coleoptera and Hemiptera at the end of August in the Transvaal, and of the gradual increase in the numbers of individuals and species of insects in that country as the spring advanced and the dry season came to an end.

HIBERNIA, in ancient geography, one of the names by which Ireland was known to Greek and Roman writers. Other names were Ierne, Iuverna, Iberio. All these are adaptations of a stem from which also Erin is descended. The island was well known to the Romans through the reports of traders, so far at least as its coasts. But it never became part of the Roman empire. Agricola (about A.D. 80) planned its conquest, which he judged an easy task, but the Roman government vetoed the enterprise. During the Roman occupation of Britain, Irish pirates seem to have been an intermittent nuisance, and Irish emigrants may have settled occasionally in Wales; the best attested emigration is that of the Scots into Caledonia. It was only in post-Roman days that Roman civilization, brought perhaps by Christian missionaries like Patrick, entered the island.

HICKERINGILL (or HICKHORNGILL), **EDMUND** (1631–1708), English divine, lived an eventful life in the days of the Commonwealth and the Restoration. After graduating at Caius College, Cambridge, where he was junior fellow in 1651–1652, he joined Lilburne's regiment as chaplain, and afterwards served in the ranks in Scotland and in the Swedish service, ultimately becoming a captain in Fleetwood's regiment. He then lived for a time in Jamaica, of which he published an account in 1661. In the same year he was ordained by Robert Sanderson, bishop of Lincoln, having already passed through such shades of belief as are connoted by the terms Baptist, Quaker and Deist. From 1662 until his death in 1708 he was vicar of All Saints', Colchester. He was a vigorous pamphleteer, and came into collision with Henry Compton, bishop of London, to whom he had to pay heavy damages for slander in 1682. He made a public recantation in 1684, was excluded from his living in 1685–1688, and ended his career by being convicted for forgery in 1707.

HICKES, GEORGE (1642–1715), English divine and scholar, was born at Newsham near Thirsk, Yorkshire, on the 20th of June 1642. In 1659 he entered St John's College, Oxford, whence after the Restoration he removed to Magdalen College and then to Magdalen Hall. In 1664 he was elected fellow of Lincoln College, and in the following year proceeded M.A. In 1673 he graduated in divinity, and in 1675 he was appointed rector of St Ebbe's, Oxford. In 1676, as private chaplain, he accompanied the duke of Lauderdale, the royal commissioner, to Scotland, and shortly afterwards received the degree of D.D. from St Andrews. In 1680 he became vicar of All Hallows, Barking, London; and after having been made chaplain to the king in 1681, he was in 1683 promoted to the deanery of Worcester. He opposed both James II.'s declaration of indulgence and Monmouth's rising, and he tried in vain to save from death his nonconformist brother John Hickes (1633–1685), one of the Sedgemoor refugees harboured by Alice Lisle. At the revolution of 1688, having declined to take the oath of allegiance, Hickes was first suspended and afterwards deprived of his deanery. When he heard of the appointment of a successor he affixed to the cathedral doors a "protestation and claim of right." After remaining some time in concealment in London, he was sent by Sancroft and the other nonjurors to James II. in France on matters connected with the continuance of their episcopal succession; upon his return in 1694 he was himself consecrated suffragan bishop of Thetford. His later years were largely occupied in controversies and in writing, while in 1713 he persuaded two Scottish bishops, James Gadderar and Archibald Campbell, to assist him in consecrating Jeremy Collier, Samuel Hawes and Nathaniel Spinckes as bishops among the nonjurors. He died on the 15th of December 1715.

The chief writings of Hickes are the *Institutiones Grammaticae Anglo-Saxonicae et Moeso-Gothicae* (1689), and *Linguarum veterum Septentrionalium Thesaurus grammatico-criticus et archaeologicus* (1703–1705), a work of great learning and industry.

Apart from these two works Hickes was a voluminous and laborious author. His earliest writings, which were anonymous, were suggested by contemporary events in Scotland that gave him great satisfaction—the execution of James Mitchell on a charge of having attempted to murder Archbishop Sharp, and that of John Kid and John King, Presbyterian ministers, "for high treason and rebellion" (*Ravillac Redivivus*, 1678; *The Spirit of Popery speaking out of the Mouths of Phanatical Protestants*, 1680). In his *Jovian* (an answer to S. Johnson's *Julian the Apostate*, 1683), he endeavoured to show that the Roman empire was not hereditary, and that the Christians under Julian had recognized the duty of passive obedience. His two treatises, one *Of the Christian Priesthood* and the other *Of the Dignity of the Episcopal Order*, originally published in 1707, have been more than once reprinted, and form three volumes of the *Library of Anglo-Catholic Theology* (1847). In 1705 and 1710 were published *Collections of Controversial Letters*, in 1711 a collection of *Sermons*, and in 1726 a volume of *Posthumous Discourses*. Other treatises, such as the *Apologetical Vindication of the Church of England*, are to be met with in Edmund Gibson's *Preservative against Popery*. There is a manuscript in the Bodleian Library which sketches his life to the year 1689, and many of his letters are extant in various collections. A posthumous publication of his *The Constitution of the Catholick Church and the Nature and Consequences of Schism* (1716) gave rise to the celebrated Bangorian controversy.

See the article by the Rev. W. D. Macray in the *Dictionary of National Biography*, vol. xxvi. (1891); and J. H. Overton, *The Nonjurors* (1902).

HICKOK, LAURENS PERSEUS (1798–1888), American philosopher and divine, was born at Bethel, Connecticut, on the 29th of December 1798. He took his degree at Union College in 1820. Until 1836 he was occupied in active pastoral work, and was then appointed professor of theology at the Western Reserve College, Ohio, and later (1844–1852) at the Auburn (N.Y.) Theological Seminary. From this post he was elected vice-president of Union College and professor of mental and moral science. In 1866 he succeeded Dr E. Nott as president, but in July 1868 retired to Amherst, Massachusetts, where he devoted himself to writing and study. A collected edition of his principal works was published at Boston in 1875. He died at Amherst on the 7th of May 1888. He wrote *Rational Psychology* (1848), *System of Moral Science* (1853), *Empirical Psychology* (1854), *Rational Cosmology* (1858), *Creator and Creation, or the Knowledge in the Reason of God and His Work* (1872), *Humanity Immortal* (1872), *Logic of Reason* (1874).

HICKORY, a shortened form of the American Indian name *pohickery*. Hickory trees are natives of North America, and belong to the genus *Carya*. They are closely allied to the walnuts (*Juglans*), the chief or at least one very obvious difference being that, whilst in *Carya* the husk which covers the shell of the nut separates into four valves, in *Juglans* it consists of but one piece, which bursts irregularly. The timber is both strong and heavy, and remarkable for its extreme elasticity, but it decays rapidly when exposed to heat and moisture, and is peculiarly subject to the attacks of worms. It is very extensively employed in manufacturing musket stocks, axle-trees, screws, rake teeth, the bows of yokes, the wooden rings used on the rigging of vessels, chair-backs, axe-handles, whip-handles and other purposes requiring great strength and elasticity. Its principal use in America is for hoop-making; and it is the only American wood found perfectly fit for that purpose.

The wood of the hickory is of great value as fuel, on account of the brilliancy with which it burns and the ardent heat which it

SpinSmart Software http://www.spinsmart.com

gives out, the charcoal being heavy, compact and long-lived. The species which furnish the best wood are *Carya alba* (shell-bark hickory), *C. tomentosa* (mockernut), *C. olivaeformis* (pecan or pacane nut), and *C. porcina* (pig-nut), that of the last named, on account of its extreme tenacity, being preferred for axle-trees

FIG. 1.—Shell-bark Hickory (*Carya alba*) in flower.

and axle-handles. The wood of *C. alba* splits very easily and is very elastic, so that it is much used for making whip-handles and baskets. The wood of this species is also used in the neighbourhood of New York and Philadelphia for making the back bows of Windsor chairs. The timber of *C. amara* and *C. aquatica* is considered of inferior quality.

Most of the hickories form fine-looking noble trees of from 60 to 90 ft. in height, with straight, symmetrical trunks, well-balanced ample heads, and bold, handsome, pinnated foliage. When confined in the forest they shoot up 50 to 60 ft. without branches, but when standing alone they expand into a fine head, and produce a lofty round-headed pyramid of foliage. They have all the qualities necessary to constitute fine graceful park trees. The most ornamental of the species are *C. olivaeformis*, *C. alba* and *C. porcina*, the last two also producing delicious nuts, and being worthy of cultivation for their fruit alone.

The husk of the hickory nut, as already stated, breaks up into four equal valves or separates into four equal portions in the upper part, while the nut itself is tolerably even on the surface, but has four or more blunt angles in its transverse outline. The

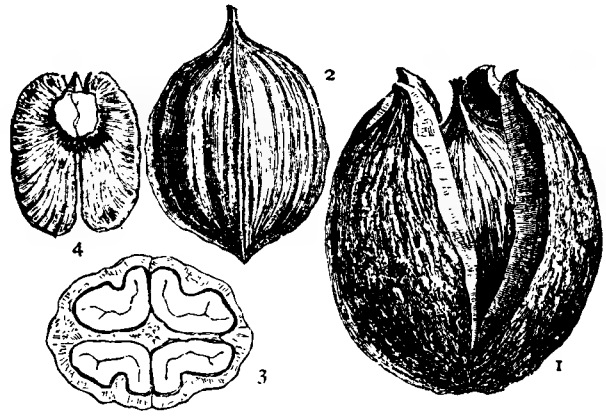

FIG. 2.—1, Fruit of *Carya alba*; 2, Hickory Nut; 3, Cross Section of Nut; 4, Vertical Section of the Seed.

hickory nuts of the American markets are the produce of *C. alba*, called the shell-bark hickory because of the roughness of its bark, which becomes loosened from the trunk in long scales bending outwards at the extremities and adhering only by the middle. The nuts are much esteemed in all parts of the States, and are exported in considerable quantities to Europe. The pecan-nuts, which come from the Western States, are from 1 in. to 1½ in. long, smooth, cylindrical, pointed at the ends and thin-shelled, with the kernels full, not like those of most of the hickories divided by partitions, and of delicate and agreeable flavour. The thick-shelled fruits of the pig-nut are generally left on the ground for swine, squirrels, &c., to devour. In *C. amara* the kernel is so bitter that even squirrels refuse to eat it.

HICKS, ELIAS (1748–1830), American Quaker, was born in Hempstead township, Long Island, on the 19th of March 1748. His parents were Friends, but he took little interest in religion until he was about twenty; soon after that time he gave up the carpenter's trade, to which he had been apprenticed when seventeen, and became a farmer. By 1775 he had "openings leading to the ministry" and was "deeply engaged for the right administration of discipline and order in the church," and in 1779 he first set out on his itinerant preaching tours between Vermont and Maryland. He attacked slavery, even when preaching in Maryland; wrote *Observations on the Slavery of the Africans and their Descendants* (1811); and was influential in procuring the passage (in 1817) of the act declaring free after 1827 all negroes born in New York and not freed by the Act of 1799. He died at Jericho, Long Island, on the 27th of February 1830. His preaching was practical rather than doctrinal and he was heartily opposed to any set creed; hence his successful opposition at the Baltimore yearly meeting of 1817 to the proposed creed which would make the Society in America approach the position of the English Friends by definite doctrinal statements. His *Doctrinal Epistle* (1824) stated his position, and a break ensued in 1827–1828, Hicks's followers, who call themselves the "Liberal Branch," being called "Hicksites" by the "Orthodox" party, which they for a time outnumbered. The village of Hicksville, in Nassau County, New York, 15 m. E. of Jamaica, lies in the centre of the Quaker district of Long Island and was named in honour of Elias Hicks.

See *A Series of Extemporaneous Discourses . . . by Elias Hicks* (Philadelphia, 1825); *The Journal of the Life and Labors of Elias Hicks* (Philadelphia, 1828), and his *Letters* (Philadelphia, 1834).

HICKS, HENRY (1837–1899), British physician and geologist, was born on the 26th of May 1837 at St David's, in Pembrokeshire, where his father, Thomas Hicks, was a surgeon. He studied medicine at Guy's Hospital, London, qualifying as M.R.C.S. in 1862. Returning to his native place he commenced a practice which he continued until 1871, when he removed to Hendon. He then devoted special attention to mental diseases, took the degree of M.D. at St Andrews in 1878, and continued his medical work until the close of his life. In Wales he had been attracted to geology by J. W. Salter (then palaeontologist to the Geological Survey), and his leisure time was given to the study of the older rocks and fossils of South Wales. In conjunction with Salter, he established in 1865 the Menevian group (Middle Cambrian) characterized by the trilobite *Paradoxides*. Subsequently Hicks contributed a series of important papers on the Cambrian and Lower Silurian rocks, and figured and described many new species of fossils. Later he worked at the Pre-Cambrian rocks of St David's, describing the Dimetian (granitoid rock) and the Pebidian (volcanic series), and his views, though contested, have been generally accepted. At Hendon Dr Hicks gave much attention to the local geology and also to the Pleistocene deposits of the Denbighshire caves. For a few years before his death he had laboured at the Devonian rocks. With his keen eye for fossils he detected organic remains in the Morte slates, previously regarded as unfossiliferous, and these he regarded as including representatives of Lower Devonian and Silurian. His papers were mostly published in the *Geol. Mag.* and *Quart. Journ. Geol. Soc.* He was elected F.R.S. in 1885, and president of the Geological Society of London 1896–1898. He died at Hendon on the 18th of November 1899.

HICKS, WILLIAM (1830–1883), British soldier, entered the Bombay army in 1849, and served through the Indian mutiny, being mentioned in despatches for good conduct at the action of Sitka Ghaut in 1859. In 1861 he became captain, and in the

SpinSmart Software http://www.spinsmart.com

Abyssinian expedition of 1867–68 was a brigade major, being again mentioned in despatches and given a brevet majority. He retired with the honorary rank of colonel in 1880. After the close of the Egyptian war of 1882, he entered the khedive's service and was made a pasha. Early in 1883 he went to Khartum as chief of the staff of the army there, then commanded by Suliman Niazi Pasha. Camp was formed at Omdurman and a new force of some 8000 fighting men collected—mostly recruited from the fellahin of Arabi's disbanded troops, sent in chains from Egypt. After a month's vigorous drilling Hicks led 5000 of his men against an equal force of dervishes in Sennar, whom he defeated, and cleared the country between the towns of Sennar and Khartum of rebels. Relieved of the fear of an immediate attack by the mahdists the Egyptian officials at Khartum intrigued against Hicks, who in July tendered his resignation. This resulted in the dismissal of Suliman Niazi and the appointment of Hicks as commander-in-chief of an expeditionary force to Kordofan with orders to crush the mahdi, who in January 1883 had captured El Obeid, the capital of that province. Hicks, aware of the worthlessness of his force for the purpose contemplated, stated his opinion that it would be best to "wait for Kordofan to settle itself" (telegram of the 5th of August). The Egyptian ministry, however, did not then believe in the power of the mahdi, and the expedition started from Khartum on the 9th of September. It was made up of 7000 infantry, 1000 cavalry and 2000 camp followers and included thirteen Europeans. On the 20th the force left the Nile at Duem and struck inland across the almost waterless wastes of Kordofan for Obeid. On the 5th of November the army, misled by treacherous guides and thirst-stricken, was ambuscaded in dense forest at Kashgil, 30 m. south of Obeid. With the exception of some 300 men the whole force was killed. According to the story of Hicks's cook, one of the survivors, the general was the last officer to fall, pierced by the spear of the khalifa Mahommed Sherif. After emptying his revolver the pasha kept his assailants at bay for some time with his sword, a body of Baggara who fled before him being known afterwards as "Baggar Hicks" (the cows driven by Hicks), a play on the words *baggara* and *baggar*, the former being the herdsmen and the latter the cows. Hicks's head was cut off and taken to the mahdi.

HIDALGO, an inland state of Mexico, bounded N. by San Luis Potosi and Vera Cruz, E. by Vera Cruz and Puebla, S. by Tlaxcala and Mexico (state), and W. by Querétaro. Pop. (1895) 551,817, (1900) 605,051. Area, 8917 sq. m. The northern and eastern parts are elevated and mountainous, culminating in the Cerro de Navajas (10,528 ft.). A considerable area of this region on the eastern side of the state is arid and semi-barren, being part of the elevated tableland of Apam where the *maguey* (American aloe) has been grown for centuries. The southern and western parts of the state consist of rolling plains, in the midst of which is the large lake of Metztitlan. Hidalgo produces cereals in the more elevated districts, sugar, maguey, coffee, beans, cotton and tobacco. Maguey is cultivated for the production of *pulque*, the national drink. The chief industry, however, is mining, the mineral districts of Pachuca, El Chico, Real del Monte, San José del Oro, and Zimapán being among the richest in Mexico. The mineral products include silver, gold, mercury, copper, iron, lead, zinc, antimony, manganese and plumbago. Coal, marble and opals are also found. Railway facilities are afforded by a branch of the Vera Cruz and Mexico line, which runs from Ometusco to Pachuca, the capital of the state, and by the Mexican Central. Among the principal towns are Tulancingo (pop. 9037), a rich mining centre 24 m. E. of Pachuca, Ixmiquilpán (about 9000) with silver mines 80 m. N. by W. of the Federal Capital, and Actópan (2666), the chief town of the district N.N.W. of Pachuca, inhabited principally by Indians of the Othomies nation.

HIDALGO (a Spanish word, contracted from *hijo d'algo* or *hijo de algo*, son of something, or somewhat), originally a Spanish title of the lower nobility; the hidalgo being the lowest grade of nobility which was entitled to use the prefix "don." The term is now used generally to denote one of gentle birth. The Portuguese *fidalgo* has a similar history and meaning.

HIDALGO Y COSTILLA, MIGUEL (1753–1811), Mexican patriot, was born on the 8th of May 1753, on a farm at Corralejos, near Guanajuato. His mother's maiden name was Gallaga, but contrary to the usual custom of the Spaniards he used only the surname of his father, Cristobal Hidalgo y Costilla. He was educated at Valladolid in Mexico, and was ordained priest in 1779. Until 1809 he was known only as a man of pious life who exerted himself to introduce various forms of industry, including the cultivation of silk, among his parishioners at Dolores. But Napoleon's invasion of Spain in 1808 caused a widespread commotion. The colonists were indisposed to accept a French ruler and showed great zeal in proclaiming Ferdinand VII. as king. The societies they formed for their professedly loyal purpose were regarded, however, by the Spanish authorities with suspicion as being designed to prepare the independence of Mexico. Hidalgo and several of his friends, among whom was Miguel Dominguez, mayor of Querétaro, engaged in consultation and preparations which the authorities considered treasonable. Dominguez was arrested, but Hidalgo was warned in time. He collected some hundred of his parishioners, and on the 16th of September 1810 they seized the prison at Dolores. This action began what was in fact a revolt against the Spanish and Creole elements of the population. With what is known as the "*grito*" or cry of Dolores as their rallying shout, a multitude gathered round Hidalgo, who took for his banner a wonder-working picture of the Virgin belonging to a popular shrine. At first he met with some success. A regiment of dragoons of the militia joined him, and some small posts were stormed. The whole tumultuous host moved on the city of Mexico. But here the Spaniards and Creoles were concentrated. Hidalgo lost heart and retreated. Many of his followers deserted, and on the march to Querétaro he was attacked at Aculco by General Felix Calleja on the 7th of November 1810, and routed. He endeavoured to continue the struggle, and did succeed in collecting a mob estimated at 100,000 about Guadalajara. With this ill-armed and undisciplined crowd he took up a position on the bridge of Calderon on the river Santiago. On the 17th of January 1811 he was completely beaten by Calleja and a small force of soldiers. Hidalgo was deposed by the other leaders, and soon afterwards all of them were betrayed to the Spaniards. They were tried at Chihuahua, and condemned. Hidalgo was first degraded from the priesthood and then shot as a rebel, on the 31st of July or the 1st of August 1811.

See H. H. Bancroft, *The Pacific States*, vol. vii., which contains a copious bibliography.

HIDDENITE, a green transparent variety of spodumene, (*q.v.*) used as a gem-stone. It was discovered by William E. Hidden (b. 1853) about 1879 at Stonypoint, Alexander county, North Carolina, and was at first taken for diopside. In 1881 J. Lawrence Smith proved it to be spodumene, and named it. Hiddenite occurs in small slender monoclinic crystals of prismatic habit, often pitted on the surface. A well-marked prismatic cleavage renders the mineral rather difficult to cut. Its colour passes from an emerald green to a greenish-yellow, and is often unevenly distributed through the stone. The mineral is dichroic in a marked degree, and shows much "fire" when properly cut. The composition of the mineral is represented by the formula $LiAl(SiO_3)_2$, the green colour being probably due to the presence of a small proportion of chromium. The presence of lithia in this green mineral suggested the inappropriate name of lithia emerald, by which it is sometimes known. Hiddenite was originally found as loose crystals in the soil, but was afterwards worked in a veinstone, where it occurred in association with beryl, quartz, garnet, mica, rutile, &c.

HIDE[1] (Lat. *hida*, A.-S. *higid*, *hîd* or *hiwisc*, members of a household), a measure of land. The word was in general use in England in Anglo-Saxon and early English times, although its meaning seems to have varied somewhat from time to time. Among its Latin equivalents are *terra unius familiae*, *terra unius cassati* and *mansio*; the first of these forms is used by Bede, who, like all early writers, gives to it no definite area. In its earliest form the hide was the typical holding of the typical family. Gradually, this typical holding came to be regarded as containing 120 "acres" (not 120 acres of 4840 sq. yds. each, but 120 times the amount of land which a ploughteam of eight oxen could plough in a single day). This definition appears to have been very general in England before the Norman Conquest, and in Domesday Book 30, 40, 50 and 80 acres are repeatedly mentioned as fractions of a hide. Some historians, however, have thought that the hide only contained 30 acres or thereabouts.

"The question about the hide," says Professor Maitland in *Domesday Book and Beyond*, "is 'pre-judicial' to all the great questions of early English history." The main argument employed by J. M. Kemble (*The Saxons in England*) in favour of the "small" hide is that the number of hides stated to have existed in the various parts of England gives an acreage far in excess of the total acreage of these parts, making due allowance for pasture and for woodland, an allowance necessary because the hide was only that part of the land which came under the plough, and each hide must have carried with it a certain amount of pasture. Two illustrations in support of Kemble's theory must suffice. Bede says the Isle of Wight contained 1200 hides. Now 1200 hides of 120 acres each gives a total acreage of 144,000 acres, while the total acreage of the island to-day is only 93,000 acres. Again a document called *The Tribal Hidage* puts the number of hides in the whole of England at nearly a quarter of a million. This gives in acres a figure about equal to the total acreage of England at the present time, but it leaves no room for pasture and for the great proportion of land which was still woodland. On these grounds Kemble regarded the hide as containing 30 or 33, certainly not more than 40 acres, and thought that each acre contained about 4000 sq. yds., *i.e.* that it was roughly equal to the modern acre. Another argument brought forward is that 30 or 40 acres was enough land for the support of the average family, in other words that it was the *terra unius familiae* of Bede. Another Domesday student, R. W. Eyton, puts down the hide at 48 acres.

But formidable arguments have been advanced against the "small" hide. There is no doubt that at the time of Domesday the hide was equated with 120 and not with 30 acres. Then, taking the word *familia* in its proper sense, a household with many dependent members, and making an allowance for primitive methods of agriculture, it is questionable whether 30 or 40 acres were sufficient for its support; and again if the equation 1 hide = 120 acres is rejected there is no serious evidence in favour of any other. A possible explanation is that, although in early Anglo-Saxon times the hide consisted of 30 acres or thereabouts, it had come before the time of Domesday to contain 120 acres. But no trace of such change can be found; there is no break in the continuity of the land-charters which refer to hides and manses. Reviewing the whole question Professor Maitland accepts the view that the hide contained 120 acres. The difficulties are serious but they are not insuperable. Bede, writing in a primitive age and speaking for the most part of lands far away from Northumbria, uses figures in a vague and general fashion; then the hide of 120 acres does not mean 120 times 4840 yds., it means much less; and lastly at the time of Domesday the hide was not a unit of measurement, it was a unit for purposes of taxation. On the other hand, Mr. H. M. Chadwick (*Studies on Anglo-Saxon Institutions*) says there is no evidence that the hide contained 120 acres before the 10th century. He suggests that possibly the size of the hide in Mercia may have been fixed at 40 acres, while in Wessex it was regarded as containing 120 acres. Dr Stubbs (*Const. Hist.* i.) suggests that the confusion may have arisen because the word was used "to express the whole share of one man in all the fields of the village." Thus it might refer to 30 acres, his share in one field, or to 120 acres, his share in the four fields. He adds, however, that this explanation is not adequate for all cases. But these differences about the size of the hide are not peculiar to modern times. Henry of Huntingdon says, *Hida Anglice vocatur terra unius aratri culturae sufficiens per annum*, while the *Dialogus de scaccario* puts its size at 100 acres, though this may be the long hundred, or 120. Perhaps, therefore, Selden is wisest when he says, "hides were of an incertain quantity." Certainly he gives a very good description of the early hide when he says (*Titles of Honour*): "Now a hide of land regularly is and was (as I think) as much land as might be well manured with one plough, together with pasture, meadow and wood competent for the maintenance of that plough, and the servants of the family." The view that the size of the hide varied from district to district is borne out by Professor Vinogradoff's more recent researches. In his *English Society in the Eleventh Century* he mentions that there was a hide of 48 acres in Wiltshire and one of 40 acres in Dorset. In addition some authorities distinguish between English hides and Welsh hides, and in Sussex the hide often contained 8 virgates. Sometimes again in the 11th century hides were not merely fiscal units; they were shares in the land itself.

The fact that the hide was a unit of assessment, has been established by Mr J. H. Round in his *Feudal England*, and is regarded as throwing a most valuable light upon the many problems which present themselves to the student of Domesday. The process which converted the hide from a unit of measurement to a unit for assessment purposes is probably as follows. Being in general use to denote a large piece of land, and such pieces of land being roughly equal all over England, the hide was a useful unit on which to levy taxation, a use which dates doubtless from the time of the Danegeld. For some time the two meanings were used side by side, but before the Norman Conquest the hide, a unit for taxation, had quite supplanted the hide, a measure of land, and this was the state of affairs when in 1086 William I. ordered his great inquest to be made. The formula used in Domesday varies from county to county, but a single illustration may be given. *Huntedun Burg defendebat se ad geldum regis pro quarta parte de Hyrstingestan hundred pro L. hidis.* This does not mean that the town of Huntingdon contained a certain fixed number of square yards multiplied by 50, but that for purposes of taxation Huntingdon was regarded as worth 50 times a certain fiscal unit.

This view of the nature of the hide was hinted at by R. W. Eyton in *A Key to Domesday* and was accepted by Maitland. Its proof rests primarily upon the prevalence of the five-hide unit. By collating various documents which formed part of the Domesday inquest Mr Round has brought together for certain parts of England, especially for Cambridgeshire and Bedfordshire, the holdings of the various lords in the different vills, and vill after vill shows a total of 5 hides or 10 hides or only a slight discrepancy therefrom. A similar result is shown for the hundreds where multiples of 5 are almost universal, and the total hidage for the county of Worcester is very near the round figure of 1200. This arrangement is obviously artificial; it must have been imposed upon the counties or the hundreds by the central authority and then divided among the vills. Another proof is found in what is called "beneficial hidation." It is shown that in certain cases the number of hides in a hundred has been reduced since the time of Edward the Confessor, and that this reduction had been transferred *pro rata* to the vills in the hundred. Thus Mr Round concludes that the hide was fixed "independently of area or value." Some slight criticism has been directed against the idea of "artificial hidation," but the most that can be said against it is that its proof rests upon isolated cases, a reproach which further research will doubtless remove. However, Professor Vinogradoff accepts the hide primarily as a fiscal unit "which corresponds only in a very rough way to the agrarian reality," and Maitland says the fiscal hide is "at its best a lame compromise between a unit of area and a unit of value."

What is the origin of the five-hide unit? Various conjectures have been hazarded, and the unit is undoubtedly older than the Danegeld. Rejecting the idea that it is of Roman or of British origin, and pointing to the serious difference in the rates at which the various counties were assessed, Mr Round thinks that it dates from the time when the various Anglo-Saxon kingdoms were independent. Possibly it was the unit of assessment for military service, possibly it was the recognized endowment of a Saxon thegn. In Anglo-Saxon times a man's standing in society was dependent to a great extent upon the number of hides which he possessed; this statement is fully proved from the laws. Moreover, in the laws of the Wessex king, Ine, the value of a man's oath is expressed in hides, the oath for a king's thegn being probably worth 60 hides and that of a ceorl 5 hides.

The usual division of the hide was into virgates, a virgate being, after the Conquest at least, the normal holding of the

[1] The homonym "hide," meaning to conceal, is in O. Eng. *hýdan*; the word appears in various forms in Old Teutonic languages. The root is probably seen in Gr. κεύθειν to hide, or may be the same as in "hide," skin, O. Eng. *hýd*, which is also seen in Ger. *Haut*, Dutch *huid*; the root appears in Lat. *cutis*, Gr. κύτος. The Indo-European root *ku-*, weakened form of *sku-*, seen in "sky," and meaning "to cover," may be the ultimate source of both words. The slang use of "to hide," to flog or whip, means "to take the skin off, to flay."

SpinSmart Software http://www.spinsmart.com

villein with two oxen. Mr Round holds that in Domesday at all events the hide always consisted of four virgates; Mr F. Seebohm in *The English Village Community*, although thinking that the normal hide "consisted as a rule of four virgates of 30 acres each," says that the Hundred Rolls for Huntingdonshire show that "the hide did not always contain the same number of virgates." The virgate, it may be noted, consisted of a strip of land in *each* acre of the hide, and there is undoubtedly a strong case in favour of the equation 1 hide = 4 virgates.

Mr Seebohm, propounding his theory that English institutions are rooted in those of Rome, argues for some resemblance between the methods of taxation of land in Rome and in England; he sees some connexion between the Roman *centuria* and the hide, and between the Roman system of taxation called *jugatio* and the English hidage. Professor Vinogradoff (*Villainage in England*) summarizes the views of those who hold a contrary opinion thus: "The curious fact that the normal holding, the hide, was equal all over England can be explained only by its origin; it came full-formed from Germany and remained unchanged in spite of all diversities of geographical and economical conditions."

In the Danish parts of England, or rather in the district of the "Five Boroughs," the carucate takes the place of the hide as the unit of value, and six supplants five, six carucates being the unit of assessment. In Leicestershire and in part of Lancashire the hide is quite different from what it is elsewhere in England. According to Mr Round the Leicestershire hide consisted of 18 carucates; Mr W. H. Stevenson (*English Historical Review*, vol. v.) argues that it contained only 12 and that it was a hundred and not a hide. Mr Seebohm thinks there was a *solanda* or double hide of 240 acres in Essex and other southern counties, but Mr Round does not think that this word refers to a measure or unit of assessment at all. For Kent, however, the word *sullung* or solin, is used in *Domesday Book* and in the charters instead of hide and carucate as elsewhere, and Vinogradoff thinks that this contained from 180 to 200 acres.

Under the Norman and early Plantagenet kings a levy of two or more shillings on each hide of land was a usual and recognized method of raising money, royal and some other estates, however, as is seen from Domesday, not being hidated and not paying the tax. This geld, or tax, received several names, one of the most general being *hidage* (Lat. *hidagium*). "Hidage," says Vinogradoff, "is historically connected with the old English Danegeld system," and as Danegeld and then hidage it was levied long after its original purpose was forgotten, and was during the 11th century "the most sweeping and the heaviest of all the taxes." Henry of Huntingdon says its usual rate was 2s. on each hide of land, and this was evidently the rate at the time of the famous dispute between Henry II. and Becket at Woodstock in 1163, but it was not always kept at this figure, as in 1084 William I. had levied a tax of 6s. on each hide, an unusual extortion. The feudal aids were levied on the hide. Thus in 1109 Henry I. raised one at the rate of 3s. per hide for the marriage of his daughter Matilda with the emperor Henry V., and in 1194, when money was collected for the ransom of Richard I., some of the taxation for this purpose seems to have been assessed according to the hidage given in Domesday Book.

By this time the word hidage as the designation of the tax was disappearing, its place being taken by the word *carucage*. The carucate (Lat. *caruca*, a plough) was a measure of land which prevailed in the north of England, the district inhabited by people of Danish descent. Some authorities regard it as equivalent to the hide, others deny this identity. In 1198, however, when Richard I. imposed a tax of 5s. on each *carucata terrae sive hyda*, the two words were obviously interchangeable, and about the same time the size of the carucate was fixed at 100 acres. The word carucage remained in use for some time longer, and then other names were given to the various taxes on land.

One or two other questions with regard to the hide still remain unsolved. What is the connexion, if any, between the hundred and a hundred hides? Again, was the size of the hide fixed at 120 acres to make the work of reckoning the amount of Danegeld, or hidage, a simple process? 120 acres to the hide, 240 pence to the pound, makes calculations easy. Lastly, is the English hide derived from the German *hufe* or *huba*? (A. W. H.*)

HIEL, EMMANUEL (1834–1899), Belgian-Dutch poet and prose writer, was born at Dendermonde, in Flanders, in May 1834. He acted in various functions, from teacher and government official to journalist and bookseller, busily writing all the time both for the theatre and the magazines of North and South Netherlands. His last posts were those of librarian at the Industrial Museum and professor of declamation at the Conservatoire in Brussels. Among his better-known poetic works may be cited *Looverkens* ("Leaflets," 1857); *Nieuwe Liedekens* ("New Poesies," 1861); *Gedichten* ("Poems," 1863); *Psalmen, Zangen, en Oratorios* ("Psalms, Songs, and Oratorios," 1869); *De Wind* (1869), an inspiriting cantata, which had a large measure of success and was crowned; *De Liefde in 't Leven* ("Love in Life," 1870); *Elle* and *Isa* (two musical dramas, 1874); *Liederen voor Groote en Kleine Kinderen* ("Songs for Big and Small Folk," 1879); *Jakoba van Beieren* ("Jacquelein of Bavaria," a poetic drama, 1880); *Mathilda van Denemarken* (a lyrical drama, 1890). His collected poetical works were published in three volumes at Rousselaere in 1885. Hiel took an active and prominent part in the so-called "Flemish movement" in Belgium, and his name is constantly associated with those of Jan van Beers, the Willems and Peter Benoit. The last wrote some of his compositions to Hiel's verses, notably to his oratorios *Lucifer* (performed in London at the Royal Albert Hall and elsewhere) and *De Schelde* ("The Scheldt"); whilst the Dutch composer, Richard Hol (of Utrecht), composed the music to Hiel's "Ode to Liberty," and van Gheluwe to the poet's "Songs for Big and Small Folk" (second edition, much enlarged, 1879), which has greatly contributed to their popularity in schools and among Belgian choral societies. Hiel also translated several foreign lyrics. His rendering of Tennyson's *Dora* appeared at Antwerp in 1871. For the national festival of 1880 at Brussels, to commemorate the fiftieth anniversary of Belgian independence, Hiel composed two cantatas, *Belgenland* ("The Land of the Belgians") and *Eer Belgenland* ("Honour to Belgium"), which, set to music, were much appreciated. He died at Schaerbeek, near Brussels, on the 27th of August 1899. Hiel's efforts to counteract Walloon influences and bring about a *rapprochement* between the Netherlanders in the north and the Teutonic racial sympathizers across the Rhine made him very popular with both, and a volume of his best poems was in 1874 the first in a collection of Dutch authors published at Leipzig.

HIEMPSAL, the name of the two kings of Numidia. For Hiempsal I. see under JUGURTHA. Hiempsal II. was the son of Gauda, the half-brother of Jugurtha. In 88 B.C., after the triumph of Sulla, when the younger Marius fled from Rome to Africa, Hiempsal received him with apparent friendliness, his real intention being to detain him as a prisoner. Marius discovered this intention in time and made good his escape with the assistance of the king's daughter. In 81 Hiempsal was driven from his throne by the Numidians themselves, or by Hiarbas, ruler of part of the kingdom, supported by Cn. Domitius Ahenobarbus, the leader of the Marian party in Africa. Soon afterwards Pompey was sent to Africa by Sulla to reinstate Hiempsal, whose territory was subsequently increased by the addition of some land on the coast in accordance with a treaty concluded with L. Aurelius Cotta. When the tribune P. Servilius Rullus introduced his agrarian law (63), these lands, which had been originally assigned to the Roman people by Scipio Africanus, were expressly exempted from sale, which roused the indignation of Cicero (*De lege agraria*, i. 4, ii. 22). From Suetonius (*Caesar*, 71) it is evident that Hiempsal was alive in 62. According to Sallust (*Jugurtha*, 17), he was the author of an historical work in the Punic language.

Plutarch, *Marius*, 40, *Pompey*, 12; Appian, *Bell. civ.*, i. 62. 80; Dio Cassius xli. 41.

HIERAPOLIS. 1. (Arabic *Manbij* or *Mumbij*) an ancient Syrian town occupying one of the finest sites in Northern Syria, in a fertile district about 16 m. S.W. of the confluence of the Sajur and Euphrates. There is abundant water supply from large springs. In 1879, after the Russo-Turkish war, a colony of

SpinSmart Software http://www.spinsmart.com

Circassians from Vidin (Widdin) was planted in the ruins, and the result has been the constant discovery of antiquities, which find their way into the bazaars of Aleppo and Aintab. The place first appears in Greek as *Bambyce*, but Pliny (v. 23) tells us its Syrian name was *Mabog*. It was doubtless an ancient Commagenian sanctuary; but history knows it first under the Seleucids, who made it the chief station on their main road between Antioch and Seleucia-on-Tigris; and as a centre of the worship of the Syrian Nature Goddess, Atargatis(*q.v.*), it became known to the Greeks as the city of the sanctuary Ἱερόπολις, and finally as the Holy City Ἱεράπολις. Lucian, a native of Commagene (or some anonymous writer) has immortalized this worship in the tract *De Dea Syria*, wherein are described the orgiastic luxury of the shrine and the tank of sacred fish, of which Aelian also relates marvels. According to the *De Dea Syria*, the worship was of a phallic character, votaries offering little male figures of wood and bronze. There were also huge *phalli* set up like obelisks before the temple, which were climbed once a year with certain ceremonies, and decorated. For the rest the temple was of Ionic character with golden plated doors and roof and much gilt decoration. Inside was a holy chamber into which priests only were allowed to enter. Here were statues of a goddess and a god in gold, but the first seems to have been the more richly decorated with gems and other ornaments. Between them stood a gilt *xoanon*, which seems to have been carried outside in sacred processions. Other rich furniture is described, and a mode of divination by movements of a *xoanon* of Apollo. A great bronze altar stood in front, set about with statues, and in the forecourt lived numerous sacred animals and birds (but not swine) used for sacrifice. Some three hundred priests served the shrine and there were numerous minor ministrants. The lake was the centre of sacred festivities and it was customary for votaries to swim out and decorate an altar standing in the middle of the water. Self-mutilation and other orgies went on in the temple precinct, and there was an elaborate ritual on entering the city and first visiting the shrine under the conduct of local guides, which reminds one of the Meccan Pilgrimage.

The temple was sacked by Crassus on his way to meet the Parthians (53 B. C.); but in the 3rd century of the empire the city was the capital of the Euphratensian province and one of the great cities of Syria. Procopius called it the greatest in that part of the world. It was, however, ruinous when Julian collected his troops there ere marching to his defeat and death in Mesopotamia, and Chosroes I. held it to ransom after Justinian had failed to put it in a state of defence. Harun restored it at the end of the 8th century and it became a bone of contention between Byzantines, Arabs and Turks. The crusaders captured it from the Seljuks in the 12th century, but Saladin retook it (1175), and later it became the headquarters of Hulagu and his Mongols, who completed its ruin. The remains are extensive, but almost wholly of late date, as is to be expected in the case of a city which survived into Moslem times. The walls are Arab, and no ruins of the great temple survive. The most noteworthy relic of antiquity is the sacred lake, on two sides of which can still be seen stepped quays and water-stairs. The first modern account of the site is in a short narrative appended by H. Maundrell to his *Journey from Aleppo to Jerusalem*. He was at Mumbij in 1699.

The coinage of the city begins in the 4th century B.C. with an Aramaic series, showing the goddess, either as a bust with mural crown or as riding on a lion. She continues to supply the chief type even during imperial times, being generally shown seated with the *tympanum* in her hand. Other coins substitute the legend Θεᾶς Συρίας Ἱεροπολιτῶν, within a wreath. It is interesting to note that from *Bambyce* (near which much silk was produced) were derived the *bombycina vestis* of the Romans and, through the crusaders, the bombazine of modern commerce.

See F. R. Chesney, *Euphrates Expedition* (1850); W. F. Ainsworth, *Personal Narrative of the Euphrates Expedition* (1888); E. Sachau, *Reise in Syrien*, &c. (1883); D. G. Hogarth in *Journal of Hellenic Studies* (1909).

2. A Phrygian city, altitude 1200 ft. on the right bank of the Churuk Su (Lycus), about 8 m. above its junction with the Menderes (Maeander), situated on a broad terrace, 200 ft. above the valley and 6 m. N. of Laodicea. On the terrace rise calcareous springs, that have deposited vast incrustations of snowy whiteness. To these springs, which are warm and slightly sulphureous, and to the "Plutonium"—a hole reaching deep into the earth, from which issued a mephitic vapour—the place owed its celebrity and sanctity. Here, at an early date, a religious establishment (*hieron*) existed in connexion with the old Phrygian Kydrara, a settlement of the tribe Hydrelitae; and the town which grew round it became one of the greatest centres of Phrygian native life but of non-political importance. The chief religious festival was the Letoia, named after the goddess Leto, a local variety of the Mother Goddess (Cybele), who was honoured with orgiastic rites in which elements of the original Anatolian matriarchate and Nature-cult survived: there was also a worship of Apollo Lairbenos. Hierapolis was the seat of an early church (Col. iv. 13), with which tradition closely connects the apostle Philip. Epictetus, the philosopher, and Papias, a disciple of St John and author of a lost work on the Sayings of Jesus, were born there. Hierapolis is now easily reached from Gonjeli, a station on the Dineir railway about 7 m. distant. A village of Yuruks has gradually grown below the site. The native name for the place is apparently *Pambuk Kale* (though doubt has been thrown on the statement), and this has always been explained by the cotton-like appearance of the white incrustations. It should be noted, however, that this name, if genuine, is curiously like that given by the Syrians to the Commagenian Hierapolis (above), *Bambyce*, the origin of which it has been suggested was a native name of the goddess Pambē or Mambē (whence Mabog). Considering that cotton is a comparatively modern phenomenon in Anatolia, it is worth suggesting that *Pambuk* in this case may be a survival of a primitive name, derived from the same goddess, Pambē. The goddesses of the two Hierapoleis were in any case closely akin. If an old native name has reappeared here after the decline of Greek influence, and been given a meaning in modern Turkish, it affords another instance of a very common feature of west Asian nomenclature. Combined with the petrified terraces, the ruins of Hierapolis present the most attractive of the easily accessible spectacles in Asia Minor. They are remarkable for the long avenue of tombs, mostly inscribed sarcophagi on plinths, by which the city is approached from the W., and for a very perfect theatre partly excavated in the hill at the N. side of the site. Stage buildings as well as auditorium are well preserved. On the S., just above the white terraces and largely blocked with petrified deposit, stand large baths, into which the natural warm spring was once conducted. Behind these is a fine triumphal arch, whence runs a colonnade. Ruins of several churches survive, and also of a large basilica. There is a sulphureous pool which may represent the "Plutonium," but it has no such deadly power as was ascribed to that pond. Ramsay thinks that the "Plutonium" was obliterated by Christians in the 4th century. Over 300 inscriptions have been collected, mostly sepulchral, whence Ramsay has deduced interesting facts about the very early Christian community which existed here. The site has been often visited and described, and was systematically examined in 1887 by parties under W. M. Ramsay and K. Humann respectively.

See K. Humann, *Altertümer v. Hierapolis* (1888); Sir W. M. Ramsay, *Cities and Bishoprics of Phrygia*, vol. i. (1895).

(C. W. W.; D. G. H.)

HIERARCHY (Gr. ἱερός, holy, and ἄρχειν, to rule), the office of a steward or guardian of holy things, not a "ruler of priests" or "priestly ruler" (see Boeckh, *Corp. inscr. Gr.* No. 1570), a term commonly used in ecclesiastical language to denote the aggregate of those persons who exercise authority within the Christian Church, the patriarchate, episcopate or entire threefold order of the clergy. The word ἱεραρχία, which does not occur in any classical Greek writer, owes its present extensive currency to the celebrated writings of Dionysius Areopagiticus. Of these the most important are the two which treat of the celestial and of the ecclesiastical hierarchy respectively. Defining hierarchy as the "function which comprises all sacred things," or, more fully, as "a sacred order and science and

SpinSmart Software http://www.spinsmart.com

activity, assimilated as far as possible to the godlike, and elevated to the imitation of God proportionately to the Divine illuminations conceded to it," the author proceeds to enumerate the nine orders of the heavenly host, which are subdivided again into hierarchies or triads, in descending order, thus: Seraphim, Cherubim, Thrones; Dominations, Virtues, Powers; Principalities, Archangels, Angels. These all exist for the common object of raising men through ascending stages of purification and illumination to perfection. The ecclesiastical or earthly hierarchy is the counterpart of the other. In it the first or highest triad is formed by baptism, communion and chrism. The second triad consists of the three orders of the ministry, bishop or hierarch, priest and minister or deacon (ἱεράρχης, ἱερεύς, λειτουργός); this is the earliest known instance in which the title hierarch is applied to a bishop. The third or lowest triad is made up of monks, "initiated" and catechumens. To Dionysius may be traced, through Thomas Aquinas and other Catholic writers of the intervening period, the definition of the term usually given by Roman Catholic writers—"coëtus seu ordo praesidum et sacrorum ministrorum ad regendam ecclesiam gignendamque in hominibus sanctitatem divinitus institutus"[1]—although it immediately rests upon the authority of the sixth canon of the twenty-third session of the council of Trent, in which anathema is pronounced upon all who deny the existence within the Catholic Church of a hierarchy instituted by divine appointment, and consisting of bishops, priests and ministers.[2] (See ORDER, HOLY).

HIERATIC, priestly or sacred (Gr. ἱερατικός, ἱερός, sacred), a term particularly applied to a style of ancient Egyptian writing, which is a simplified cursive form of hieroglyphic. The name was first given by Champollion (see EGYPT, § *Language*).

HIERAX, or HIERACAS, a learned ascetic who flourished about the end of the 3rd century at Leontopolis in Egypt, where he lived to the age of ninety, supporting himself by calligraphy and devoting his leisure to scientific and literary pursuits, especially to the study of the Bible. He was the author of Biblical commentaries both in Greek and Coptic, and is said to have composed many hymns. He became leader of the so-called sect of the Hieracites, an ascetic society from which married persons were excluded, and of which one of the leading tenets was that only the celibate could enter the kingdom of heaven. He asserted that the suppression of the sexual impulse was emphatically the new revelation brought by the Logos, and appealed to 1 Cor. vii., Heb. xii. 14, and Matt. xix. 12, xxv. 21. Hierax may be called the connecting link between Origen and the Coptic monks. A man of deep learning and prodigious memory, he seems to have developed Origen's Christology in the direction of Athanasius. He held that the Son was a torch lighted at the torch of the Father, that Father and Son are a bipartite light. He repudiated the ideas of a bodily resurrection and a material paradise, and on the ground of 2 Tim. ii. 5 questioned the salvation of even baptized infants, "for without knowledge no conflict, without conflict no reward." In his insistence on virginity as the specifically Christian virtue he set up the great theme of the church of the 4th and 5th centuries.

HIERO (strictly HIERON), the name of two rulers of Syracuse.

HIERO I. was the brother of Gelo, and tyrant of Syracuse from 478 to 467 6 B.C. During his reign he greatly increased the power of Syracuse. He removed the inhabitants of Naxos and Catana to Leontini, peopled Catana (which he renamed Aetna) with Dorians, concluded an alliance with Acragas (Agrigentum), and espoused the cause of the Locrians against Anaxilaus, tyrant of Rhegium. His most important achievement was the defeat of the Etruscans at Cumae (474), by which he saved the Greeks of Campania. A bronze helmet (now in the British Museum), with an inscription commemorating the event, was dedicated at Olympia. Though despotic in his rule Hiero was a liberal patron of literature. He died at Catana in 467.

See Diod. Sic. xi. 38-67; Xenophon, *Hiero*, 6. 2; E. Lübbert, *Syrakus zur Zeit des Gelon und Hieron* (1875); for his coins see NUMISMATICS (section *Sicily*).

HIERO II., tyrant of Syracuse from 270 to 216 B.C., was the illegitimate son of a Syracusan noble, Hierocles, who claimed descent from Gelo. On the departure of Pyrrhus from Sicily (275) the Syracusan army and citizens appointed him commander of the troops. He materially strengthened his position by marrying the daughter of Leptines, the leading citizen. In the meantime, the Mamertines, a body of Campanian mercenaries who had been employed by Agathocles, had seized the stronghold of Messana, whence they harassed the Syracusans. They were finally defeated in a pitched battle near Mylae by Hiero, who was only prevented from capturing Messana by Carthaginian interference. His grateful countrymen then chose him king (270). In 264 he again returned to the attack, and the Mamertines called in the aid of Rome. Hiero at once joined the Punic leader Hanno, who had recently landed in Sicily; but being defeated by the consul Appius Claudius, he withdrew to Syracuse. Pressed by the Roman forces, in 263 he was compelled to conclude a treaty with Rome, by which he was to rule over the south-east of Sicily and the eastern coast as far as Tauromenium (Polybius i. 8-16; Zonaras viii. 9). From this time till his death in 216 he remained loyal to the Romans, and frequently assisted them with men and provisions during the Punic wars (Livy xxi. 49-51, xxii. 37, xxiii. 21). He kept up a powerful fleet for defensive purposes, and employed his famous kinsman Archimedes in the construction of those engines that, at a later date, played so important a part during the siege of Syracuse by the Romans.

A picture of the prosperity of Syracuse during his rule is given in the sixteenth idyll of Theocritus, his favourite poet. See Diod. Sic. xxii. 24–xxvi. 24; Polybius i. 8–vii. 7; Justin xxiii. 4.

HIEROCLES, proconsul of Bithynia and Alexandria, lived during the reign of Diocletian (A.D. 284–305). He is said to have been the instigator of the fierce persecution of the Christians under Galerius in 303. He was the author of a work (not extant) entitled Λόγοι φιλαλήθεις πρὸς τοὺς Χριστιανούς in two books, in which he endeavoured to persuade the Christians that their sacred books were full of contradictions, and that in moral influence and miraculous power Christ was inferior to Apollonius of Tyana. Our knowledge of this treatise is derived from Lactantius (*Instit. div.* v. 2) and Eusebius, who wrote a refutation entitled Ἀντιῤῥητικὸς πρὸς τὰ Ἱεροκλέους.

HIEROCLES OF ALEXANDRIA, Neoplatonist writer, flourished *c.* A.D. 430. He studied under the celebrated Neoplatonist Plutarch at Athens, and taught for some years in his native city. He seems to have been banished from Alexandria and to have taken up his abode in Constantinople, where he gave such offence by his religious opinions that he was thrown into prison and cruelly flogged. The only complete work of his which has been preserved is the commentary on the *Carmina Aurea* of Pythagoras. It enjoyed a great reputation in middle age and Renaissance times, and there are numerous translations in various European languages. Several other writings, especially one on providence and fate, a consolatory treatise dedicated to his patron Olympiodorus of Thebes, author of ἱστορικοὶ λόγοι, are quoted or referred to by Photius and Stobaeus. The collection of some 260 witticisms (ἀστεῖα) called Φιλόγελως (ed. A. Eberhard, Berlin, 1869), attributed to Hierocles and Philagrius, has no connexion with Hierocles of Alexandria, but is probably a compilation of later date, founded on two older collections. It is now agreed that the fragments of the *Elements of Ethics* (Ἠθικὴ στοιχείωσις) preserved in Stobaeus are from a work by a Stoic named Hierocles, contemporary of Epictetus, who has been identified with the "Hierocles Stoicus vir sanctus et gravis" in Aulus Gellius (ix. 5. 8). This theory is confirmed by the discovery of a papyrus (ed. H. von Arnim in *Berliner Klassikertexte*, iv. 1906; see also C. Prächter, *Hierokles der Stoiker*, 1901).

[1] Perrone, *De locis theologicis*, pt. i., sec. i. cap. 2.

[2] Si quis dixerit in ecclesia catholica non esse hierarchiam divina ordinatione institutam, quae constat ex episcopis, presbyteris, et ministris: anathema sit.

SpinSmart Software http://www.spinsmart.com

There is an edition of the commentary by F. W. Mullach in *Fragmenta philosophorum Graecorum* (1860), i. 408, including full information concerning Hierocles, the poem and the commentary; see also E. Zeller, *Philosophie der Griechen* (2nd ed.), iii. 2, pp. 681-687; W. Christ, *Geschichte der griechischen Literatur* (1898), pp. 834, 849.

Another Hierocles, who flourished during the reign of Justinian, was the author of a list of provinces and towns in the Eastern Empire, called Συνέκδημος ("fellow-traveller"; ed. A. Burckhardt, 1893); it was one of the chief authorities used by Constantine Porphyrogenitus in his work on the "themes" of the Roman Empire (see C. Krumbacher, *Geschichte der byzantinischen Literatur*, 1897, p. 417). In Fabricius's *Bibliotheca Graeca* (ed. Harles), i. 791, sixteen persons named Hierocles, chiefly literary, are mentioned.

HIEROGLYPHICS (Gr. ἱερός, sacred, and γλυφή, carving), the term used by Greek and Latin writers to describe the sacred characters of the ancient Egyptian language in its classical phase. It is now also used for various systems of writing in which figures of objects take the place of conventional signs. Such characters which symbolize the idea of a thing without expressing the name of it are generally styled "ideographs" (Gr. ἰδέα, idea, and γράφειν, to write), *e.g.* the Chinese characters.

See EGYPT, *Language*; CUNEIFORM; INSCRIPTIONS and WRITING.

HIERONYMITES, a common name for three or four congregations of hermits living according to the rule of St Augustine with supplementary regulations taken from St Jerome's writings. Their habit was white, with a black cloak. (1) The Spanish Hieronymites, established near Toledo in 1374. The order soon became popular in Spain and Portugal, and in 1415 it numbered 25 houses. It possessed some of the most famous monasteries in the Peninsula, including the royal monastery of Belem near Lisbon, and the magnificent monastery built by Philip II. at the Escurial. Though the manner of life was very austere the Hieronymites devoted themselves to studies and to the active work of the ministry, and they possessed great influence both at the Spanish and the Portuguese courts. They went to Spanish and Portuguese America and played a considerable part in Christianizing and civilizing the Indians. There were Hieronymite nuns founded in 1375, who became very numerous. The order decayed during the 18th century and was completely suppressed in 1835. (2) Hieronymites of the Observance, or of Lombardy: a reform of (1) effected by the third general in 1424; it embraced seven houses in Spain and seventeen in Italy, mostly in Lombardy. It is now extinct. (3) Poor Hermits of St Jerome, established near Pisa in 1377: it came to embrace nearly fifty houses whereof only one in Rome and one in Viterbo survive. (4) Hermits of St Jerome of the congregation of Fiesole, established in 1406: they had forty houses but in 1668 they were united to (3).

See Helyot, *Histoire des ordres religieux* (1714), iii. cc. 57-60, iv. cc. 1-3; Max Heimbucher, *Orden und Kongregationen* (1896), i. § 70; and art. "Hieronymiten" in Herzog-Hauck, *Realencyklopädie* (ed. 3), and in Welte and Wetzer, *Kirchenlexicon* (ed. 2). (E. C. B.)

HIERONYMUS OF CARDIA, Greek general and historian, contemporary of Alexander the Great. After the death of the king he followed the fortunes of his friend and fellow-countryman Eumenes. He was wounded and taken prisoner by Antigonus, who pardoned him and appointed him superintendent of the asphalt beds in the Dead Sea. He was treated with equal friendliness by Antigonus's son Demetrius, who made him polemarch of Thespiae, and by Antigonus Gonatas, at whose court he died at the age of 104. He wrote a history of the Diadochi and their descendants, embracing the period from the death of Alexander to the war with Pyrrhus (323–272 B.C.), which is one of the chief authorities used by Diodorus Siculus (xviii.-xx.) and also by Plutarch in his life of Pyrrhus. He made use of official papers and was careful in his investigation of facts. The simplicity of his style rendered his work unpopular, but it is probable that it was on a high level as compared with that of his contemporaries. In the last part of his work he made a praiseworthy attempt to acquaint the Greeks with the character and early history of the Romans. He is reproached by Pausanias (i. 9. 8) with unfairness towards all rulers with the exception of Antigonus Gonatas.

See Lucian, *Macrobii*, 22; Plutarch, *Demetrius*, 39; Diod. Sic. xviii. 42. 44. 50, xix. 100; Dion. Halic. *Antiq. Rom.* i. 6; F. Brückner, "De vita et scriptis Hieronymi Cardii" in *Zeitschrift für die Alterthumswissenschaft* (1842); F. Reuss, *Hieronymos von Kardia* (Berlin, 1876); C. Wachsmuth, *Einleitung in das Studium der alten Geschichte* (1895); fragments in C. W. Müller, *Frag. hist. Graec.* ii. 450-461.

HIERRO, or FERRO, an island in the Atlantic Ocean, forming part of the Spanish archipelago of the Canary Islands (*q.v.*). Pop. (1900) 6508; area 107 sq. m. Hierro, the most westerly and the smallest island of the group, is somewhat crescent-shaped. Its length is about 18 m., its greatest breadth about 15 m., and its circumference 50 m. It lies 92 m. W.S.W. of Teneriffe. Its coast is bound by high, steep rocks, which only admit of one harbour, but the interior is tolerably level. Its hill-tops in winter are sometimes wrapped in snow. Better and more abundant grass grows here than on any of the other islands. Hierro is exposed to westerly gales which frequently inflict great damage. Fresh water is scarce, but there is a sulphurous spring, with a temperature of 102° Fahr. The once celebrated and almost sacred Til tree, which was reputed to be always distilling water in great abundance from its leaves, no longer exists. Only a small part of the cultivable land is under tillage, the inhabitants being principally employed in pasturage. Valverde (pop. about 3000) is the principal town. Geographers were formerly in the habit of measuring all longitudes from Ferro, the most westerly land known to them. The longitude assigned at first has, however, turned out to be erroneous; and the so-called "Longitude of Ferro" does not coincide with the actual longitude of the island.

HIGDON (or HIGDEN), **RANULF** (*c.* 1299–*c.* 1363), English chronicler, was a Benedictine monk of the monastery of St Werburg in Chester, in which he lived, it is said, for sixty-four years, and died "in a good old age," probably in 1363. Higdon was the author of a long chronicle, one of several such works based on a plan taken from Scripture, and written for the amusement and instruction of his society. It closes the long series of general chronicles, which were soon superseded by the invention of printing. It is commonly styled the *Polychronicon*, from the longer title *Ranulphi Castrensis, cognomine Higdon, Polychronicon (sive Historia Polycratica) ab initio mundi usque ad mortem regis Edwardi III. in septem libros dispositum.* The work is divided into seven books, in humble imitation of the seven days of Genesis, and, with exception of the last book, is a summary of general history, a compilation made with considerable style and taste. It seems to have enjoyed no little popularity in the 15th century. It was the standard work on general history, and more than a hundred MSS. of it are known to exist. The Christ Church MS. says that Higdon wrote it down to the year 1342; the fine MS. at Christ's College, Cambridge, states that he wrote to the year 1344, after which date, with the omission of two years, John of Malvern, a monk of Worcester, carried the history on to 1357, at which date it ends. According, however, to its latest editor, Higdon's part of the work goes no further than 1326 or 1327 at latest, after which time it was carried on by two continuators to the end. Thomas Gale, in his *Hist. Brit. &c., scriptores*, xv. (Oxon., 1691), published that portion of it, in the original Latin, which comes down to 1066. Three early translations of the *Polychronicon* exist. The first was made by John of Trevisa, chaplain to Lord Berkeley, in 1387, and was printed by Caxton in 1482; the second by an anonymous writer, was written between 1432 and 1450; the third, based on Trevisa's version, with the addition of an eighth book, was prepared by Caxton. These versions are specially valuable as illustrating the change of the English language during the period they cover.

The *Polychronicon*, with the continuations and the English versions, was edited for the Rolls Series (No. 41) by Churchill Babington (vols. i. and ii.) and Joseph Rawson Lumby (1865–1886). This edition was adversely criticized by Mandell Creighton in the *Eng. Hist. Rev.* for October 1888.

HIGGINS, MATTHEW JAMES (1810–1868), British writer over the nom-de-plume "Jacob Omnium," which was the title of his first magazine article, was born in County Meath, Ireland,

SpinSmart Software http://www.spinsmart.com

on the 4th of December 1810. His letters in *The Times* were instrumental in exposing many abuses. He was a frequent contributor to the *Cornhill*, and was a friend of Thackeray, who dedicated to him *The Adventures of Philip*, and one of his ballads, "Jacob Omnium's Hoss," deals with an incident in Higgins's career. He died on the 14th of August 1868. Some of his articles were published in 1875 as *Essays on Social Subjects*.

HIGGINSON, THOMAS WENTWORTH (1823–1911), American author and soldier, was born in Cambridge, Massachusetts, on the 22nd of December 1823. He was a descendant of Francis Higginson (1588–1630), who emigrated from Leicestershire to the colony of Massachusetts Bay and was a minister of the church of Salem, Mass., in 1629–1630; and a grandson of Stephen Higginson (1743–1828), a Boston merchant, who was a member of the Continental Congress in 1783, took an active part in suppressing Shay's Rebellion, was the author of the "Laco" letters (1789), and rendered valuable services to the United States government as navy agent from the 11th of May to the 22nd of June 1798. Graduating from Harvard in 1841, he was a schoolmaster for two years, studied theology at the Harvard Divinity School, and was pastor in 1847–1850 of the First Religious Society (Unitarian) of Newburyport, Massachusetts, and of the Free Church at Worcester in 1852–1858. He was a Free Soil candidate for Congress (1850), but was defeated; was indicted with Wendell Phillips and Theodore Parker for participation in the attempt to release the fugitive slave, Anthony Burns, in Boston (1853); was engaged in the effort to make Kansas a free state after the passage of the Kansas-Nebraska Bill of 1854; and during the Civil War was captain in the 51st Massachusetts Volunteers, and from November 1862 to October 1864, when he was retired because of a wound received in the preceding August, was colonel of the First South Carolina Volunteers, the first regiment recruited from former slaves for the Federal service. He described his experiences in *Army Life in a Black Regiment* (1870). In politics Higginson was successively a Republican, an Independent and a Democrat. His writings show a deep love of nature, art and humanity, and are marked by vigour of thought, sincerity of feeling, and grace and finish of style. In his *Common Sense About Women* (1881) and his *Women and Men* (1888) he advocated equality of opportunity and equality of rights for the two sexes.

Among his numerous books are *Outdoor Papers* (1863); *Malbone: an Oldport Romance* (1869); *Life of Margaret Fuller Ossoli* (in "American Men of Letters" series, 1884); *A Larger History of the United States of America to the Close of President Jackson's Administration* (1885); *The Monarch of Dreams* (1886); *Travellers and Outlaws* (1889); *The Afternoon Landscape* (1889), poems and translations; *Life of Francis Higginson* (in "Makers of America," 1891); *Concerning All of Us* (1892); *The Procession of the Flowers and Kindred Papers* (1897); *Henry Wadsworth Longfellow* (in "American Men of Letters" series, 1902); *John Greenleaf Whittier* (in "English Men of Letters" series, 1902); *A Reader's History of American Literature* (1903), the Lowell Institute lectures for 1903, edited by Henry W. Boynton; and *Life and Times of Stephen Higginson* (1907). His volumes of reminiscence, *Cheerful Yesterdays* (1898), *Old Cambridge* (1899), *Contemporaries* (1899), and *Part of a Man's Life* (1905), are characteristic and charming works. His collected works were published in seven vols. (1900).

HIGHAM FERRERS, a market town and municipal borough in the Eastern parliamentary division of Northamptonshire, England, 63 m. N.N.W. from London, on branches of the London & North-Western and Midland railways. Pop. (1901), 2540. It is pleasantly situated on high ground above the south bank of the river Nene. The church of St Mary is among the most beautiful of the many fine churches in Northamptonshire. To the Early English chancel a very wide north aisle, resembling a second nave, was added in the Decorated period, and the general appearance of the chancel, with its north aisle and Lady-chapel, is Decorated. The tower with its fine spire and west front was partially but carefully rebuilt in the 17th century. Close to the church, but detached from it, stands a beautiful Perpendicular building, the school-house, founded by Archbishop Chichele in 1422. The Bede House, a somewhat similar structure by the same founder, completes a striking group of buildings. In the town are remains of Chichele's college. Higham Ferrers shares in the widespread local industry of shoemaking. The town is governed by a mayor, 4 aldermen and 12 councillors, Area, 1945 acres.

Higham (Hecham, Heccam, Hegham Ferers) was evidently a large village before the Domesday Survey. It was then held by William Peverel of the king, but on the forfeiture of the lordship by his son it was granted in 1199 to William Ferrers, earl of Derby. On the outlawry of Robert his grandson it passed to Edmund, earl of Lancaster, and, reverting to the crown in 1322, was granted to Aymer de Valence, earl of Pembroke, but escheated to the crown in 1327, and was granted to Henry, earl of Lancaster. The castle, which may have been built before Henry III. visited Higham in 1229, is mentioned in 1322, but had been destroyed by 1540. It appears by the confirmation of Henry III. in 1251 that the borough originated in the previous year when William de Ferrers, earl of Derby, manumitted by charter ninety-two persons, granting they should have a free borough. A mayor was elected from the beginning of the reign of Richard II., while a town hall is mentioned in 1395. The revenues of Chichele's college were given to the corporation by the charter of 1566, whereby the borough returned one representative to parliament, a privilege enjoyed until 1832. James I. in 1604 gave the mayor the commission of the peace with other privileges which were confirmed by Charles II. in 1664. The old charters were surrendered in 1684 and a new grant obtained; a further charter was granted in 1887.

HIGHGATE, a northern district of London, England, partly in the metropolitan borough of St Pancras, but extending into Middlesex. It is a high-lying district, the greatest elevation being 426 ft. The Great North Road passes through Highgate, which is supposed to have received its name from the toll-gate erected by the bishop of London when the road was formed through his demesne in the 14th century. It is possible, however, that "gate" is used here in its old signification, and that the name means simply high road. The road rose so steeply here that in 1812 an effort was made to lessen the slope for coaches by means of an archway, and a new way was completed in 1900. In the time of stage-coaches a custom was introduced of making ignorant persons believe that they required to be sworn and admitted to the freedom of the Highgate before being allowed to pass the gate, the fine of admission being a bottle of wine. Not a few famous names occur among the former residents of Highgate. Bacon died here in 1626; Coleridge and Andrew Marvell, the poets, were residents. Cromwell House, now a convalescent home, was presented by Oliver Cromwell to his eldest daughter Bridget on her marriage with Henry Ireton (January 15, 1646/7). Lauderdale House, now attached to the public grounds of Waterlow Park, belonged to the Duke of Lauderdale, one of the "Cabal" of Charles II. Among various institutions may be mentioned Whittington's almshouses, near Whittington Stone, at the foot of Highgate Hill, on which the future mayor of London is reputed to have been resting when he heard the peal of Bow bells and "turned again." Highgate grammar school was founded (1562–1565) by Sir Roger Cholmley, chief-justice. St Joseph's Retreat is the mother-house of the Passionist Fathers in England. There is an extensive and beautiful cemetery on the slope below the church of St Michael.

HIGHLANDS, THE, that part of Scotland north-west of a line drawn from Dumbarton to Stonehaven, including the Inner and Outer Hebrides and the county of Bute, but excluding the Orkneys and Shetlands, Caithness, the flat coastal land of the shires of Nairn, Elgin and Banff, and all East Aberdeenshire (see SCOTLAND). This area is to be distinguished from the Lowlands by language and race, the preservation of the Gaelic speech being characteristic. Even in a historical sense the Highlanders were a separate people from the Lowlanders, with whom, during many centuries, they shared nothing in common. The town of Inverness is usually regarded as the capital of the Highlands. The Highlands consist of an old dissected plateau, or block, of ancient crystalline rocks with incised valleys and lochs carved by the action of mountain streams and by ice, the resulting topography being a wide area of irregularly distributed

SpinSmart Software http://www.spinsmart.com

mountains whose summits have nearly the same height above sea-level, but whose bases depend upon the amount of denudation to which the plateau has been subjected in various places. The term "highland" is used in physical geography for any elevated mountainous plateau.

HIGHNESS, literally the quality of being lofty or high, a term used, as are so many abstractions, as a title of dignity and honour, to signify exalted rank or station. These abstractions arose in great profusion in the Roman empire, both of the East and West, and "highness" is to be directly traced to the *altitudo* and *celsitudo* of the Latin and the ὑψηλότης of the Greek emperors. Like other "exorbitant and swelling attributes" of the time, they were conferred on ruling princes generally. In the early middle ages such titles, couched in the second or third person, were "uncertain and much more arbitrary (according to the fancies of secretaries) than in the later times" (Selden, *Titles of Honour*, pt. i. ch. vii. 100). In English usage, "Highness" alternates with "Grace" and "Majesty," as the honorific title of the king and queen until the time of James I. Thus in documents relating to the reign of Henry VIII. all three titles are used indiscriminately; an example is the king's judgment against Dr Edward Crome (d. 1562), quoted, from the lord chamberlain's books, ser. 1, p. 791, in *Trans. Roy. Hist. Soc.* N.S. xix. 299, where article 15 begins with "Also the Kinges Highness" hath ordered, 16 with "Kinges Majestie," and 17 with "Kinges Grace." In the Dedication of the Authorized Version of the Bible of 1611 James I. is still styled "Majesty" and "Highness"; thus, in the first paragraph, "the appearance of Your Majesty, as of the Sun in his strength, instantly dispelled those supposed and surmised mists . . . especially when we beheld the government established in Your Highness and Your hopeful Seed, by an undoubted title." It was, however, in James I.'s reign that "Majesty" became the official title. It may be noted that Cromwell, as lord protector, and his wife were styled "Highness." In present usage the following members of the British Royal Family are addressed as "Royal Highness" (H.R.H.): all sons and daughters, brothers and sisters, uncles and aunts of the reigning sovereign, grandsons and granddaughters if children of sons, and also great grandchildren (decree of 31st of May 1898) if children of an eldest son of any prince of Wales. Nephews, nieces and cousins and grandchildren, offspring of daughters, are styled "Highness" only. A change of sovereign does not entail the forfeiture of the title "Royal Highness," once acquired, though the father of the bearer has become a nephew and not a grandson of the sovereign. The principal feudatory princes of the Indian empire are also styled "Highness."

As a general rule the members of the blood royal of an Imperial or Royal house are addressed as "Imperial" or "Royal Highness" (*Altesse Impériale, Royale, Kaiserliche, Königliche Hoheit*) respectively. In Germany the reigning heads of the Grand Duchies bear the title of Royal or Grand Ducal Highness (*Königliche* or *Gross-Herzogliche Hoheit*), while the members of the family are addressed as *Hoheit*, Highness, simply. *Hoheit* is borne by the reigning dukes and the princes and princesses of their families. The title "Serene Highness" has also an antiquity equal to that of "highness," for γαληνότης and ἡμερότης were titles borne by the Byzantine rulers, and *serenitas* and *serenissimus* by the emperors Honorius and Arcadius. The doge of Venice was also styled *Serenissimus*. Selden (*op. cit.* pt. ii. ch. x. 739) calls this title "one of the greatest that can be given to any Prince that hath not the superior title of King." In modern times "Serene Highness" (*Altesse Sérénissime*) is used as the equivalent of the German *Durchlaucht*, a stronger form of *Erlaucht*, illustrious, represented in the Latin honorific *superillustris*. Thackeray's burlesque title "Transparency" in the court at Pumpernickel very accurately gives the meaning. The title of *Durchlaucht* was granted in 1375 by the emperor Charles IV. to the electoral princes (*Kurfürsten*). In the 17th century it became the general title borne by the heads of the reigning princely states of the empire (*reichständische Fürsten*), as *Erlaucht* by those of the countly houses (*reichständische Grafen*). In 1825 the German Diet agreed to grant the title *Durchlaucht* to the heads of the mediatized princely houses whether domiciled in Germany or Austria, and it is now customary to use it of the members of those houses. Further, all those who are elevated to the rank of prince (*Fürst*) in the secondary meaning of that title (see PRINCE) are also styled *Durchlaucht*. In 1829 the title of *Erlaucht*, which had formerly been borne by the reigning counts of the empire, was similarly granted to the mediatized countly families (see *Almanach de Gotha*, 1909, 107).

HIGH PLACE, in the English version of the Old Testament, the literal translation of the Heb. *bāmāh*. This rendering is etymologically correct, as appears from the poetical use of the plural in such expressions as to ride, or stalk, or stand on the high places of the earth, the sea, the clouds, and from the corresponding usage in Assyrian; but in prose *bāmāh* is always a place of worship. It has been surmised that it was so called because the places of worship were originally upon hill-tops, or that the *bāmāh* was an artificial platform or mound, perhaps imitating the natural eminence which was the oldest holy place, but neither view is historically demonstrable. The development of the religious significance of the word took place probably not in Israel but among the Canaanites, from whom the Israelites, in taking possession of the holy places of the land, adopted the name also.

In old Israel every town and village had its own place of sacrifice, and the common name for these places was *bāmāh*, which is synonymous with *miḳdāsh*, holy place (Amos vii. 9; Isa. xvi. 12, &c.). From the Old Testament and from existing remains a good idea may be formed of the appearance of such a place of worship. It was often on the hill above the town, as at Ramah (1 Sam. ix. 12-14); there was a stelè (*maṣṣēbāh*), the seat of the deity, and a wooden post or pole (*ashērāh*), which marked the place as sacred and was itself an object of worship; there was a stone altar, often of considerable size and hewn out of the solid rock[1] or built of unhewn stones (Ex. xx. 25; see ALTAR), on which offerings were burnt (*mizbēḥ*, lit. "slaughter place"); a cistern for water, and perhaps low stone tables for dressing the victims; sometimes also a hall (*lishkāh*) for the sacrificial feasts.

Around these places the religion of the ancient Israelite centred; at festival seasons, or to make or fulfil a vow, he might journey to more famous sanctuaries at a distance from his home, but ordinarily the offerings which linked every side of his life to religion were paid at the *bāmāh* of his own town. The building of royal temples in Jerusalem or in Samaria made no change in this respect; they simply took their place beside the older sanctuaries, such as Bethel, Dan, Gilgal, Beersheba, to which they were, indeed, inferior in repute.

The religious reformers of the 8th century assail the popular religion as corrupt and licentious, and as fostering the monstrous delusion that immoral men can buy the favour of God by worship; but they make no difference in this respect between the high places of Israel and the temple in Jerusalem (cf. Amos v. 21 sqq.; Hos. iv.; Isa. i. 10 sqq.); Hosea stigmatizes the whole cultus as pure heathenism—Canaanite baal-worship adopted by apostate Israel. The fundamental law in Deut. xii. prohibits sacrifice at every place except the temple in Jerusalem; in accordance with this law Josiah, in 621 B.C., destroyed and desecrated the altars (*bāmōth*) throughout his kingdom, where Yahweh had been worshipped from time immemorial, and forcibly removed their priests to Jerusalem, where they occupied an inferior rank in the temple ministry. In the prophets of the 7th and 6th centuries the word *bāmōth* connotes "seat of heathenish or idolatrous worship"; and the historians of the period apply the term in this opprobrious sense not only to places sacred to other gods but to the old holy places of Yahweh in the cities and villages of Judah, which, in their view, had been illegitimate from the building of Solomon's temple, and therefore not really seats of the worship of Yahweh; even the most pious kings of

[1] Several altars of this type have been preserved.

SpinSmart Software http://www.spinsmart.com

Judah are censured for tolerating their existence. The reaction which followed the death of Josiah (608 B.C.) restored the old altars of Yahweh; they survived the destruction of the temple in 586, and it is probable that after its restoration (520–516 B.C.) they only slowly disappeared, in consequence partly of the natural predominance of Jerusalem in the little territory of Judaea, partly of the gradual establishment of the supremacy of the written law over custom and tradition in the Persian period.

It may not be superfluous to note that the deuteronomic dogma that sacrifice can be offered to Yahweh only at the temple in Jerusalem was never fully established either in fact or in legal theory. The Jewish military colonists in Elephantine in the 5th century B.C. had their altar of Yahweh beside the high way; the Jews in Egypt in the Ptolemaic period had, besides many local sanctuaries, one greater temple at Leontopolis, with a priesthood whose claim to "valid orders" was much better than that of the High Priests in Jerusalem, and the legitimacy of whose worship is admitted even by the Palestinian rabbis.

See Baudissin, "Höhendienst," *Protestantische Realencyklopadie*[3] (viii. 177-195); Hoonacker, *Le Lieu du culte dans la législation rituelle des Hébreux* (1894); v. Gall, *Altisraelitische Kultstädte* (1898).

HIGH SEAS, an expression in international law meaning all those parts of the sea not under the sovereignty of adjacent states. Claims have at times been made to exclusive dominion over large areas of the sea as well as over wide margins, such as a 100 m., 60 m., range of vision, &c., from land. The action and reaction of the interests of navigation, however, have brought states to adopt a limitation first enunciated by Bynkershoek in the formula "terrae dominium finitur ubi finitur armorum vis." Thenceforward cannon-shot range became the determining factor in the fixation of the margin of sea afterwards known as "territorial waters" (*q.v.*). With the exception of these territorial waters, bays of certain dimensions and inland waters surrounded by territory of the same state, and serving only as a means of access to ports of the state by whose territory they are surrounded, and some waters allowed by immemorial usage to rank as territorial, all seas and oceans form part of the high sea. The usage of the high sea is free to all the nations of the world, subject only to such restrictions as result from respect for the equal rights of others, and to those which nations may contract with each other to observe. An interesting case affecting land-locked seas was that of the *Emperor of Japan* v. *The Peninsular and Oriental Steam Navigation Company*, in which a collision had taken place in the inland sea of Japan. The British Supreme Court at Shanghai declared this sea to form part of the high sea. On appeal to the privy council, the appellants were successful. Though the decision of the Shanghai court on the point in question was not dealt with by the privy council, Japan continues to treat her inland sea as under her exclusive jurisdiction. (T. BA.)

HIGHWAY, a public road over which all persons have full right of way—walking, riding or driving. Such roads in England for the most part either are of immemorial antiquity or have been created under the authority of an act of parliament. But a private owner may create a highway at common law by dedicating the soil to the use of the public for that purpose; and the using of a road for a number of years, without interruption, will support the presumption that the soil has been so dedicated. At common law the parish is required to maintain all highways within its bounds; but by special custom the obligation may attach to a particular township or district, and in certain cases the owner of land is bound by the conditions of his holding to keep a highway in repair. Breach of the obligation is treated as a criminal offence, and is prosecuted by indictment. Bridges, on the other hand, and so much of the highway as is immediately connected with them, are as a general rule a charge on the county; and by 22 Henry VIII. c. 5 the obligation of the county is extended to 300 yds. of the highway on either side of the bridge. A bridge, like a highway, may be a burden on neighbouring land *ratione tenurae*. Private owners so burdened may sometimes claim a special toll from passengers, called a "toll traverse."

Extensive changes in the English law of highways have been made by various highway acts, viz. the Highway Act 1835, and amending acts of 1862, 1864, 1878 and 1891. The leading principle of the Highway Act 1835 is to place the highways under the direction of parish surveyors, and to provide for the necessary expenses by a rate levied on the occupiers of land. It is the duty of the surveyor to keep the highways in repair; and if a highway is out of repair, the surveyor may be summoned before justices and convicted in a penalty not exceeding £5, and ordered to complete the repairs within a limited time. The surveyor is likewise specially charged with the removal of nuisances on the highway. A highway nuisance may be abated by any person, and may be made the subject of indictment at common law. The amending acts, while not interfering with the operation of the principal act, authorize the creation of highway districts on a larger scale. The justices of a county may convert it or any portion of it into a highway district to be governed by a highway board, the powers and responsibilities of which will be the same as those of the parish surveyor under the former act. The board consists of representatives of the various parishes, called "way wardens" together with the justices for the county residing within the district. Salaries and similar expenses incurred by the board are charged on a district fund to which the several parishes contribute; but each parish remains separately responsible for the expenses of maintaining its own highways. By the Local Government Act 1888 the entire maintenance of main roads was thrown upon county councils. The Public Health Act 1875 vested the powers and duties of surveyors of highways and vestries in urban authorities, while the Local Government Act 1894 transferred to the district councils of every rural district all the powers of rural sanitary authorities and highway authorities (see ENGLAND: *Local Government*).

The Highway Act of 1835 specified as offences for which the driver of a carriage on the public highway might be punished by a fine, in addition to any civil action that might be brought against him—riding upon the cart, or upon any horse drawing it, and not having some other person to guide it, unless there be some person driving it; negligence causing damage to person or goods being conveyed on the highway; quitting his cart, or leaving control of the horses, or leaving the cart so as to be an obstruction on the highway; not having the owner's name painted up; refusing to give the same; and not keeping on the left or near side of the road, when meeting any other carriage or horse. This rule does not apply in the case of a carriage meeting a foot-passenger, but a driver is bound to use due care to avoid driving against any person crossing the highway on foot. At the same time a passenger crossing the highway is also bound to use due care in avoiding vehicles, and the mere fact of a driver being on the wrong side of the road would not be evidence of negligence in such a case.

The "rule of the road" given above is peculiar to the United Kingdom. Cooley's treatise on the *American Law of Torts* states that "the custom of the country, in some states enacted into statute law, requires that when teams approach and are about to pass on the highway, each shall keep to the right of the centre of the travelled portion of the road." This also appears to be the general rule on the continent of Europe.

By the Lights on Vehicles Act 1907, all vehicles on highways in England and Wales must display to the front a white light during the period between one hour after sunset and one hour before sunrise. Locomotives and motor cars, being dealt with by special acts, are excluded from the operation of the act, as are bicycles and tricycles (dealt with by the Local Government Act 1888), and vehicles drawn or propelled by hand, but every machine or implement drawn by animals comes within the act. There are two exceptions: (1) vehicles carrying inflammable goods in the neighbourhood of places where inflammable goods are stored, and (2) vehicles engaged in harvesting. The public have a right to pass along a highway freely, safely and conveniently, and any wrongful act or omission which prevents them doing so is a nuisance, for the prevention and abatement of which the highways and other acts contain provisions. Generally, nuisance

SpinSmart Software http://www.spinsmart.com

to highway may be caused by encroachment, by interfering with the soil of the highway, by attracting crowds, by creating danger or inconvenience on or near the highway, by placing obstacles on the highway, by unreasonable user, by offences against decency and good order, &c.

The use of locomotives, motor cars and other vehicles on highways is regulated by acts of 1861–1903.

Formerly under the Turnpike Acts many of the more important highways were placed under the management of boards of commissioners or trustees. The trustees were required and empowered to maintain, repair and improve the roads committed to their charge, and the expenses of the trust were met by tolls levied on persons using the road. The various grounds of exemption from toll on turnpike roads were all of a public character, *e.g.* horses and carriages attending the sovereign or royal family, or used by soldiers or volunteers in uniform, were free from toll. In general horses and carriages used in agricultural work were free from toll. By the Highways and Locomotives Act of 1878 disturnpiked roads became " main roads." Ordinary highways might be declared to be " main roads," and " main roads " be reduced to the status of ordinary highways.

In Scotland the highway system is regulated by the Roads and Bridges Act 1878 and amending acts. The management and maintenance of the highways and bridges is vested in county road trustees, viz. the commissioners of supply, certain elected trustees representing ratepayers in parishes and others. One of the consequences of the act was the abolition of tolls, statute-labour, causeway mail and other exactions for the maintenance of bridges and highways, and all turnpike roads became highways, and all highways became open to the public free of tolls and other exactions. The county is divided into districts under district committees, and county and district officers are appointed. The expenses of highway management in each district (or parish), together with a proportion of the general expenses of the act, are levied by the trustees by an assessment on the lands and heritages within the district (or parish).

Highway, in the law of the states of the American Union, generally means a lawful public road, over which all citizens are allowed to pass and repass on foot, on horseback, in carriages and waggons. Sometimes it is held to be restricted to county roads as opposed to town-ways. In statutes dealing with offences connected with the highway, such as gaming, negligence of carriers, &c., " highway " includes navigable rivers. But in a statute punishing with death robbery on the highway, railways were held not to be included in the term. In one case it has been held that any way is a highway which has been used as such for fifty years.

See Glen, *Law Relating to Highways*; Pratt, *Law of Highways, Main Roads and Bridges*.

HIGINBOTHAM, GEORGE (1827–1893), chief-justice of Victoria, Australia, sixth son of T. Higinbotham of Dublin, was born on the 19th of April 1827, and educated at the Royal School, Dungannon, and at Trinity College, Dublin. After entering as a law student at Lincoln's Inn, and being engaged as reporter on the *Morning Chronicle* in 1849, he emigrated to Victoria, where he contributed to the *Melbourne Herald* and practised at the bar (having been " called " in 1853) with much success. In 1850 he became editor of the *Melbourne Argus*, but resigned in 1859 and returned to the bar. He was elected to the legislative assembly in 1861 for Brighton as an independent Liberal, was rejected at the general election of the same year, but was returned nine months later. In 1863 he became attorney-general. Under his influence measures were passed through the legislative assembly of a somewhat extreme character, completely ignoring the rights of the legislative council, and the government was carried on without any Appropriation Act for more than a year. Mr Higinbotham, by his eloquence and earnestness, obtained great influence amongst the members of the legislative assembly, but his colleagues were not prepared to follow him as far as he desired to go. He contended that in a constitutional colony like Victoria the secretary of state for the colonies had no right to fetter the discretion of the queen's representative. Mr Higinbotham did not return to power with his chief, Sir James M'Culloch, after the defeat of the short-lived Sladen administration; and being defeated for Brighton at the next general election by a comparatively unknown man, he devoted himself to his practice at the bar. Amongst his other labours as attorney-general he had codified all the statutes which were in force throughout the colony. In 1874 he was returned to the legislative assembly for Brunswick, but after a few months he resigned his seat. In 1880 he was appointed a puisne judge of the supreme court, and in 1886, on the retirement of Sir William Stawell, he was promoted to the office of chief justice. Mr Higinbotham was appointed president of the International Exhibition held at Melbourne in 1888–1889, but did not take any active part in its management. One of his latest public acts was to subscribe a sum of £10, 10s. a week towards the funds of the strikers in the great Australian labour dispute of 1890, an act which did not meet with general approval. He died in 1893.

HILARION, ST (*c.* 290–371), abbot, the first to introduce the monastic system into Palestine. The chief source of information is a life written by St Jerome; it was based upon a letter, no longer extant, written by St Epiphanius, who had known Hilarion. The accounts in Sozomen are mainly based on Jerome's *Vita*; but Otto Zöcker has shown that Sozomen also had at his disposal authentic local traditions (see " Hilarion von Gaza " in the *Neue Jahrbücher für deutsche Theologie*, 1894), the most important study on Hilarion, which is written against the hypercritical school of Weingarten and shows that Hilarion must be accepted as an historical personage and the *Vita* as a substantially correct account of his career. He was born of heathen parents at Tabatha near Gaza about 290; he was sent to Alexandria for his education and there became a convert to Christianity; about 306 he visited St Anthony and became his disciple, embracing the eremitical life. He returned to his native place and for many years lived as a hermit in the desert by the marshes on the Egyptian border. Many disciples put themselves under his guidance; but his influence must have been limited to south Palestine, for there is no mention of him in Palladius or Cassian. In 356 he left Palestine and went again to Egypt; but the accounts given in the *Vita* of his travels during the last fifteen years of his life must be taken with extreme caution. It is there said that he went from Egypt to Sicily, and thence to Epidaurus, and finally to Cyprus where he met Epiphanius and died in 371.

An abridged story of his life will be found in Alban Butler's *Lives of the Saints*, on the 21st of October, and a critical sketch with full references in Herzog-Hauck, *Realencyklopädie* (ed. 3). (E. C. B.)

HILARIUS (HILARY[1]), **ST** (*c.* 300–367), bishop of Pictavium (Poitiers), an eminent " doctor " of the Western Church, sometimes referred to as the " malleus Arianorum " and the " Athanasius of the West," was born at Poitiers about the end of the 3rd century A.D. His parents were pagans of distinction. He received a good education, including what had even then become somewhat rare in the West, some knowledge of Greek. He studied, later on, the Old and New Testament writings, with the result that he abandoned his neo-platonism for Christianity, and with his wife and his daughter received the sacrament of baptism. So great was the respect in which he was held by the citizens of Poitiers that about 353, although still a married man, he was unanimously elected bishop. At that time Arianism was threatening to overrun the Western Church; to repel the irruption was the great task which Hilary undertook. One of his first steps was to secure the excommunication, by those of the Gallican hierarchy who still remained orthodox, of Saturninus, the Arian bishop of Arles and of Ursacius and Valens, two of his prominent supporters. About the same time he wrote to the emperor Constantius a remonstrance against the persecutions by which the Arians had sought to crush their opponents (*Ad Constantium Augustum liber primus*, of which the most probable date is 355). His efforts were not at first successful, for at the synod of Biterrae (Beziers), summoned in 356 by

[1] The name is derived from Gr. ἱλαρός, gay, cheerful, whence hilarious, hilarity.

SpinSmart Software http://www.spinsmart.com

Constantius with the professed purpose of settling the long-standing disputes, Hilary was by an imperial rescript banished with Rhodanus of Toulouse to Phrygia, in which exile he spent nearly four years. Thence, however, he continued to govern his diocese; while he found leisure for the preparation of two of the most important of his contributions to dogmatic and polemical theology, the *De synodis* or *De fide Orientalium*, an epistle addressed in 358 to the Semi-Arian bishops in Gaul, Germany and Britain, expounding the true views (sometimes veiled in ambiguous words (of the Oriental bishops on the Nicene controversy, and the *De trinitate libri xii.*,[1] composed in 359 and 360, in which, for the first time, a successful attempt was made to express in Latin the theological subtleties elaborated in the original Greek. The former of these works was not entirely approved by some members of his own party, who thought he had shown too great forbearance towards the Arians; to their criticisms he replied in the *Apologetica ad reprehensores libri de synodis responsa*. In 359 Hilary attended the convocation of bishops at Seleucia in Isauria, where, with the Egyptian Athanasians, he joined the Homoiousian majority against the Arianizing party headed by Acacius of Caesarea; thence he went to Constantinople, and, in a petition (*Ad Constantium Augustum liber secundus*) personally presented to the emperor in 360, repudiated the calumnies of his enemies and sought to vindicate his trinitarian principles. His urgent and repeated request for a public discussion with his opponents, especially with Ursacius and Valens, proved at last so inconvenient that he was sent back to his diocese, which he appears to have reached about 361, within a very short time of the accession of Julian. He was occupied for two or three years in combating Arianism within his diocese; but in 364, extending his efforts once more beyond Gaul, he impeached Auxentius, bishop of Milan, and a man high in the imperial favour, as heterodox. Summoned to appear before the emperor (Valentinian) at Milan and there maintain his charges, Hilary had the mortification of hearing the supposed heretic give satisfactory answers to all the questions proposed; nor did his (doubtless sincere) denunciation of the metropolitan as a hypocrite save himself from an ignominious expulsion from Milan. In 365 he published the *Contra Arianos vel Auxentium Mediolanensem liber*, in connexion with the controversy; and also (but perhaps at a somewhat earlier date) the *Contra Constantium Augustum liber*, in which he pronounced that lately deceased emperor to have been Antichrist, a rebel against God, "a tyrant whose sole object had been to make a gift to the devil of that world for which Christ had suffered." Hilary is sometimes regarded as the first Latin Christian hymn-writer, but none of the compositions assigned to him is indisputable. The later years of his life were spent in comparative quiet, devoted in part to the preparation of his expositions of the Psalms (*Tractatus super Psalmos*), for which he was largely indebted to Origen; of his *Commentarius in Evangelium Matthaei*, a work on allegorical lines of no exegetical value; and of his no longer extant translation of Origen's commentary on Job. While he thus closely followed the two great Alexandrians, Origen and Athanasius, in exegesis and Christology respectively, his work shows many traces of vigorous independent thought. He died in 367; no more exact date is trustworthy. He holds the highest rank among the Latin writers of his century. Designated already by Augustine as "the illustrious doctor of the churches," he by his works exerted an increasing influence in later centuries; and by Pius IX. he was formally recognized as "universae ecclesiae doctor" at the synod of Bordeaux in 1851. Hilary's day in the Roman calendar is the 13th of January.[2]

[1] Hilary's own title was *De fide contra Arianos*. It really deals less with the doctrine of the Trinity than with that of the Incarnation. That it is not an easy work to read is due partly to the nature of the subject, partly to the fact that it was issued in detached portions.

[2] "Hilary" was the name of one of the four terms of the English legal year. These terms were abolished by the Judicature Act, 1873, s. 26, and "sittings" substituted. It is now the name of the sitting of the Supreme Court of Judicature which commences on the 11th of January and terminates on the Wednesday before Easter. In the Inns of Court, Hilary is one of the four dining terms; it begins on the 11th of January and ends on the 1st of February. It is also the name of one of the terms at the universities of Oxford (more usually "Lent term") and Dublin.

EDITIONS.—Erasmus (Basel, 1523, 1526, 1528); P. Coustant (Benedictine, Paris, 1693); Migne (*Patrol. Lat.* ix., x.). The *Tractatus de mysteriis*, ed. J. F. Gamurrini (Rome, 1887), and the *Tractatus super Psalmos*, ed. A. Zingerle in the Vienna *Corpus scrip. eccl. Lat.* xxii. Translation by E. W. Watson in *Nicene and Post-Nicene Fathers*, ix.

LITERATURE.—The life by (Venantius) Fortunatus *c.* 550 is almost worthless. More trustworthy are the notices in Jerome (*De vir. illus.* 100), Sulpicius Severus (*Chron.* ii. 39-45) and in Hilary's own writings. H. Reinkens, *Hilarius von Poictiers* (1864); O. Bardenhewer, *Patrologie*; A. Harnack, *Hist. of Dogma*, esp. vol. iv.; F. Loofs, in Herzog-Hauck's *Realencyk.* viii.

HILARIUS, or HILARUS (HILARY), bishop of Rome from 461 to 468, is known to have been a deacon and to have acted as legate of Leo the Great at the "robber" synod of Ephesus in 449. There he so vigorously defended the conduct of Flavian in deposing Eutyches that he was thrown into prison, whence he had great difficulty in making his escape to Rome. He was chosen to succeed Leo on the 19th of November 461. In 465 he held at Rome a council which put a stop to some abuses, particularly to that of bishops appointing their own successors. His pontificate was also marked by a successful encroachment of the papal authority on the metropolitan rights of the French and Spanish hierarchy, and by a resistance to the toleration edict of Anthemius, which ultimately caused it to be recalled. Hilarius died on the 17th of November 467, and was succeeded by Simplicius.

HILARIUS (fl. 1125), a Latin poet who is supposed to have been an Englishman. He was one of the pupils of Abelard at his oratory of Paraclete, and addressed to him a copy of verses with its refrain in the vulgar tongue, "*Tort avers vos li mestre*," Abelard having threatened to discontinue his teaching because of certain reports made by his servant about the conduct of the scholars. Later Hilarius made his way to Angers. His poems are contained in MS. supp. lat. 1008 of the Bibliothèque Nationale, Paris, purchased in 1837 at the sale of M. de Rosny. Quotations from this MS. had appeared before, but in 1838 it was edited by Champollion Figeac as *Hilarii versus et ludi*. His works consist chiefly of light verses of the goliardic type. There are verses addressed to an English nun named Eva, lines to Rosa, "*Ave splendor puellarum, generosa domina*," and another poem describes the beauties of the priory of Chaloutre la Petite, in the diocese of Sens, of which the writer was then an inmate. One copy of satirical verses seems to aim at the pope himself. He also wrote three miracle plays in rhymed Latin with an admixture of French. Two of them, *Suscitatio Lazari* and *Historia de Daniel repraesentanda*, are of purely liturgical type. At the end of *Lazarus* is a stage direction to the effect that if the performance has been given at matins, Lazarus should proceed with the *Te Deum*, if at vespers, with the *Magnificat*. The third, *Ludus super iconia Sancti Nicholai*, is founded on a sufficiently foolish legend. Petit de Julleville sees in the play a satiric intention and a veiled incredulity that put the piece outside the category of liturgical drama.

A rhymed Latin account of a dispute in which the nuns of Ronceray at Angers were concerned, contained in a cartulary of Ronceray, is also ascribed to the poet, who there calls himself Hilarius Canonicus. The poem is printed in the *Bibliothèque de l'École des Chartes* (vol. xxxvii. 1876), and is dated by P. Marchegay from 1121. See also a notice in *Hist. litt. de la France* (xii. 251-254), supplemented (in xx. 627-630), *s.v.* Jean Bodel, by Paulin Paris; also Wright, *Biographia Britannica literaria, Anglo-Norman Period* (1846); and Petit de Julleville, *Les Mystères* (vol. i. 1880).

HILARIUS (HILARY), **ST** (*c.* 403–449), bishop of Arles, was born about 403. In early youth he entered the abbey of Lérins, then presided over by his kinsman Honoratus (St Honoré), and succeeded Honoratus in the bishopric of Arles in 429. Following the example of St Augustine, he is said to have organized his cathedral clergy into a "congregation," devoting a great part of their time to social exercises of ascetic religion. He held the rank of metropolitan of Vienne and Narbonne, and attempted to realize the sort of primacy over the church of south Gaul

SpinSmart Software http://www.spinsmart.com

which seemed implied in the vicariate granted to his predecessor Patroclus (417). Hilarius deposed the bishop of Besançon (Chelidonus), for ignoring this primacy, and for claiming a metropolitan dignity for Besançon. An appeal was made to Rome, and Leo I. used it to extinguish the Gallican vicariate (A.D. 444). Hilarius was deprived of his rights as metropolitan to consecrate bishops, call synods, or exercise ecclesiastical oversight in the province, and the pope secured the edict of Valentinian III., so important in the history of the Gallican church, "ut episcopis Gallicanis omnibusque pro lege esset quidquid apostolicae sedis auctoritas sanxisset." The papal claims were made imperial law, and violation of them subject to legal penalties (*Novellae Valent.* iii. tit. 16). Hilarius died in 449, and his name was afterwards introduced into the Roman martyrology for commemoration on the 5th of May. He enjoyed during his lifetime a high reputation for learning and eloquence as well as for piety; his extant works (*Vita S. Honorati Arelatensis episcopi* and *Metrum in Genesin*) compare favourably with any similar literary productions of that period.

A poem, *De providentia*, usually included among the writings of Prosper, is sometimes attributed to Hilary of Arles.

HILDA, ST, strictly HILD (614–680), was the daughter of Hereric, a nephew of Edwin, king of Northumbria. She was converted to Christianity before 633 by the preaching of Paulinus. According to Bede she took the veil in 614, when Oswio was king of Northumbria and Aidan bishop of Lindisfarne, and spent a year in East Anglia, where her sister Hereswith had married Æthelhere, who was to succeed his brother Anna, the reigning king. In 648 or 649 Hilda was recalled to Northumbria by Aidan, and lived for a year in a small monastic community north of the Wear. She then succeeded Heiu, the foundress, as abbess of Hartlepool, where she remained several years. From Hartlepool Hilda moved to Whitby, where in 657 she founded the famous double monastery which in the time of the first abbess included among its members five future bishops, Bosa, Ætta, Oftfor, John and Wilfrid II. as well as the poet Cædmon. Hilda exercised great influence in Northumbria, and ecclesiastics from all over Christian England and from Strathclyde and Dalriada visited her monastery. In 655 after the battle of Winwæd Oswio entrusted his daughter Ælfled to Hilda, with whom she went to Whitby. At the synod of Whitby in 664 Hilda sided with Colman and Cedd against Wilfrid. In spite of the defeat of the Celtic party she remained hostile to Wilfrid until 679 at any rate. Hilda died in 680 after a painful illness lasting for seven years.

See Bede, *Hist. eccl.* (ed. C. Plummer, Oxford, 1869), iii. 24, 25, iv. 23; Eddius, *Vita Wilfridi* (Raine, *Historians of Church of York*, Rolls Series, vol. i., 1879), c. liv.

HILDBURGHAUSEN, a town of Germany, in the duchy of Saxe-Meiningen, situated in a wide and fruitful valley on the river Werra, 19 m. S.E. of Meiningen, on the railway Eisenach-Lichtenfels. Pop. (1905) 7456. The principal buildings are a ducal palace, erected 1685–1695, now used as barracks, with a park in which there is a monument to Queen Louisa of Prussia, the old town hall, two Evangelical and a Roman Catholic church and a theatre. A technical college occupies the premises in which Meyer's Bibliographisches Institut carried on business from 1828, when it removed hither from Gotha, until 1874, when it was transferred to Leipzig. A monument has been erected to those citizens who died in the Franco-Prussian War of 1870–71. The manufactures include linen fabrics, cloth, toys, buttons, optical instruments, agricultural machines, knives, mineral waters, condensed soups and condensed milk. Hildburghausen (in records *Hilpershusia* and *Villa Hilperti*) belonged in the 13th century to the counts of Henneberg, from whom it passed to the landgraves of Thuringia and then to the dukes of Saxony. In 1683 it became the capital of a principality which in 1826 was united to Saxe-Meiningen.

See R. A. Human, *Chronik der Stadt Hildburghausen* (Hildburghausen, 1888).

HILDEBERT, HYDALBERT, GILDEBERT or ALDEBERT (*c.* 1055–1133), French writer and ecclesiastic, was born of poor parents at Lavardin, near Vendôme, and was intended for the church. He was probably a pupil of Berengarius of Tours, and became master (*scholasticus*) of the school at Le Mans; in 1091 he was made archdeacon and in 1096 bishop of Le Mans. He had to face the hostility of a section of his clergy and also of the English king, William II., who captured Le Mans and carried the bishop with him to England for about a year. Hildebert then travelled to Rome and sought permission to resign his bishopric, which Pope Paschal II. refused. In 1116 his diocese was thrown into great confusion owing to the preaching of Henry of Lausanne, who was denouncing the higher clergy, especially the bishop. Hildebert compelled him to leave the neighbourhood of Le Mans, but the effects of his preaching remained. In 1125 Hildebert was translated very unwillingly to the archbishopric of Tours, and there he came into conflict with the French king Louis VI. about the rights of ecclesiastical patronage and with the bishop of Dol about the authority of his see in Brittany. He presided over the synod of Nantes, and died at Tours probably on the 18th of December 1133. Hildebert, who built part of the cathedral at Le Mans, has received from some writers the title of saint, but there appears to be no authority for this. He was not a man of very strict life; his contemporaries, however, had a very high opinion of him and he was called *egregius versificator*.

The extant writings of Hildebert consist of letters, poems, a few sermons, two lives and one or two treatises. An edition of his works prepared by the Maurist, Antoine Beaugendre, and entitled *Venerabilis Hildeberti, primo Cenomannensis episcopi, deinde Turonensis archiepiscopi, opera tam edita quam inedita*, was published in Paris in 1708 and was reprinted with additions by J. J. Bourassé in 1854. These editions, however, are very faulty. They credit Hildebert with numerous writings which are the work of others, while some genuine writings are omitted. The revelation of this fact has affected Hildebert's position in the history of medieval thought. His standing as a philosopher rested upon his supposed authorship of the important *Tractatus theologicus*; but this is now regarded as the work of Hugh of St Victor, and consequently Hildebert can hardly be counted among the philosophers. His genuine writings include many letters. These *Epistolae* enjoyed great popularity in the 12th and 13th centuries, and were frequently used as classics in the schools of France and Italy. Those which concern the struggle between the emperor Henry V. and Pope Paschal II. have been edited by E. Sackur and printed in the *Monumenta Germaniae historica. Libelli de lite ii.* (1893). His poems, which deal with various subjects, are disfigured by many defects of style and metre, but they too were very popular. Hildebert attained celebrity also as a preacher both in French and Latin, but only a few of his sermons are in existence, most of the 144 attributed to him by his editors being the work of Peter Lombard and others. The *Vitae* written by Hildebert are the lives of Hugo, abbot of Cluny, and of St Radegunda. Undoubtedly genuine is also his *Liber de querimonia et conflictu carnis et spiritus seu animae*. Hildebert was an excellent Latin scholar, being acquainted with Cicero, Ovid and other authors, and his spirit is rather that of a pagan than of a Christian writer.

See B. Hauréau, *Les Mélanges poétiques d'Hildebert de Lavardin* (Paris, 1882), and *Notices et extraits de quelques manuscrits latins de la Bibliothèque nationale* (Paris, 1890–1893); Comte P. de Déservillers, *Un Évêque au XII^e siècle, Hildebert et son temps* (Paris, 1876); E. A. Freeman, *The Reign of Rufus*, vol. ii. (Oxford, 1882); tome xi. of the *Histoire littéraire de la France*, and H. Böhmer in Band viii. of Herzog-Hauck's *Realencyklopädie* (1900). The most important work, however, to be consulted is L. Dieudonné's *Hildebert de Lavardin, évêque du Mans, archévêque de Tours. Sa vie, ses lettres* (Paris, 1898).

HILDEBRAND, LAY OF (*Das Hildebrandslied*), a unique example of Old German alliterative poetry, written about the year 800 on the first and last pages of a theological manuscript, by two monks of the monastery of Fulda. The fragment, or rather fragments, only extend to sixty-eight lines, and the conclusion of the poem is wanting. The theory propounded by Karl Lachmann, that the poem had been written in its present form from memory, has been discredited by later philological investigation; it is clearly a transcript of an older original,

SpinSmart Software http://www.spinsmart.com

which the copyists—or more probably the writer to whom we owe the older version—imperfectly understood. The language of the poem shows a curious mixture of Low and High German forms; as the High German elements point to the dialect of Fulda, the inference is that the copyists were reproducing an originally Low German lay in the form in which it was sung in Franconia.

The fragment is mainly taken up with a dialogue between Hildebrand and his son Hadubrand. When Hildebrand followed his master, Theodoric the Great, who was fleeing eastwards before Odoacer, he left his young wife and an infant child behind him. At his return to his old home, after thirty years' absence among the Huns, he is met by a young warrior and challenged to single combat. Before the fight begins, Hildebrand asks for the name of his opponent, and discovering his own son in him, tries to avert the fight, but in vain; Hadubrand only regards the old man's words as the excuse of cowardice. "In sharp showers the ashen spears fall on the shields, and then the warriors seize their swords and hew vigorously at the white shields until these are beaten to pieces. . . ." With these words the fragment breaks off abruptly, giving no clue as to the issue of the combat. There is little doubt, however, that, as in the Old Norse *Asmundar saga*, where the tale is alluded to, the fight must have been fatal to Hadubrand. But in the later traditions, both of the Old Norse *Thidreks saga* (13th century), and the so-called *Jüngere Hildebrandslied*—a German popular lay, preserved in several versions from the 15th to the 17th century—Hadubrand is simply represented as defeated, and obliged to recognize his father. The Old High German *Hildebrandslied* is dramatically conceived, and written in a terse, vigorous style; it is the only remnant that has come down from early Germanic times of an undoubtedly extensive ballad literature, dealing with the national sagas.

The MS. of the *Hildebrandslied*, originally in Fulda, is now preserved in the Landesbibliothek at Cassel. The literature on the poem will be found most conveniently in K. Müllenhoff and W. Scherer, *Denkmäler deutscher Poesie und Prosa aus dem VIII. bis XI. Jahrh.*, 3rd ed. (1892), and in W. Braune, *Althochdeutsches Lesebuch*, 5th ed. (1902), to which authorities the reader is referred for a critical text. The poem was discovered and first printed (as prose) by J. G. von Eckhart, *Commentarii de rebus Franciae orientalis* (1729), i. 864 ff.; the first scholarly edition was that of the brothers Grimm (1812). Facsimile reproductions of the MS. have been published by W. Grimm (1830), E. Sievers (1872), G. Könnecke in his *Bilderatlas* (1887; 2nd ed., 1895) and M. Enneccerus (1897). See also K. Lachmann, *Über das Hildebrandslied* (1833) in *Kleine Schriften*, i. 407 ff.; C. W. M. Grein, *Das Hildebrandslied* (1858; 2nd ed., 1880); O. Schröder, *Bemerkungen zum Hildebrandslied* (1880); H. Möller, *Zur althochdeutschen Alliterationspoesie* (1888); R. Heinzel, *Über die ostgotische Heldensage* (1889); B. Busse, "Sagengeschichtliches zum Hildebrandslied," in Paul und Braune's *Beiträge*, xxvi. (1901), pp. 1 ff.; R. Koegel, *Geschichte der deutschen Literatur bis zum Ausgang des Mittelalters*, i. (1894), pp. 210 ff.; and R. Koegel and W. Bruckner, in Paul's *Grundriss der germanischen Philologie*, 2nd ed., ii. (1901), pp. 71 ff. (J. G. R.)

HILDEBRANDT, EDUARD (1818–1868), German painter, was born in 1818, and served as apprentice to his father, a house-painter at Danzig. He was not twenty when he came to Berlin, where he was taken in hand by Wilhelm Krause, a painter of sea pieces. Several early pieces exhibited after his death—a breakwater, dated 1838, ships in a breeze off Swinemünde (1840), and other canvases of this and the following year—show Hildebrandt to have been a careful student of nature, with inborn talents kept down by the conventionalisms of the formal school to which Krause belonged. Accident made him acquainted with masterpieces of French art displayed at the Berlin Academy, and these awakened his curiosity and envy. He went to Paris, where, about 1842, he entered the atelier of Isabey and became the companion of Lepoittevin. In a short time he sent home pictures which might have been taken for copies from these artists. Gradually he mastered the mysteries of touch and the secrets of effect in which the French at this period excelled. He also acquired the necessary skill in painting figures, and returned to Germany, skilled in the rendering of many kinds of landscape forms. His pictures of French street life, done about 1843, while impressed with the stamp of the Paris school, reveal a spirit eager for novelty, quick at grasping, equally quick at rendering, momentary changes of tone and atmosphere. After 1843 Hildebrandt, under the influence of Humboldt, extended his travels, and in 1864–1865 he went round the world. Whilst his experience became enlarged his powers of concentration broke down. He lost the taste for detail in seeking for scenic breadth, and a fatal facility of hand diminished the value of his works for all those who look for composition and harmony of hue as necessary concomitants of tone and touch. In oil he gradually produced less, in water colours more, than at first, and his fame must rest on the sketches which he made in the latter form, many of them represented by chromo-lithography. Fantasies in red, yellow and opal, sunset, sunrise and moonshine, distances of hundreds of miles like those of the Andes and the Himalaya, narrow streets in the bazaars of Cairo or Suez, panoramas as seen from mastheads, wide cities like Bombay or Pekin, narrow strips of desert with measureless expanses of sky—all alike display his quality of *bravura*. Hildebrandt died at Berlin on the 25th of October 1868.

HILDEBRANDT, THEODOR (1804–1874), German painter, was born at Stettin. He was a disciple of the painter Schadow, and, on Schadow's appointment to the presidency of a new academy in the Rhenish provinces in 1828, followed that master to Düsseldorf. Hildebrandt began by painting pictures illustrative of Goethe and Shakespeare; but in this form he followed the traditions of the stage rather than the laws of nature. He produced rapidly "Faust and Mephistopheles" (1824), "Faust and Margaret" (1825), and "Lear and Cordelia" (1828). He visited the Netherlands with Schadow in 1829, and wandered alone in 1830 to Italy; but travel did not alter his style, though it led him to cultivate alternately eclecticism and realism. At Düsseldorf, about 1830, he produced "Romeo and Juliet," "Tancred and Clorinda," and other works which deserved to be classed with earlier paintings; but during the same period he exhibited (1829) the "Robber" and (1832) the "Captain and his Infant Son," examples of an affected but kindly realism which captivated the public, and marked to a certain extent an epoch in Prussian art. The picture which made Hildebrandt's fame is the "Murder of the Children of King Edward" (1836), of which the original, afterwards frequently copied, still belongs to the Spiegel collection at Halberstadt. Comparatively late in life Hildebrandt tried his powers as an historical painter in pictures representing Wolsey and Henry VIII., but he lapsed again into the romantic in "Othello and Desdemona." After 1847 Hildebrandt gave himself up to portrait-painting, and in that branch succeeded in obtaining a large practice. He died at Düsseldorf in 1874.

HILDEGARD, ST (1098–1179), German abbess and mystic, was born of noble parents at Böckelheim, in the countship of Sponheim, in 1098, and from her eighth year was educated at the Benedictine cloister of Disibodenberg by Jutta, sister of the count of Sponheim, whom she succeeded as abbess in 1136. From earliest childhood she was accustomed to see visions, which increased in frequency and vividness as she approached the age of womanhood; these, however, she for many years kept almost secret, nor was it until she had reached her forty-third year (1141) that she felt constrained to divulge them. Committed to writing by her intimate friend the monk Godefridus, they now form the first and most important of her printed works, entitled *Scivias* (probably an abbreviation for "sciens vias" or "nosce vias Domini") *s. visionum et revelationum libri iii.*, and completed in 1151. In 1147 St Bernard of Clairvaux, while at Bingen preaching the new crusade, heard of Hildegard's revelations, and became so convinced of their reality that he not only wrote to her a letter cordially acknowledging her as a prophetess of God, but also successfully advocated her recognition as such by his friend and former pupil Pope Eugenius III. in the synod of Trèves (1148). In the same year Hildegard migrated along with eighteen of her nuns to a new convent on the Rupertsberg near Bingen, over which she presided during the remainder of her life. By means of voluminous correspondence, as well as by extensive journeys,

SpinSmart Software http://www.spinsmart.com

in the course of which she was unwearied in the exercise of her gift of prophecy, she wielded for many years an increasing influence upon her contemporaries—an influence doubtless due to the fact that she was imbued with the most widely diffused feelings and beliefs, fears and hopes, of her time. Amongst her correspondents were Popes Anastasius IV. and Adrian IV., the emperors Conrad III. and Frederick I., and also the theologian Guibert of Gembloux, who submitted numerous questions in dogmatic theology for her determination. She died in 1179, but has never been canonized; her name, however, was received into the Roman martyrology in the 15th century, September 17th being the day fixed for her commemoration.

Her biography, which was written by two contemporaries, Godefridus and Theodoricus, was first printed at Cologne in 1566. Hildegard's writings, besides the *Scivias* already mentioned and first printed in Paris in 1513, include the *Liber divinorum operum*, *Explanatio regulae S. Benedicti*, *Physica* and the Letters, &c., are contained in Migne, *Patr. Lat.* t. cxcvii., and in Cardinal Pitra's *Analecta sacra spicilegio Solesmensi parata*; *Nova S. Hildegardis opera* (Paris, 1882).

For a modern study of the saint's writings, see *Sainte Hildegarde* by Pal Franche, "*Les Saints*" series (Paris, 1903); and U. Chevalier, *Répertoire des sources historiques, bio.-bibl.* 2153.

HILDEN, a town in the Prussian Rhine province on the Itter, 9 m. S.E. of Düsseldorf by rail. Pop. (1905) 13,946. It possesses an Evangelical and a Roman Catholic church and a monument to the emperor William I. Its manufactures include silks, velvets, carpets, calico-printing, machinery and brick-making.

HILDESHEIM, a town and episcopal see of Germany, in the Prussian province of Hanover, beautifully situated at the north foot of the Harz Mountains, on the right bank of the Innerste, 18 m. S.E. of Hanover by railway, and on the main line from Berlin, via Magdeburg to Cologne. Pop. (1885) 20,386, (1905) 47,060. The town consists of an old and a new part, and is surrounded by ramparts which have been converted into promenades. Its streets are for the most part narrow and irregular, and contain many old houses with overhanging upper storeys and richly and curiously adorned wooden façades. Its religious edifices are five Roman Catholic and four Evangelical churches and a synagogue. The most interesting is the Roman Catholic cathedral, which dates from the middle of the 11th century and occupies the site of a building founded by the emperor Louis the Pious early in the 9th century. It is famous for its antiquities and works of art. These include the bronze doors executed by Bishop Bernward, with reliefs from the history of Adam and of Jesus Christ; a brazen font of the 13th century; two large candelabra of the 11th century; the sarcophagus of St Godehard; and the tomb of St Epiphanius. In the cathedral also there is a bronze column 15 ft. high, adorned with reliefs from the life of Christ and dating from 1022, and another column, at one time thought to be an Irminsäule erected in honour of the Saxon idol Irmin, but now regarded as belonging to a Roman aqueduct. On the wall of the Romanesque crypt, which was restored in 1896, is a rose-bush, alleged to be a thousand years old; this sends its branches to a height of 24 ft. and a breadth of 30 ft., and they are trained to interlace one of the windows. Before the cathedral is the pretty cloister garth, with the chapel of St Anne, erected in 1321 and restored in 1888. The Romanesque church of St Godehard was built in the 12th century and restored in the 19th. The church of St Michael, founded by Bishop Bernward early in the 11th century and restored after injury by fire in 1186, contains a unique painted ceiling of the 12th century, the sarcophagus and monument of Bishop Bernward, and a bronze font; it is now a Protestant parish church, but the crypt is used by the Roman Catholics. The church of the Magdalene possesses two candelabra, a gold cross, and various other works in metal by Bishop Bernward; and the Lutheran church of St Andrew has a choir dating from 1389 and a tower 385 ft. high. In the suburb of Moritzberg there is an abbey church founded in 1040, the only pure columnar basilica in north Germany.

The chief secular buildings are the town-hall (Rathaus), which dates from the 15th century and was restored in 1883–1892, adorned with frescoes illustrating the history of the city; the Tempelherrenhaus, in Late Gothic erroneously said to have been built by the Knights Templars; the Knochenhaueramthaus, formerly the gild-house of the butchers, which was restored after being damaged by fire in 1884, and is probably the finest specimen of a wooden building in Germany; the Michaelis monastery, used as a lunatic asylum; and the old Carthusian monastery. The Römer museum of antiquities and natural history is housed in the former church of St Martin; the buildings of Trinity hospital, partly dating from the 14th century, are now a factory; and the Wedekindhaus (1598) is now a savings-bank. The educational establishments include a Roman Catholic and a Lutheran gymnasium, a Roman Catholic school and college and two technical institutions, the Georgstift for daughters of state servants and a conservatoire of music. Hildesheim is the seat of considerable industry. Its chief productions are sugar, tobacco and cigars, stoves, machines, vehicles, agricultural implements and bricks. Other trades are brewing and tanning. It is connected with Hanover by an electric tram line, 19 m. in length.

Hildesheim owes its rise and prosperity to the fact that in 822 it was made the seat of the bishopric which Charlemagne had founded at Elze a few years before. Its importance was greatly increased by St Bernward, who was bishop from 993 to 1022 and walled the town. By his example and patronage the art of working in metals was greatly stimulated. In the 13th century Hildesheim became a free city of the Empire; in 1249 it received municipal rights and about the same time it joined the Hanseatic league. Several of its bishops belonged to one or other of the great families of Germany; and gradually they became practically independent. The citizens were frequently quarrelling with the bishops, who also carried on wars with neighbouring princes, especially with the house of Brunswick-Lüneburg, under whose protection Hildesheim placed itself several times. The most celebrated of these struggles is the one known as the *Hildesheimer Stiftsfehde*, which broke out early in the 16th century when John, duke of Saxe-Lauenburg, was bishop. At first the bishop and his allies were successful, but in 1521 the king of Denmark and the duke of Brunswick overran his lands and in 1523 he made peace, surrendering nearly all his possessions. Much, however, was restored when Ferdinand, prince of Bavaria, was bishop (1612-1650), as this warlike prelate took advantage of the disturbances caused by the Thirty Years' War to seize the lost lands, and at the beginning of the 19th century the extent of the prince bishopric was 682 sq. m. In 1801 the bishopric was secularized and in 1803 was granted to Prussia; in 1807 it was incorporated with the kingdom of Westphalia and in 1813 was transferred to Hanover. In 1866, along with Hanover, it was annexed by Prussia. In 1803 a new bishopric of Hildesheim, a spiritual organization only, was established, and this has jurisdiction over all the Roman Catholic churches in the centre of north Germany.

In October 1868 a unique collection of ancient Augustan silver plate was discovered on the Galgenberg near Hildesheim by some soldiers who were throwing up earthworks. This *Hildesheimer Silberfund* excited great interest among classical archaeologists. Some authorities think that it is the actual plate which belonged to Drusus himself. The most noteworthy pieces are a crater richly ornamented with arabesques and figures of children, a platter with a representation of Minerva, another with one of the boy Hercules and another with one of Cybele. The collection is in the Kunstgewerbemuseum in Berlin.

Winter, *Der Hildesheimer Silberfund der königlichen Museen zu Berlin* (Berlin, 1901)

HILDRETH, RICHARD (1807–1865), American journalist and author, was born at Deerfield, Massachusetts, on the 28th of June 1807, the son of Hosea Hildreth (1782–1835), a teacher of mathematics and later a Congregational minister. Richard graduated at Harvard in 1826, and, after studying law at Newburyport, was admitted to the bar at Boston in 1830. He had already taken to journalism, and in 1832 he became joint founder and editor of a daily newspaper, the Boston *Atlas*. Having in 1834 gone to the South for the benefit of his health, he was led by what he witnessed of the evils of slavery (chiefly in Florida) to write the anti-slavery novel *The Slave: or Memoir of Archy Moore* (1836; enlarged edition, 1852, *The White Slave*). In 1837 he wrote for the *Atlas* a series of articles vigorously opposing the annexation of Texas. In the same year he published *Banks, Banking, and Paper Currencies*, a work which helped to promote the growth of the free banking system in America. In 1838 he resumed his editorial duties on the *Atlas*, but in 1840 removed, on account of his health, to British Guiana, where he lived for three years and was editor of two weekly newspapers in succession at Georgetown. He published in this year (1840) a volume in opposition to slavery, *Despotism in America* (2nd ed., 1854). In 1849 he published the first three volumes of his *History of the United States*, two more volumes of which were published in 1851 and the sixth and last in 1852. The first three volumes of this history, his most important work, deal with the period 1492–1789, and the second three with the period 1789–1821. The history is notable for its painstaking accuracy and candour, but the later volumes have a strong Federalist bias. Hildreth's *Japan as It Was and Is* (1855) was at the time a valuable digest of the information contained in other works on that country (new ed., 1906). He also wrote a campaign biography of William Henry Harrison (1839); *Theory of Morals* (1844); and *Theory of Politics* (1853), as well as *Lives of Atrocious Judges* (1856), compiled from Lord Campbell's two works. In 1861 he was appointed United States consul at Trieste, but ill-health compelled him to resign and remove to Florence, where he died on the 11th of July 1865.

HILGENFELD, ADOLF BERNHARD CHRISTOPH (1823–1907), German Protestant divine, was born at Stappenbeck near Salzwedel in Prussian Saxony on the 2nd of June 1823. He studied at Berlin and Halle, and in 1890 became professor ordinarius of theology at Jena. He belonged to the Tübingen school. "Fond of emphasizing his independence of Baur, he still, in all important points, followed in the footsteps of his master; his method, which he is wont to contrast as *Literarkritik* with Baur's *Tendenzkritik*, is nevertheless essentially the same as Baur's" (Otto Pfleiderer). On the whole, however, he modified the positions of the founder of the Tübingen school, going beyond him only in his investigations into the Fourth Gospel. In 1858 he became editor of the *Zeitschrift für wissenschaftliche Theologie*. He died on the 12th of January 1907.

His works include: *Die elementarischen Recognitionen und Homilien* (1848); *Die Evangelien und die Briefe des Johannes nach ihrem Lehrbegriff* (1849); *Das Markusevangelium* (1850); *Die Evangelien nach ihrer Entstehung und geschichtlichen Bedeutung* (1854); *Das Unchristentum* (1855); *Jüd. Apokalyptik* (1857); *Novum Testamentum extra canonem receptum* (4 parts, 1866; 2nd ed., 1876–1884); *Histor.-kritische Einleitung in das Neue Testament* (1875); *Acta Apostolorum graece et latine secundum antiquissimos testes* (1899); the first complete edition of the *Shepherd of Hermas* (1887); *Ignatii et Polycarpi epistolae* (1902).

HILL, AARON (1685–1750), English author, was born in London on the 10th of February 1685. He was the son of George Hill of Malmesbury Abbey, Wiltshire, who contrived to sell an estate entailed on his son. In his fourteenth year he left Westminster School to go to Constantinople, where William, Lord Paget de Beaudesert (1637–1713), a relative of his mother, was ambassador. Paget sent him, under care of a tutor, to travel in Palestine and Egypt, and he returned to England in 1703. He was estranged from his patron by the "envious fears and malice of a certain female," and again went abroad as companion to Sir William Wentworth. On his return home in 1709 he published *A Full and Just Account of the Present State of the Ottoman Empire*, a production of which he was afterwards much ashamed, and he addressed his poem of *Camillus* to Charles Mordaunt, earl of Peterborough. In the same year he is said to have been manager of Drury Lane theatre and in 1710 of the Haymarket. His first play, *Elfrid: or The Fair Inconstant* (afterwards revised as *Athelwold*), was produced at Drury Lane in 1709. His connexion with the theatre was of short duration, and the rest of his life was spent in ingenious commercial enterprises, none of which were successful, and in literary pursuits. He formed a company to extract oil from beechmast, another for the colonization of the district to be known later as Georgia, a third to supply wood for naval construction from Scotland, and a fourth for the manufacture of potash. In 1730 he wrote *The Progress of Wit, being a caveat for the use of an Eminent Writer*. The "eminent writer" was Pope, who had introduced him into *The Dunciad* as one of the competitors for the prize offered by the goddess of Dullness, though the satire was qualified by an oblique compliment. A note in the edition of 1729 on the obnoxious passage, in which, however, the original initial was replaced by asterisks, gave Hill great offence. He wrote to Pope complaining of his treatment, and received a reply in which Pope denied responsibility for the notes. Hill appears to have been a persistent correspondent, and inflicted on Pope a series of letters, which are printed in Elwin & Courthope's edition (x. 1-78). Hill died on the 8th of February 1750, and was buried in Westminster Abbey. The best of his plays were *Zara* (acted 1735) and *Merope* (1749), both adaptations from Voltaire. He also published two series of periodical essays, *The Prompter* (1735) and, with William Bond, *The Plaindealer* (1724). He was generous to fellow-men of letters, and his letters to Richard Savage, whom he helped considerably, show his character in a very amiable light.

The Works of the late Aaron Hill, consisting of letters . . ., original poems. . . . With an essay on the Art of Acting appeared in 1753, and his *Dramatic Works* in 1760. His *Poetical Works* are included in Anderson's and other editions of the British poets. A full account of his life is provided by an anonymous writer in Theophilus Cibber's *Lives of the Poets*, vol. v.

HILL, AMBROSE POWELL (1825–1865), American Confederate soldier, was born in Culpeper county, Virginia, on the 9th of November 1825, and graduated from West Point in 1847, being appointed to the 1st U.S. artillery. He served in the Mexican and Seminole Wars, was promoted first lieutenant in September 1851, and in 1855–1860 was employed on the United States' coast survey. In March 1861, just before the outbreak of the Civil War, he resigned his commission, and when his state seceded he was made colonel of a Virginian infantry regiment, winning promotion to the rank of brigadier-general on the field of Bull Run. In the Peninsular campaign of 1862 he gained further promotion, and as a major-general Hill was one of the most prominent and successful divisional commanders of Lee's army in the Seven Days', Second Bull Run, Antietam and Fredericksburg campaigns. His division formed part of "Stonewall" Jackson's corps, and he was severely wounded in the flank attack of Chancellorsville in May 1863. After Jackson's death Hill was made a lieutenant-general and placed in command of the 3rd corps of Lee's army, which he led in the Gettysburg campaign of 1863, the autumn campaign of the same year, and the Wilderness and Petersburg operations of 1864–65. He was killed in front of the Petersburg lines on the 2nd of April 1865. His reputation as a troop leader in battle was one of the highest amongst the generals of both sides, and both Lee and Jackson, when on their death-beds their thoughts wandered in delirium to the battlefield, called for "A. P. Hill" to deliver the decisive blow.

HILL, DANIEL HARVEY (1821–1889), American Confederate soldier, was born in York district, South Carolina, on the 12th of July 1821, and graduated at the United States Military Academy in 1842, being appointed to the 1st United States artillery. He distinguished himself in the Mexican War, being breveted captain and major for bravery at Contreras and Churubusco and at Chapultepec respectively. In February 1849 he resigned his commission and became a professor of mathematics at Washington College (now Washington and Lee University), Lexington, Virginia. In 1854 he joined the faculty of Davidson College, North Carolina, and was in 1859 made superintendent of the North Carolina Military Institute of Charlotte. At the outbreak of the Civil War, D. H. Hill was made colonel of a Confederate infantry regiment, at the head of which he won the action of Big Bethel, near Fortress Monroe, Va., on the 10th of June 1861. Shortly after this he was made a brigadier-general. He took part in the Yorktown and Williamsburg operations in the spring of 1862, and as a major-general led a division with great distinction in the battle of Fair Oaks and the Seven Days. He took part in the Second Bull Run campaign in August-September 1862, and in the Antietam campaign the stubborn resistance of D. H. Hill's division in the passes of South Mountain enabled Lee to concentrate for battle. The division bore a conspicuous part in the battles of the Antietam and Fredericksburg. On the reorganization of the army of Northern Virginia after Jackson's death, D. H. Hill was not appointed to a corps command, but somewhat later in 1863 he was sent to the west as a lieutenant-general and commanded one of Bragg's corps in the brilliant victory of Chickamauga. D. H. Hill surrendered with Gen. J. E. Johnston on the 26th of April 1865. In 1866–1869 he edited a magazine, *The Land we Love*, at Charlotte, N.C., which dealt with social and historical subjects and had a great influence in the South. In 1877 he became president of the university of Arkansas, a post which he held until 1884, and in 1885 president of the Military and Agricultural College of Milledgeville, Georgia. General Hill died at Charlotte, N.C., on the 24th of September 1889.

HILL, DAVID BENNETT (1843–1910), American politician, was born at Havana, New York, on the 29th of August 1843. In 1862 he removed to Elmira, New York, where in 1864 he was admitted to the bar. He at once became active in the affairs of the Democratic party, attracting the attention of Samuel J. Tilden, one of whose shrewdest and ablest lieutenants he became. In 1871 and 1872 he was a member of the New York State Assembly, and in 1877 and again in 1881 presided over the Democratic State Convention. In 1882 he was elected mayor of Elmira, and in the same year was chosen lieutenant-governor of the state, having been defeated for nomination as governor by Grover Cleveland. In January 1885, however, Cleveland having resigned to become president, Hill became governor, and in November was elected for a three-year term, and subsequently re-elected. In 1891–1897 he was a member of the United States Senate. During these years, and in 1892, when he tried to get the presidential nomination, he was prominent in working against Cleveland. In 1896 he opposed the free silver plank in the platform adopted by the Democratic National Convention which nominated W. J. Bryan; in the National Convention of 1900, however, the free-silver issue having been subordinated to anti-imperialism, he seconded Bryan's nomination. After 1897 he devoted himself to his law practice, and in 1905 retired from politics. He died in Albany on the 30th of October 1910.

HILL, GEORGE BIRKBECK NORMAN (1835–1903), English author, son of Arthur Hill, head master of Bruce Castle school, was born at Tottenham, Middlesex, on the 7th of June 1835. Arthur Hill, with his brothers Rowland Hill, the postal reformer, and Matthew Davenport Hill, afterwards recorder of Birmingham, had worked out a system of education which was to exclude compulsion of any kind. The school at Bruce Castle, of which Arthur Hill was head master, was founded to carry into execution their theories, known as the Hazelwood system. George Birkbeck Hill was educated in his father's school and at Pembroke College, Oxford. In 1858 he began to teach at Bruce Castle school, and from 1868 to 1877 was head master. In 1869 he became a regular contributor to the *Saturday Review*, with which he remained in connexion until 1884. On his retirement from teaching he devoted himself to the study of English 18th-century literature, and established his reputation as the most learned commentator on the works of Samuel Johnson. He settled at Oxford in 1887, but from 1891 onwards his winters were usually spent abroad. He died at Hampstead, London, on the 27th of February 1903. His works include: *Dr Johnson, his Friends and his Critics* (1878); an edition of Boswell's *Correspondence* (1879); a laborious edition of *Boswell's Life of Johnson, including Boswell's Journal of a Tour to the Hebrides, and Johnson's Diary of a Journey into North Wales* (Clarendon Press, 6 vols., 1887); *Wit and Wisdom of Samuel Johnson* (1888); *Select Essays of Dr Johnson* (1889); *Footsteps of Dr Johnson in Scotland* (1890); *Letters of Johnson* (1892); *Johnsonian Miscellanies* (2 vols., 1897); an edition (1900) of Edward Gibbon's *Autobiography*; Johnson's *Lives of the Poets* (3 vols., 1905), and other works on the 18th-century topics. Dr Birkbeck Hill's elaborate edition of Boswell's *Life* is a monumental work, invaluable to the student.

See a memoir by his nephew, Harold Spencer Scott, in the edition of the *Lives of the English Poets* (1905), and the *Letters* edited by his daughter, Lucy Crump, in 1903.

HILL, JAMES J. (1838–), American railway capitalist, was born near Guelph, Ontario, Canada, on the 16th of September 1838, and was educated at Rockwood (Ont.) Academy, a Quaker institution. In 1856 he settled in St Paul, Minnesota. Abandoning, because of his father's death, his plans to study medicine, he became a clerk in the office of a firm of river steamboat agents and shippers, and later the agent for a line of river packets; he established about 1870 transportation lines on the Mississippi and on the Red River (of the North). He effected a traffic arrangement between the St Paul Pacific Railroad and his steamboat lines; and when the railway failed in 1873 for $27,000,000, Hill interested Sir Donald A. Smith (Lord Strathcona), George Stephen (Lord Mount Stephen), and other Canadian capitalists, in the road and in the wheat country of the Red River Valley; he got control of the bonds (1878), foreclosed the mortgage, reorganized the road as the St Paul, Minneapolis & Manitoba, and began to extend the line, then only 380 m. long, toward the Pacific; and in 1883 he became its president. He was president of the Great Northern Railway (comprehending all his secondary lines) from 1893 to April 1907, when he became chairman of its board of directors. In the extension (1883–1893) of this railway westward to Puget Sound (whence it has direct steamship connexions with China and Japan), the line was built by the company itself, none of the work being handled by contractors. Subsequently his financial interests in American railways caused constant sensations in the stock-markets. The Hill interests obtained control not only of the Great-Northern system, but of the Northern Pacific and the Chicago, Burlington & Quincy, and proposed the construction of another northern line to the Pacific coast. Hill was the president of the Northern Securities Company, which in 1904 was declared by the United States Supreme Court to be in conflict with the Sherman Anti-Trust Law. (See Vol. 27, p. 733.) Among Hill's gifts to public institutions was one of $500,000 to the St. Paul Theological Seminary (Roman Catholic).

HILL, JOHN (*c.* 1716–1775), called from his Swedish honours, "Sir" John Hill, English author, son of the Rev. Theophilus Hill, is said to have been born in Peterborough in 1716. He was apprenticed to an apothecary and on the completion of his apprenticeship he set up in a small shop in St Martin's Lane, Westminster. He also travelled over the country in search of rare herbs, with a view to publishing a *hortus siccus*, but the plan failed. His first publication was a translation of Theophrastus's *History of Stones* (1746). From this time forward he was an indefatigable writer. He edited the *British Magazine* (1746–1750), and for two years (1751–1753) he wrote a daily letter, "The Inspector," for the *London Advertiser and Literary Gazette*. He also produced novels, plays and scientific works, and was a large contributor to the supplement of Ephraim

SpinSmart Software http://www.spinsmart.com

Chambers's *Cyclopaedia*. His personal and scurrilous writings involved him in many quarrels. Henry Fielding attacked him in the *Covent Garden Journal*, Christopher Smart wrote a mock-epic, *The Hilliad*, against him, and David Garrick replied to his strictures against him by two epigrams, one of which runs:—

"For physics and farces, his equal there scarce is;
His farces are physic, his physic a farce is."

He had other literary passages-at-arms with John Rich, who accused him of plagiarizing his *Orpheus*, also with Samuel Foote and Henry Woodward. From 1759 to 1775 he was engaged on a huge botanical work—*The Vegetable System* (26 vols. fol.)—adorned by 1600 copperplate engravings. Hill's botanical labours were underaken at the request of his patron, Lord Bute, and he was rewarded by the order of Vasa from the king of Sweden in 1774. He had a medical degree from Edinburgh, and he now practised as a quack doctor, making considerable sums by the preparation of vegetable medicines. He died in London on the 21st of November 1775.

Of the seventy-six separate works with which he is credited in the *Dictionary of National Biography*, the most valuable are those that deal with botany. He is said to have been the author of the second part of *The Oeconomy of Human Life* (1751), the first part of which is by Lord Chesterfield, and Hannah Glasse's famous manual of cookery was generally ascribed to him (see Boswell, ed. Hill, iii. 285). Dr Johnson said of him that he was "an ingenious man, but had no veracity."

See a *Short Account of the Life, Writings and Character of the late Sir John Hill* (1779), which is chiefly occupied with a descriptive catalogue of his works; also *Temple Bar* (1872, xxxv. 261-266).

HILL, MATTHEW DAVENPORT (1792–1872), English lawyer and penologist, was born on the 6th of August 1792, at Birmingham, where his father, T. W. Hill, for long conducted a private school. He was a brother of Sir Rowland Hill. He early acted as assistant in his father's school, but in 1819 was called to the bar at Lincoln's Inn. He went the midland circuit. In 1832 he was elected one of the Liberal members for Kingston-upon-Hull, but he lost his seat at the next election in 1834. On the incorporation of Birmingham in 1839 he was chosen recorder; and in 1851 he was appointed commissioner in bankruptcy for the Bristol district. Having had his interest excited in questions relating to the treatment of criminal offenders, he ventilated in his charges to the grand juries, as well as in special pamphlets, opinions which were the means of introducing many important reforms in the methods of dealing with crime. One of his principal coadjutors in these reforms was his brother Frederick Hill (1803–1896), whose *Amount, Causes and Remedies of Crime*, the result of his experience as inspector of prisons for Scotland, marked an era in the methods of prison discipline. Hill was one of the chief promoters of the Society for the Diffusion of Useful Knowledge, and the originator of the *Penny Magazine*. He died at Stapleton, near Bristol, on the 7th of June 1872.

His principal works are *Practical Suggestions to the Founders of Reformatory Schools* (1855); *Suggestions for the Repression of Crime* (1857), consisting of charges addressed to the grand juries of Birmingham; *Meltray* (1855); *Papers on the Penal Servitude Acts* (1864); *Journal of a Third Visit to the Convict Gaols, Refuges and Reformatories of Dublin* (1865); *Addresses delivered at the Birmingham and Midland Institute* (1867). See *Memoir of Matthew Davenport Hill*, by his daughters Rosamond and Florence Davenport Hill (1878).

HILL, OCTAVIA (1838–) and **MIRANDA** (1836–1910), English philanthropic workers, were born in London, being daughters of Mr James Hill and granddaughters of Dr Southwood Smith, the pioneer of sanitary reform. Miss Octavia Hill's attention was early drawn to the evils of London housing, and the habits of indolence and lethargy induced in many of the lower classes by their degrading surroundings. She conceived the idea of trying to free a few poor people from such influences, and Mr Ruskin, who sympathized with her plans, supplied the money for starting the work. For £750 Miss Hill purchased the 56 years' lease of three houses in one of the poorest courts of Marylebone. Another £78 was spent in building a large room at the back of her own house where she could meet the tenants. The houses were put in repair, and let out in sets of two rooms. At the end of eighteen months it was possible to pay 5% interest, to repay £48 of the capital, as well as meet all expenses for taxes, ground rent and insurance. What specially distinguished this scheme was that Miss Hill herself collected the rents, thus coming into contact with the tenants and helping to enforce regular and self-respecting habits. The success of her first attempt encouraged her to continue. Six more houses were bought and treated in a similar manner. A yearly sum was set aside for the repairs of each house, and whatever remained over was spent on such additional appliances as the tenants themselves desired. This encouraged them to keep their tenements in good repair. By the help of friends Miss Hill was now enabled to enlarge the scope of her work. In 1869 eleven more houses were bought. The plan was to set a visitor over a small court or block of buildings to do whatever work in the way of rent-collecting, visiting for the School Board, &c., was required. As years went on Miss Octavia Hill's work was largely increased. Numbers of her friends bought and placed under her care small groups of houses, over which she fulfilled the duties of a conscientious landlord. Several large owners of tenement houses, notably the Ecclesiastical Commissioners, entrusted to her the management of such property, and consulted her about plans of rebuilding; and a number of fellow-workers were trained by her in the management of houses for the poor. The results in Southwark (where Red Cross Hall was established) and elsewhere were very beneficial. Both Miss Miranda and Miss Octavia Hill took an interest in the movement for bringing beauty into the homes of the poor, and the former was practically the founder of the Kyrle Society, the first suggestion of which was contained in a paper read to a small circle of friends. Both sisters worked for the preservation of open spaces, and helped to promote the work of the Charity Organization Society, and for several years Miss Miranda Hill (who died on the 31st of May 1910) did admirable work in Marylebone as a member of the Board of Guardians.

HILL, ROWLAND (1744–1833), English preacher, sixth son of Sir Rowland Hill, Bart. (d. 1783), was born at Hawkstone, Shropshire, on the 23rd of August 1744. He was educated at Shrewsbury, Eton and St John's College, Cambridge. Stimulated by George Whitefield's example, he scandalized the university authorities and his own friends by preaching and visiting the sick before he had taken orders. In 1773 he was appointed to the parish of Kingston, Somersetshire, where he soon attracted great crowds to his open-air services. Having inherited considerable property, he built for his own use Surrey Chapel, in the Blackfriars Road, London (1783). Hill conducted his services in accordance with the forms of the Church of England, in whose communion he always remained. Both at Surrey Chapel and in his provincial "gospel tours" he had great success. His oratory was specially adapted for rude and uncultivated audiences. He possessed a voice of great power, and according to Southey "his manner" was "that of a performer as great in his own line as Kean or Kemble." His earnest and pure purposes more than made up for his occasional lapses from good taste and the eccentricity of his wit. He helped to found the Religious Tract Society, the British and Foreign Bible Society, and the London Missionary Society, and was a stout advocate of vaccination. His best-known work is the *Village Dialogues*, which first appeared in 1810, and reached a 34th edition in 1839. He died on the 11th of April 1833.

See *Life* by E. Sidney (1833); *Memoirs*, by William Jones (1834); and *Memorials*, by Jas. Sherman (1857).

HILL, SIR ROWLAND (1795–1879), English administrator, author of the penny postal system, a younger brother of Matthew Davenport Hill, and third son of T. W. Hill, who named him after Rowland Hill the preacher, was born on the 3rd of December 1795 at Kidderminster. As a young child he had, on account of an affection of the spine, to maintain a recumbent position, and his principal method of relieving the irksomeness of his situation was to repeat figures aloud consecutively until he had reached very high totals. A similar bent of mind was manifested when he entered school in 1802, his aptitude for mathematics

SpinSmart Software http://www.spinsmart.com

being quite exceptional. But he was indebted for the direction of his abilities in no small degree to the guidance of his father, a man of advanced political and social views, which were qualified and balanced by the strong practical tendency of his mind. At the age of twelve Rowland began to assist in teaching mathematics in his father's school at Hilltop, Birmingham, and latterly he had the chief management of the school. On his suggestion the establishment was removed in 1819 to Hazelwood, a more commodious building in the Hagley Road, in order to have the advantages of a large body of boys, for the purpose of properly carrying out an improved system of education. That system, which was devised principally by Rowland, was expounded in a pamphlet entitled *Plans for the Government and Education of Boys in Large Numbers*, the first edition of which appeared in 1822, and a second with additions in 1827. The principal feature of the system was "to leave as much as possible all power in the hands of the boys themselves"; and it was so successful that, in a circular issued six years after the experiment had been in operation, it was announced that "the head master had never once exercised his right of veto on their proceedings." It may be said that Rowland Hill, as an educationist, is entitled to a place side by side with Arnold of Rugby, and was equally successful with him in making moral influence of the highest kind the predominant power in school discipline. After his marriage in 1827 Hill removed to a new school at Bruce Castle, Tottenham, which he conducted until failing health compelled him to retire in 1833. About this time he became secretary of Gibbon Wakefield's scheme for colonizing South Australia, the objects of which he explained in 1832 in a pamphlet on *Home Colonies*, afterwards partly reprinted during the Irish famine under the title *Home Colonies for Ireland*. It was in 1835 that his zeal as an administrative reformer was first directed to the postal system. The discovery which resulted from these investigations is when stated so easy of comprehension that there is great danger of losing sight of its originality and thoroughness. A fact which enhances its merit was that he was not a post-office official, and possessed no practical experience of the details of the old system. After a laborious collection of statistics he succeeded in demonstrating that the principal expense of letter carriage was in receiving and distributing, and that the cost of conveyance differed so little with the distance that a uniform rate of postage was in reality the fairest to all parties that could be adopted. Trusting also that the deficiency in the postal rate would be made up by the immense increase of correspondence, and by the saving which would be obtained from prepayment, from improved methods of keeping accounts, and from lessening the expense of distribution, he in his famous pamphlet published in 1837 recommended that within the United Kingdom the rate for letters not exceeding half an ounce in weight should be only one penny. The employment of postage stamps is mentioned only as a suggestion, and in the following words: "Perhaps the difficulties might be obviated by using a bit of paper just large enough to bear the stamp, and covered at the back with a glutinous wash which by applying a little moisture might be attached to the back of the letter." Proposals so striking and novel in regard to a subject in which every one had a personal interest commanded immediate and general attention. So great became the pressure of public opinion against the opposition offered to the measure by official prepossessions and prejudices that in 1838 the House of Commons appointed a committee to examine the subject. The committee having reported favourably, a bill to carry out Hill's recommendations was brought in by the government. The act received the royal assent in 1839, and after an intermediate rate of fourpence had been in operation from the 5th of December of that year, the penny rate commenced on the 10th of January 1840. Hill received an appointment in the Treasury in order to superintend the introduction of his reforms, but he was compelled to retire when the Liberal government resigned office in 1841. In consideration of the loss he thus sustained, and to mark the public appreciation of his services, he was in 1846 presented with the sum of £13,360. On the Liberals returning to office in the same year he was appointed secretary to the postmaster-general and in 1854 he was made chief secretary. His ability as a practical administrator enabled him to supplement his original discovery by measures realizing its benefits in a degree commensurate with continually improving facilities of communication, and in a manner best combining cheapness with efficiency. In 1860 his services were rewarded with the honour of knighthood; and when failing health compelled him to resign his office in 1864, he received from parliament a grant of £20,000 and was also allowed to retain his full salary of £2000 a year as retiring pension. In 1864 the university of Oxford conferred on him the degree of D.C.L., and on the 6th of June 1879 he was presented with the freedom of the city of London. The presentation, on account of his infirm health, took place at his residence at Hampstead, and he died on the 27th of August following. He was buried in Westminster Abbey.

He wrote, in conjunction with his brother, Arthur Hill, a *History of Penny Postage*, published in 1880, with an introductory memoir by his nephew, G. Birkbeck Hill. See also *Sir Rowland Hill, the Story of a Great Reform*, told by his daughter (1907). To commemorate his memory the Rowland Hill Memorial and Benevolent Fund was founded shortly after his death for the purpose of relieving distressed persons connected with the post office who were outside the scope of the Superannuation Act. See also POST AND POSTAL SERVICE.

HILL, ROWLAND HILL, 1ST VISCOUNT (1772–1842), British general, was the second son of (Sir) John Hill, of Hawkstone, Shropshire, and nephew of the Rev. Rowland Hill (1744–1833), was born at Prees Hall near Hawkstone on the 11th of August 1772. He was gazetted to the 38th regiment in 1790, obtaining permission at the same time to study in a military academy at Strassburg, where he continued after removing into the 53rd regiment with the rank of lieutenant in 1791. In the beginning of 1793 he raised a company, and was promoted to the rank of captain. The same year he acted as assistant secretary to the British minister at Genoa, and served with distinction as a staff officer in the siege of Toulon. Hill took part in many minor expeditions in the following years. In 1800, when only twenty-eight, he was made a brevet colonel, and in 1801 he served with distinction in Sir Ralph Abercromby's expedition to Egypt, and was wounded at the battle of Alexandria. He continued to command his regiment, the 90th, until 1803, when he became a brigadier-general. During his regimental command he introduced a regimental school and a sergeants' mess. He held various commands as brigadier, and after 1805 as major-general, in Ireland. In 1805 he commanded a brigade in the abortive Hanover expedition. In 1808 he was appointed to a brigade in the force sent to Portugal, and from Vimeira to Vittoria, in advance or retreat, he proved himself Wellington's ablest and most indefatigable coadjutor. He led a brigade at Vimeira, at Corunna and at Oporto, and a division at Talavera (see PENINSULAR WAR). His capacity for independent command was fully demonstrated in the campaigns of 1810, 1811 and 1812. In 1811 he annihilated a French detachment under Girard at Arroyo-dos-Molinos, and early in 1812, having now attained a rank of lieutenant-general (January 1812) and become a K.B. (March), he carried by assault the important works of Almaraz on the Tagus. Hill led the right wing of Wellington's army in the Salamanca campaign in 1812 and at the battle of Vittoria in 1813. Later in this year he conducted the investment of Pampeluna and fought with the greatest distinction at the Nivelle and the Nive. In the invasion of France in 1814 his corps was victoriously engaged both at Orthez and at Toulouse. Hill was one of the general officers rewarded for their services by peerages, his title being at first Baron Hill of Almaraz and Hawkstone, and he received a pension, the thanks of parliament and the freedom of the city of London. For about two years previous to his elevation to the peerage, he had been M.P. for Shrewsbury. In 1815 the news of Napoleon's return from Elba was followed by the assembly of an Anglo-Allied army (see WATERLOO CAMPAIGN) in the Netherlands, and Hill was appointed to one of the two corps commands in this army. At Waterloo he led the famous charge of Sir Frederick Adams's brigade against the Imperial Guard, and for some time it was thought that he

SpinSmart Software http://www.spinsmart.com

had fallen in the mêlée. He escaped, however, without a wound, and continued with the army in France until its withdrawal in 1818. Hill lived in retirement for some years at his estate of Hardwicke Grange. He carried the royal standard at the coronation of George IV. and became general in 1825. When Wellington became premier in 1828, he received the appointment of general commanding-in-chief, and on resigning this office in 1842 he was created a viscount. He died on the 10th of December of the same year. Lord Hill was, next to Wellington, the most popular and able soldier of his time in the British service, and was so much beloved by the troops, especially those under his immediate command, that he gained from them the title of "the soldier's friend." He was a G.C.B. and G.C.H., and held the grand crosses of various foreign orders, amongst them the Russian St George and the Austrian Maria Theresa.

The *Life of Lord Hill, G.C.B.*, by Rev. Edwin Sidney, appeared in 1845.

HILL (O. Eng. *hyll*; cf. Low Ger. *hull*, Mid. Dutch *hul*, allied to Lat. *celsus*, high, *collis*, hill, &c.), a natural elevation of the earth's surface. The term is now usually confined to elevations lower than a mountain, but formerly was used for all such elevations, high or low.

HILLAH, a town of Asiatic Turkey, in the pashalik of Bagdad, 60 m. S. of the city of Bagdad, in 32° 28′ 35″ N., 44° 48′ 40½″ E., formerly the capital of a sanjak and the residence of a mutasserif, who in 1893 was transferred to Diwanieh. It is situated on both banks of the Euphrates, the two parts of the town being connected by a floating bridge, 450 ft. in length, in the midst of a very fertile district. The estimated population, which includes a large number of Jews, varies from 6000 to 12,000. The town has suffered much from the periodical breaking of the Hindieh dam and the consequent deflection of the waters of the Euphrates to the westward, as a result of which at times the Euphrates at this point has been entirely dry. This deflection of water has also seriously interfered with the palm groves, the cultivation of which constitutes a large part of the industry of the surrounding country along the river. The bazaars of Hillah are relatively large and well supplied. Many of the houses in the town are built of brick, not a few bearing an inscription of Nebuchadrezzar, obtained from the ruins of Babylon, which lie less than an hour away to the north.

HILLARD, GEORGE STILLMAN (1808–1879), American lawyer and author, was born at Machias, Maine, on the 22nd of September 1808. After graduating at Harvard College in 1828, he taught in the Round Hill School at Northampton, Massachusetts. He graduated at the Harvard Law School in 1832, and in 1833 he was admitted to the bar in Boston, where he entered into partnership with Charles Sumner. He was a member of the state House of Representatives in 1836, of the state Senate in 1850, and of the state constitutional convention of 1853, and in 1866–70 was United States district attorney for Massachusetts. He devoted a large portion of his time to literature. He became a member of the editorial staff of the *Christian Register*, a Unitarian weekly, in 1833; in 1834 he became editor of The *American Jurist* (1829–1843), a legal journal to which Sumner, Simon Greenleaf and Theron Metcalf contributed; and from 1856 to 1861 he was an associate editor of the Boston *Courier*. His publications include an edition of Edmund Spenser's works (in 5 vols., 1839); *Selections from the Writings of Walter Savage Landor* (1856); *Six Months in Italy* (2 vols., 1853); *Life and Campaigns of George B. McClellan* (1864); a part of the *Life, Letters, and Journals of George Ticknor* (1876); besides a series of school readers and many articles in periodicals and encyclopaedias. He died in Boston on the 21st of January 1879.

HILLEBRAND, KARL (1829–1884), German author, was born at Giessen on the 17th of September 1829, his father Joseph Hillebrand (1788–1871) being a literary historian and writer on philosophic subjects. Karl Hillebrand became involved, as a student in Heidelberg, in the Baden revolutionary movement, and was imprisoned in Rastatt. He succeeded in escaping and lived for a time in Strassburg, Paris—where for several months he was Heine's secretary—and Bordeaux. He continued his studies, and after obtaining the doctor's degree at the Sorbonne, he was appointed teacher of German in the *École militaire* at St Cyr, and shortly afterwards, professor of foreign literatures at Douai. On the outbreak of the Franco-German War he resigned his professorship and acted for a time as correspondent to *The Times* in Italy. He then settled in Florence, where he died on the 19th of October 1884. Hillebrand wrote with facility and elegance in French, English and Italian, besides his own language. His essays, collected under the title *Zeiten, Völker und Menschen* (Berlin, 1874–1885), show clear discernment, a finely balanced cosmopolitan judgment and grace of style. He undertook to write the *Geschichte Frankreichs von der Thronbesteigung Ludwig Philipps bis zum Fall Napoleons III.*, but only two volumes were completed (to 1848) (2nd ed., 1881–1882). In French he published *Des conditions de la bonne comédie* (1863), *La Prusse contemporaine* (1867), *Études italiennes* (1868), and a translation of O. Müller's *Griechische Literaturgeschichte* (3rd ed., 1883). In English he published his Royal Institution Lectures on *German Thought during the Last Two Hundred Years* (1880). He also edited a collection of essays dealing with Italy, under the title *Italia* (4 vols., Leipzig, 1874–1877).

See H. Homberger, *Karl Hillebrand* (Berlin, 1884).

HILLEL, Jewish rabbi, of Babylonian origin, lived at Jerusalem in the time of King Herod. Though hard pressed by poverty, he applied himself to study in the schools of Shemaiah and Abtalion (Sameas and Pollion in Josephus). On account of his comprehensive learning and his rare qualities he was numbered among the recognized leaders of the Pharisaic scribes. Tradition assigns him the highest dignity of the Sanhedrin, under the title of *nasi* ("prince"), about a hundred years before the destruction of Jerusalem, *i.e.* about 30 B.C. The date at least can be recognized as historic; the fact that Hillel took a leading position in the council can also be established. The epithet *ha-zaḳen* ("the elder"), which usually accompanies his name, proves him to have been a member of the Sanhedrin, and according to a trustworthy authority Hillel filled his leading position for forty years, dying, therefore, about A.D. 10. His descendants remained, with few exceptions, at the head of Judaism in Palestine until the beginning of the 5th century, two of them, his grandson Gamaliel I. and the latter's son Simon, during the time when the Temple was still standing. The fact that Josephus (*Vita* 38) ascribes to Simon descent from a very distinguished stock (γένους σφόδρα λαμπροῦ), shows in what degree of estimation Hillel's descendants stood. When the dignity of *nasi* became afterwards hereditary among them, Hillel's ancestry, perhaps on the ground of old family traditions, was traced back to David. Hillel is especially noted for the fact that he gave a definite form to the Jewish traditional learning, as it had been developed and made into the ruling and conserving factor of Judaism in the latter days of the second Temple, and particularly in the centuries following the destruction of the Temple. He laid down seven rules for the interpretation of the Scriptures, and these became the foundation of rabbinical hermeneutics; and the ordering of the traditional doctrines into a whole, effected in the Mishna by his successor Judah I., two hundred years after Hillel's death, was probably likewise due to his instigation. The tendency of his theory and practice in matters pertaining to the Law is evidenced by the fact that in general he advanced milder and more lenient views in opposition to his colleague Shammai, a contrast which after the death of the two masters, but not until after the destruction of the Temple, was maintained in the strife kept up between the two schools named the House of Hillel and the House of Shammai. The well-known institution of the Prosbol (προσβολή), introduced by Hillel, was intended to avert the evil consequences of the scriptural law of release in the seventh year (Deut. xv. 1). He was led to this, as is expressly set forth (*M. Giṭṭin*, iv. 3), by a regard for the welfare of the community. Hillel lived in the

SpinSmart Software http://www.spinsmart.com

memory of posterity chiefly as the great teacher who enjoined and practised the virtues of charity, humility and true piety. His proverbial sayings, in particular, a great number of which were written down partly in Aramaic, partly in Hebrew, strongly affected the spirit both of his contemporaries and of the succeeding generations. In his Maxims (*Aboth*, i. 12) he recommends the love of peace and the love of mankind beyond all else, and his own love of peace sprang from the tenderness and deep humility which were essential features in his character, as has been illustrated by many anecdotes. Hillel's patience has become proverbial. One of his sayings commends humility in the following paradox: "My abasement is my exaltation." His charity towards men is given its finest expression in the answer which he made to a proselyte who asked to be taught the commandments of the Torah in the shortest possible form: "What is unpleasant to thyself that do not to thy neighbour; this is the whole Law, all else is but its exposition." This allusion to the scriptural injunction to love one's neighbour (Lev. xix. 18) as the fundamental law of religious morals, became in a certain sense a commonplace of Pharisaic scholasticism. For the Pharisee who accepts the answer of Jesus regarding that fundamental doctrine which ranks the love of one's neighbour as the highest duty after the love of God (Mark xii. 33), does so because as a disciple of Hillel the idea is familiar to him. St Paul also (Gal. v. 14) doubtless learned this in the school of Gamaliel. Hillel emphasized the connexion between duty towards one's neighbour and duty towards oneself in the epigrammatic saying: "If I am not for myself, who is for me? And if I am for myself alone, what then am I? And if not now, then when?" (*Aboth*, i. 14). The duty of working both with and for men he teaches in the sentence: "Separate not thyself from the congregation" (*ib.* ii. 4). The duty of considering oneself part of comman humanity, of not differing from others by any peculiarity of behaviour, he sums up in the words: "Appear neither naked nor clothed, neither sitting nor standing, neither laughing nor weeping" (*Tosef. Ber.* c. ii.). The command to love one's neighbour inspired also Hillel's injunction (*Aboth*, ii. 4): "Judge not thy neighbour until thou art in his place" (cf. Matt. vii. 1). The disinterested pursuit of learning, study for study's sake, is commended in many of Hillel's sayings as being what is best in life: "He who wishes to make a name for himself loses his name; he who does not increase [his knowledge] decreases it; he who does not learn is worthy of death; he who works for the sake of a crown is lost" (*Aboth*, i. 13). "He who occupies himself much with learning makes his life" (*ib.* ii. 7). "He who has acquired the words of doctrine has acquired the life of the world to come" (*ib.*). "Say not: When I am free from other occupations I shall study; for may be thou shalt never at all be free" (*ib.* 4). One of his strings of proverbs runs as follows: "The uncultivated man is not innocent; the ignorant man is not devout; the bashful man learns not; the wrathful man teaches not; he who is much absorbed in trade cannot become wise; where no men are, there strive thyself to be a man" (*ib.* 5). The almost mystical profundity of Hillel's conciousness of God is shown in the words spoken by him on the occasion of a feast in the Temple—words alluding to the throng of people gathered there which he puts into the mouth of God Himself: "If I am here every one is here; if I am not here no one is here" (*Sukkah* 53*a*). In like manner Hillel makes God say to Israel, referring to Exodus xx. 24: "Whither I please, thither will I go; if thou come into my house I come into thy house; if thou come not into my house, I come not into thine" (*ib.*).

It is noteworthy that no miraculous legends are connected with Hillel's life. A scholastic tradition, however, tells of a voice from heaven which made itself heard when the wise men had assembled in Jericho, saying: "Among those here present is one who would have deserved the Holy Spirit to rest upon him, if his time had been worthy of it." And all eyes turned towards Hillel (*Tos. Soṭah*, xiii. 3). When he died lamentation was made for him as follows: "Woe for the humble, woe for the pious, woe for the disciple of Ezra!" (*ib.*)

HILLEL II., one of the patriarchs belonging to the family of Hillel I., lived in Tiberias about the middle of the 4th century, and introduced the arrangement of the calendar through which the Jews of the Diaspora became independent of Palestine in the uniform fixation of the new moons and feasts.

The Rabbi HILLEL, who in the 4th century made the remarkable declaration that Israel need not expect a Messiah, because the promise of a Messiah had already been fulfilled in the days of King Hezekiah (Babli, *Sanhedrin*, 99a), is probably Hillel, the son of Samuel ben Naḥman, a well-known expounder of the scriptures. (W. Ba.)

HILLER, FERDINAND (1811–1885), German composer, was born at Frankfort-on-Main, on the 24th of October 1811. His first master was Aloys Schmitt, and when he was ten years of age his compositions and talent led his father, a well-to-do man, to send him to Hummel in Weimar. There he devoted himself to composition, among his work being the entr'actes to *Maria Stuart*, through which he made Goethe's acquaintance. Under Hummel, Hiller made great strides as a pianist, so much so that early in 1827 he went on a tour to Vienna, where he met Beethoven and produced his first quartet. After a brief visit home Hiller went to Paris in 1829, where he lived till 1836. His father's death necessitated his return to Frankfort for a time, but on the 8th of January 1839 he produced at Milan his opera *La Romilda*, and began to write his oratorio *Die Zerstörung Jerusalems*, one of his best works. Then he went to Leipzig, to his friend Mendelssohn, where in 1843–1844 he conducted a number of the Gewandhaus concerts and produced his oratorio. After a further visit to Italy to study sacred music, Hiller produced two operas, *Ein Traum* and *Conradin*, at Dresden in 1845 and 1847 respectively; he went as conductor to Düsseldorf in 1847 and Cologne in 1850, and conducted at the Opéra Italien in Paris in 1851 and 1852. At Cologne he became a power as conductor of the Gürzenich concerts and head of the Conservatorium. In 1884 he retired, and died on the 12th of May in the following year. Hiller frequently visited England. He composed a work for the opening of the Royal Albert Hall, his *Nala and Damayanti* was performed at Birmingham, and he gave a series of pianoforte recitals of his own compositions at the Hanover Square Rooms in 1871. He had a perfect mastery over technique and form in musical composition, but his works are generally dry. He was a sound pianist and teacher, and occasionally a brilliant writer on musical matters. His compositions, numbering about two hundred, include six operas, two oratorios, six or seven cantatas, much chamber music and a once-popular pianoforte concerto.

HILLER, JOHANN ADAM (1728–1804), German musical composer, was born at Wendisch-Ossig near Görlitz in Silesia on the 25th of December 1728. By the death of his father in 1734 he was left dependent to a large extent on the charity of friends. Entering in 1747 the Kreuzschule in Dresden, the school attended many years afterwards by Richard Wagner, he subsequently went to the university of Leipzig, where he studied jurisprudence, supporting himself by giving music lessons, and also by performing at concerts both on the flute and as a vocalist. Gradually he adopted music as his sole profession, and devoted himself more especially to the permanent establishment of a concert institute at Leipzig. It was he who in 1781 originated the celebrated Gewandhaus concerts which still flourish at Leipzig. In 1789 he became "cantor" of the Thomas school there, a position previously held by John Sebastian Bach. He died in Leipzig on the 16th of June 1804. Two of his pupils placed a monument to his memory in front of the Thomas school. Hiller's compositions comprise almost every kind of church music, from the cantata to the simple chorale. But much more important are his operettas, 14 in number, which for a long time retained their place on the boards, and had considerable influence on the development of light dramatic music in Germany. The *Jolly Cobbler*, *Love in the Country* and the *Village Barber* were amongst the most popular of his works. Hiller also excelled in sentimental songs and ballads. With great simplicity of structure his music combines a considerable amount of genuine melodic invention. Although an admirer and imitator of the Italian school, Hiller fully appreciated the greatness of Handel, and did much for the appreciation of his music in Germany. It was under his direction that the *Messiah*

SpinSmart Software http://www.spinsmart.com

was for the first time given at Berlin, more than forty years after the composition of that great work. Hiller was also a writer on music, and for some years (1766–1770) edited a musical weekly periodical named *Wöchentliche Nachrichten und Anmerkungen die Musik betreffend.*

HILLIARD, LAWRENCE (d. 1640), English miniature painter. The date of his birth is not known, but he died in 1640. He was the son of Nicholas Hilliard, and evidently derived his Christian name from that of his grandmother. He adopted his father's profession and worked out the unexpired time of his licence after Nicholas Hilliard died. It was from Lawrence Hilliard that Charles I. received the portrait of Queen Elizabeth now at Montagu House, since van der Dort's catalogue describes it as "done by old Hilliard, and bought by the king of young Hilliard." In 1624 he was paid £42 from the treasury for five pictures, but the warrant does not specify whom they represented. His portraits are of great rarity, two of the most beautiful being those in the collections of Earl Beauchamp and Mr J. Pierpont Morgan. They are as a rule signed L.H., but are also to be distinguished by the beauty of the calligraphy in which the inscriptions round the portraits are written. The writing is as a rule very florid, full of exquisite curves and flourishes, and more elaborate than the more formal handwriting of Nicholas Hilliard. The colour scheme adopted by the son is richer and more varied than that used by the father, and Lawrence Hilliard's miniatures are not so hard as are those of Nicholas, and are marked by more shade and a greater effect of atmosphere. (G. C. W.)

HILLIARD, NICHOLAS (*c.* 1537–1619), the first true English miniature painter, is said to have been the son of Richard Hilliard of Exeter, high sheriff of the city and county in 1560, by Lawrence, daughter of John Wall, goldsmith, of London, and was born probably about 1537. He was appointed goldsmith, carver and portrait painter to Queen Elizabeth, and engraved the Great Seal of England in 1586. He was in high favour with James I. as well as with Elizabeth, and from the king received a special patent of appointment, dated the 5th of May 1617, and granting him a sole licence for the royal work for twelve years. He is believed to have been the author of an important treatise on miniature painting, now preserved in the Bodleian Library, but it seems more probable that the author of that treatise was John de Critz, Serjeant Painter to James I. It is probable, however, that the treatise was taken down from the instructions of Hilliard, for the benefit of one of his pupils, perhaps Isaac Oliver.

The esteem of his countrymen for Hilliard is testified to by Dr Donne, who in a poem called "The Storm" (1597) praises the work of this artist. He painted a portrait of himself at the age of thirteen, and is said to have executed one of Mary queen of Scots when he was eighteen years old. He died on the 7th of January 1619, and was buried in St Martin's-in-the-Fields, Westminster, leaving by his will twenty shillings to the poor of the parish, £30 between his two sisters, some goods to his maid-servant, and all the rest of his effects to his son, Lawrence Hilliard, his sole executor.

It seems to be pretty certain that he visited France, and that he is the artist alluded to in the papers of the duc d'Alençon under the name of "Nicholas Belliart, peintre anglois" who was painter to this prince in 1577, receiving a stipend of 200 livres. The miniature of Mademoiselle de Sourdis, in the collection of Mr J. Pierpont Morgan, is certainly the work of Hilliard, and is dated 1577, in which year she was a maid of honour at the French Court; and other portraits which are his work are believed to represent Gabrielle d'Estrées, niece of Madame de Sourdis, la Princesse de Condé and Madame de Montgomery.

For further information respecting Hilliard's sojourn in France, see the privately printed catalogue of the collection of miniatures belonging to Mr J. Pierpont Morgan, compiled by Dr G. C. Williamson. (G. C. W.)

HILLSDALE, a city and the county-seat of Hillsdale county, Michigan, U.S.A., about 87 m. W. by S. of Detroit. Pop. (1900) 4151, of whom 300 were foreign-born; (1904) 4809; (1910) 5001. Hillsdale is served by the Lake Shore & Michigan Southern railway. It has a public library, and is the seat of Hillsdale College (co-educational, Free Baptist), which was opened as Michigan Central College, at Spring Arbor, Michigan, in 1844, was removed to Hillsdale and received its present name in 1853 and was re-opened here in 1855. The college in 1907-1908 had 22 instructors and 345 students. The city is a centre for a rich farming region; among its manufactures are gasoline and gas engines, screen doors, wagons, barrels, shoes, fur-coats and flour. Hillsdale was first settled in 1837, was incorporated as a village in 1847, and was chartered as a city in 1869.

HILL TIPPERA, or TRIPURA, a native state of India, adjoining the British district of Tippera, in Eastern Bengal and Assam. Area, 4086 sq. m.; pop. (1901) 173,325; estimated revenue, £55,000. Six parallel ranges of hill cross it from north to south, at an average distance of 12 m. apart. The hills are covered for the most part with bamboo jungle, while the low ground abounds with trees of various kinds, canebrakes and swamps. The principal crop and food staple is rice. The other articles of produce are cotton, chillies and vegetables. The chief exports are cotton, timber, oilseeds, bamboo canes, thatching-grass and firewood, on all of which tolls are levied. The chief rivers are the Gumti, Haora, Khoyai, Dulai, Manu and Fenny (Pheni). During the heavy rains the people in the plains use boats as almost the sole means of conveyance.

The history of the state includes two distinct periods—the traditional period described in the *Rajmala,* or "Chronicles of the Kings of Tippera," and the period since A.D. 1407. The *Rajmala* is a history in Bengali verse, compiled by the Brahmans of the court of Tripura. In the early history of the state, the rajas were in a state of chronic feud with all the neighbouring countries. The worship of Siva was here, as elsewhere in India, associated with the practice of human sacrifice, and in no part of India were more victims offered. It was not until the beginning of the 17th century that the Moguls obtained any footing in this country. When the East India Company obtained the *diwani* or financial administration of Bengal in 1765, so much of Tippera as had been placed on the Mahommedan rent-roll came under British rule. Since 1808, each successive ruler has received investiture from the British government. In October 1905 the state was attached to the new province of Eastern Bengal and Assam. It has a chronological era of its own, adopted by Raja Birraj, from whom the present raja is 93rd in descent. The year 1875 corresponded with 1285 of the Tippera era.

Besides being the ruler of Hill Tippera, the raja holds an estate in the British district of Tippera, called *chakla* Roshnabad, which is far the most valuable of his possessions. The capital is Agartala (pop. 9513), where there is an Arts College. The raja's palace and other public buildings were seriously damaged by the earthquake of the 12th of June 1897. The late raja, who died from the result of a motor-car accident in 1909, succeeded his father in 1896, but he had taken a large share in the administration of the state for some years previously. The principle of succession, which had often caused serious disputes, was defined in 1904, to the effect that the chief may nominate any male descendant through males from himself or from any male ancestor, but failing such nomination, then the rule of primogeniture applies.

HILTON, JOHN (1804–1878), British surgeon, was born at Castle Hedingham, in Essex, in 1804. He entered Guy's Hospital in 1824. He was appointed demonstrator of anatomy in 1828, assistant-surgeon in 1845, surgeon 1849. In 1867 he was president of the Royal College of Surgeons, of which he became member in 1827 and fellow in 1843, and he also delivered the Hunterian oration in 1867. As Arris and Gale professor (1859–1862) he delivered a course of lectures on "Rest and Pain," which have become classics. He was also surgeon-extraordinary to Queen Victoria. Hilton was the greatest anatomist of his time, and was nick named "Anatomical John." It was he who, with Joseph Towne the artist, enriched Guy's Hospital with its unique collection of models. In his grasp of the structure and functions of the brain and

SpinSmart Software http://www.spinsmart.com

spinal cord he was far in advance of his contemporaries. As an operator he was more cautious than brilliant. This was doubtless due partly to his living in the pre-anaesthetics period, and partly to his own consummate anatomical knowledge, as is indicated by the method for opening deep abscesses which is known by his name. But he could be bold when necessary; he was the first to reduce a case of obturator hernia by abdominal section, and one of the first to practise lumbar colostomy. He died at Clapham on the 14th of September 1878.

HILTON, WILLIAM (1786–1839), English painter, was born in Lincoln on the 3rd of June 1786, son of a portrait-painter. In 1800 he was placed with the engraver J. R. Smith, and about the same time began studying in the Royal Academy school. He first exhibited in this institution in 1803, sending a "Group of Banditti"; and he soon established a reputation for choice of subject, and qualities of design and colour superior to the great mass of his contemporaries. He made a tour in Italy with Thomas Phillips, the portrait-painter. In 1813, having exhibited "Miranda and Ferdinand with the Logs of Wood," he was elected an associate of the Academy, and in 1820 a full academician, his diploma-picture representing "Ganymede." In 1823 he produced "Christ crowned with Thorns," a large and important work, subsequently bought out of the Chantrey Fund; this may be regarded as his masterpiece. In 1827 he succeeded Henry Thomson as keeper of the Academy. He died in London on the 30th of December 1839. Some of his best pictures remained on his hands at his decease—such as the "Angel releasing Peter from Prison" (life-size), painted in 1831, "Una with the Lion entering Corceca's Cave" (1832), the "Murder of the Innocents," his last exhibited work (1838), "Comus," and "Amphitrite." The National Gallery now owns "Edith finding the Body of Harold" (1834), "Cupid Disarmed," "Rebecca and Abraham's Servant" (1829), "Nature blowing Bubbles for her Children" (1821), and "Sir Calepine rescuing Serena" (from the *Faerie Queen*) (1831). In the National Portrait Gallery is his likeness of John Keats, with whom he was acquainted. In a great school or period Hilton could not count as more than a respectable subordinate; but in the British school of the earlier part of the 19th century he had sufficient elevation of aim and width of attainment to stand conspicuous.

HILVERSUM, a town in the province of North Holland, 18 m. by rail S.E. of Amsterdam. It is connected with Amsterdam by a steam tramway, passing by way of the small fortified towns of Naarden and Muiden on the Zuider Zee. Pop. (1900) 20,238. It is situated in the middle of the Gooi, a stretch of hilly country extending from the Zuider Zee to about 5 m. south of Hilversum, and composed of pine woods and sandy heaths. A convalescent home, the Trompenberg, was established here in 1874, and there are a town hall, middle-class and technical schools, and various places of worship, including a synagogue. Hilversum manufactures large quantities of floor-cloths and horse-blankets.

HIMALAYA, the name given to the mountains which form the northern boundary of India. The word is Sanskrit and literally signifies "snow-abode," from *him*, snow, and *álaya*, abode, and might be translated "snowy-range," although that expression is perhaps more nearly the equivalent of *Himachal*, another Sanskrit word derived from *him*, snow, and *áchal*, mountain, which is practically synonymous with Himalaya and is often used by natives of northern India. The name was converted by the Greeks into *Emodos* and *Imaos*.

Modern geographers restrict the term Himalaya to that portion of the mountain region between India and Tibet enclosed within the arms of the Indus and the Brahmaputra. From the bend of the Indus southwards towards the plains of the Punjab to the bend of the Brahmaputra southwards towards the plains of Assam, through a length of 1500 m., is Himachal or Himalaya. Beyond the Indus, to the north-west, the region of mountain ranges which stretches to a junction with the Hindu Kush south of the Pamirs, is usually known as Trans-Himalaya. Thus the Himalaya represents the southern face of the great central upheaval—the plateau of Tibet—the northern face of which is buttressed by the Kuen Lun.

Structure of the Himalaya

Throughout this vast space of elevated plateau and mountain face geologists now trace a system of main chains, or axes, extending from the Hindu Kush to Assam, arranged in approximately parallel lines, and traversed at intervals by main lines of drainage obliquely. Godwin-Austen indicates six of these geological axes as follows:

1. The main Central Asian axis, the Kuen Lun forming the northern edge or ridge of the Tibetan plateau.
2. The Trans-Himalayan chain of Muztagh (or Karakoram), which is lost in the Tibetan uplands, passing to the north of the sources of the Indus.
3. The Ladakh chain, partly north and partly south of the Indus—for that river breaks across it about 100 m. above Leh. This chain continues south of the Tsanpo (or Upper Brahmaputra), and becomes part of the Himalayan system.
4. The Zaskar, or main chain of the Himalaya, *i.e.* the "snowy range" *par excellence* which is indicated by Nanga Parbat (overlooking the Indus), and passes in a south-east direction to the southern side of the Deosai plains. Thence, bending slightly south, it extends in the line of snowy peaks which are seen from Simla to the famous peaks of Gangotri and Nanda Devi. This is the best known range of the Himalaya.
5. The outer Himalaya or Pir Panjal-Dhaoladhar ridge.
6. The Sub-Himalaya, which is "easily defined by the fringing line of hills, more or less broad, and in places very distinctly marked off from the main chain by open valleys (dhúns) or narrow valleys, parallel to the main axis of the chain." These include the Siwaliks.

Interspersed between these main geological axes are many other minor ridges, on some of which are peaks of great elevation. In fact, the geological axis seldom coincides with the line of highest elevation, nor must it be confused with the main lines of water-divide of the Himalaya.

The great northern watershed of India.

On the north and north-west of Kashmir the great water-divide which separates the Indus drainage area from that of the Yarkand and other rivers of Chinese Turkestan has been explored by Sir F. Younghusband, and subsequently by H. H. P. Deasy. The general result of their investigations has been to prove that the Muztagh range, as it trends south-eastwards and finally forms a continuous mountain barrier together with the Karakoram, is the true water-divide west of the Tibetan plateau. Shutting off the sources of the Indus affluents from those of the Central Asian system of hydrography, this great water-parting is distinguished by a group of peaks of which the altitude is hardly less than that of the Eastern Himalaya. Mount Godwin-Austen (28,250 ft. high), only 750 ft. lower than Everest, affords an excellent example in Asiatic geography of a dominating, peak-crowned water-parting or divide. From Kailas on the far west to the extreme north-eastern sources of the Brahmaputra, the great northern water-parting of the Indo-Tibetan highlands has only been occasionally touched. Littledale, du Rhins and Bonvalot may have stood on it as they looked southwards towards Lhasa, but for some 500 or 600 m. east of Kailas it appears to be lost in the mazes of the minor ranges and ridges of the Tibetan plateau. Nor can it be said to be as yet well defined to the east of Lhasa.

Eastern Tibet.

The Tibetan plateau, or Chang, breaks up about the meridian of 92° E., and to the east of this meridian the affluents of the Tsanpo (the same river as the Dihong and subsequently as the Brahmaputra) drain no longer from the elevated plateau, but from the rugged slopes of a wild region of mountains which assumes a systematic conformation where its successive ridges are arranged in concentric curves around the great bend of the Brahmaputra, wherein are hidden the sources of all the great rivers of Burma and China. Neither immediately beyond this great bend, nor within it in the Himalayan regions lying north of Assam and east of Bhutan, have scientific investigations yet been systematically carried out; but it is known that the largest of the Himalayan affluents of the Brahmaputra west of the bend derive their sources from the Tibetan plateau, and break down through the containing bands of hills, carrying deposits of gold from their sources to the plains, as do all the rivers of Tibet.

SpinSmart Software http://www.spinsmart.com

Although the northern limits of the Tsanpo basin are not sufficiently well known to locate the Indo-Tibetan watershed even approximately, there exists some scattered evidence of the nature of that strip of Northern Himalaya on the Tibeto-Nepalese border which lies between the line of greatest elevation and the trough of the Tsanpo. Recent investigations show that all the chief rivers of Nepal flowing southwards to the Tarai take their rise north of the line of highest crests, the "main range" of the Himalaya; and that some of them drain long lateral high-level valleys enclosed between minor ridges whose strike is parallel to the axis of the Himalaya and, occasionally, almost at right angles to the course of the main drainage channels breaking down to the plains. This formation brings the southern edge of the Tsanpo basin to the immediate neighbourhood of the banks of that river, which runs at its foot like a drain flanking a wall. It also affords material evidence of that wrinkling or folding action which accompanied the process of upheaval, when the Central Asian highlands were raised, which is more or less marked throughout the whole of the north-west Indian borderland. North of Bhutan, between the Himalayan crest and Lhasa, this formation is approximately maintained; farther east, although the same natural forces first resulted in the same effect of successive folds of the earth's crust, forming extensive curves of ridge and furrow, the abundant rainfall and the totally distinct climatic conditions which govern the processes of denudation subsequently led to the erosion of deeper valleys enclosed between forest-covered ranges which rise steeply from the river banks.

Himalaya north of the central chain of snowy peaks.

Although suggestions have been made of the existence of higher peaks north of the Himalaya than that which dominates the Everest group, no evidence has been adduced to support such a contention. On the other hand the observations of Major Ryder and other surveyors who explored from Lhasa to the sources of the Brahmaputra and Indus, at the conclusion of the Tibetan mission in 1904, conclusively prove that Mount Everest, which appears from the Tibetan plateau as a single dominating peak, has no rival amongst Himalayan altitudes, whilst the very remarkable investigations made by permission of the Nepal durbar from peaks near Kathmandu in 1903, by Captain Wood, R.E., not only place the Everest group apart from other peaks with which they have been confused by scientists, isolating them in the topographical system of Nepal, but clearly show that there is no one dominating and continuous range indicating a main Himalayan chain which includes both Everest and Kinchinjunga. The main features of Nepalese topography are now fairly well defined. So much controversy has been aroused on the subject of Himalayan altitudes that the present position of scientific analysis in relation to them may be shortly stated. The heights of peaks determined by exact processes of trigonometrical observation are bound to be more or less in error for three reasons: (1) the extraordinary geoidal deformation of the level surface at the observing stations in submontane regions; (2) ignorance of the laws of refraction when rays traverse rarefied air in snow-covered regions; (3) ignorance of the variations in the actual height of peaks due to the increase, or decrease, of snow. The value of the heights attached to the three highest mountains in the world are, for these reasons, adjudged by Colonel S. G. Burrard, the Supt. Trigonometrical Surveys in India, to be in probable error to the following extent:

Height of Himalayan peaks.

	Present Survey Value of Height	Most probable Value.
Mount Everest . . .	29,002	29,141
K_2 (Godwin Austen) . .	28,250	28,191
Kinchinjunga . . .	28,146	28,225

These determinations have the effect of placing Kinchinjunga second and K_2 third on the list. (T. H. H.*)

Geology.—The Himalaya have been formed by violent crumpling of the earth's crust along the southern margin of the great tableland of Central Asia. Outside the arc of the mountain chain no sign of this crumpling is to be detected except in the Salt Range, and the Peninsula of India has been entirely free from folding of any importance since early Palaeozoic times, if not since the Archean period itself. But the contrast between the Himalaya and the Peninsula is not confined to their structure: the difference in the rocks themselves is equally striking. In the Himalaya the geological sequence, from the Ordovician to the Eocene, is almost entirely marine; there are indeed occasional breaks in the series, but during nearly the whole of this long period the Himalayan region, or at least its northern part, must have been beneath the sea—the Central Mediterranean Sea of Neumayr or Tethys of Suess. In the peninsula, however, no marine fossils have yet been found of earlier date than Jurassic and Cretaceous, and these are confined to the neighbourhood of the coasts; the principal fossiliferous deposits are the plant-bearing beds of the Gondwana series, and there can be no doubt that, at least since the Carboniferous period, nearly the whole of the Peninsula has been land. Between the folded marine beds of the Himalaya and the nearly horizontal strata of the peninsula lies the Indo-Gangetic plain, covered by an enormous thickness of alluvial and wind-blown deposits of recent date. The deep boring at Lucknow passed through 1336 ft. of sands—reaching nearly to 1000 ft. below sea-level—without any sign of approaching the base of the alluvial series. It is clear, then, that in front of the Himalaya there is a great depression, but as yet there is no indication that this depression was ever beneath the sea.

In the light thrown by recent researches on the structure and origin of mountain chains the explanation of these facts is no longer difficult. From early Palaeozoic times the peninsula of India has been dry land, a part, indeed, of a great continent which in Mesozoic times extended across the Indian Ocean towards South Africa. Its northern shores were washed by the Sea of Tethys, which, at least in Jurassic and Cretaceous times, stretched across the Old World from west to east, and in this sea were laid down the marine deposits of the Himalaya. The tangential pressures which are known to be set up in the earth's crust—either by the contraction of the interior or in some other way—caused the deposits of this sea to be crushed up against the rigid granites and other old rocks of the peninsula and finally led to the whole mass being pushed forward over the edge of the part which did not crumple. The Indo-Gangetic depression was formed by the weight of the over-riding mass bending down the edge over which it rode, or else it is the lower limb of the S-shaped fold which would necessarily result if there were no fracture—the Himalaya representing the upper limb of the S.

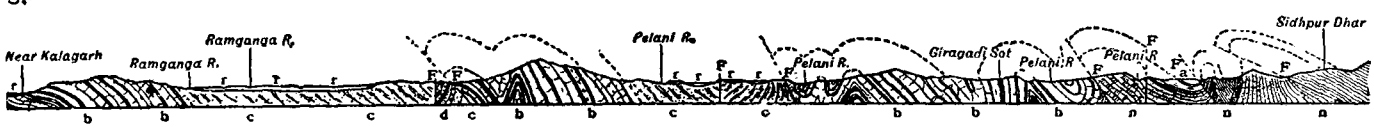
Geologically, the Himalaya may be divided into three zones which correspond more or less with orographical divisions. The northern zone is the Tibetan, in which fossiliferous beds of Palaeozoic and Mesozoic age are largely developed—excepting in the north-west no such rocks are known on the southern flanks. The second is the zone of the snowy peaks and of the lower Himalaya, and is composed chiefly of crystalline and metamorphic rocks together with unfossiliferous sedimentary beds supposed to be of Palaeozoic age. The southern zone comprises the Sub-Himalaya and consists entirely of Tertiary beds, and especially of the upper Tertiaries. The oldest beds which have hitherto yielded fossils, belong to the Ordovician system, but it is highly probable that the underlying "Haimantas" of the central Himalaya are of Cambrian age. From these beds up to the top of the Carboniferous there appears to be no break; but the Carboniferous beds were in some places eroded before the deposition of the *Productus* shales, which belong to the Permian period. It is, however, possible that this erosion was merely local, for in other places there seems to be a complete passage from the Carboniferous to the Permian. From the Permian to the Lias the sequence in the central Himalaya shows no sign of a break, nor has any unconformity been proved between the Liassic beds and the overlying Spiti shales, which contain fossils of Middle and Upper Jurassic age. The Spiti shales are succeeded conformably by Cretaceous beds (Gieumal sandstone below and Chikkim limestone above), and these are followed without a break by Nummulitic beds of Eocene age, much disturbed and altered by intrusions of gabbro and syenite. Thus, in the Spiti area at least, there appears to have been continuous deposition of marine beds from the Permian *Productus* shales to the Eocene Nummulitic formation. The next succeeding deposit is a sandstone, often highly inclined, which rests unconformably upon the Nummulitic beds and resembles the Lower Siwaliks of the Sub-Himalaya (Pliocene) but which as yet has yielded no fossils of any kind. The whole is overlaid unconformably by the younger Tertiaries of Hundes, which are perfectly horizontal and have been quite unaffected by any of the folds.

From the absence of any well-marked unconformity it is evident that in the northern part of the Himalayan belt, at least in the Spiti area, there can have been no post-Archaean folding of any magnitude until after the deposition of the Nummulitic beds, and that the folding was completed before the later Tertiaries of Hundes were laid down. It was, therefore, during the Miocene period that the elevation of this part of the chain began, while the disturbance of the Siwalik-like sandstone indicates that the folding continued into the Pliocene period. Along the southern flanks of the Himalaya the history of the chain is still more clearly shown. The sub-Himalaya are formed of Tertiary beds, chiefly Siwalik or upper Tertiary, while the lower Himalaya proper consist mainly of pre-Tertiary rocks

SpinSmart Software http://www.spinsmart.com

without fossils. Throughout the whole length of the chain, wherever the junction of the Siwaliks with the pre-Tertiary rocks has been seen, it is a great reversed fault. West of the Blas river a similar reversed fault forms the boundary between the lower Tertiaries and the pre-Tertiary rocks of the Himalaya, while between the Sutlej and the Jumna rivers, where the lower Tertiaries help to form the lower Himalaya, the fault lies between them and the Siwaliks. The hade of the fault is constantly inwards, towards the centre of the chain, and the older rocks which form the Himalaya proper, have been pushed forward over the later beds of the sub-Himalaya. But the fault is more than an ordinary reversed fault: it was, nearly everywhere, the northern boundary of deposition of the Siwalik beds, and only in a few instances do any of the Siwalik deposits extend even to a short distance beyond it. The fault in fact was being formed during the deposition of the Siwalik beds, and as the beds were laid down, the Himalaya were pushed forward over them, the Siwaliks themselves being folded and upturned during the process. Accordingly, in some places the Siwaliks now form a continuous and conformable series from base to summit, in other places the middle beds are absent and the upper beds of the series rest upon the upturned and denuded edges of the lower beds. The Siwaliks are fluviatile and torrential deposits similar to those which are now being formed at the foot of the mountains, in the Indo-Gangetic plain; and their relations to the older rocks of the Himalaya proper were very similar to those which now exist between the deposits of the plain and the Siwaliks themselves. But the great fault just described is not the only one of this character. There is a series of such faults, approximately parallel to one another, and although they have not been traced throughout the whole chain, yet wherever they occur they seem to have formed the northern boundary of deposition of the deposits immediately to the south of them. It appears, therefore, that the Himalaya grew southwards in a series of stages. A reversed fault was formed at the foot of the chain, and upon this fault the mountains were pushed forward over the beds deposited at their base, crumpling and folding them in the process, and forming a sub-Himalayan ridge in front of the main chain. After a time a new fault originated at the foot of the sub-Himalayan zone thus raised, which now became part of the Himalaya themselves, and a new sub-Himalayan chain was formed in front of the previous one. The earthquakes of the present day show that the process is still in operation, and in time the deposits of the present Indo-Gangetic plain will be involved in the folds.

The regular form of the Himalaya, constituting an arc of a true circle, appears to indicate that the whole chain has been pushed forward as one mass upon a gigantic thrust-plane; but, if so, the dip of the plane must be low, for a line drawn along the southern foot of the Himalaya would coincide with the outcrop of a plane inclined to the surface at an angle of about 14°. The thrust-plane, then, does not coincide with any of the boundary faults already mentioned, which are usually inclined at angles of 50° or 60°. The latter are due to the fact that, although, perhaps, the whole mass above the thrust-plane may move, yet the pressure which pushes it forwards necessarily proceeds from behind. The back, accordingly, moves faster than the front, and the whole is packed together; as when an ice-floe drives against the shore, the ice breaks and the outer fragments ride over those within. The great thrust-plane which is thus imagined to exist at the base of the Himalaya, corresponds with the "major thrusts" of the N.W. Highlands of Scotland, and the reversed faults which appear at the surface with the "minor thrusts." (P. La.)



Such is the general outline of Himalayan evolution as now understood, and the process of it has led to certain marked features of scenery and topography. Within the area of the trans-Indus mountains we have beds of hard limestone or sandstone alternating with soft shales, which leads to the scooping out by erosion of long narrow valleys where the shales occur, and the passage of the streams through deep rifts or gorges across the hard limestone anticlinals, which stand in irregular series of parallel ridges with the eroded valleys between. The great mass of the Himalaya exhibits the same structure, due to the same conditions acting for longer periods and on a much larger scale; but the structure is varied in the eastern portions of the mountains by the effect of different climatic conditions, and especially by the greater rainfall. Instead of wide, barren, wind-swept valleys, here are found fertile alluvial plains—such as Manipur—but for the most part the erosive action of the river has been able to keep pace with the rise of the river bed, and we have deep, steep-sided valleys arranged between the same parallel system of folds as we see on the western frontier, connected by short transverse gaps where the rivers cross the folds, frequently to resume a course parallel to that originally held. An instance of this occurs where the Indus suddenly breaks through the well-defined Ladakh range in the North-west Himalaya to resume its north-westerly course after passing from the northern to the southern side of the range. The reason assigned for these extraordinary diversions of the drainage right across the general strike of the ridges is that it is antecedent—*i.e.* that the lines of drainage were formed ere the folds or anticlinals were raised; and that the drainage has merely maintained the course originally held, by the power of erosion during the gradual process of upheaval.

Topographical results of evolution.

In the outer valleys of the Himalaya the sides are generally steep, so steep as to be liable to landslip, whilst the streams are still cutting down the river beds and have not yet reached the stage of equilibrium. Here and there a valley has become filled with alluvial detritus owing to some local impediment in the drainage, and when this occurs there is usually to be found a fertile and productive field for agriculture. The straits of the Jhelum, below Baramulla, probably account for the lovely vale of Kashmir, which is in form (if not in principles of construction) a repetition on grand scale of the Maidan of the Afridi Tirah, where the drainage from the slopes of a great amphitheatre of hills is collected and then arrested by the gorge which marks the outlet to the Bara.

Other rivers besides the Indus and the Brahmaputra begin by draining a considerable area north of the snowy range—the Sutlej, the Kosi, the Gandak and the Subansiri, for example. All these rivers break through the main snowy range ere they twist their way through the southern hills to the plains of India. Here the "antecedent" theory will not suffice, for there is no sufficient catchment area north of the snows to support it. Their formation is explained by a process of "cutting back," by which the heads of these streams are gradually eating their way northwards owing to the greater rainfall on the southern than on the northern slopes. The result of this process is well exhibited in the relative steepness of slope on the Indian and Tibetan sides of the passes to the Indus plateau. On the southern or Indian side the routes to Tibet and Ladakh follow the levels of Himalayan valleys with no remarkably steep gradients till they near the approach to the water-divide. The slope then steepens with the ascending curve to the summit of the pass, from which point it falls with a comparatively gentle gradient to the general level of the plateau. The Zoji La, the Kashmir water-divide between the Jhelum and the Indus, is a prominent case in point, and all the passes from the Kumaon and Garhwal hills into Tibet exhibit this formation in a marked degree. Taking the average elevation of the central axial line of snowy peaks as 19,000 ft., the average height of the passes is not more than 10,000 owing to this process of cutting down by erosion and gradual encroachment into the northern basin.

General Himalayan formation is typical.

Section across the sub-Himalayan zone.

Meteorology.—Independently of the enormous variety of topographical conformation contained in the Himalayan system, the vast altitude of the mountains alone is sufficient to cause modifications of climate in ascending over their slopes such as are not surpassed by those observed in moving from the equator to the poles. One half of the total mass of the atmosphere and three-fourths of the water suspended in it in the form of vapour lie below the average altitude of the Himalaya; and of the residue, one-half of the air and virtually almost all the vapour come within the influence of the highest peaks. The regular variations in pressure of the air indicated by the barometer and the annual and diurnal oscillations are as well marked in the Himalaya as elsewhere, but the amount of vapour held in suspension diminishes so rapidly with the altitude that not more than one-sixth (sometimes only one-tenth) of that observed at the foot of the mountains is found at the greatest heights. This is dependent on the temperature of the air which rapidly decreases with altitude. On the mountains every altitude has its corresponding temperature, an elevation of 1000 ft. producing a fall of 3½°, or about 1° to each 300 ft. The mean winter temperature at 7000 ft. (which is about the average height of Himalayan "hill stations") is 44° F. and the summer mean about 65° F. At 9000 ft. the mean temperature of the coldest month is 32° F. At 12,000 ft. the thermometer never falls below freezing-point from the end of May to the middle of October, and at 15,000 ft. it is seldom above that point even in the height of summer. It should be noted that the thermometrical conditions of Tibet vary considerably from those of the Himalaya. At 12,000 ft. in Tibet the mean of the hottest month is about 60° F. and of the coldest about 10° F. whilst, at 15,000 ft. the frost is only permanent

SpinSmart Software http://www.spinsmart.com

from the end of October to the end of April. The distribution of vegetation and topographical conformation largely influence the question of local temperature. For instance it may be found that the difference of temperature between forest-clad ranges and the Indian plains is twice as much in April and May as in December or January; and the difference between the temperature of a well-wooded hill top and the open valley below may vary from 9° to 24° within twenty-four hours. The general relations of temperature to altitude as determined by Himalayan observations are as follows: (1) The decrease of temperature with altitude is most rapid in summer. (2) The annual range diminishes with the elevation. (3) The diurnal range diminishes with the elevation. Comparisons are, however, apt to become anomalous when applied to elevated zones with a dense covering of forest and a great quantity of cloud and open and uncloudy regions both above and below the forest-clad tracts.

The chief rainfall occurs in the summer months between May and October (*i.e.* the period of the monsoon rains of India) the remainder of the year being comparatively dry. The fall of rain over the great plain of northern India gradually diminishes in quantity, and begins later, as we pass from east to west. At the same time the rain is heavier as we approach the Himalaya and the greatest falls are measured in its outer ranges; but the quantity again diminishes as we pass onward across the chain, and on arriving at the border of Tibet, behind the great line of snowy peaks, the rain falls in such small quantities as to be hardly susceptible of measurement. Diurnal currents of wind, which are established from the plains to the mountains during the day, and from the hills to the plains during the night, are important agents in distributing the rainfall. The condensation of vapour from the ascending currents and their gradual exhaustion as they are precipitated on successive ranges is very obvious in the cloud effects produced during the monsoon, the southern or windward face of each range being clothed day after day with a white crest of cloud whilst the northern slopes are often left entirely free. This shows how large a proportion of the vapour is arrested and how it is that only by drifting through the deeper gorges can any moisture find its way to the Tibetan table-land.

Rainfall.

The yearly rainfall, which amounts to between 60 and 70 in. in the delta of the Ganges, is reduced to about 40 in. when that river issues from the mountains, and diminishes to 30 in. at the debouchment of the Indus into the plains. At Darjeeling (7000 ft. altitude) on the outer ranges of the eastern Himalaya it amounts to about 120 in. At Naini Tal north of the United Provinces it is about 90 in.; at Simla about 80 in., diminishing still further as one approaches the north-western hills. All these stations are about the same altitude.

In the eastern Himalaya the ordinary winter limit of snow is 6000 ft. and it never lies for many days even at 7000 ft. In Kumaon, on the west, it usually reaches down to the 5000 ft. level and occasionally to 2500 ft. Snow has been known to fall at Peshawar. At Leh, in western Tibet, hardly 2 ft. of snow are usually registered and the fall on the passes between 17,000 and 19,000 ft. is not generally more than 3 ft., but on the Himalayan passes farther east the falls are much heavier. Even in September these passes may be quite blocked and they are not usually open till the middle of June. The snow-line, or the level to which snow recedes in the course of the year, ranges from 15,000 to 16,000 ft. on the southern exposures of the Himalaya that carry perpetual snow, along all that part of the system that lies between Sikkim and the Indus. It is not till December that the snow begins to descend for the winter, although after September light falls occur which cover the mountain sides down to 12,000 ft., but these soon disappear. On the snowy range the snow-line is not lower than 18,500 ft. and on the summit of the table-land it reaches to 20,000 ft. On all the passes into Tibet vegetation reaches to about 17,500 ft., and in August they may be crossed in ordinary years up to 18,400 ft. without finding any snow upon them; and it is as impossible to find snow in the summer in Tibet at 15,500 ft. above the sea as on the plains of India.

Snowfall.

Glaciers.—The level to which the Himalayan glaciers extend is greatly dependent on local conditions, principally the extent and elevation of the snow basins which feed them, and the slope and position of the mountain on which they are formed. Glaciers on the outer slopes of the Himalaya descend much lower than is commonly the case in Tibet, or in the most elevated valleys near the snowy range. The glaciers of Sikkim and the eastern mountains are believed not to reach a lower level than 13,500 or 14,000 ft. In Kumaon many of them descend to between 11,500 and 12,500 ft. In the higher valleys and Tibet 15,000 and 16,000 ft. is the ordinary level at which they end, but there are exceptions which descend far lower. In Europe the glaciers descend between 3000 and 5000 ft. below the snow-line, and in the Himalaya and Tibet about the same holds good. The summer temperatures of the points where the glaciers end on the Himalaya also correspond fairly with those of the corresponding positions in European glaciers, viz. for July a little below 60° F., August 58° and September 55°.

Measurements of the movement of Himalayan glaciers give results according closely with those obtained under analogous conditions in the Alps, viz. rates from $9\frac{1}{2}$ to $14\frac{1}{4}$ in. in twenty-four hours. The motion of one glacier from the middle of May to the middle of October averaged 8 in. in the twenty-four hours. The dimensions of the glaciers on the outer Himalaya, where, as before remarked, the valleys descend rapidly to lower levels, are fairly comparable with those of Alpine glaciers, though frequently much exceeding them in length—8 or 10 m. not being unusual. In the elevated valleys of northern Tibet, where the destructive action of the summer heat is far less, the development of the glaciers is enormous. At one locality in north-western Ladakh there is a continuous mass of snow and ice extending across a snowy ridge, measuring 64 m. between the extremities of the two glaciers at its opposite ends. Another single glacier has been surveyed 36 m. long.

The northern tributaries of the Gilgit river, which joins the Indus near its south-westerly bend towards the Punjab, take their rise from a glacier system which is probably unequalled in the world for its extent and magnificent proportions. Chief amongst them are the glaciers which have formed on the southern slopes of the Muztagh mountains below the group of gigantic peaks dominated by Mount Godwin-Austen (28,250 ft. high). The Biafo glacier system, which lies in a long narrow trough extending south-west from Nagar on the Hunza to near the base of the Muztagh peaks, may be traced for 90 m. between mountain walls which tower to a height of from 20,000 to 25,000 ft. above sea-level on either side.

In connexion with almost all the Himalayan glaciers of which precise accounts are forthcoming are ancient moraines indicating some previous condition in which their extent was much larger than now. In the east these moraines are very remarkable, extending 8 or 10 m. In the west they seem not to go beyond 2 or 3 m. reach. They have been observed on the summit of the table-land as well as on the Himalayan slope. The explanation suggested to account for the former great extension of glaciers in Norway would seem applicable here. Any modification of the coast-line which should submerge the area now occupied by the North Indian plain, or any considerable part of it, would be accompanied by a much wetter and more equable climate on the Himalaya; more snow would fall on the highest ranges, and less summer heat would be brought to bear on the destruction of the glaciers, which would receive larger supplies and descend lower.

Botany.—Speaking broadly, the general type of the flora of the lower, hotter and wetter regions, which extend along the great plain at the foot of the Himalaya, and include the valleys of the larger rivers which penetrate far into the mountains, does not differ from that of the contiguous peninsula and islands, though the tropical and insular character gradually becomes less marked going from east to west, where, with a greater elevation and distance from the sea and higher latitude, the rainfall and humidity diminish and the winter cold increases. The vegetation of the western part of the plain and of the hottest zone of the western mountains thus becomes closely allied to, or almost identical with, that of the drier parts of the Indian peninsula, more especially of its hilly portions; and, while a general tropical character is preserved, forms are observed which indicate the addition of an Afghan as well as of an African element, of which last the gay lily *Gloriosa superba* is an example, pointing to some previous connexion with Africa.

The European flora, which is diffused from the Mediterranean along the high lands of Asia, extends to the Himalaya; many European species reach the central parts of the chain, though few reach its eastern end, while genera common to Europe and the Himalaya are abundant throughout and at all elevations. From the opposite quarter an influx of Japanese and Chinese forms, such as the rhododendrons, the tea plant, *Aucuba*, *Helwingia*, *Skimmia*, *Adamia*, *Goughia* and others, has taken place, these being more numerous in the east and gradually disappearing in the west. On the higher and therefore cooler and less rainy ranges of the Himalaya the conditions of temperature requisite for the preservation of the various species are readily found by ascending or descending the mountain slopes, and therefore a greater uniformity of character in the vegetation is maintained along the whole chain. At the greater elevations the species identical with those of Europe become more frequent, and in the alpine regions many plants are found identical with species of the Arctic zone. On the Tibetan plateau, with the increased dryness, a Siberian type is established, with many true Siberian species and more genera; and some of the Siberian forms are further disseminated, even to the plains of Upper India. The total absence of a few of the more common forms of northern Europe and Asia should also be noticed, among which may be named *Tilia*, *Fagus*, *Arbutus*, *Erica*, *Azalea* and *Cistacae*.

In the more humid regions of the east the mountains are almost everywhere covered with a dense forest which reaches up to 12,000 or 13,000 ft. Many tropical types here ascend to 7000 ft. or more. To the west the upper limit of forest is somewhat lower, from 11,500 to 12,000 ft. and the tropical forms usually cease at 5000 ft.

In Sikkim the mountains are covered with dense forest of tall umbrageous trees, commonly accompanied by a luxuriant growth of under shrubs, and adorned with climbing and epiphytal plants in wonderful profusion. In the tropical zone large figs abound, *Terminalia*, *Shorea* (sál), laurels, many *Leguminosae*, *Bombax*, *Artocarpus*, bamboos and several palms, among which species of *Calamus* are remarkable, climbing over the largest trees; and this is the western limit of *Cycas* and *Myristica* (nutmeg). Plantains ascend to 7000 ft. *Pandanus* and tree-ferns abound. Other ferns, *Scitamineae*, orchids

SpinSmart Software http://www.spinsmart.com

and climbing *Aroideae* are very numerous, the last named profusely adorning the forests with their splendid dark-green foliage. Various oaks descend within a few hundred feet of the sea-level, increasing in numbers at greater altitudes, and becoming very frequent at 4000 ft., at which elevation also appear *Aucuba*, *Magnolia*, cherries, *Pyrus*, maple, alder and birch, with many *Araliaceae*, *Hollböllea*, *Skimmia*, *Daphne*, *Myrsine*, *Symplocos* and *Rubus*. Rhododendrons begin at about 6000 ft. and become abundant at 8000 ft., from 10,000 to 14,000 ft. forming in many places the mass of the shrubby vegetation which extends some 2000 ft. above the forest. Epiphytal orchids are extremely numerous between 6000 and 8000 ft. Of the Coniferae, *Podocarpus* and *Pinus longifolia* alone descend to the tropical zone; *Abies Brunoniana* and *Smithiana* and the larch (a genus not seen in the western mountains) are found at 8000, and the yew and *Picea Webbiana* at 10,000 ft. *Pinus excelsa*, which occurs in Bhutan, is absent in the wetter climate of Sikkim.

On the drier and higher mountains of the interior of the chain, the forests become more open, and are spread less uniformly over the hill-sides, a luxuriant herbaceous vegetation appears, and the number of shrubby *Leguminosae*, such as *Desmodium* and *Indigofera*, increases, as well as *Ranunculaceae*, *Rosaceae*, *Umbelliferae*, *Labiatae*, *Gramineae*, *Cyperaceae* and other European genera.

Passing to the westward, and viewing the flora of Kumaon, which province holds a central position on the chain, on the 80th meridian, we find that the gradual decrease of moisture and increase of high summer heat are accompanied by a marked change of the vegetation. The tropical forest is characterized by the trees of the hotter and drier parts of southern India, combined with a few of European type. Ferns are more rare, and the tree-ferns have disappeared. The species of palm are also reduced to two or three, and bamboos, though abundant, are confined to a few species.

The outer ranges of mountains are mainly covered with forests of *Pinus longifolia*, rhododendron, oak and *Pieris*. At Naini Tal cypress is abundant. The shrubby vegetation comprises *Rosa*, *Rubus*, *Indigofera*, *Desmodium*, *Berberis*, *Boehmeria*, *Viburnum*, *Clematis*, with an *Arundinaria*. Of herbaceous plants species of *Ranunculus*, *Potentilla*, *Geranium*, *Thalictrum*, *Primula*, *Gentiana* and many other European forms are common. In the less exposed localities, on northern slopes and sheltered valleys, the European forms become more numerous, and we find species of alder, birch, ash, elm, maple, holly, hornbeam, *Pyrus*, &c. At greater elevations in the interior, besides the above are met *Corylus*, the common walnut, found wild throughout the range, horse chestnut, yew, also *Picea Webbiana*, *Pinus excelsa*, *Abies Smithiana*, *Cedrus Deodara* (which tree does not grow spontaneously east of Kumaon), and several junipers. The denser forests are commonly found on the northern faces of the higher ranges, or in the deeper valleys, between 8000 and 10,500 ft. The woods on the outer ranges from 3000 up to 7000 ft. are more open, and consist mainly of evergreen trees.

The herbaceous vegetation does not differ greatly, generically, from that of the east, and many species of *Primulaceae*, *Ranunculaceae*, *Cruciferae*, *Labiatae* and *Scrophulariaceae* occur; balsams abound, also beautiful forms of *Campanulaceae*, *Gentiana*, *Meconopsis*, *Saxifraga* and many others.

Cultivation hardly extends above 7000 ft., except in the valleys behind the great snowy peaks, where a few fields of buckwheat and Tibetan barley are sown up to 11,000 or 12,000 ft. At the lower elevations rice, maize and millets are common, wheat and barley at a somewhat higher level, and buckwheat and amaranth usually on the poorer lands, or those recently reclaimed from forest. Besides these, most of the ordinary vegetables of the plains are reared, and potatoes have been introduced in the neighbourhood of all the British stations.

As we pass to the west the species of rhododendron, oak and *Magnolia* are much reduced in number as compared to the eastern region, and both the Malayan and Japanese forms are much less common. The herbaceous tropical and semi-tropical vegetation likewise by degrees disappears, the *Scitamineae*, epiphytal and terrestrial *Orchideae*, *Araceae*, *Cyrtandraceae* and *Begoniae* only occur in small numbers in Kumaon, and scarcely extend west of the Sutlej. In like manner several of the western forms suited to drier climates find their eastern limit in Kumaon. In Kashmir the plane and Lombardy poplar flourish, though hardly seen farther east, the cherry is cultivated in orchards, and the vegetation presents an eminently European cast. The alpine flora is slower in changing its character as we pass from east to west, but in Kashmir the vegetation of the higher mountains hardly differs from that of the mountains of Afghanistan, Persia and Siberia, even in species.

The total number of flowering plants inhabiting the range amounts probably to 5000 or 6000 species, among which may be reckoned several hundred common English plants chiefly from the temperate and alpine regions; and the characteristic of the flora as a whole is that it contains a general and tolerably complete illustration of almost all the chief natural families of all parts of the world, and has comparatively few distinctive features of its own.

The timber trees of the Himalaya are very numerous, but few of them are known to be of much value. The "Sál" is one of the most valuable of the trees; with the "Toon" and "Sissoo," it grows in the outer ranges most accessible from the plains. The "Deodar" is also much used, but the other pines produce timber that is not durable. Bamboos grow everywhere along the outer ranges, and rattans to the eastward, and are largely exported for use in the plains of India.

Though one species of coffee is indigenous in the hotter Himalayan forests, the climate does not appear suitable for the growth of the plant which supplies the coffee of commerce. The cultivation of tea, however, is carried on successfully on a large scale, both in the east and west of the mountains. In the western Himalaya the cultivated variety of the tea plant of China succeeds well; on the east the indigenous tea of Assam, which is not specifically different, and is perhaps the original parent of the Chinese variety, is now almost everywhere preferred. The produce of the Chinese variety in the hot and wet climate of the eastern Himalaya, Assam and eastern Bengal is neither so abundant nor so highly flavoured as that of the indigenous plant.

The cultivation of the cinchona, several species of which have been introduced from South America and naturalized in the Sikkim Himalaya, promises to yield at a comparatively small cost an ample supply of the febrifuge extracted from its bark. At present the manufacture is almost wholly in the hands of the Government, and the drug prepared is all disposed of in India.

Zoology.—The general distribution of animal life is determined by much the same conditions that have controlled the vegetation. The connexion with Europe on the north-west, with China on the north-east, with Africa on the south-west, and with the Malayan region on the south-east is manifest; and the greater or less prevalence of the European and Eastern forms varies according to more western or eastern position on the chain. So far as is known these remarks will apply to the extinct as well as to the existing fauna. The Palaeozoic forms found in the Himalaya are very close to those of Europe, and in some cases identical. The Triassic fossils are still more closely allied, more than a third of the species being identical. Among the Jurassic Mollusca, also, are many species that are common in Europe. The Siwalik fossils contain 84 species of mammals of 45 genera, the whole bearing a marked resemblance to the Miocene fauna of Europe, but containing a larger number of genera still existing, especially of ruminants, and now held to be of Pliocene age.

The fauna of the Tibetan Himalaya is essentially European or rather that of the northern half of the old continent, which region has by zoologists been termed Palaearctic. Among the characteristic animals may be named the yak, from which is reared a cross breed with the ordinary horned cattle of India, many wild sheep, and two antelopes, as well as the musk-deer; several hares and some burrowing animals, including pikas (*Lagomys*) and two or three species of marmot; certain arctic forms of carnivora—fox, wolf, lynx, ounce, marten and ermine; also wild asses. Among birds are found bustard and species of sand-grouse and partridge; water-fowl in great variety, which breed on the lakes in summer and migrate to the plains of India in winter; the raven, hawks, eagles and owls, a magpie, and two kinds of chough; and many smaller birds of the passerine order, amongst which are several finches. Reptiles, as might be anticipated, are far from numerous, but a few lizards are found, belonging for the most part to types, such as *Phrynocephalus*, characteristic of the Central-Asiatic area. The fishes from the head-waters of the Indus also belong, for the most part, to Central-Asiatic types, with a small admixture of purely Himalayan forms. Amongst the former are several peculiar small-scaled carps, belonging to the genus *Schizothorax* and its allies.

The ranges of the Himalaya, from the border of Tibet to the plains, form a zoological region which is one of the richest of the world, particularly in respect to birds, to which the forest-clad mountains offer almost every range of temperature.

Only two or three forms of monkey enter the mountains, the langur, a species of *Semnopithecus*, ranging up to 12,000 ft. No lemurs occur, although a species is found in Assam, and another in southern India. Bats are numerous, but the species are for the most part not peculiar to the area; several European forms are found at the higher elevations. Moles, which are unknown in the Indian peninsula, abound in the forest regions of the eastern Himalayas at a moderate altitude, and shrews of several species are found almost everywhere; amongst them are two very remarkable forms of water-shrew, one of which, however, *Nectogale*, is probably Tibetan rather than Himalayan. Bears are common, and so are a marten, several weasels and otters, and cats of various kinds and sizes, from the little spotted *Felis bengalensis*, smaller than a domestic cat, to animals like the clouded leopard rivalling a leopard in size. Leopards are common, and the tiger wanders to a considerable elevation, but can hardly be considered a permanent inhabitant, except in the lower valleys. Civets, the mungoose (*Herpestes*), and toddy cats (*Paradoxurus*) are only found at the lower elevations. Wild dogs (*Cyon*) are common, but neither foxes nor wolves occur in the forest area. Besides these carnivora some very peculiar forms are found, the most remarkable of which is *Aelurus*, sometimes called the cat-bear, a type akin to the American racoon. Two other genera, *Helictis*, an aberrant badger, and linsang, an aberrant civet, are representatives of Malayan types. Amongst the rodents squirrels abound, and the so-called flying squirrels are represented by several species. Rats and mice swarm, both kinds and individuals being numerous, but few present much peculiarity, a bamboo rat (*Rhizomys*) from the base of the eastern Himalaya being perhaps most worthy of notice. Two or three species of vole (*Arvicola*) have been detected, and porcupines are

SpinSmart Software http://www.spinsmart.com

common. The elephant is found in the outer forests as far as the Jumna, and the rhinoceros as far as the Sarda; the spread of both of these animals as far as the Indus and into the plains of India, far beyond their present limits, is authenticated by historical records; they have probably retreated before the advance of cultivation and fire-arms. Wild pigs are common in the lower ranges, and one peculiar species of pigmy-hog (*Sus salvanius*) of very small size inhabits the forests at the base of the mountains in Nepál and Sikim. Deer of several kinds are met with, but do not ascend very high on the hillsides, and belong exclusively to Indian forms. The musk deer keeps to the greater elevations. The chevrotains of India and the Malay countries are unrepresented. The gaur or wild ox is found at the base of the hills. Three very characteristic ruminants, having some affinities with goats, inhabit the Himalaya; these are the "serow" (*Nemorhaedus*), "goral" (*Cemas*) and "tahr" (*Hemitragus*), the last-named ranging to rather high elevations. Lastly, the pangolin (*Manis*) is represented by two species in the eastern Himalaya. A dolphin (*Platanista*) living in the Ganges ascends that river and its affluents to their issue from the mountains.

Almost all the orders of birds are well represented, and the marvellous variety of forms found in the eastern Himalaya is only rivalled in Central and South America. Eagles, vultures and other birds of prey are seen soaring high over the highest of the forest-clad ranges. Owls are numerous, and a small species, *Glaucidium*, is conspicuous, breaking the stillness of the night by its monotonous though musical cry of two notes. Several kinds of swifts and night-jars are found, and gorgeously-coloured trogons, bee-eaters, rollers, and beautiful kingfishers and barbets are common. Several large hornbills inhabit the highest trees in the forest. The parrots are restricted to parrakeets, of which there are several species, and a single small lory. The number of woodpeckers is very great and the variety of plumage remarkable, and the voice of the cuckoo, of which there are numerous species, resounds in the spring as in Europe. The number of passerine birds is immense. Amongst them the sun-birds resemble in appearance and almost rival in beauty the humming-birds of the New Continent. Creepers, nuthatches, shrikes, and their allied forms, flycatchers and swallows, thrushes, dippers and babblers (about fifty species), bulbuls and orioles, peculiar types of redstart, various sylviads, wrens, tits, crows, jays and magpies, weaver-birds, avadavats, sparrows, crossbills and many finches, including the exquisitely coloured rose-finches, may also be mentioned. The pigeons are represented by several wood-pigeons, doves and green pigeons. The gallinaceous birds include the peacock, which everywhere adorns the forest bordering on the plains, jungle fowl and several pheasants; partridges, of which the chikor may be named as most abundant, and snow-pheasants and partridges, found only at the greatest elevations. Waders and waterfowl are far less abundant, and those occurring are nearly all migratory forms which visit the peninsula of India—the only important exception being two kinds of solitary snipe and the red-billed curlew.

Of the reptiles found in these mountains many are peculiar. Some of the snakes of India are to be seen in the hotter regions, including the python and some of the venomous species, the cobra being found as high up as 8000 or 9000 ft., though not common. Lizards are numerous, and as well as frogs are found at all elevations from the plains to the upper Himalayan valleys, and even extend to Tibet.

The fishes found in the rivers of the Himalaya show the same general connexion with the three neighbouring regions, the Palaearctic, the African and the Malayan. Of the principal families, the *Acanthopterygii*, which are abundant in the hotter parts of India, hardly enter the mountains, two genera only being found, of which one is the peculiar amphibious genus *Ophiocephalus*. None of these fishes are found in Tibet. The *Siluridae*, or scaleless fishes, and the *Cyprinidae*, or carp and loach, form the bulk of the mountain fish, and the genera and species appear to be organized for a mountain-torrent life, being almost all furnished with suckers to enable them to maintain their positions in the rapid streams which they inhabit. A few *Siluridae* have been found in Tibet, but the carps constitute the larger part of the species. Many of the Himalayan forms are Indian fish which appear to go up to the higher streams to deposit their ova, and the Tibetan species as a rule are confined to the rivers on the table-land or to the streams at the greatest elevations, the characteristics of which are Tibetan rather than Himalayan. The *Salmonidae* are entirely absent from the waters of the Himalaya proper, of Tibet and of Turkestan east of the Terektag.

The Himalayan butterflies are very numerous and brilliant, for the most part belonging to groups that extend both into the Malayan and European regions, while African forms also appear. There are large and gorgeous species of *Papilio*, *Nymphalidae*, *Morphidae* and *Danaidae*, and the more favoured localities are described as being only second to South America in the display of this form of beauty and variety in insect life. Moths, also, of strange forms and of great size are common. The cicada's song resounds among the woods in the autumn; flights of locusts frequently appear after the summer, and they are carried by the prevailing winds even among the glaciers and eternal snows. Ants, bees and wasps of many species, and flies and gnats abound, particularly during the summer rainy season, and at all elevations.

Mountain Scenery.—Much has been written about the impressiveness of Himalayan scenery. It is but lately, however, that any adequate conception of the magnitude and majesty of the most stupendous of the mountain groups which mass themselves about the upper tributaries and reaches of the Indus has been presented to us in the works of Sir F. Younghusband, Sir W. M. Conway, H. C. B. Tanner and D. Freshfield. It is not in comparison with the picturesque beauty of European Alpine scenery that the Himalaya appeals to the imagination, for amongst the hills of the outer Himalaya—the hills which are known to the majority of European residents and visitors—there is often a striking absence of those varied incidents and sharp contrasts which are essential to picturesqueness in mountain landscape. Too often the brown, barren, sun-scorched ridges are obscured in the yellow dust haze which drifts upwards from the plains; too often the whole perspective of hill and vale is blotted out in the grey mists that sweep in soft, resistless columns against these southern slopes, to be condensed and precipitated in ceaseless, monotonous rainfall. Few Europeans really see the Himalaya; fewer still are capable of translating their impressions into language which is neither exaggerated nor inadequate.

Some idea of the magnitude of Himalayan mountain construction—a magnitude which the eye totally fails to appreciate—may, however, be gathered from the following table of comparison of the absolute height of some peaks above sea-level with the actual amount of their slopes exposed to view:—

Relative Extent of Snow Slopes Visible.

Name of Mountain.	Place of Observation.	Height above sea.	Amount of Slope exposed.
Everest	Dewanganj . . .	29,002	8,000
,, ...	Sandakphu . . .	,,	12,000
K_2 or Godwin-Austen	Between Gilgit and Gor, 16,000 ft. .	28,250	
Pk. XIII. or Makalu	Purnea, 200 ft. . .	27,800	8,000
,, ,,	Sandakphu, 12,000 ft.	,,	9,000
Nanga Parbat . .	Gor, 16,000 ft. . .	26,656	23,000
Tirach Mir . . .	Between Gilgit and Chitral, 8000 ft. .	25,400	17-18,000
Rakapushi . . .	Chaprot (Gilgit), 13,000 ft. . . .	25,560	18,000
Kinchinjunga . .	Darjeeling, 7000 ft.	28,146	16,000
Mont Blanc . . .	Above Chamonix, 7000 ft. . . .	15,781	11,500

It will be observed from this table that it is not often that a greater slope of snow-covered mountain side is observable in the Himalaya than that which is afforded by the familiar view of Mont Blanc from Chamonix. (T. H. H.*)

HIMERA, a city on the north coast of Sicily, on a hill above the east bank of the Himeras Septentrionalis. It was founded in 648 B.C. by the Chalcidian inhabitants of Zancle, in company with many Syracusan exiles. Early in the 5th century the tyrant Terillas, son-in-law of Anaxilas of Rhegium and Zancle, appealed to the Carthaginians, who came to his assistance, but were utterly defeated by Gelon of Syracuse in 480 B.C.—on the same day, it is said, as the battle of Salamis. Thrasydaeus, son of Theron of Agrigentum, seems to have ruled the city oppressively, but an appeal made to Hiero of Syracuse, Gelon's brother, was betrayed by him to Theron; the latter massacred all his enemies and in the following year resettled the town. In 415 it refused to admit the Athenian fleet and remained an ally of Syracuse. In 408 the Carthaginian invading army under Hannibal, after capturing Selinus, invested and took Himera

SpinSmart Software http://www.spinsmart.com

and razed the city to the ground, founding a new town close to the hot springs (Thermae Himeraeae), 8 m. to the west. The only relic of the ancient town now visible above ground is a small portion (four columns, lower diameter 7 ft.) of a Doric temple, the date of which (whether before or after 480 B.C.) is uncertain.

HIMERIUS (*c.* A.D. 315–386), Greek sophist and rhetorician, was born at Prusa in Bithynia. He completed his education at Athens, whence he was summoned to Antioch in 362 by the emperor Julian to act as his private secretary. After the death of Julian in the following year Himerius returned to Athens, where he established a school of rhetoric, which he compared with that of Isocrates and the Delphic oracle, owing to the number of those who flocked from all parts of the world to hear him. Amongst his pupils were Gregory of Nazianzus and Basil the Great, bishop of Caesarea. In recognition of his merits, civic rights and the membership of the Areopagus were conferred upon him. The death of his son Rufinus (his lament for whom, called *μονῳδία*, is extant) and that of a favourite daughter greatly affected his health; in his later years he became blind and he died of epilepsy. Although a heathen, who had been initiated into the mysteries of Mithra by Julian, he shows no prejudice against the Christians. Himerius is a typical representative of the later rhetorical schools. Photius (cod. 165, 243 Bekker) had read 71 speeches by him, of 36 of which he has given an epitome; 24 have come down to us complete and fragments of 10 or 12 others. They consist of epideictic or "display" speeches after the style of Aristides, the majority of them having been delivered on special occasions, such as the arrival of a new governor, visits to different cities (Thessalonica, Constantinople), or the death of friends or well-known personages. The *Polemarchicus*, like the *Menexenus* of Plato and the *Epitaphios Logos* of Hypereides, is a panegyric of those who had given their lives for their country; it is so called because it was originally the duty of the polemarch to arrange the funeral games in honour of those who had fallen in battle. Other declamations, only known from the excerpts in Photius, were imaginary orations put into the mouth of famous persons—Demosthenes advocating the recall of Aeschines from banishment, Hypereides supporting the policy of Demosthenes, Themistocles inveighing against the king of Persia, an orator unnamed attacking Epicurus for atheism before Julian at Constantinople. Himerius is more of a poet than a rhetorician, and his declamations are valuable as giving prose versions or even the actual words of lost poems by Greek lyric writers. The prose poem on the marriage of Severus and his greeting to Basil at the beginning of spring are quite in the spirit of the old lyric. Himerius possesses vigour of language and descriptive powers, though his productions are spoilt by too frequent use of imagery, allegorical and metaphorical obscurities, mannerism and ostentatious learning. But they are valuable for the history and social conditions of the time, although lacking the sincerity characteristic of Libanius.

See Eunapius, *Vitae sophistarum*; Suidas, *s.v.*; editions by G. Wernsdorf (1790), with valuable introduction and commentaries, and by F. Dübner (1849) in the Didot series; C. Teuber, *Quaestiones Himerianae* (Breslau, 1882); on the style, E. Norden, *Die antike Kunstprosa* (1898).

HIMLY (LOUIS), AUGUSTE (1823–1906), French historian and geographer, was born at Strassburg on the 28th of March 1823. After studying in his native town and taking the university course in Berlin (1842–1843) he went to Paris, and passed first in the examination for fellowship (*agrégation*) of the *lycées* (1845), first in the examinations on leaving the École des Chartes, and first in the examination for fellowship of the faculties (1849). In 1849 he took the degree of doctor of letters with two theses, one of which, *Wala et Louis le Débonnaire* (published in Paris in 1849), placed him in the front rank of French scholars in the province of Carolingian history. Soon, however, he turned his attention to the study of geography. In 1858 he obtained an appointment as teacher of geography at the Sorbonne, and henceforth devoted himself to that subject. It was not till 1876 that he published, in two volumes, his remarkable *Histoire de la formation territoriale des états de l'Europe centrale*, in which he showed with a firm, but sometimes slightly heavy touch, the reciprocal influence exerted by geography and history. While the work gives evidence throughout of wide and well-directed research, he preferred to write it in the form of a student's manual; but it was a manual so original that it gained him admission to the Institute in 1881. In that year he was appointed dean of the faculty of letters, and for ten years he directed the intellectual life of that great educational centre during its development into a great scientific body. He died at Sèvres on the 6th of October 1906.

HIMMEL, FREDERICK HENRY (1765–1814), German composer, was born on the 20th of November 1765 at Treuenbrietzen in Brandenburg, Prussia, and originally studied theology at Halle. During a temporary stay at Potsdam he had an opportunity of showing his self-acquired skill as a pianist before King Frederick William II., who thereupon made him a yearly allowance to enable him to complete his musical studies. This he did under Naumann, a German composer of the Italian school, and the style of that school Himmel himself adopted in his serious operas. The first of these, a pastoral opera, *Il Primo Navigatore*, was produced at Venice in 1794 with great success. In 1792 he went to Berlin, where his oratorio *Isaaco* was produced, in consequence of which he was made court Kapellmeister to the king of Prussia, and in that capacity wrote a great deal of official music, including cantatas, and a coronation Te Deum. His Italian operas, successively composed for Stockholm, St Petersburg and Berlin, were all received with great favour in their day. Of much greater importance than these is an operetta to German words by Kotzebue, called *Fanchon*, an admirable specimen of the primitive form of the musical drama known in Germany as the *Singspiel*. Himmel's gift of writing genuine simple melody is also observable in his songs, amongst which one called "To Alexis" is the best. He died in Berlin on the 8th of June 1814.

HINCKLEY, a market town in the Bosworth parliamentary division of Leicestershire, England, 14½ m. S.W. from Leicester on the Nuneaton-Leicester branch of the London & North-Western railway, and near the Ashby-de-la-Zouch canal. Pop. of urban district (1901), 11,304. The town is well situated on a considerable eminence. Among the principal buildings are the church of St Mary, a Decorated and Perpendicular structure, with lofty tower and spire; the Roman Catholic academy named St Peter's Priory, and a grammar school. The ditch of a castle erected by Hugh de Grentismenil in the time of William Rufus is still to be traced. Hinckley is the centre of a stocking-weaving district, and its speciality is circular hose. It also possesses a boot-making industry, brick and tile works, and lime works. There are mineral springs in the neighbourhood.

HINCKS, EDWARD (1792–1866), British assyriologist, was born at Cork, Ireland, and educated at Trinity College, Dublin. He took orders in the Protestant Church of Ireland, and was rector of Killyleagh, Down, from 1825 till his death on the 3rd of December 1866. Hincks devoted his spare time to the study of hieroglyphics, and to the deciphering of the cuneiform script (see CUNEIFORM), in which he was a pioneer, working out contemporaneously with Sir H. Rawlinson, and independently of him, the ancient Persian vowel system. He published a number of original and scholarly papers on assyriological questions of the highest value, chiefly in the *Transactions* of the Royal Irish Academy.

HINCKS, SIR FRANCIS (1807–1885), Canadian statesman, was born at Cork, Ireland, the son of an Irish Presbyterian minister. In 1832 he engaged in business in Toronto, became a friend of Robert Baldwin, and in 1835 was chosen to examine the accounts of the Welland Canal, the management of which was being attacked by W. L. Mackenzie. This turned his attention to political life and in 1838 he founded the *Examiner*, a weekly paper in the Liberal interest. In 1841 he was elected M.P. for the county of Oxford, and in the following year was appointed inspector-general, the title then borne by the finance minister, but in 1843 resigned with Baldwin and the other ministers on the question of responsible government. In 1848 he again became inspector-general in the Baldwin-Lafontaine

SpinSmart Software http://www.spinsmart.com

ministry, and on their retirement in 1851 became premier of Canada, his chief colleague being A. N. Morin (1803–1865). While premier he was prominent in the negotiations which led to the construction of the Grand Trunk railway, and in co-operation with Lord Elgin negotiated with the United States the reciprocity treaty of 1854. In the same year the bitter hostility of the "Clear Grits" under George Brown compelled his resignation, and he was prominent in the formation of the Liberal-Conservative Party. In 1855 he was chosen governor of Barbados and the Windward Islands, and subsequently governor of British Guiana. In 1869 he was created K.C.M.G. and returned to Canada, becoming till 1873 finance minister in the cabinet of Sir John Macdonald. In February of that year he resigned, but continued to take an active part in public life. In 1879 the failure of the Consolidated Bank of Canada, of which he was president, led to his being tried for issuing false statements. Though found guilty on a technicality (see *Journal* of the Canadian Bankers' Association, April 1906) judgment was suspended, his personal credit remained unimpaired, and he continued to take part in the discussion of public questions till his death on the 18th of August 1885.

His writings include: *The Political History of Canada between 1840 and 1855* (1877); *The Political Destiny of Canada* (1878), and his *Reminiscences* (1884).

HINCMAR (*c.* 805–882), archbishop of Reims, one of the most remarkable figures in the ecclesiastical history of France, belonged to a noble family of the north or north-east of Gaul. Destined, doubtless, to the monastic life, he was brought up at St Denis under the direction of the abbot Hilduin (*d.* 844), who brought him in 822 to the court of the emperor Louis the Pious. When Hilduin was disgraced in 830 for having joined the party of Lothair, Hincmar accompanied him into exile at Corvey in Saxony, but returned with him to St Denis when the abbot was reconciled with the emperor, and remained faithful to the emperor during his struggle with his sons. After the death of Louis the Pious (840) Hincmar supported Charles the Bald, and received from him the abbacies of Notre-Dame at Compiègne and St Germer de Fly. In 845 he obtained through the king's support the archbishopric of Reims, and this choice was confirmed at the synod of Beauvais (April 845). Archbishop Ebbo, whom he replaced, had been deposed in 835 at the synod of Thionville (Diedenhofen) for having broken his oath of fidelity to the emperor Louis, whom he had deserted to join the party of Lothair. After the death of Louis, Ebbo succeeded in regaining possession of his see for some years (840–844), but in 844 Pope Sergius II. confirmed his deposition. It was in these circumstances that Hincmar succeeded, and in 847 Pope Leo IV. sent him the pallium.

One of the first cares of the new prelate was the restitution to his metropolitan see of the domains that had been alienated under Ebbo and given as benefices to laymen. From the beginning of his episcopate Hincmar was in constant conflict with the clerks who had been ordained by Ebbo during his reappearance. These clerks, whose ordination was regarded as invalid by Hincmar and his adherents, were condemned in 853 at the council of Soissons, and the decisions of that council were confirmed in 855 by Pope Benedict III. This conflict, however, bred an antagonism of which Hincmar was later to feel the effects. During the next thirty years the archbishop of Reims played a very prominent part in church and state. His authoritative and energetic will inspired, and in great measure directed, the policy of the west Frankish kingdom until his death. He took an active part in all the great political and religious affairs of his time, and was especially energetic in defending and extending the rights of the church and of the metropolitans in general, and of the metropolitan of the church of Reims in particular. In the resulting conflicts, in which his personal interest was in question, he displayed great activity and a wide knowledge of canon law, but did not scruple to resort to disingenuous interpretation of texts. His first encounter was with the heresiarch Gottschalk, whose predestinarian doctrines claimed to be modelled on those of St Augustine. Hincmar placed himself at the head of the party that regarded Gottschalk's doctrines as heretical, and succeeded in procuring the arrest and imprisonment of his adversary (849). For a part at least of his doctrines Gottschalk found ardent defenders, such as Lupus of Ferrières, the deacon Florus and Amolo of Lyons. Through the energy and activity of Hincmar the theories of Gottschalk were condemned at Quierzy (853) and Valence (855), and the decisions of these two synods were confirmed at the synods of Langres and Savonnières, near Toul (859). To refute the predestinarian heresy Hincmar composed his *De praedestinatione Dei et libero arbitrio*, and against certain propositions advanced by Gottschalk on the Trinity he wrote a treatise called *De una et non trina deitate*. Gottschalk died in prison in 868. The question of the divorce of Lothair II., king of Lorraine, who had repudiated his wife Theutberga to marry his concubine Waldrada, engaged Hincmar's literary activities in another direction. At the request of a number of great personages in Lorraine he composed in 860 his *De divortio Lotharii et Teutbergae*, in which he vigorously attacked, both from the moral and the legal standpoints, the condemnation pronounced against the queen by the synod of Aix-la-Chapelle (February 860). Hincmar energetically supported the policy of Charles the Bald in Lorraine, less perhaps from devotion to the king's interests than from a desire to see the whole of the ecclesiastical province of Reims united under the authority of a single sovereign, and in 869 it was he who consecrated Charles at Metz as king of Lorraine.

In the middle of the 9th century there appeared in Gaul the collection of false decretals commonly known as the Pseudo-Isidorian Decretals. The exact date and the circumstances of the composition of the collection are still an open question, but it is certain that Hincmar was one of the first to know of their existence, and apparently he was not aware that the documents were forged. The importance assigned by these decretals to the bishops and the provincial councils, as well as to the direct intervention of the Holy See, tended to curtail the rights of the metropolitans, of which Hincmar was so jealous. Rothad, bishop of Soissons, one of the most active members of the party in favour of the pseudo-Isidorian theories, immediately came into collision with his archbishop. Deposed in 863 at the council of Soissons, presided over by Hincmar, Rothad appealed to Rome. Pope Nicholas I. supported him zealously, and in 865, in spite of the protests of the archbishop of Reims, Arsenius, bishop of Orta and legate of the Holy See, was instructed to restore Rothad to his episcopal see. Hincmar experienced another check when he endeavoured to prevent Wulfad, one of the clerks deposed by Ebbo, from obtaining the archbishopric of Bourges with the support of Charles the Bald. After a synod held at Soissons, Nicholas I. pronounced himself in favour of the deposed clerks, and Hincmar was constrained to make submission (866). He was more successful in his contest with his nephew Hincmar, bishop of Laon, who was at first supported both by the king and by his uncle, the archbishop of Reims, but soon quarrelled with both. Hincmar of Laon refused to recognize the authority of his metropolitan, and entered into an open struggle with his uncle, who exposed his errors in a treatise called *Opusculum LV. capitulorum*, and procured his condemnation and deposition at the synod of Douzy (871). The bishop of Laon was sent into exile, probably to Aquitaine, where his eyes were put out by order of Count Boso. Pope Adrian protested against his deposition, but it was confirmed in 876 by Pope John VIII., and it was not until 878, at the council of Troyes, that the unfortunate prelate was reconciled with the Church. A serious conflict arose between Hincmar on the one side and Charles and the pope on the other in 876, when Pope John VIII., at the king's request, entrusted Ansegisus, archbishop of Sens, with the primacy of the Gauls and of Germany, and created him vicar apostolic. In Hincmar's eyes this was an encroachment on the jurisdiction of the archbishops, and it was against this primacy that he directed his treatise *De jure metropolitanorum*. At the same time he wrote a life of St Remigius, in which he endeavoured by audacious falsifications to prove the supremacy of the church of Reims over the other churches. Charles the Bald, however, upheld the rights of

SpinSmart Software http://www.spinsmart.com

Ansegisus at the synod of Ponthion. Although Hincmar had been very hostile to Charles's expedition into Italy, he figured among his testamentary executors and helped to secure the submission of the nobles to Louis the Stammerer, whom he crowned at Compiègne (8th of December 877).

During the reign of Louis, Hincmar played an obscure part. He supported the accession of Louis III. and Carloman, but had a dispute with Louis, who wished to instal a candidate in the episcopal see of Beauvais without the archbishop's assent. To Carloman, on his accession in 882, Hincmar addressed his *De ordine palatii*, partly based on a treatise (now lost) by Adalard, abbot of Corbie (*c.* 814), in which he set forth his system of government and his opinion of the duties of a sovereign, a subject he had already touched in his *De regis persona et regio ministerio*, dedicated to Charles the Bald at an unknown date, and in his *Instructio ad Ludovicum regem*, addressed to Louis the Stammerer on his accession in 877. In the autumn of 882 an irruption of the Normans forced the old archbishop to take refuge at Epernay, where he died on the 21st of December 882. Hincmar was a prolific writer. Besides the works already mentioned, he was the author of several theological tracts; of the *De villa Noviliaco*, concerning the claiming of a domain of his church; and he continued from 861 the *Annales Bertiniani*, of which the first part was written by Prudentius, bishop of Troyes, the best source for the history of Charles the Bald. He also wrote a great number of letters, some of which are extant, and others embodied in the chronicles of Flodoard.

Hincmar's works, which are the principal source for the history of his life, were collected by Jacques Sirmond (Paris, 1645), and reprinted by Migne, *Patrol. Latina*, vol. cxxv. and cxxvi. See also C. von Noorden, *Hinkmar, Erzbischof von Reims* (Bonn, 1863), and, especially, H. Schrörs, *Hinkmar, Erzbischof von Reims* (Freiburg-im-Breisgau, 1884). For Hincmar's political and ecclesiastical theories see preface to Maurice Prou's edition of the *De ordine palatii* (Paris, 1885), and the abbé Lesné, *La Hiérarchie épiscopale en Gaule et en Germanie* (Paris, 1905). (R. Po.)

HIND, the female of the red-deer, usually taken as being three years old and over, the male being known as a "hart. It is sometimes also applied to the female of other species of deer. The word appears in several Teutonic languages, cf. Dutch and Ger. *Hinde*, and has been connected with the Goth. *hin*þ*an* (*hinthan*), to seize, which may be connected ultimately with "hand" and "hunt." "Hart," from the O.E. *heort*, may be in origin connected with the root of Gr. κέρας, horn. "Hind" (O.E. *hine*, probably from the O.E. *hinan*, members of a family or household), meaning a servant, especially a labourer on a farm, is another word. In Scotland the "hind" is a farm servant, with a cottage on the farm, and duties and responsibilities that make him superior to the rest of the labourers. Similarly "hind" is used in certain parts of northern England as equivalent to "bailiff."

HINDERSIN, GUSTAV EDUARD VON (1804–1872), Prussian general, was born at Wernigerode near Halberstadt on the 18th of July 1804. He was the son of a priest and received a good education. His earlier life was spent in great poverty, and the struggle for existence developed in him an iron strength of character. Entering the Prussian artillery in 1820 he became an officer in 1825. From 1830 to 1837 he attended the Allgemeine Kriegsakademie at Berlin, and in 1841, while still a subaltern, he was posted to the great General Staff, in which he afterwards directed the topographical section. In 1849 he served with the rank of major on the staff of General Peucker, who commanded a federal corps in the suppression of the Baden insurrection. He fell into the hands of the insurgents at the action of Ladenburg, but was released just before the fall of Rastadt. In the Danish war of 1864 Hindersin, now lieutenant-general, directed the artillery operations against the lines of Düppel, and for his services was ennobled by the king of Prussia. Soon afterwards he became inspector-general of artillery. His experience at Düppel had convinced him that the days of the smooth-bore gun were past, and he now devoted himself with unremitting zeal to the rearmament and reorganization of the Prussian artillery. The available funds were small, and grudgingly voted by the parliament. There was a strong feeling moreover that the smooth-bore was still tactically superior to its rival (see ARTILLERY, § 19). There was no practical training for war in either the field or the fortress artillery units. The latter had made scarcely any progress since the days of Frederick the Great, and before von Hindersin's appointment had practised with the same guns in the same bastion year after year. All this was altered, the whole "foot-artillery" was reorganized, manoeuvres were instituted, and the smooth-bores were, except for ditch defence, eliminated from the armament of the Prussian fortresses. But far more important was his work in connexion with the field and horse batteries. In 1864 only one battery in four had rifled guns, but by the unrelenting energy of von Hindersin the outbreak of war with Austria one and a half years later found the Prussians with ten in every sixteen batteries armed with the new weapon. But the battles of 1866 showed, besides the superiority of the rifled gun, a very marked absence of tactical efficiency in the Prussian artillery, which was almost always outmatched by that of the enemy. Von Hindersin had pleaded, in season and out of season, for the establishment of a school of gunnery; and in spite of want of funds, such a school had already been established. After 1866, however, more support was obtained, and the improvement in the Prussian field artillery between 1866 and 1870 was extraordinary, even though there had not been time for the work of the school to leaven the whole arm. Indeed, the German artillery played by far the most important part in the victories of the Franco-German war. Von Hindersin accompanied the king's headquarters as chief of artillery, as he had done in 1866, and was present at Gravelotte, Sedan and the siege of Paris. But his work, which was now accomplished, had worn out his physical powers, and he died on the 23rd of January 1872 at Berlin.

See Bartholomäus, *Der General der Infanterie von Hindersin* (Berlin, 1895), and Prince Kraft zu Hohenlohe-Ingelfingen, *Letters on Artillery* (translated by Major Walford, R.A.), No. xi.

HINDĪ, EASTERN, one of the "intermediate" Indo-Aryan languages (see HINDOSTANI). It is spoken in Oudh, Baghelkhand and Chhattisgarh by over 22,000,000 people. It is derived from the Apabhraṁśa form of Ardhamāgadhī Prakrit (see PRAKRIT), and possesses a large and important literature. Its most famous writer was Tulsī Dās, the poet and reformer, who died early in the 17th century, and since his time it has been the North-Indian language employed for epic poetry.

HINDĪ, WESTERN, the Indo-Aryan language of the middle and upper Gangetic Doab, and of the country to the north and south. It is the vernacular of over 40,000,000 people. Its standard dialect is Braj Bhāshā, spoken near Muttra, which has a considerable literature mainly devoted to the religion founded on devotion to Krishna. Another dialect spoken near Delhi and in the upper Gangetic Doab is the original from which Hindostani, the great *lingua franca* of India, has developed (see HINDOSTANI). Western Hindī, like Punjabi, its neighbour to the west, is descended from the Apabhraṁśa form of Śaurasēnī Prakrit (see PRAKRIT), and represents the language of the Madhyadēśa or Midland, as distinct from the intermediate and outer Indo-Aryan languages.

HINDKI, the name given to the Hindus who inhabit Afghanistan. They are of the Khatri class, and are found all over the country even amongst the wildest tribes. Bellew in his *Races of Afghanistan* estimates their number at about 300,000. The name Hindki is also loosely used on the upper Indus, in Dir, Bajour, &c., to denote the speakers of Punjabi or any of its dialects. It is sometimes applied in a historical sense to the Buddhist inhabitants of the Peshawar Valley north of the Kabul river, who were driven thence about the 5th or 6th century and settled in the neighbourhood of Kandahar.

HINDLEY, an urban district in the Ince parliamentary division of Lancashire, England, 2 m. E.S.E. of Wigan, on the Lancashire & Yorkshire and Great Central railways. Pop. (1901) 23,504. Cotton spinning and the manufacture of cotton goods are the principal industries, and there are extensive coal-mines in the neighbourhood. It is recorded that in the time of the

SpinSmart Software http://www.spinsmart.com

Puritan revolution Hindley church was entered by the Cavaliers, who played at cards in the pews, pulled down the pulpit and tore the Bible in pieces.

HINDOSTANI (properly *Hindōstāni*, of or belonging to Hindostan[1]), the name given by Europeans to an Indo-Aryan dialect (whose home is in the upper Gangetic Doab and near the city of Delhi), which, owing to political causes, has become the great *lingua franca* of modern India. The name is not employed by natives of India, except as an imitation of the English nomenclature. Hindostani is by origin a dialect of Western Hindi, and it is first of all necessary to explain what we mean by the term "Hindi" as applied to language. Modern Indo-Aryan languages fall into three groups,—an outer band, the language of the Midland and an intermediate band. The Midland consists of the Gangetic Doab and of the country to its immediate north and south, extending, roughly speaking, from the Eastern Punjab on the west, to Cawnpore on its east. The language of this tract is called "Western Hindi"; to its west we have Panjabi (of the Central Punjab), and to the east, reaching as far as Benares, Eastern Hindi, both Intermediate languages. These three will all be dealt with in the present article. Panjabi and Western Hindi are derived from Śaurasēnī, and Eastern Hindi from Ardham gadhā Prakrit, through the corresponding Apabhraṁśas (see PRAKRIT). Eastern Hindi differs in many respects from the two others, but it is customary to consider it together with the language of the Midland, and this will be followed on the present occasion. In 1901 the speakers of these three languages numbered: Panjabi, 17,070,961; Western Hindi, 40,714,925; Eastern Hindi, 22,136,358.

Linguistic Boundaries.—Taking the tract covered by these three forms of speech, it has to its west, in the western Punjab, Lahndā (see SINDHI), a language of the Outer band. The parent of Lahndā once no doubt covered the whole of the Punjab, but, in the process of expansion of the tribes of the Midland described in the article INDO-ARYAN LANGUAGES, it was gradually driven back, leaving traces of its former existence which grow stronger as we proceed westwards, until at about the 74th degree of east longitude there is a mixed, transition dialect. To the west of that degree Lahndā may be said to be established, the deserts of the west-central Punjab forming a barrier and protecting it, just as, farther south, a continuation of the same desert has protected Sindhi from Rajasthani. It is the old traces of Lahndā which mainly differentiate Panjabi from Hindostani. To the south of Panjabi and Western Hindi lies Rajasthani. This language arose in much the same way as Panjabi. The expanding Midland language was stopped by the desert from reaching Sindhi, but to the south-west it found an unobstructed way into Gujarat, where, under the form of Gujarati, it broke the continuity of the Outer band. Eastern Hindi, as an Intermediate form of speech, is of much older lineage. It has been an Intermediate language since, at least, the institution of Jainism (say, 500 B.C.), and is much less subject to the influence of the Midland than is Panjabi. To its east it has Bihari, and, stretching far to the south, it has Marathi as its neighbour in that direction, both of these being Outer languages.

Dialects.—The only important dialect of Eastern Hindi is Awadhī, spoken in Oudh, and possessing a large literature of great excellence. Chhattīsgaṛhī and Baghēlī, the other dialects, have scanty literatures of small value. Western Hindi has four main dialects, Bundēlī of Bundelkhand, Braj Bhasha (properly "Braj Bhāṣā") of the country round Mathura (Muttra), Kanaujī of the central Doab and the country to its north, and vernacular Hindostani of Delhi and the Upper Doab. West of the Upper Doab, across the Jumna, another dialect, Bāngarū, is also found. It possesses no literature. Kanauji is very closely allied to Braj Bhasha, and these two share with Awadhi the honour of being the great literary speeches of northern India. Nearly all the classical literature of India is religious in character, and we may say that, as a broad rule, Awadhi literature is devoted to the Ramaite religion and the epic poetry connected with it, while that of Braj Bhasha is concerned with the religion of Krishna. Vernacular Hindostani has no literature of its own, but as the *lingua franca* now to be described it has a large one. Panjabi has one dialect, Dōgrī, spoken in the Himalayas.

Hindostani as a Lingua Franca.—It has often been said that Hindostani is a mongrel "pigeon" form of speech made up of contributions from the various languages which met in Delhi bazaar, but this theory has now been proved to be unfounded, owing to the discovery of the fact that it is an actual living dialect of Western Hindi, existing for centuries in its present habitat, and the direct descendant of Śaurasēnī Prakrit. It is not a typical dialect of that language, for, situated where it is, it represents Western Hindi merging into Panjabi (Braj Bhasha being admittedly the standard of the language), but to say that it is a mongrel tongue thrown together in the market is to reverse the order of events. It was the natural language of the people in the neighbourhood of Delhi, who formed the bulk of those who resorted to the bazaar, and hence it became the bazaar language. From here it became the *lingua franca* of the Mogul camp and was carried everywhere in India by the lieutenants of the empire. It has several recognized varieties, amongst which we may mention Dakhinī, Urdū, Rēk̲hta and Hindī. Dakhini or "southern," is the form current in the south of India, and was the first to be employed for literature. It contains many archaic expressions now extinct in the standard dialect. Urdu, or *Urdū zabān*, "the language of the camp," is the name usually employed for Hindostani by natives, and is now the standard form of speech used by Mussulmans. All the early Hindostani literature was in poetry, and this literary form of speech was named "Rēk̲hta," or "scattered," from the way in which words borrowed from Persian were "scattered" through it. The name is now reserved for the dialect used in poetry, Urdu being the dialect of prose and of conversation. The introduction of these borrowed words, which has been carried to even a greater extent in Urdu, was facilitated by the facts that the latter was by origin a "camp" language, and that Persian was the official language of the Mogul court. In this way Persian (and, with Persian, Arabic) words came into current use, and, though the language remained Indo-Aryan in its grammar and essential characteristics, it soon became unintelligible to any one who had not at least a moderate acquaintance with the vocabulary of Iran. This extreme Persianization of Urdu was due rather to Hindu than to Persian influence. Although Urdu literature was Mussulman in its origin, the Persian element was first introduced in excess by the pliant Hindu officials employed in the Mogul administration, and acquainted with Persian, rather than by Persians and Persianized Moguls, who for many centuries used only their own languages for literary purposes.[2] Prose Urdu literature took its

[1] "Hindōstān" is a Persian word, and in modern Persian is pronounced "Hindūstān." It means the country of the Hindūs. In medieval Persian the word was "Hindōstān," with an *ō*, but in the modern language the distinctions between *ē* and *ī* and between *ō* and *ū* have been lost. Indian languages have borrowed Persian words in their medieval form. Thus in India we have *shēr*, a tiger, as compared with modern Persian *shīr*; *gō*, but modern Pers. *gū*; *bōstān*, but modern Pers. *būstān*. The word "Hindu" is in medieval Persian "Hindō" representing the ancient Avesta *hendava* (Sanskrit, *saindhava*), a dweller on the *Sindhu* or Indus. Owing to the influence of scholars in modern Persian the word "Hindū" is now established in English and, through English, in the Indian literary languages; but "Hindō" is also often heard in India. "Hindostan" with *o* is much more common both in English and in Indian languages, although "Hindustan" is also employed. Up to the days of Persian supremacy inaugurated in Calcutta by Gilchrist and his friends, every traveller in India spoke of "Indostan" or some such word, thus bearing testimony to the current pronunciation. Gilchrist introduced "Hindoostan," which became "Hindustan" in modern spelling. The word is not an Indian one, and both pronunciations, with *ō* and with *ū*, are current in India at the present day, but that with *ō* is unquestionably the one demanded by the history of the word and of the form which other Persian words take on Indian soil. On the other hand "Hindu" is too firmly established in English for us to suggest the spelling "Hindo." The word "Hindī" has another derivation, being formed from the Persian *Hind*, India (Avesta *hindu*, Sanskrit *sindhu*, the Indus). "Hindi" means "of or belonging to India," while "Hindu" now means "a person of the Hindu religion." (Cf. Sir C. J. Lyall, *A Sketch of the Hindustani Language*, p. 1).

[2] Sir C. J. Lyall, *op. cit.* p. 9.

SpinSmart Software http://www.spinsmart.com

origin in the English occupation of India and the need for text-books for the college of Fort William. It has had a prosperous career since the commencement of the 19th century, but some writers, especially those of Lucknow, have so overloaded it with Persian and Arabic that little of the original Indo-Aryan character remains, except, perhaps, an occasional pronoun or auxiliary verb. The Hindi form of Hindostani was invented simultaneously with Urdu prose by the teachers at Fort William. It was intended to be a Hindostani for the use of Hindus, and was derived from Urdu by ejecting all words of Persian or Arabic birth, and substituting for them words either borrowed from Sanskrit (*tatsamas*) or derived from the old primary Prakrit (*tadbhavas*) (see INDO-ARYAN LANGUAGES). Owing to the popularity of the first book written in it, and to its supplying the need for a *lingua franca* which could be used by the most patriotic Hindus without offending their religious prejudices, it became widely adopted, and is now the recognized vehicle for writing prose by those inhabitants of northern India who do not employ Urdu. This Hindi, which is an altogether artificial product of the English, is hardly ever used for poetry. For this the indigenous dialects (usually Awadhi or Braj Bhasha) are nearly always employed by Hindus. Urdu, on the other hand, having had a natural growth, has a vigorous poetical literature. Modern Hindi prose is often disfigured by that too free borrowing of Sanskrit words instead of using home-born *tadbhavas*, which has been the ruin of Bengali, and it is rapidly becoming a Hindu counterpart of the Persianized Urdu, neither of which is intelligible except to persons of high education.

Not only has Urdu adopted a Persian vocabulary, but even a few peculiarities of Persian construction, such as reversing the positions of the governing and the governed word (*e.g. báp mērā* for *mērā bāp*), or of the adjective and the substantive it qualifies, or such as the use of Persian phrases with the preposition *ba* instead of the native postposition of the ablative case (*e.g. ba-k̲hushī* for *k̲hushī-sē*, or *ba-ḥukm sarkār-kē* instead of *sarkār-kē ḥukm-sē*) are to be met with in many writings; and these, perhaps, combined with the too free indulgence on the part of some authors in the use of high-flown and pedantic Persian and Arabic words in place of common and yet chaste Indian words, and the general use of the Persian instead of the Nāgarī character, have induced some to regard Hindostani or Urdu as a language distinct from Hindi. But such a view betrays a radical misunderstanding of the whole question. We must define Urdu as the Persianized Hindostani of educated Mussulmans, while Hindi is the Sanskritized Hindostani of educated Hindus. As for the written character, Urdu, from the number of Persian words which it contains, can only be written conveniently in the Persian character, while Hindi, for a parallel reason, can only be written in the Nagari or one of its related alphabets (see SANSKRIT). On the other hand, "Hindostani" implies the great *lingua franca* of India, capable of being written in either character, and, without purism, avoiding the excessive use of either Persian or Sanskrit words when employed for literature. It is easy to write this Hindostani, for it has an opulent vocabulary of *tadbhava* words understood everywhere by both Mussulmans and Hindus. While "Hindostani," "Urdu" and "Hindi" are thus names of dialects, it should be remembered that the terms "Western Hindi" and "Eastern Hindi" connote, not dialects, but languages.

The epoch of Akbar, which first saw a regular revenue system established, with toleration and the free use of their religion to the Hindus, was, there can be little doubt, the period of the formation of the language. But its final consolidation did not take place till the reign of Shah Jahān. After the date of this monarch the changes are comparatively immaterial until we come to the time when European sources began to mingle with those of the East. Of the contributions from these sources there is little to say. Like the greater part of those from Arabic and Persian, they are chiefly nouns, and may be regarded rather as excrescences which have sprung up casually and have attached themselves to the original trunk than as ingredients duly incorporated in the body. In the case of the Persian and Arabic element, indeed, we do find not a few instances in which nouns have been furnished with a Hindi termination, *e.g. k̲harīdnā, badalnā, guzarnā, dāgh̲nā, bak̲hshnā, kamīnapan*, &c.; but the European element cannot be said to have at all woven itself into the grammar of the language. It consists, as has been observed, solely of nouns, principally substantive nouns, which on their admission into the language are spelt phonetically, or according to the corrupt pronunciation they receive in the mouths of the natives, and are declined like the indigenous nouns by means of the usual postpositions or case-affixes. A few examples will suffice. The Portuguese, the first in order of seniority, contributes a few words, as *kamarā* or *kamrā* (*camera*), a room; *mārtōl* (*martello*), a hammer; *nīlām* (*leilão*), an auction, &c. &c. Of French and Dutch influence scarcely a trace exists. English has contributed a number of words, some of which have even found a place in the literature of the language; *e.g. kamishanar* (commissioner); *jaj* (judge); *ḍāk̲tar* (doctor); *ḍāk̲tarī*, "the science of medicine" or "the profession of physicians"; *inspēk̲tar* (inspector); *is̲tant* (assistant); *sōsayaṭī* (society); *apīl* (appeal); *apīl karnā*, "to appeal"; *ḍikrī* or *ḍigrī* (decree); *ḍigrī* (degree); *inc* (inch); *fut* (foot); and many more, are now words commonly used. Some borrowed words are distorted into the shape of genuine Hindostani words familiar to the speakers; *e.g.* the English railway term "signal" has become *sikandar*, the native name for Alexander the Great, and "signal-man" is *sikandar-mān*, or "the pride of Alexander." How far the free use of Anglicisms will be adopted as the language progresses is a question upon which it would be hazardous to pronounce an opinion, but of late years it has greatly increased in the language of the educated, especially in the case of technical terms. A native veterinary surgeon once said to the present writer, "*kuttē-kā saliva bahut antiseptic hai*" for "a dog's saliva is very antiseptic," and this is not an extravagant example.[1]

The vocabulary of Panjabi and Eastern Hindi is very similar to that of Western Hindi. Panjabi has no literature to speak of and is free from the burden of words borrowed from Persian or Sanskrit, only the commonest and simplest of such being found in it. Its vocabulary is thus almost entirely *tadbhava*, and, while capable of expressing all ideas, it has a charming rustic flavour, like the Lowland Scotch of Burns, indicative of the national character of the sturdy peasantry that employs it. Eastern Hindi is very like Panjabi in this respect, but for a different reason. In it were written the works of Tulsī Dās, one of the greatest writers that India has produced, and his influence on the language has been as great as that of Shakespeare on English. The peasantry are continually quoting him without knowing it, and his style, simple and yet vigorous, thoroughly Indian and yet free from purism, has set a model which is everywhere followed except in the large towns where Urdu or Sanskritized Hindi prevails. Eastern Hindi is written in the Nāgarī alphabet, or in the current character related to it called "Kaithi" (see BIHARI). The indigenous alphabet of the Punjab is called *Laṇḍā* or "clipped." It is related to Nāgarī, but is hardly legible to any one except the original writer, and sometimes not even to him. To remedy this defect an improved form of the alphabet was devised in the 16th century by Angad, the fifth Sikh Guru, for the purpose of recording the Sikh scriptures. It was named *Gurmukhī*, "proceeding from the mouth of the Guru," and is now generally used for writing the language.

Grammar.—In the following account we use these contractions: Skr. = Sanskrit; Pr. = Prakrit; Ap. = Apabhraṁśa; W.H. = Western Hindi; E.H. = Eastern Hindi; H. = Hindostani; Br. = Braj Bhasha; P. = Panjabi.

(A) *Phonetics.*—The phonetic system of all three languages is nearly the same as that of the Apabhraṁśas from which they are derived. With a few exceptions, to be noted below, the letters of the alphabets of the three languages are the same as in Sanskrit. Panjabi, and the western dialects of Western Hindi, have preserved the old Vedic cerebral *l*. There is a tendency for concurrent vowels to run into each other, and for the semi-vowels *y* and *v* to become vowels. Thus, Skr. *carmakāras*, Ap. *cammaāru*, a leather-worker,

[1] This and the preceding paragraph are partly taken from Mr. Platts's article in vol. xi. of the 9th edition of this encyclopaedia.

SpinSmart Software http://www.spinsmart.com

becomes H. *camār*; Skr. *rajani*, Ap. *ra(y)aṇi*, H. *rain*, night; Skr. *dhavalakas*, Ap. *dhavalau*, H. *dhaulā*, white. Sometimes the semi-vowel is retained, as in Skr. *kātaras*, Ap. *kā(y)aru*, H. *kāyar*, a coward. Almost the only compound consonants which survived in the Pr. stage were double letters, and in W.H. and E.H. these are usually simplified, the preceding vowel being lengthened and sometimes nasalized, in compensation. P., on the other hand, prefers to retain the double consonant. Thus, Skr. *karma*, Ap. *kammu*, W.H. and E.H. *kām*, but P. *kamm*, a work; Skr. *satyas*, Ap. *saccu*, W.H. and E.H. *sāc*, but P. *sacc*, true (H., being the W.H. dialect which lies nearest to P., often follows that language, and in this instance has *sacc*, usually written *sac*); Skr. *hastas*, Ap. *hatthu*, W.H. and E.H. *hāth*, but P. *hatth*, a hand. The nasalization of vowels is very frequent in all three languages, and is here represented by the sign ~ over the vowel. Sometimes it is compensatory, as in *sāc*, but it often represents an original *m*, as in *kawāl* from Skr. *kamalas*, a lotus. Final short vowels quiesce in prose pronunciation, and are usually not written in transliteration; thus the final *a*, *i* or *u* has been lost in all the examples given above, and other *tatsama* examples are Skr. *mati-* which becomes *mat*, mind, and Skr. *vastu-*, which becomes *bast*, a thing. In all poetry, however (except in the Urdū poetry formed on Persian models, and under the rules of Persian prosody), they reappear and are necessary for the scansion.

In *tadbhava* words an original long vowel in any syllable earlier than the penultimate is shortened. In P. and H. when the long vowel is *ē* or *ō* it is shortened to *i* or *u* respectively, but in other W.H. dialects and in E.H. it is shortened to *e* or *o*; thus, *bēṭī*, daughter, long form H. *biṭiyā*, E.H. *beṭiyā*; *ghoṛī*, mare, long form H. *ghuṛiyā*, E.H. *ghoṛiyā*. The short vowels *e* and *o* are very rare in P. and H., but are not uncommon (though ignored by most grammars) in E.H. and the other W.H. dialects. A medial *ḍ* is pronounced as a strongly burred cerebral *ṛ*, and is then written as shown, with a supposited dot. All these changes and various contractions of Prakrit syllables have caused considerable variations in the forms of words, but generally not so as to obscure the origin.

(B) *Declension.*—The nominative form of a *tadbhava* word is derived from the nominative form in Sanskrit and Prakrit, but *tatsama* words are usually borrowed in the form of the Skr. crude base; thus, Skr. *hastin-*, nom. *hastī*, Ap. nom. *hatthī*, H. *hāthī*, an elephant; Skr. base *mati-*, nom. *matis*, H. (*tatsama*) *mati*, or, with elision of the final short vowel, *mat*. Some *tatsamas* are, however, borrowed in the nominative form, as in Skr. *dhanin-*, nom. *dhanī*, H. *dhanī*, a rich man. As another example of a *tadbhava* word, we may take the Skr. nom. *ghoṭas*, Ap. *ghoḍu*, H. *ghoṛ*, a horse. Here again the final short vowel has been elided, but in old poetry we should find *ghoṛu*, and corresponding forms in *u* are occasionally met with at the present day.

In the article PRAKRIT attention is drawn to the frequent use of pleonastic suffixes, especially *-ka-* (fem.*-(i)kā*). With such a suffix we have the Skr. *ghoṭa-kas*, Ap. *ghoḍa-u*, Western Hindi *ghoṛau*, or in P. and H. (which is the W.H. dialect nearest in locality to P.) *ghoṛā*, a horse; Skr. *ghoṭi-kā*, Ap. *ghoḍi-ā*, W.H. and P. *ghoḍī*, a mare. Such modern forms made with one pleonastic suffix are called "strong forms," while those made without it are called "weak forms." All strong forms end in *au* (or *ā*) in the masculine, and in *ī* in the feminine, whereas, in Skr., and hence in *tatsamas*, both *ā* and *ī* are generally typical of feminine words, though sometimes employed for the masculine. It is shown in the article PRAKRIT that these pleonastic suffixes can be doubled, or even trebled, and in this way we have a new series of *tadbhava* forms. Let us take the imaginary Skr. **ghoṭa-ka-kas* with a double suffix. From this we have the Ap. *ghoḍa-a-u*, and modern *ghoṛawā* (with euphonic *w* inserted), a horse. Similarly for the feminine we have Skr. **ghoṭi-ka-kā*, Ap. *ghoḍi-a-ā*, modern *ghoṛiyā* (with euphonic *y* inserted), a mare. Such forms, made with two suffixes, are called "long forms," and are heard in familiar conversation, the feminine also serving as diminutives. There is a further stage, built upon three suffixes, and called the "redundant form," which is mainly used by the vulgar. As a rule masculine long forms end in *-awā*, *-iyā* or *-uā*, and feminines in *-iyā*, although the matter is complicated by the occasional use of pleonastic suffixes other than the *-ka-* which we have taken for our example, and is the most common. Strong forms are rarely met with in E.H., but on the other hand long forms are more common in that language.

There are a few feminine terminations of weak nouns which may be noted. These are *-inī*, *-in*, *-an*, *-nī* (Skr. *-inī*, Pr. *-iṇī*); and *-āni*, *-ăni*, *-āin* (Skr. *-ānī*, Pr. *-āṇī*). These are found not only in words derived from Prakrit, but are added to Persian and even Arabic words; thus, *hathinī*, *hathnī*, *hāthin* (Skr. *hastinī*, Pr. *hatthiṇī*), a she-elephant; *sunārin*, *sunāran*, a female goldsmith (*sōnār*); *shērnī*, a tigress (Persian *shēr*, a tiger); *Naṣīban*, a proper name (Arabic *naṣīb*); *paṇḍitānī*, the wife of a *paṇḍit*; *caudhrāin*, the wife of a *caudhrī* or head man; *mehtrānī*, the wife of a sweeper (Pres. *mehtar*, a sweeper). With these exceptions weak forms rarely have any terminations distinctive of gender.[1]

The synthetic declension of Sanskrit and Prakrit has disappeared. We see it in the actual stage of disappearance in Apabhraṁśa (see PRAKRIT), in which the case terminations had become worn down to *-hu*, *-ho*, *-hi*, *-hī* and *-hā*, of which *-hi* and *-hī* were employed for several cases, both singular and plural. There was also a marked tendency for these terminations to be confused, and in the earliest stages of the modern vernaculars we find *-hi* freely employed for any oblique case of the singular, and *-hī* for any oblique case of the plural, but more especially for the genitive and the locative. In the case of modern weak nouns these terminations have disappeared altogether in W.H. and P. except in sporadic forms of the locative such as *gāwē* (for *gāwahi*), in the village. In E.H. they are still heard as the termination of a form which can stand for any oblique case, and is called the "oblique form" or the "oblique case." Thus, from *ghar*, a house (a weak noun), we have W.H. and P. oblique form *ghar*, E.H. *gharahi*, *gharē* or *ghar*. In the plural, the oblique form is sometimes founded on the Ap. terminations *-hā* and *-hu*, and sometimes on the Skr. termination of the genitive plural *-ānām* (Pr. *-āṇa*, *-aṇhaṃ*), as in P. *gharā̃*, W.H. *gharaũ*, *gharõ*, *gharani*, E.H. *gharan*. In the case of masculine weak forms, the plural nominative has dropped the old termination, except in E.H., where it has adopted the oblique plural form for this case also, thus *gharan*. The nominative plural of feminine weak forms follows the example of the masculine in E.H. In P. it also takes the oblique plural form, while in W.H. it takes the old singular oblique form in *-ahĭ*, which it weakens to *aĭ* or (H.) *ĕ*; thus *bāt* (fem.), a word, nom. plur. E.H. *bāt-an*, P. *bāt-ā̃*, W.H. *bātaĭ* or (H.) *bāte*.

Strong masculine bases in Ap. ended in *-a-a* (nom. *-a-u*); thus *ghōḍa-a-* (nom. *ghōḍa-u*), and adding *-hi* we get *ghōḍa-a-hi*, which becomes contracted *ghōḍāhi* and finally to *ghoṛē*. The nominative plural is the same as the oblique singular, except in E.H. where it follows the oblique plural. The oblique plural of all closely follows in principle the weak forms. Feminine strong forms in Ap. ended in *-i-ā*, contracted to *ī* in the modern languages. Except in E.H. the *-hi* of the original oblique form singular disappears, so that we have E.H. *ghoṛihi* or *ghoṛī*, others only *ghoṛī*. The nominative plural of feminine strong forms exhibits some irregularities. In E.H., as usual, it follows the plural oblique forms. In W.H. (except Hindostani) it simply nasalizes the oblique form singular (*i.e.* adds *-hĭ* instead of *-hi*), as in *ghoṛī*. P. and H. adopt the oblique long form for the plural and nasalize it, thus, P. *ghoṛīā̃*, H. *ghoṛiyā̃*. The oblique plurals call for no further remarks. We thus get the following summary, illustrating the way in which these nominative and oblique forms are made.

	Panjabi.	Hindostani.	Braj Bhasha.	Eastern Hindi.
Weak Noun Masc.—				
Nom. Sing.	*ghar*	*ghar*	*ghar*	*ghar*
Obl. Sing.	*ghar*	*ghar*	*ghar*	*ghar, gharahi*
Nom. Plur.	*ghar*	*ghar*	*ghar*	*gharan*
Obl. Plur.	*gharā̃*	*gharõ*	*gharaũ, gharani*	*gharan*
Strong Noun Masc.—				
Nom. Sing.	*ghoṛā*	*ghoṛā*	*ghoṛau*	*ghoṛā*
Obl. Sing.	*ghoṛē*	*ghoṛē*	*ghoṛē, ghoṛai*	*ghoṛā, ghoṛē*
Nom. Plur.	*ghoṛē*	*ghoṛē*	*ghoṛē*	*ghoṛan*
Obl. Plur.	*ghoṛiā̃*	*ghoṛõ*	*ghoṛaũ, ghoṛani*	*ghoṛan*
Weak Noun Fem.—				
Nom. Sing.	*bāt*	*bāt*	*bāt*	*bāt*
Obl. Sing.	*bāt*	*bāt*	*bāt*	*bāt*
Nom. Plur.	*bātā̃*	*bātĕ*	*bātaĭ*	*bātan*
Obl. Plur.	*bātā̃*	*bātõ*	*bātaũ, bātani*	*bātan*
Strong Noun Fem.—				
Nom. Sing.	*ghoṛī*	*ghoṛī*	*ghoṛī*	*ghoṛī*
Obl. Sing.	*ghoṛī*	*ghoṛī*	*ghoṛī*	*ghoṛī, ghoṛihi*
Nom. Plur.	*ghoṛīā̃*	*ghoṛiyā̃*	*ghoṛī*	*ghoṛin*
Obl. Plur.	*ghoṛīā̃*	*ghoṛiyõ*	*ghoṛiyaũ, ghoṛiyani*	*ghoṛin*

We have seen that the oblique form is the resultant of a general melting down of all the oblique cases of Sanskrit and Prakrit, and that in consequence it can be used for any oblique case. It is obvious that if it were so employed it would often give rise to great confusion. Hence, when it is necessary to show clearly what particular case is intended, it is usual to add defining particles corresponding to the English prepositions "of," "to," "from," "by," &c., which, as in all Indo-Aryan languages they follow the main word, are here called "postpositions." The following are the postpositions commonly employed to form cases in our three languages:—

[1] In some dialects of W.H. weak forms have masculines ending in *u* and corresponding feminines in *i*, but these are nowadays rarely met in the literary forms of speech. In old poetry they are common. In Braj Bhasha they have survived in the present participle.

SpinSmart Software http://www.spinsmart.com

	Agent.	Genitive.	Dative.	Ablative.	Locative.
Panjabi . .	*nai*	*dā*	*nũ*	*tẽ*	*vicc*
Hindostani .	*nẽ*	*kā*	*kō*	*sẽ*	*mẽ*
Braj Bhasha	*nẽ*	*kau*	*kaũ*	*tẽ, saũ*	*maī*
Eastern Hindi	None	*kēr, k*	*kā*	*sẽ*	*mẽ, bikhẽ*

The agent case is the case which a noun takes when it is the subject of a transitive verb in a tense formed from the past participle. This participle is passive in origin, and must be construed passively. In the Prakrit stage the subject was in such cases put into the instrumental case (see PRAKRIT), as in the phrase *ahaṁ tēṇa māriō*, I by-him (was) struck, *i.e.* he struck me. In Eastern Hindi this is still the case, the old instrumental being represented by the oblique form without any suffix. The other two languages define the fact that the subject is in the instrumental (or agent) case by the addition of the postposition *nē*, &c., an old form employed elsewhere to define the dative. It is really the oblique form (by origin a locative) of *nā* or *nō*, which is employed in Gujarati (*q.v.*) for the genitive. As this suffix is never employed to indicate a material instrument but here only to indicate the agent or subject of a verb, it is called the postposition of the "agent" case.

The genitive postpositions have an interesting origin. In Buddhist Sanskrit the words *kṛtas*, done, and *kṛtyas*, to be done, were added to a noun to form a kind of genitive. A synonym of *kṛtyas* was *kāryas*. These three words were all adjectives, and agreed with the thing possessed in gender, number, and case; thus, *māla-kṛtē karaṇḍē*, in the basket of the garland, literally, in the garland-made basket. In the various dialects of Apabhraṁśa Prakrit *kṛtas* became (strong form) *kida-u* or *kia-u*, *kṛtyas* became *kicca-u*, and *kāryas* became *kēra-u* or *kajja-u*, the initial *k* of which is liable to elision after a vowel. With the exception of Gujarati (and perhaps Marathi, *q.v.*) every Indo-Aryan language has genitive postpositions derived from one or other of these forms. Thus from (*ki*)*da-u* we have Panjabi *dā*; from *kia-u* we have H. *kā*, Br. *kau*, E.H. and Bihari *k* and Naipali *kō*; from (*ki*)*cca-u* we have perhaps Marathi *cā*; from *kēra-u*, E.H. and Bihari *kēr*, *kar*, Bengali Oriya and Assamese *-r*, and Rajasthani *-rō*; while from (*ka*)*jja-u* we have the Sindhi *jō*. It will be observed that while *k*, *kēr*, *kar*, and *r* are weak forms, the rest are strong. As already stated, the genitive is an adjective. *Bāp* means "father," and *bāp-kā ghōrā* is literally "the paternal horse." Hence (while the weak forms as usual do not change) these genitives agree with the thing possessed in gender, number, and case. Thus, *bāp-kā ghōṛā*, the horse of the father, but *bāp-kī ghōṛī*, the mare of the father, and *bāp-kē ghōṛē-kō*, to the horse of the father, the *kā* being put into the oblique case masculine *kē*, to agree with *ghōṛē*, which is itself in an oblique case. The details of the agreement vary slightly in P. and W.H., and must be learnt from the grammars. The E.H. weak forms do not change in the modern language. Finally, in Prakrit it was customary to add these postpositions (*kēra-u*, &c.) to the genitive, as in *mama* or *mama kēra-u*, of me. Similarly these postpositions are, in the modern languages, added to the oblique form.

The locative of the Sanskrit *kṛtas*, *kṛtē*, was used in that language as a dative postposition, and it can be shown that all the dative postpositions given above are by origin old oblique forms of some genitive postposition. Thus H. *kō*, Br. *kaũ*, is a contraction of *kahũ*, an old oblique form of *kia-u*. Similarly for the others. The origin of the ablative postpositions is obscure. To the present writer they all seem (like the Bengal *haītē*) to be connected with the verb substantive, but their derivation has not been definitely fixed. The locative postpositions *mẽ* and *maī* are derived from the Skr. *madhyē*, in, through *majjhi*, *māhī*, and so on. The derivation of *vicc* and *bikhe* is obscure.

The pronouns closely follow the Prakrit originals. This will be evident from the preceding table of the first two personal pronouns compared with Apabhraṁśa.

It will be observed that in most of the nominatives of the first person, and in the E.H. nominative of the second person, the old nominative has disappeared, and its place has been supplied by an oblique form, exactly as we have observed in the nominative plural of nouns substantive. The P. *asī̃*, *tusī̃*, &c., are survivals from the old Lahndā (see *Linguistic Boundaries*, above). The genitives of these two pronouns are rarely used, possessive pronouns (in H. *mērā*, my; *hamārā*, our; *tērā*, thy; *tumhārā*, your) being employed instead. They can all (except P. *asāḍā*, our; *tusāḍā*, your, which are Lahndā) be referred to corresponding Ap. forms.

There is no pronoun of the third person, the demonstrative pronouns being used instead. The following table shows the principal remaining pronominal forms, with their derivation from Ap.:—

		Apabhraṁśa.	Panjabi.	Hindostani.	Braj Bhasha.	Eastern Hindi.
THAT, HE,	Nom.	?	*uh*	*woh*	*wō*	*ū*
	Obl.	?	*uh*	*us*	*wā*	*ō*
THOSE, THEY,	Nom.	*ōi*	*ōh*	*wé*	*wai*	*unh*
	Obl.	?	*unhā̃*	*unh*	*uni*	*unh*
THIS, HE,	Nom.	*ēhu*	*ih*	*yeh*	*yah*	*ī*
	Obl.	*ēhasu, ēhaho*	*ih*	*is*	*yā*	*ē*
THESE, THEY,	Nom.	*ēi*	*ēh*	*yẽ*	*yai*	*inh*
	Obl.	*ēhāṇa*	*inhā̃*	*inh*	*ini*	*inh*
THAT,	Nom.	*sō*	*sō*	*sō*	*sō*	*sē*
	Obl.	*tasu, taho*	*tih*	*tis*	*tā*	*tē*
THOSE,	Nom.	*sē*	*sō*	*sō*	*sō*	*sē*
	Obl.	*tāṇa*	*tinhā̃*	*tinh*	*tini*	*tenh*
WHO,	Nom.	*jō*	*jō*	*jō*	*jō*	*jē*
	Obl.	*jasu, jaho*	*jih*	*jis*	*jā*	*jē*
WHO (pl.),	Nom.	*jē*	*jō*	*jō*	*jō*	*jē*
	Obl.	*jāṇa*	*jinhā̃*	*jinh*	*jini*	*jenh*
WHO?	Nom.	*kō, kawaṇu*	*kauṇ*	*kaun*	*kō*	*kē*
	Obl.	*kasu, kaho*	*kih*	*kis*	*kā*	*kē*
WHO? (pl.),	Nom.	*kē*	*kauṇ*	*kaun*	*kō*	*kē*
	Obl.	*kāṇa*	*kinhā̃*	*kinh*	*kini*	*kenh*
WHAT?(Neut.),	Nom.	*kiṁ*	*kiā*	*kyā*	*kahā*	*kā*
	Obl.	*kāha, kāsu*	*kāh, kās*	*kāhē*	*kāhē*	*kāhē*

The origin of the first pronoun given above (that, he; those, they) cannot be referred to Sanskrit. It is derived from an Indo-Aryan base which was not admitted to the classical literary language, but of which we find sporadic traces in Apabhraṁśa. The existence of this base is further vouched for by its occurrence in the Iranian language of the Avesta under the form *ava-*. The base of the second pronoun is the same as the base of the first syllable in the Skr. *ē-ṣas*, this, and other connected pronouns, and also occurs in the Avesta. Ap. *ēhu* is directly derived from *ē-sas*.

There are other pronominal forms upon which, except perhaps *kōī* (Pr. *kō-vi*, Skr. *kō-'pi*), any one, it is unnecessary to dwell. The phrase *kōī hai?* "Is any one (there)?" is the usual formula for calling a servant in upper India, and is the origin of the Anglo-Indian word "Qui-hi." The reflexive pronoun is *āp* (Ap. *appu*, Skr. *ātmā*), self, which, something like the Latin *suus* (Skr. *svas*), always refers to the subject of the sentence, but to all persons, not only to the third. Thus *maī apnē* (not *mērē*) *bāp-kō dēkhtā-hū̃*, "I see my father."

C. *Conjugation.*—The synthetic conjugation was already commencing to disappear in Prakrit, and in the modern languages the only original tenses which remain are the present, the imperative, and here and there the future. The first is now generally employed as a present subjunctive. In the accompanying table we have the conjugation of this tense, and also the three participles, present active, and past and future passive, compared with Apabhraṁśa, the verb selected being the intransitive root *call* or *cal*, go. In Ap. the word may be spelt with one or with two *l*s, which accounts for the variations of spelling in the modern languages.

The imperative closely resembles the old present, except that it drops all terminations in the 2nd person singular; thus, *cal*, go thou.

In P. and H. a future is formed by adding the syllable *gā* (fem. *gī*) to the simple present. Thus, H. *calū̃-gā*, I shall go. The *gā* is commonly said to be derived from the Skr. *gatas* (Pr. *gaō*), gone, but this suggestion is not altogether acceptable to the present writer, although he is not now able to propose a better. Under the form of *-gau* the same termination is used in Br., but in that dialect the old future has also survived, as in *calihaũ* (Ap. *calihaũ*, Skr. *calişyāmi*), I shall go, which is conjugated like the simple present. The E.H. formation of the future is closely analogous to what we find in Bihari (*q.v.*). The third person is formed as in Braj Bhasha, but the first and second persons are formed by adding pronominal suffixes, meaning "by me," "by thee," &c., to the future passive participle.

		Apabhraṁśa.	Panjabi.	Hindostani.	Braj Bhasha.	Eastern Hindi.

	Apabhraṁśa.	Panjabi.	Hindostani.	Braj Bhasha.	Eastern Hindī.
Old Present—					
Singular 1. . . .	*callaũ*	*callā̃*	*calū*	*calaũ*	*calaũ*
,, 2. . . .	*callasi, callahi*	*callẽ*	*calẽ*	*calai*	*calas*
,, 3. . . .	*callai*	*callē*	*calẽ*	*calai*	*calai*
Plural 1. . . .	*callahũ*	*calliyẽ*	*calẽ*	*calaī*	*calaī*
,, 2. . . .	*callahu*	*callō*	*calō*	*calau*	*calau*
,, 3. . . .	*callanti, callahī*	*callaṇ*	*calẽ*	*calaī*	*calaī*
Present Participle .	*callanta-u*	*calldā*	*caltā*	*calatu*	*calat*
Past Part. Passive .	*callia-u*	*calliā*	*calā*	*calyau*	*calā*
Future Part. Passive .	*callaṇia-u*	*callṇā*	*calnā*	*calnaũ*	
	calliavva-u	..	..	*caliwaũ*	*calab*

Thus, *calab-ū̃*, it-is-to-be-gone by-me, I shall go. We thus get the following forms. It will be observed that, as in many other Indo-Aryan languages, the first person plural has no suffix:—

	Sing.	Plur.
1.	*calabū̃*	*calab*
2.	*calabē*	*calabō*
3.	*calihai*	*calihaī*

In old E.H. the future participle passive, *calab*, takes no suffix for any person, and is used for all persons.

The last remark leads us to a class of tenses in P. and W.H., in which a participle, by itself, can be employed for any person of a finite tense. A few examples of the use of the present and past participles will show the construction. They are all taken from Hindostani. *Woh caltā*, he goes; *woh caltī*, she goes; *maī calā*, I went; *woh calī*, she went; *wē calē*, they went. The present participle in this construction, though it may be used to signify the present, is more commonly employed to signify a past conditional "(if) he had gone." It will have been observed that in the above examples, in all of which the verb is intransitive, the past as well as the present participle agrees with the subject in gender and number; but, if the verb be transitive, the passive meaning of the past participle comes into force. The subject must be put into the case of the agent, and the participle inflects to agree with the object. If the object be not expressed, or, as sometimes happens, be expressed in the dative case, the participle is construed impersonally, and takes the masculine (for want of a neuter) form. Thus, *maī-nē kahā*, by-me it-was-said, *i.e.* I said; *us-nē ciṭṭhī likhī*, by-him a-letter (fem.) was-written, he wrote a letter; *rājā-nē shērnī-kō mārā*, the king killed the tigress, lit., by-the-king, with-reference-to-the-tigress, it (impersonal) -was-killed. In the article PRAKRIT it is shown that the same construction obtained in that language.

In E.H. the construction is the same, but is obscured by the fact that (as in the future) pronominal suffixes are added to the participle to indicate the person of the subject or of the agent, as in *calat-eũ*, (if) I had gone; *cal-eũ*, I went; *mār-eũ* (transitive), I struck, lit., struck-by-me; *mār-es*, struck-by-him, he struck. If the participle has to be feminine, it (although a weak form) takes the feminine termination *i*, as in *māri-ū̃*, I struck her; *calati-ū̃*, (if) I (fem.) had gone; *cali-ū̃*, I (fem.) went.

Further tenses are formed by adding the verb substantive to these participles, as in H. *maī caltā-hū̃*, I am going; *maī caltā-thā*, I was going; *maī calā-hū̃*, I have gone; *maī calā-thā*, I had gone. These and other auxiliary verbs need not detain us long. They differ in the various languages. For "I am" we have P. *hā̃*, H. *hū̃*, Br. *haũ*, E.H. *bāṭyeũ* or *aheũ*. For "I was" we have P. *sī* or *sā*, H. *thā*, Br. *hau* or *hutau*, E.H. *raheũ*. The H. *hū̃* is thus conjugated:—

	Sing.	Plur.
1.	*hū̃*	*haī*
2.	*hai*	*hō*
3.	*hai*	*haī*

The derivation of *hā̃*, *hū̃*, *haũ*, and *aheũ* is uncertain. They are usually derived from the Skr. *asmi*, I am; but this presents many difficulties. An old form of the third person singular is *hwai*, and this points to the Pr. *havaī*, he is, equivalent to the Skr. *bhavati*, he becomes. On the other hand this does not account for the initial *a* of *aheũ*. This last word is in the *form* of a past tense, and it may be a secondary formation from *asmi*. The P. *sī* is not a feminine of *sā*, as usually stated, but is a survival of the Skr. *āsīt*, Pr. *āsī*, was. As in the Prakrit form, *sī* is employed for both genders, both numbers and all persons. *Sā* is a secondary formation from this, on the analogy of the H. *thā*, which is from the Skr. *sthitas*, Pr. *thiō*, stood, and is a participial form like *calā*; thus, *woh thā*, he was; *woh thī*, she was. The Br. *hau* is a modern past of *haũ*, while *hutau* is probably by origin a present participle of the Skr. *bhū*, become, Pr. *huntaō*. The E.H. *bāṭeũ*, is the Skr. *vartē*, Ap. *vaṭṭaũ*. *Raheũ* is the past tense of the root *rah*, remain.

The future participle passive is everywhere freely used as an infinitive or verbal noun; thus, H. *calnā*, E.H. *calab*, the act of going, to go. There is a whole series of derivative verbal forms, making potential passives and transitives from intransitives, and causals (and even double causals) from transitives. Thus *dīkhnā*, to be seen; potential passive, *dikhānā*, to be visible; transitive, *dēkhnā*, to see; causal, *dikhlānā*, to show.

D. *Literature.*—The literatures of Western and Eastern Hindi form the subject of a separate article (see HINDOSTANI LITERATURE). Panjabi has no formal literature. Even the *Granth*, the sacred book of the Sikhs, is mainly in archaic Western Hindi, only a small portion being in Panjabi. On the other hand, the language is peculiarly rich in folksongs and ballads, some of considerable length and great poetic beauty. The most famous is the ballad of *Hīr and Rānjhā* by Wāris Shāh, which is considered to be a model of pure Panjabi. Colonel Sir Richard Temple has published an important collection of these songs under the title of *The Legends of the Punjab* (3 vols., Bombay and London, 1884–1900), in which both texts and translations of nearly all the favourite ones are to be found.

AUTHORITIES.—(*a*) General: The two standard authorities are the comparative grammars of J. Beames (1872–1879) and A. F. R. Hoernle (1880), mentioned in the article INDO-ARYAN LANGUAGES. To these may be added G. A. Grierson, "On the Radical and Participial Tenses of the Modern Indo-Aryan Languages" in the *Journal of the Asiatic Society of Bengal*, vol. lxiv. (1895), part i. pp. 352 et seq.; and "On Certain Suffixes in the Modern Indo-Aryan Vernaculars" in the *Zeitschrift für vergleichende Sprachforschung auf dem Gebiete der indogermanischen Sprachen* for 1903, pp. 473 et seq.

(*b*) For the separate languages, see C. J. Lyall, *A Sketch of the Hindustani Language* (Edinburgh, 1880); S. H. Kellogg, *A Grammar of the Hindi Language* (for both Western and Eastern Hindi), (2nd ed., London, 1893); J. T. Platts, *A Grammar of the Hindūstānī or Urdū Language* (London, 1874); and *A Dictionary of Urdū, Classical Hindi and English* (London, 1884); E. P. Newton, *Panjābī Grammar: with Exercises and Vocabulary* (Ludhiana, 1898); and Bhai Maya Singh, *The Panjabi Dictionary* (Lahore, 1895). *The Linguistic Survey of India*, vol. vi., describes Eastern Hindi, and vol. ix., Hindostani and Panjabi, in each instance in great detail.

(G. A. GR.)

HINDŌSTĀNĪ LITERATURE. The writings dealt with in this article are those composed in the vernacular of that part of India which is properly called Hindōstān,—that is, the valleys of the Jumna and Ganges rivers as far east as the river Kōs, and the tract to the south including Rajpūtānā, Central India (Bundēlkhaṇḍ and Baghēlkhaṇḍ), the Narmadā (Nerbudda) valley as far west as Khandwā, and the northern half of the Central Provinces. It does not include the Punjab proper (though the town population there speak Hindōstānī), nor does it extend to Lower Bengal.

In this region several different dialects prevail. The people of the towns everywhere use chiefly the form of the language called *Urdū* or *Rēkhta*,[1] stocked with Persian words and phrases, and ordinarily written in a modification of the Persian character. The country folk (who form the immense majority) speak different varieties of *Hindī*, of which the word-stock derives from the Prākrits and literary Sanskrit, and which are written in the Dēvanāgarī or Kaithī character. Of these the most important from a literary point of view, proceeding from west to east, are *Mārwārī* and *Jaipurī* (the languages of Rajpūtānā), *Brajbhāshā* (the language of the country about Mathurā and Agra), *Kanaujī* (the language of the lower Ganges-Jumna Doāb and western Rohilkhaṇḍ), *Eastern Hindī*, also called *Awadhī* and *Baiswārī* (the language of Eastern Rohilkhaṇḍ, Oudh and the Benares division of the United Provinces) and *Bihārī* (the language of Bihār or Mithilā, comprising several distinct dialects). What is called *High Hindī* is a modern development, for literary purposes, of the dialect of Western Hindi spoken in the neighbourhood of Delhi and thence northwards to the Himālaya, which has formed the vernacular basis of Urdū; the Persian words in the latter have been eliminated and replaced by words of Sanskritic origin, and the order of words in the sentence which is proper to

[1] *Urdū* is a Turkish word meaning a camp or army with its followers, and is the origin of the European word *horde*. *Rēkhta* means "scattered, strewn," referring to the way in which Persian words are intermixed with those of Indian origin; it is used chiefly for the literary form of Urdū.

Hindī literature, the works of the *Bhagats*, mention may be made here of a remarkable composition, a poem entitled the *Padmāwat*, the materials of which are derived from the heroic legends of Rajpūtānā, but which is not the work of a bard nor even of a Hindu. The author, Malik Muḥammad of Jā'is, in Oudh, was a venerated Muslim devotee, to whom the Hindu rājā of Amēṭhī was greatly attached. Malik Muḥammad wrote the Padmāwat in 1540, the year in which Shēr Shāh Sūr ousted Humāyān from the throne of Delhi. The poem is composed in the purest vernacular Awadhī, with no admixture of traditional Hindu learning, and is generally to be found written in the Persian character, though the metres and language are thoroughly Indian. It professes to tell the tale of Padmāwatī or Padminī, a princess celebrated for her beauty who was the wife of the Chauhān rājā of Chītōr in Mēwār. The historical Padminī's husband was named Bhīm Singh, but Malik Muḥammad calls him Ratan Sēn; and the story turns upon the attempts of 'Alā'uddīn Khiljī, the sovereign of Delhi, to gain possession of her person. The tale of the siege of Chītōr in 1303 by 'Alā-uddīn, the heroic stand made by its defenders, who perished to the last man in fight with the Sultan's army, and the self-immolation of Padminī and the other women, the wives and daughters of the warriors, by the fiery death called *jōhar*, will be found related in Tod's *Rājāsthān*, i. 262 sqq. Malik Muḥammad takes great liberties with the history, and explains at the end of the poem that all is an allegory, and that the personages represent the human soul, Divine wisdom, Satan, delusion and other mystical characters.

Both on account of its interest as a true vernacular work, and as the composition of a Musalmān who has taken the incidents of his morality from the legends of his country and not from an exotic source, the poem is memorable. It has often been lithographed, and is very popular; a translation has even been made into Sanskrit. A critical edition has been prepared by Dr G. A. Grierson and Paṇḍit Sudhākar Dwivēdī.

The other class of composition which is characteristic of the period of early Hindī, the literature of the *Bhagats*, or Vaishnava saints, who propagated the doctrine of *bhakti*, or faith in Vishnu, as the popular religion of Hindōstān, has exercised a much more powerful influence both upon the national speech and upon the themes chosen for poetic treatment. It is also, as a body of literature, of high intrinsic interest for its form and content. Nearly the whole of subsequent poetical composition in Hindī is impressed with one or other type of Vaishnava doctrine, which, like Buddhism many centuries before, was essentially a reaction against Brahmanical influence and the chains of caste, a claim for the rights of humanity in face of the monopoly which the "twice-born" asserted of learning, of worship, of righteousness. A large proportion of the writers were non-Brahmans, and many of them of the lowest castes. As Śiva was the popular deity of the Brahmans, so was Vishnu of the people; and while the literature of the Śaivas and Śāktas[1] is almost entirely in Sanskrit, and exercised little or no influence on the popular mind in northern India, that of the Vaishnavas is largely in Hindī, and in itself constitutes the great bulk of what has been written in that language.

The Vaishnava doctrine is commonly carried back to Rāmānuja, a Brahman who was born about the end of the 11th century, at Perambur in the neighbourhood of the modern Madras, and spent his life in southern India. His works, which are in Sanskrit and consist of commentaries on the Vēdānta Sūtras, are devoted to establishing "the personal existence of a Supreme Deity, possessing every gracious attribute, full of love and pity for the sinful beings who adore him, and granting the released soul a home of eternal bliss near him—a home where each soul never loses its identity, and whose state is one of perfect peace."[2] In the Deity's infinite love and pity he has on several occasions become incarnate for the salvation of mankind, and of these incarnations two, Rāmachandra, the prince of Ayōdhyā, and Krishṇa, the chief of the Yādava clan and son of Vasudēva, are pre-eminently those in which it is most fitting that he should be worshipped. Both of these incarnations had for many centuries[3] attracted popular veneration, and their histories had been celebrated by poets in epics and by weavers of religious myths in *Purānas* or "old stories"; but it was apparently Rāmānuja's teaching which secured for them, and especially for Rāmachandra, their exclusive place as the objects of *bhakti*—ardent faith and personal devotion addressed to the Supreme. The adherents of Rāmānuja were, however, all Brahmans, and observed very strict rules in respect of food, bathing and dress; the new doctrine had not yet penetrated to the people.

Whether Rāmānuja himself gave the preference to Rāma against Krishna as the form of Vishnu most worthy of worship is uncertain. He dealt mainly with philosophic conceptions of the Divine Nature, and probably busied himself little with mythological legend. His *mantra*, or formula of initiation, if Wilson[4] was correctly informed, implies devotion to Rāma; but Vāsudēva (Krishna) is also mentioned as a principal object of adoration, and Rāmānuja himself dwelt for several years in Mysore, at a temple erected by the rājā at Yādavagiri in honour of Krishna in his form Raṇchhōṛ.[5] It is stated that in his worship of Krishna he joined with that god as his *Śaktī*, or Energy, his wife Rukminī; while the later varieties of Krishna-worship prefer to honour his mistress Rādhā. The great difference, in temper and influence upon life, between these two forms of Vaishnava faith appears to be a development subsequent to Rāmānuja; but by the time of Jaidēo (about 1250) it is clear that the theme of Krishna and Rādhā, and the use of passionate language drawn from the relations of the sexes to express the longings of the soul for God, had become fully established; and from that time onwards the two types of Vaishnava religious emotion diverged more and more from one another.

The cult of Rāma is founded on family life, and the relation of the worshipper to the Deity is that of a child to a father. The morality it inculcates springs from the sacred sources of human piety which in all religions have wrought most in favour of pureness of life, of fraternal helpfulness and of humble devotion to a loving and tender Parent, who desires the good of mankind, His children, and hates violence and wrong. That of Krishna, on the other hand, had for its basis the legendary career of a less estimable human hero, whose exploits are marked by a kind of elvish and fantastic wantonness; it has more and more spent its energy in developing that side of devotion which is perilously near to sensual thought, and has allowed the imagination and ingenuity of poets to dwell on things unmeet for verse or even for speech. It is claimed for those who first opened this way to faith that their hearts were pure and their thoughts innocent, and that the language of erotic passion which they use as the vehicle of their religious emotion is merely mystical and allegorical. This is probable; but that these beginnings were followed by corruption in the multitude, and that the fervent impulses of adoration made way in later times for those of lust and lasciviousness, seems beyond dispute.

The worship of Krishna, especially in his infant and youthful form (which appeals chiefly to women), is widely popular in the neighbourhood of Mathurā, the capital of that land of Braj where as a boy he lived. Its literature is mainly composed in the dialect of this region, called Brajbhāshā. That of Rāma,

[1] Worshippers of the energic power—*Śaktī*—of Śiva, represented by his consort Pārvatī or Bhawānī.

[2] Quoted from G. A. Grierson, chapter on "Literature," in the *India Gazetteer* (ed. 1907).

[3] The worship of Krishna is as old as Megasthenes (about 300 B.C.), who calls him Herakles, and was then, as now, located at Mathurā on the Jumna river. That of Rāma is probably still more ancient; the name occurs in stories of the Buddha.

[4] *Religious Sects of the Hindus*, p. 40.

[5] This name of Krishna, which means "He who quits the battle," is connected with the story of the transfer of the Yādava clan from Mathurā to the new capital on the coast of the peninsula of Kāthiawār, the city of Dwārakā. This migration was the result of an invasion of Braj by Jarāsandha, king of Magadhā, before whom Krishna resolved to retreat. As his path southwards took him through Rajpūtānā and Gujarāt, it is in these regions that his form Raṇchhōṛ is most generally venerated as a symbol of the shifting of the centre of divine life from Gangetic to southern India.

SpinSmart Software http://www.spinsmart.com

the indigenous speech is more strictly adhered to than in Urdū, which under the influence of Persian constructions has admitted many inversions.

As in many other countries, nearly all the early vernacular literature of Hindōstān is in verse, and works in prose are a modern growth.[1] Both Hindī and Urdū are, in their application to literary purposes, at first intruders upon the ground already occupied by the learned languages Sanskrit and Persian, the former representing Hindū and the latter Musalmān culture. But there is this difference between them, that, whereas Hindī has been raised to the dignity of a literary speech chiefly by impulses of revolt against the monopoly of the Brahmans, Urdū has been cultivated with goodwill by authors who have themselves highly valued and dexterously used the polished Persian. Both Sanskrit and Persian continue to be employed occasionally for composition by Indian writers, though much fallen from their former estate; but for popular purposes it may be said that their vernacular rivals are now almost in sole possession of the field.

The subject may be conveniently divided as follows:—

1. Early Hindī, of the period during which the language was being fashioned as a literary medium out of the ancient Prākrits, represented by the old heroic poems of Rajpūtānā and the literature of the early *Bhagats* or Vaishnava reformers, and extending from about A.D. 1100 to 1550;
2. Middle Hindī, representing the best age of Hindī poetry, and reaching from about 1550 to the end of the 18th century;
3. The rise and development of literary Urdū, beginning about the end of the 16th century, and reaching its height during the 18th;
4. The modern period, marked by the growth of a prose literature in both dialects, and dating from the beginning of the 19th century.

1. *Early Hindī.*—Our knowledge of the ancient metrical chronicles of Rajpūtānā is still very imperfect, and is chiefly derived from the monumental work of Colonel James Tod, called *The Annals and Antiquities of Rājāsthān* (published in 1829–1832), which is founded on them. It is in the nature of compositions of this character to be subjected to perpetual revision and recasting; they are the production of the family bards of the dynasties whose fortunes they record, and from generation to generation they are added to, and their language constantly modified to make it intelligible to the people of the time. Round an original nucleus of historical fact a rich growth of legend accumulates; later redactors endeavour to systematize and to assign dates, but the result is not often such as to inspire confidence; and the mass has more the character of ballad literature than of serious history. The materials used by Tod are nearly all still unprinted; his manuscripts are now deposited in the library of the Royal Asiatic Society in London; and one of the tasks which, on linguistic and historical grounds, should first be undertaken by the investigator of early Hindī literature is the examination and sifting, and the publication in their original form, of these important texts.

Omitting a few fragments of more ancient bards given by compilers of accounts of Hindī literature, the earliest author of whom any portion has as yet been published in the original text is Chand Bardāī, the court bard of Prithwī-Rāj, the last Hindū sovereign of Delhi. His poem, entitled *Prithī-Rāj Rāsau* (or *Rāysā*), is a vast chronicle in 69 books or cantos, comprising a general history of the period when he wrote. Of this a small portion has been printed, partly under the editorship of the late Mr John Beames and partly under that of Dr Rudolf Hoernle, by the Asiatic Society of Bengal; but the excessively difficult nature of the task prevented both scholars from making much progress.[2] Chand, who came of a family of bards, was a native of Lahore, which had for nearly 170 years (since 1023) been under Muslim rule when he flourished, and the language of the poem exhibits a considerable leaven of Persian words. In its present form the work is a redaction made by Amar Singh of Mēwār, about the beginning of the 17th century, and therefore more than 400 years after Chand's death, with his patron Prithwī-Rāj, in 1193. There is, therefore, considerable reason to doubt whether we have in it much of Chand's composition in its original shape; and the nature of the incidents described enhances this doubt. The detailed dates contained in the Chronicle have been shown by Kabirāj Syāmal Dās[3] to be in every case about ninety years astray. It tells of repeated conflicts between the hero Prithwī-Rāj and Sultān Shihābuddin, of Ghōr (Muhammad Ghori), in which the latter always, except in the last great battle, comes off the worst, is taken prisoner and is released on payment of a ransom; these seem to be entirely unhistorical, our contemporary Persian authorities knowing of only one encounter (that of Tiraurī (Tirawari) near Thēnēsar, fought in 1191) in which the Sultān was defeated, and even then he escaped uncaptured to Lahore. The Mongols (Book XV.) are brought on the stage more than thirty years before they actually set foot in India, and are related to have been vanquished by the redoubtable Prithwī-Rāj. It is evident that such a record cannot possibly be, in its entirety, a contemporary chronicle; but nevertheless it appears to contain a considerable element which, from its language, may belong to Chand's own age, and represents the earliest surviving document in Hindī. "Though we may not possess the actual text of Chand, we have certainly in his writings some of the oldest known specimens of Gaudian literature, abounding in pure Apabhramśa Śaurasēnī Prākrit forms" (Grierson).

It is very difficult now to form a just estimate of the poem as literature. The language, essentially transitional in character, consists largely of words which have long since died out of the vernacular speech. Even the most learned Hindus of the present day are unable to interpret it with confidence; and the meaning of the verses must be sought by investigating the processes by which Sanskrit and Prākrit forms have been transfigured in their progress into Hindī. Chand appears, on the whole, to exhibit the merits and defects of ballad chroniclers in general. There is much that is lively and spirited in his descriptions of fight or council; and the characters of the Rājpūt warriors who surround his hero are often sketched in their utterances with skill and animation. The sound, however, frequently predominates over the sense; the narrative is carried on with the wearisome iteration and tedious unfolding of familiar themes and images which characterize all such poetry in India; and his value, for us at least, is linguistic rather than literary.

Chand may be taken as the representative of a long line of successors, continued even to the present day in the Rājpūt states. Many of their compositions are still widely popular as ballad literature, but are known only in oral versions sung in Hindōstān by professional singers. One of the most famous of these is the *Ālhā-khaṇḍ*, reputed to be the work of a contemporary of Chand called Jagnik or Jagnāyak, of Mahōbā in Bundēlkhaṇḍ, who sang the praises of Rājā-Parmāl, a ruler whose wars with Prithwī-Rāj are recorded in the Mahōbā-Khaṇḍ of Chand's work. Ālhā and Ūdal, the heroes of the poem, are famous warriors in popular legend, and the stories connected with them exist in an eastern recension, current in Bihār, as well as in the Bundēlkhaṇḍī or western form which is best known. Two versions of the latter have been printed, having been taken down as recited by illiterate professional rhapsodists. Another celebrated bard was Sārangdhar of Rantambhōr, who flourished in 1363, and sang the praises of Hammīr Dēo (Hamir Deo), the Chauhān chief of Rantambhōr who fell in a heroic struggle against Sultān 'Alā'uddīn Khiljī in 1300. He wrote the *Hammīr Kāvya* and *Hammīr Rāsau*, of which an account is given by Tod;[4] he was also a poet in Sanskrit, in which language he compiled, in 1363, the anthology called *Sārngadhara-Paddhati*. Another work which may be mentioned (though much more modern) is the long chronicle entitled *Chhattra-Prakās*, or the history of Rājā Chhatarsāl, the Bundēlā rājā of Pannā, who was killed, fighting on behalf of Prince Dārā-Shukōh, in the battle of Dhōlpur won by Aurangzēb in 1658. The author, Lāl Kabi, has given in this work a history of the valiant Bundēlā nation which was rendered into English by Captain W. R. Pogson in 1828, and printed at Calcutta.

Before passing on to the more important branch of early

[1] The only known exceptions are a work in Hindī called the *Chaurāsī Vārtā* (mentioned below) and a few commentaries on poems; the latter can scarcely be called literature.

[2] A fresh critical edition of the text by Paṇḍit Mōhan Lāl Vishnu Lāl Paṇḍia at Benares, under the auspices of the *Nāgarī Prachārinī Sabhā*, had reached canto xxiv. in 1907.

though general throughout Hindōstān, has since the time of Tulsī Dās adopted for poetic use the language of Oudh, called Awadhī or Baiswārī, a form of Eastern Hindī easily understood throughout the whole of the Gangetic valley. Thus these two dialects came to be, what they are to this day, the standard vehicles of poetic expression.

Subsequently to Rāmānuja his doctrine appears to have been set forth, about 1250, in the vernacular of the people by Jaidēo, a Brahman born at Kinduvilva, the modern Kenduli, in the Bīrbhūm district of Bengal, author of the Sanskrit *Gītā Gōvinda*, and by Nāmdēo or Nāmā, a tailor[1] of Mahārāshtra, of both of whom verses in the popular speech are preserved in the *Ādi Granth* of the Sikhs. But it was not until the beginning of the 15th century that the Brahman Rāmānand, a prominent *Gōsāiṅ* of the sect of Rāmānuja, having had a dispute with the members of his order in regard to the stringent rules observed by them, left the community, migrated to northern India (where he is said to have made his headquarters Galtā in Rajpūtānā), and addressed himself to those outside the Brahman caste, thus initiating the teaching of Vaishnavism as the popular faith of Hindōstān. Among his twelve disciples or apostles were a Rājpūt, a Jāt, a leather-worker, a barber and a Musalmān weaver; the last-mentioned was the celebrated KABĪR (see separate article). One short Hindī poem by Rāmānand is contained in the *Ādi Granth*, and Dr Grierson has collected hymns (*bhajans*) attributed to him and still current in Mithilā or Tirhūt. Both Rāmānand and Kabīr were adherents of the form of Vaishnavism where devotion is specially addressed to Rāma, who is regarded not only as an incarnation, but as himself identical with the Deity. A contemporary of Rāmānand, Bidyāpati Ṭhākur, is celebrated as the author of numerous lyrics in the Maithilī dialect of Bihār, expressive of the other side of Vaishnavism, the passionate adoration of the Deity in the person of Krishna, the aspirations of the worshipper being mystically conveyed in the character of Rādhā, the cowherdess of Braj and the beloved of the son of Vasudēva. These stanzas of Bidyāpati (who was a Brahman and author of several works in Sanskrit) afterwards inspired the Vaishnava literature of Bengal, whose most celebrated exponent was Chaitanya (b. 1484). Another famous adherent of the same cult was Mīrā Bāī, "the one great poetess of northern India" (Grierson). This lady, daughter of Rājā Ratiyā Rānā, Rāṭhōr, of Mērtā in Rajpūtānā, must have been born about the beginning of the 15th century; she was married in 1413 to Rājā Kumbhkaran of Mēwār, who was killed by his son Uday Rānā in 1469. She was devoted to Krishna in the form of Raṇchhōṛ, and her songs have a wide currency in northern India.

An important compilation of the utterances of the early Vaishnava saints or *Bhagats* is contained in the sacred book, or *Ādi Granth*, of the Sikh *Gurus*. Nānak, the founder of this sect (1469–1538), though a native of the Punjab (born at Talvandī on the Rāvī near Lahore), took his doctrine from the *Bhagats* (see KABĪR); and each of the thirty-one *rāgs*, forming the body of the *Granth*, is followed by a compilation of texts from the utterances of Vaishnava saints, chiefly of Kabīr, in confirmation of the teaching of the *Gurus*, while the whole book is closed by a *bhōg* or conclusion, containing more verses by the same authors, as well as by a celebrated Indian Sūfī, Shēkh Farīd of Pākpaṭṭan. The body of the *Granth* (*q.v.*), being in old Panjābī, falls outside the scope of this article; but the extracts included in it from the early writers of old Hindī are a precious store of specimens of authors some of whom have left no other record in the surviving literature. The *Ādi Granth*, which was put together about 1600 by Arjun, the fifth *Guru* of the Sikhs, sets forth the creed of the sect in its original pietistic form, before it assumed the militant character which afterwards distinguished it under the five *Gurus* who succeeded him.

2. *Middle Hindī.*—The second period, that of middle Hindī, begins with the reign of the Emperor Akbar (1556–1605); and it is not improbable that the broad and liberal views of this great monarch, his active sympathy with his Hindū subjects, the interest which he took in their religion and literature, and the peace which his organization of the empire secured for Hindostan, had an important effect on the great development of Hindī poetry which now set in.[2] Akbar's court was itself a centre of poetical composition. The court musician Tān Sēn (who was also a poet) is still renowned, and many verses composed by him in the Emperor's name live to this day in the memory of the people. Akbar's favourite minister and companion, Rājā Bīrbal (who fell in battle on the north-western frontier in 1583), was a musician and a poet as well as a politician, and held the title, conferred by the Emperor, of *Kabi-Rāy*, or poet laureate; his verses and witty sayings are still extremely popular in northern India, though no complete work by him is known to exist. Other nobles of the court were also poets, among them the *Khān-khānān* 'Abdur-Raḥīm, son of Bairam Khān, whose Hindī *dōhās* and *kabittas* are still held in high estimation, and Faiẓī, brother of the celebrated Abul-Faẓl, the Emperor's annalist.

By this time the worship of Krishna as the lover of Rādhā (*Rādhā-ballabh*) had been systematized, and a local habitation found for it at Gokul, opposite Mathurā on the Jumna, some 30 m. upstream from Agra, Akbar's capital, by Vallabhāchārya, a Tailinga Brāhman from Madras. Born in 1478, in 1497 he chose the land of Braj as his headquarters, thence making missionary tours throughout India. He wrote chiefly, if not entirely, in Sanskrit; but among his immediate followers, and those of his son Biṭṭhalnāth (who succeeded his father on the latter's death in 1530), were some of the most eminent poets in Hindī. Four disciples of Vallabhāchārya and four of Biṭṭhalnāth, who flourished between 1550 and 1570, are known as the *Ashṭ Chhāp*, or "Eight Seals," and are the acknowledged masters of the literature of Braj-bhāshā, in which dialect they all wrote. Their names are Krishna-Dās Pay-ahārī, Sūr Dās (the Bhāṭ), Parmānand Dās, Kumbhan Dās, Chaturbhuj Dās, Chhīt Swāmī, Nand Dās and Gōbind Dās. Of these much the most celebrated, and the only one whose verses are still popular, is Sūr Dās. The son of Bābā Rām Dās, who was a singer at Akbar's court, Sūr Dās was descended, according to his own statement, from the bard of Prithwī-Rāj, Chand Bardāī. A tradition gives the date of his birth as 1483, and that of his death as 1573; but both seem to be placed too early, and in Abul-Faẓl's *Āīn-i Akbarī* he is mentioned as living when that work was completed (1596/7). He was blind, and entirely devoted to the worship of Krishna, to whose address he composed a great number of hymns (*bhajans*), which have been collected in a compilation entitled the *Sūr Sāgar*, said to contain 60,000 verses; this work is very highly esteemed as the high-water mark of Braj devotional poetry, and has been repeatedly printed in India. Other compositions by him were a translation in verse of the *Bhāgavata Purāna*, and a poem dealing with the famous story of Nala and Damayanti; of the latter no copies are now known to exist.

The great glory of this age is Tulsī Dās (*q.v.*). He and Sūr Dās between them are held to have exhausted the possibilities of the poetic art. It is somewhat remarkable that the time of their appearance coincided with the Elizabethan age of English literature.

To these great masters succeeded a period of artifice and reflection, when many works were composed dealing with the rules of poetry and the analysis and the appropriate language of sentiment. Of their writers the most famous is Kēsab Dās, a Brahman of Bundēlkhaṇḍ, who flourished during the latter part of Akbar's reign and the beginning of that of Jahāngīr. His works are the *Rasik-priyā*, on composition (1591), the *Kavi-priyā*, on the laws of poetry (1601), a highly esteemed poem dedicated to Parbīn Rāi Pāturī, a celebrated courtesan of Orchha in Bundēlkhaṇḍ, the *Rāmachandrikā*, dealing with the history of Rāma, (1610), and the *Vigyān-gītā* (1610). The fruit of this elaboration of the poetic art reached its highest perfection in BIHĀRĪ LĀL, whose *Sat-saī*, or "seven centuries" (1662), is the most remarkable example in Hindī of the rhetorical style in poetry (see separate article).

[1] In the *Granth* Nāmdēo is called a calico-printer, *Chhīpī*. The Marāthi tradition is that he was a tailor, *Shimpī*; it is probable that the latter word, being unknown in northern India, has been wrongly rendered by the former.

[2] It will be remembered that Akbar's reign was remarkable for the translation into Persian of a large number of Sanskrit works of religion and philosophy, most of the versions being made by, or in the names of, members of his court.

Side by side with this cultivation of the literary use of the themes of Rāma and Krishna, there grew up a class of compositions dealing, in a devotional spirit, with the lives and doings of the holy men from whose utterances and example the development of the popular religion proceeded. The most famous of these is the *Bhakta-mālā*, or " Roll of the *Bhagats*," by Nārāyan Dās, otherwise called Nābhā Dās, or Nābhājī. This author, who belonged to the despised caste of Dōms and was a native of the Deccan, had in his youth seen Tulsī Dās at Mathurā, and himself flourished in the first half of the 17th century. His work consists of 108 stanzas in *chhappāī* metre, each setting forth the characteristics of some holy personage, and expressed in a style which is extremely brief and obscure. Its exact date is unknown, but it falls between 1585 and 1623. The book was furnished with a *īkā* (supplement or gloss) in the *kabitta* metre, by Priyā Dās in 1713, gathering up, in an allusive and disjointed fashion, all the legendary stories related of each saint. This again was expanded about a century later by a modern author named Lachhman into a detailed work of biography, called the *Bhakta-sindhu*. From these nearly all our knowledge (such as it is) of the lives of the Vaishnava authors, both of the Rāma and the Krishna cults, is derived, and much of it is of a very legendary and untrustworthy character. Another work, somewhat earlier in date than the *Bhakta-mālā*, named the *Chaurāsī Vārta*, is devoted exclusively to stories of the followers of Vallabhāchārya. It is reputed to have been written by Gōkulnāth, son of Biṭṭhalnāth, son of Vallabhāchārya, and is dated in 1551.

The matter of these tales is justly characterized by Professor Wilson[1] (who gives some translated specimens) as " marvellous and insipid anecdotes "; but the book is remarkable for being in very artless prose, and, though written more than 300 years ago, shows that the current language of Braj was then almost precisely identical with that now spoken in that region. A specimen of the text will be found at p. 296 of Mr F. S. Growse's *Mathura, a District Memoir* (3rd ed., 1883).

It would be tedious to enumerate the many authors who succeeded the great period of Hind poetical composition which extended through the reigns of Akbar, Jahāngīr and Shāhjahān. None of them attained to the fame of Sūr Dās, Tuls Dās or Bihārī Lāl. Their themes exhibit no novelty, and they repeat with a wearisome monotony the sentiments of their predecessors. The list of Hindī authors drawn up by Dr G. A. Grierson, and printed in the *Journal of the Asiatic Society of Bengal* in 1889, may be consulted for the names and works of these *epigoni*. The courts of Chhatarsāl, rājā of Pannā in Bundēlkhaṇḍ, who was killed in battle with Aurangzēb in 1658, and of several rājās of Bāndhō (now called Rīwān or Rewah) in Baghēlkhaṇḍ, were famous for their patronage of poets; and the Mogul court itself kept up the office of *Kabi-Rāy* or poet laureate even during the fanatical reign of Aurangzēb.

Such, in the briefest outline, is the character of Hind literature during the period when it grew and flourished through its own original forces. Founded by a popular and religious impulse in many respects comparable to that which, nearly 1600 years before, had produced the doctrine and literature, in the vernacular tongue, of Jainism and Buddhism, and cultivated largely (though by no means exclusively) by authors not belonging to the Brahmanical order, it was the legitimate descendant in spirit, as Hindī is the legitimate descendant in speech, of the Prākrit literature which preceded it. Entirely in verse, it adopted and elaborated the Prākrit metrical forms, and carried them to a pitch of perfection too often overlooked by those who concern themselves rather with the substance than the form of the works they read. It covers a wide range of style, and expresses, in the works of its greatest masters, a rich variety of human feeling. Little studied by Europeans in the past, it deserves much more attention than it has received. The few who have explored it speak of it as an " enchanted garden " (Grierson), abounding in beauties of thought and phrase. Above all it is to be remembered that it is genuinely popular, and has reached strata of society scarcely touched by literature in Europe. The ballads of Rajput prowess, the aphorisms of Kabīr, Tulsī Dās's *Rāmāyan*, and the *bhajans* of Sūr Dās are to this day carried about everywhere by wandering minstrels, and have found their way, throughout the great plains of northern India and the uplands of the Vindhyā plateau, to the hearts of the people. There is no surer key to unlock the confidence of the villager than an apt quotation from one of these inspired singers.

[1] *Religious Sects*, p. 132.

3. *Literary Urdū.*—The *origines* of Urdū as a literary language are somewhat obscure. The popular account refers its rise to the time of Tīmūr's invasion (1398). Some authors even claim for it a higher antiquity, asserting that a *dīwān*, or collection of poems, was composed in *Rēkhta* by Mas'ūd, son of Sa'd, in the last half of the 11th or beginning of the 12th century, and that Sa'di of Shīrāz and his friend Amīr Khusrau[2] of Delhi likewise made verses in that dialect before the end of the 13th century. This, however, is very improbable. It has already been seen that during the early centuries of Muslim rule in India adherents of that faith used the language and metrical forms of the country for their compositions. Persian words early made their way into the popular speech; they are common in Chand, and in Kabīr's verses (which are nevertheless unquestionable Hindī) they are in many places used as freely as in the modern dialect. Much of the confusion which besets the subject is due to the want of a clear understanding of what Urdū, as opposed to Hindī, really is.

Urdū, as a literary language, differs from Hindī rather in its form than in its substance. The grammar, and to a large extent the vocabulary, of both are the same. The really vital point of difference, that in which Hindī and Urdū are incommensurable, is the *prosody*. Hardly one of the metres taken over by Urdū poets from Persian agrees with those used in Hindī. In the latter language it is the rule to give the short *a* inherent in every consonant or *nexus* of consonants its full value in scansion (though in prose it is no longer heard), except occasionally at the metrical pause; in Urdū this is never done, the words being scanned generally as pronounced in prose, with a few exceptions which need not be mentioned here. The great majority of Hindī metres are scanned by the number of *mātrās* or syllabic instants—the value in time of a short syllable—of which the lines consist; in Urdū, as in Persian, the metre follows a special order of long and short syllables.

The question, then, is not When did Persian first become intermixed with Hindī in the literary speech?—for this process began with the first entry of Muslim conquerors into India, and continued for centuries before a line of Urdū verse was composed; nor When was the Persian character first employed to write Hindī?—for the written form is but a subordinate matter; as already mentioned, the MSS. of Malik Muḥammad's purely Hindī poem, the *Padmāwat*, are ordinarily found to be written in the Persian character; and copies lithographed in Dēvanāgarī of the popular compositions of the Urdū poet Naẓīr are commonly procurable in the bāzārs. We must ask When was the first verse composed in Hindī, whether with or without foreign admixture, according to the forms of Persian prosody, and not in those of the indigenous metrical system? Then, and not till then, did Urdū poetry come into being. This appears to have happened, as already mentioned, about the end of the 16th century. Meantime the vernacular speech had been gradually permeated with Persian words and phrases. The impulse which Akbar's interest in his Hindū subjects had given to the translation of Sanskrit works into Persian had brought the indigenous and the foreign literatures into contact. The current language of the neighbourhood of the capital, the Hindī spoken about Delhi and thence northwards to the Himālaya, was naturally the form of the vernacular which was most subject to foreign influences; and with the extension of Mogul

[2] Amīr Khusrau is credited with the authorship of many still popular rhymes, riddles or punning verses (called *pahēlīs* and *mukurīs*); but these, though often containing Persian words, are in Hindī and scanned according to the prosody of that language; they are, therefore, like Malik Muḥammad's *Padmāwat*, not Urdū or Rekhta verse (see Professor Āzād's *Ābi-Ḥayāt*, pp. 72-76). A late Dakkhanī poet who used the *takkallus* of Sa'dī is said by Āzād (p. 79) to have been confused by Mīrzā Rafī'us-Saudā in his *Tazkira* with Sa'dī of Shīrāz.

SpinSmart Software http://www.spinsmart.com

territory by the conquests in the south of Akbar and his successors, this idiom was carried abroad by their armies, and was adopted by the Musalmān kingdoms of the Deccan as their court language some time before their overthrow by the campaigns of Aurangzēb.

It is not a little remarkable that, as happened with the Vaishnava reformation initiated by Rāmānuja and Rāmānand, and with the Vallabhāchārya cult of Krishna established at Mathurā, the first impulse to literary composition in Urdū should have been given, not at the headquarters of the empire in the north, but at the Muhammadan courts of Gōlkondā and Bījāpur in the south, the former situated amid an indigenous population speaking Telugu, and the latter among one whose speech was Kanarese, both Dravidian languages having nothing in common with the Aryan tongues of the north. This fact of itself defines the nature of the literature thus inaugurated. It had nothing to do with the idiom or ideas of the people among whom it was born, but was from the beginning an imitation of Persian models. It adopted the standards of form and content current among the poets of Ērān. The *qaṣīda* or laudatory ode, the *ghazal* or love-sonnet, usually of mystical import, the *marṣiya* or dirge, the *maṣnavī* or narrative poem with coupled rhymes, the *hijā* or satire, the *rubā'ī* or epigram—these were the types which Urdū took over ready-made. And with the forms were appropriated also all the conventions of poetic diction. The Persians, having for centuries treated the same themes with a fecundity which most Europeans find extremely wearisome, had elaborated a system of rhetoric and a stock of poetic images which, in the exhaustion of original matter, made the success of the poet depend chiefly upon dexterity of artifice and cleverness of conceit. Pleasing hyperbole, ingenious comparison, antithesis, alliteration, carefully arranged gradation of noun and epithet, are the means employed to obtain variety; and few of the most eloquent passages of later Persian verse admit of translation into any other language without losing that which in the original makes their whole charm. What is true of Persian is likewise true of Urdū poetry. Until quite modern times, there is scarcely anything in it which can be called original.[1] Differences of school, which are made much of by native critics, are to us hardly perceptible; they consist in the use of one or other range of metaphor or comparison, classed, according as they repeat the well-worn poetical stock-in-trade of the Persians, or seek a slightly fresher and more Indian field of sentiment, as the old or the new style of composition.

Shujā'uddīn Nūrī, a native of Gujarāt, a friend of Faiẓī and contemporary of Akbar, is mentioned by the native biographers as the most ancient Urdū poet after Amīr Khusrau. He was tutor of the son of the *wazīr* of Sultān Abu-l-Ḥasan Kuṭb Shāh of Golkonda, and several *ghazals* by him are said to survive. Kulī Kuṭb Shāh of Golkonda, who reigned from 1581, and his successor 'Abdullāh Kuṭb Shāh, who came to the throne in 1611, have both left collections of verse, including *ghazals*, *rubā'īs*, *maṣnavīs* and *qaṣīdas*. And during the reign of the latter Ibn Nishāṭī wrote two works which are still famous as models of composition in Dakhni; they are *maṣnavīs* entitled the *Ṭūṭī-nāma*, or "Tales of a Parrot," and the *Phūl-ban*. The first, written in 1639, is an adaptation of a Persian work by Nakhshabī, but derives ultimately from a Sanskrit original entitled the *Śuka-saptati*; this collection has been frequently rehandled in Urdū, both in verse and prose, and is the original of the *Ṭōṭā-Kahānī*, one of the first works in Urdū prose, composed in 1801 by Muḥammad Ḥaidar-bakhsh Ḥaidarī of the Fort William College. The *Phūl-ban* is a love tale named from its heroine, said to be translated from a Persian work entitled the *Basātīn*. Another famous work which probably belongs to the same place and time is the *Story of Kāmrūp and Kalā* by Taḥsīnuddīn, a *maṣnavī* which has been published (1836) by M. Garcin de Tassy; what makes this poem remarkable is that, though the work of a Musalmān, its personages are Hindu. Kāmrūp, the hero, is son of the king of Oudh, and the heroine, Kalā, daughter of the king of Ceylon; the incidents somewhat resemble those of the tale of as-Sindibād in the *Thousand and One Nights*; the hero and heroine dream one of the other, and the former sets forth to find his beloved; his wanderings take him to many strange countries and through many wonderful adventures, ending in a happy marriage.

The court of Bījāpur was no less distinguished in literature. Ibrāhīm 'Ādil Shāh (1579–1626) was the author of a work in verse on music entitled the *Nau-ras* or "Nine Savours," which, however, appears to have been in Hindī rather than Urdū; the three prefaces (*dībājas*) to this poem were rendered into Persian prose by Maulā Ẓuhūrī, and, under the name of the *Sih naṣr-i Ẓuhūrī*, are well-known models of style. A successor of this prince, 'Alī 'Ādil Shāh, had as his court poet a Brahman known poetically as Nuṣratī, who in 1657 composed a *maṣnavī* of some repute entitled the *Gulshan-i 'Ishq*, or "Rose-garden of Love," a romance relating the history of Prince Manōhar and Madmālatī,—like the *Kāmrūp*, an Indian theme. The same poet is author of an extremely long *maṣnavī* entitled the *'Alī-nāma*, celebrating the monarch under whom he lived.

These early authors, however, were but pioneers; the first generally accepted standard of form, a standard which suffered little change in two centuries, was established by Walī of Aurangābād (about 1680–1720) and his contemporary and fellow-townsman Sirāj. The former of these is commonly called "the Father of Rēkhtah"—*Bābā-e Rēkhta*; and all accounts agree that the immense development attained by Urdū poetry in northern India during the 18th century was due to his example and initiative. Very little is known of Walī's life; he is believed to have visited Delhi towards the end of the reign of Aurangzēb, and is said to have there received instruction from Shāh Gulshan in the art of clothing in a vernacular dress the ideas of the Persian poets. His *Kullīyāt* or complete works have been published by M. Garcin de Tassy, with notes and a translation of selected passages (Paris, 1834–1836), and may be commended to readers desirous of consulting in the original a favourable specimen of Urdū poetical composition.

The first of the Delhi school of poets was Zuhūruddīn Hātim, who was born in 1699 and died in 1792. In the second year of Muhammad Shāh (1719), the *dīwān* of Walī reached Delhi, and excited the emulation of scholars there. Hātim was the first to imitate it in the Urdū of the north, and was followed by his friends Nājī, Mazmūn and Ābrū. Two *dīwāns* by him survive. He became the founder of a school, and one of his pupils was Rafī us-Saudā, the most distinguished poet of northern India. Khān Ārzū (1689–1756) was another of the fathers of Urdū poetry in the north. This author is chiefly renowned as a Persian scholar, in which language he not only composed much poetry, but one of the best of Persian lexicons, the *Sirāju-l-lughāt*; but his compositions in Urdū are also highly esteemed. He was the master of Mīr Taqī, who ranks next to Saudā as the most eminent Urdū poet. Ārzū died at Lucknow, whither he betook himself after the devastation of Delhi by Nādir Shāh (1739). Another of the early Delhi poets who is considered to have surpassed his fellows was In'āmullāh Khān Yaqīn, who died during the reign of Ahmad Shāh (1748–1754), aged only twenty-five. Another was Mīr Dard, pupil of the same Shāh Gulshan who is said to have instructed Walī; his *dīwān* is not long, but extremely popular, and especially esteemed for the skill with which it develops the themes of spiritualism. In his old age he became a *darwēsh* of the *Naqshbandī* following, and died in 1793.

Saudā and Mīr Taqī are beyond question the most distinguished Urdū poets. The former was born at Delhi about the beginning of the 18th century, and studied under Hātim. He left Delhi after its devastation, and settled at Lucknow, where the Nawāb Āṣafuddaulah gave him a *jāgīr* of Rs. 6000 a year, and where he died in 1780. His poems are very numerous, and cover all the styles of Urdū poetry; but it is to his satires that his fame is chiefly due, and in these he is considered to have surpassed all other Indian poets. Mīr Taqī was born at Agra, but early removed to Delhi, where he studied under Ārzū; he was still living there at the time of Saudā's death, but in 1782 repaired to Lucknow, where he likewise received a pension; he died at a very advanced age in 1810. His works are very voluminous, including no less than six *dīwāns*. Mīr is counted the superior of Saudā in the *ghazal* and *maṣnavī*, while the latter excelled him in the satire and *qaṣīda*. Sayyid Aḥmad, an excellent authority, and himself one of the best of modern authors in Urdū, says of him in his *Āṣāru-ṣ-Ṣanādīd*: "Mīr's language is so pure, and the expressions which he employs so suitable and natural, that to this day all are unanimous in his praise. Although the language of Saudā is also excellent, and he is superior to Mīr in the point of his allusions, he is nevertheless inferior to him in style."

The tremendous misfortunes which befell Delhi at the hands of Nādir Shāh (1739), Ahmad Shāh Durrānī (1756), and the Marāṭhās (1759), and the rapid decay of the Mogul empire under these repeated shocks, transferred the centre of the cultivation of literature from that city to Lucknow, the capital of the newly founded and flourishing state of Oudh. It has been mentioned how Ārzū, Saudā and Mīr betook themselves to this refuge and ended their days there; they were followed in their new residence by a school of poets hardly inferior to those who had made Delhi illustrious in the first half of the century. Here they were joined by Mīr Hasan (d. 1786), Mīr Sōz (d. 1800) and Qalandar-bakhsh Jur'at (d. 1810), also like themselves refugees from Delhi, and illustrious poets. Mīr Hasan was a friend and collaborator of Mīr Dard, and first established himself at Faizābād and subsequently at Lucknow; he excelled in the *ghazal*.

[1] An exception may be made to this general statement in favour of the *genre* pictures of city and country life contained in the *maṣnavīs* of Saudā and Naẓīr. These are often satires (in the vein of Horace rather than Juvenal), and are full of interest as pictures of society. In Saudā, however, the conventional language used in description is often Persian rather than Indian.

SpinSmart Software http://www.spinsmart.com

rubā'ī, *maṣnavī* and *marṣiya*, and is counted the third, with Saudā and Mīr Taqī, among the most eminent of Urdū poets. His fame chiefly rests upon a much admired *maṣnavī* entitled the *Siḥru-l-bayān*, or "Magic of Eloquence," a romance relating the loves of Prince Bē-naẓīr and the Princess Badr-i Munīr; his *maṣnavī* called the *Gulzār-i Iram* ("Rose-garden of Iram," the legendary 'Ādite paradise in southern Arabia), in praise of Faizābād, is likewise highly esteemed. Mīr Muḥammadī Sōz was an elegant poet, remarkable for the success with which he composed in the dialect of the harem called *Rekhtī*, but somewhat licentious in his verse; he became a *darwēsh* and renounced the world in his later years. Jur'at was also a prolific poet, but, like Sōz, his *ghazals* and *maṣnavīs* are licentious and full of double meanings. He imitated Saudā in satire with much success; he also cultivated Hindī poetry, and composed *dohās* and *kabittas*. Miskīn was another Lucknow poet of the same period, whose *marṣiyas* are especially admired; one of them, that on the death of Muslim and his two sons, is considered a masterpiece of this style of composition. The school of Lucknow, so founded and maintained during the early years of the century, continued to flourish till the dethronement of the last king, Wājid 'Alī, in 1856. Ātash and Nāsikh (who died respectively in 1847 and 1841) are the best among the modern poets of the school in the *ghazal*; Mīr Anīs, a grandson of Mīr Hasan, and his contemporary Dabīr, the former of whom died in December 1875 and the latter a few months later, excelled in the *marṣiyah*. Rajab Alī Beg Surūr, who died in 1869, was the author of a much-admired romance in rhyming prose entitled the *Fisānah-e 'Ajāib* or "Tale of Marvels," besides a *dīwān*. The dethroned prince Wājid 'Alī himself, poetically styled Akhtar, was also a poet; he published three *dīwāns*, among them a quantity of poetry in the rustic dialect of Oudh which is philologically of much interest.

Though Delhi was thus deserted by its brightest lights of literature, it did not altogether cease to cultivate the poetic art. Among the last Moguls several princes were themselves creditable poets. Shāh Ālam II. (1761–1806) wrote under the name of Āftāb, and was the author of a romance entitled ***Manẓūm-i Aqdas***, besides a *dīwān*. His son Sulaimān-shukoh, brother of Akbar Shāh II., who had at first, like his brother authors, repaired to Lucknow, returned to Delhi in 1815, and died in 1838; he also has left a *dīwān*. Lastly, his nephew Bahādur Shāh II., the last titular emperor of Delhi (d. 1862), wrote under the name of Ẓafar, and was a pupil in poetry of Shaikh Ibrāhīm Ẓauq, a distinguished writer; he has left a voluminous *dīwān*, which has been printed at Delhi. Maṣḥafī (Ghulām-i Hamdānī), who died about 1814, was one of the most distinguished of the revived poetic school of Delhi, and was himself one of its founders. Originally of Lucknow, he left that city for Delhi in 1777, and held conferences of poets, at which several authors who afterwards acquired repute formed their style; he has left five *dīwāns*, a *Taẓkira* or biography of Urdū poets, and a *Shāh-nāma* or account of the kings of Delhi down to Shāh 'Ālam. Qāim (Qiyāmuddīn 'Alī) was one of his society, and died in 1792; he has left several works of merit. Ghālib, otherwise Mirzā Asadullāh Khān Naushāh, laureate of the last Mogul, who died in 1869, was undoubtedly the most eminent of the modern Delhi poets. He wrote chiefly in Persian, of which language, especially in the form cultivated by Firdausī, free from intermixture of Arabic words, he was a master; but his Urdū *dīwān*, though short, is excellent in its way, and his reputation spread far and wide. To this school, though he lived and died at Agra, may be attached Mīr Walī Muḥammad Naẓīr (who died in the year 1832): his *maṣnavīs* entitled *Jogī-nāma*, *Kaurī-nāma*, *Banjāre-nāma*, and *Buṛhāpe-nāma*, as well as his *dīwān*, have been frequently reprinted, and are extremely popular. His language is less artificial than that of the generality of Urdū poets, and some of his poems have been printed in Nāgarī, and are as well known and as much esteemed by Hindus as by Mahommedans. His verse is defaced by much obscenity.

4. *Modern Period.*—While such, in outline, is the history of the literary schools of the Deccan, Delhi and Lucknow, a fourth, that of the Fort William College at Calcutta, was being formed, and was destined to give no less an impulse to the cultivation of Urdū prose than had a hundred years before been given to that of poetry by Walī. At the commencement of the 19th century Dr John Gilchrist was the head of this institution, and his efforts were directed towards getting together a body of literature suitable as text-books for the study of the Urdū language by the European officers of the administration. To his exertions we owe the elaboration of the vernacular as an official speech, and the possibility of substituting it for the previously current Persian as the language of the courts and the government. He gathered together at Calcutta the most eminent vernacular scholars of the time, and their works, due to his initiative, are still notable as specimens of elegant and serviceable prose composition, not only in Urdū, but also in Hindī. The chief authors of this school are Ḥaidarī (Sayyid Muḥammad Ḥaidar-bakhsh), Ḥusainī (Mīr Bahādur 'Alī), Mīr Amman Luṭf, Ḥafīẓuddīn Aḥmad, Shēr 'Alī Afsōs, Nihāl Chand of Lahore, Kāẓim 'Alī Jawān, Lallū Lāl Kavi, Maẓhar 'Alī Wilā and Ikrām 'Alī.

Ḥaidarī died in 1828. He composed the *Ṭoṭā-Kahānī* (1801), a prose redaction of the *Ṭūṭī-nāmah* which has been already mentioned; a romance named *Ārāish-i Maḥfil* ("Ornament of the Assembly"), detailing the adventures of the famous Arab chief Ḥātim-i Ṭai; the *Gul-i Maghfirat* or *Dah Majlis*, an account of the holy persons of the Muhammadan faith; the *Gulzār-i Dānish*, a translation of the *Bahār-i Dānish*, a Persian work containing stories descriptive of the craft and faithlessness of women; and the *Tārīkh-i Nādirī*, a translation of a Persian history of Nādir Shāh. Ḥusainī is the author of an imitation in prose of Mīr Ḥasan's *Siḥru-l-bayān*, under the name of *Naṣr-i Bēnaẓīr* ("the Incomparable Prose," or "the Prose of Bēnaẓīr," the latter being the name of the hero), and of a work named *Akhlāq-i Hindī*, or "Indian Morals," both composed in 1802. The *Akhlāq-i Hindī* is an adaptation of a Persian work called the *Mufarriḥu-l-qulūb* ("the Delighter of Hearts"), itself a version of the *Hitōpadēśa*. Mīr Amman was a native of Delhi, which he left in the time of Aḥmad Shāh Durrānī for Patna, and in 1801 repaired to Calcutta. To him we owe the *Bāgh o Bahār* (1801–1802), an adaptation of Amīr Khusrau's famous Persian romance entitled the *Chahār Darwēsh*, or "Story of the Four Dervishes." Amman's work is not itself directly modelled on the Persian, but is a rehandling of an almost contemporary rendering by Tahsīn of Etāwā, called the *Nau-ṭarz-i Muraṣṣa'*. The style of this composition is much admired by natives of India, and editions of it are very numerous. Amman also composed an imitation of Husain Wā'iz Kāshifī's *Akhlāq-i Muḥsinī* under the name of the *Ganj-i Khūbī* ("Treasure of Virtue"), produced in 1802. Ḥafīẓuddīn Aḥmad was a professor at the Fort William College; in 1803 he completed a translation of Abu-l-Faẓl's *'Iyār-i Dānish*, under the name of the *Khirad-afrōz* ("Enlightener of the Understanding"). The *'Iyār-i Dānish* ("Touchstone of Wisdom") is one of the numerous imitations of the originally Sanskrit collection of apologues known in Persian as the *Fables of Bīdpāī*, or *Kalīlah and Dimna*. Afsōs was one of the most illustrious of the Fort William school; originally of Delhi, he left that city at the age of eleven, and entered the service of Qāsim 'Alī Khān, Nawāb of Bengal; he afterwards repaired to Ḥyderābād in the Deccan, and thence to Lucknow, where he was the pupil of Mīr Ḥasan, Mīr Sōz and Mīr Ḥaidar 'Alī Ḥairān. He joined the Fort William College in 1800, and died in 1809. He is the author of a much esteemed *dīwān*; but his chief reputation is founded on two prose works of great excellence, the *Ārāish-i Maḥfil* (1805), an account of India adapted from the introduction of the Persian *Khulāṣatu-t-tawārikh* of Sujān Rāe, and the *Bāgh-i Urdū* (1808), a translation of Sa'dī's *Gulistān*. Nihāl Chand translated into Urdū a *maṣnavī*, entitled the *Gul-i Bakāwalī*, under the name of *Maẓhab-i 'Ishq* ("Religion of Love"); this work is in prose intermingled with verse, was composed in 1804, and has been frequently reproduced. Jawān, like most of his collaborators, was originally of Delhi and afterwards of Lucknow; he joined the College in 1800. He is the author of a version in Urdū of the well-known story of Sakuntalā, under the name of *Sakuntalā Nāṭak*; the Urdū was rendered from a previous Braj-bhāshā version by Nawāz Kabīshwar made in 1716, and was printed in 1802. He also composed a *Bārah-māsā*, or poetical description of the twelve months (a very popular and often-handled form of composition), with accounts of the various Hindu and Muhammadan festivals, entitled the *Dastūr-i Hind* ("Usages of India"), printed in 1812. Ikrām 'Alī translated, under the name of the *Ikhwānu-ṣ-ṣafā*, or "Brothers of Purity" (1810), a chapter of a famous Arabian collection of treatises on science and philosophy entitled *Rasāilu Ikhwāni-ṣ-ṣafā*, and composed in the 10th century. The complete collection, due to different writers who dwelt at Baṣra, has recently been made known to European readers by the translation of Dr F. Dieterici (1858–1879); the chapter selected by Ikrām 'Alī is the third, which records an allegorical strife for the mastery between men and animals before the king of the *Jinn*. The translation is written in excellent Urdū, and is one of the best of the Fort William productions.

Srī Lallū Lāl was a Brahman, whose family, originally of Gujarāt, had long been settled in northern India. What was done by the other Fort William authors for Urdū prose was done by Lallū Lāl almost alone for Hindī. He may indeed without exaggeration be said to have created "High Hindī" as a literary language. His *Prem Sāgar* and *Rājnīti*, the former a version in pure Hindī of the 10th chapter of the *Bhāgavata Purāṇa*, detailing the history of Kṛishṇa, and founded on a previous Braj-bhāshā version by Chaturbhuj Misr, and the latter an adaptation in Braj-bhāshā prose of the *Hitōpadēśa* and part of the *Pancha-tantra*, are unquestionably the most important works in Hindī prose. The *Prem Sāgar* was begun in 1804 and ended in 1810; it enjoys immense popularity in northern India, has been frequently reproduced in a lithographed form, and has several times been printed. The *Rājnīti* was composed in 1809; it is much admired for its sententious brevity and the purity of its language. Besides these two works, Lallū Lāl was the author of a collection of a hundred anecdotes in Hindī and Urdū entitled *Laṭāif-i Hindī*, an anthology of Hindī verse called the *Sabhā-bilās*.

SpinSmart Software http://www.spinsmart.com

a *Sat-saī* in the style of Bihāri-Lāl called *Sapta-satika* and several other works. He and Jawān worked together at the *Singhāsan Battīsī* (1801), a redaction in mixed Urdū and Hindī (Dēvanāgarī character) of a famous collection of legends relating the prowess of King Vikramāditya; and he also aided the latter author in the production of the *Sakuntalā Nāṭak*. Maẓhar 'Alī Wilā was his collaborator in the *Baitāl Pachīsī*, a collection of stories similar in many respects to the *Singhāsan Battīsī*, and also in mixed Urdū-Hindī; and he aided Wilā in the preparation in Urdū of the *Story of Mādhōnal*, a romance originally composed in Braj-bhāshā by Mōtī Rām.

The works of these authors, though compiled and published under the superintendence of Dr Gilchrist, Captain Abraham Lockett, Professor J. W. Taylor, Dr W. Hunter and other European officers of the college of Fort William, and originally intended for the instruction of the Company's officers in the vernacular, are essentially Indian in taste and style, and, until superseded by the more recent developments of literature noticed below, enjoyed a very wide reputation and popularity. They may, indeed, be said to have set the standard of prose composition in Urdū and Hindī, and for the first half of the 19th century their influence in this respect continued almost unchallenged. Side by side with them, among the Musalmān population of northern India, another almost contemporaneous impulse did much for the expansion of the Urdū language, and, like the work of the Vaishnava reformers in moulding literary Hindī, gave an impetus to composition which might otherwise have been lacking. This was the reform in Islam led by Sayyid Aḥmad[1] and his followers. In all Eastern countries religion is the first and chief subject of literary production; and the controversies which the new preaching aroused in India at once afforded abundant material for authorship in Urdū, and interested deeply the people to whom the works were addressed.

Sayyid Aḥmad was born in 1782, and received his early education at Delhi; his instructors were two learned Muslims, Shāh 'Abdu-l-'Azīz, author of a celebrated commentary on the Qur'ān (the *Tafsīr-i 'Azīziyyah*), and his brother 'Abdu-l-Qādir, the writer of the first translation of the holy volume into Urdū. Under their guidance Sayyid Aḥmad embraced the doctrines of the Wahhābīs, a sect whose preaching appears at this time to have first reached India. He gathered round him a large number of fervent disciples, among others Ismā'īl Ḥājī, nephew of 'Abdu-l-'Azīz and 'Abdu-l-Qādir, the chief author of the sect. After a course of preaching and apostleship at Delhi, Sayyid Aḥmad set out in 1820 for Calcutta, attended by numerous adherents. Thence in 1822 he started on a pilgrimage to Mecca, whence he went to Constantinople, and was there received with distinction and gained many disciples. He travelled for nearly six years in Turkey and Arabia, and then returned to Delhi. The religious degradation and coldness which he found in his native country strongly impressed him after his sojourn in lands where the life of Islām is stronger, and he and his disciples established a propaganda throughout northern India, reprobating the superstitions which had crept into the faith from contact with Hindus, and preaching a *jihād* or holy war against the Sikhs. In 1828 he started for Peshāwar, attended by, it is said, upwards of 100,000 Indians, and accompanied by his chief followers, Ḥājī Ismā'īl and 'Abdu-l-Ḥayy. He was furnished with means by a general subscription in northern India, and by several Muhammadan princes who had embraced his doctrines. At the beginning of 1829 he declared war against the Sikhs, and in the course of time made himself master of Peshāwar. The Afghāns, however, with whom he had allied himself in the contest, were soon disgusted by the rigour of his creed, and deserted him and his cause. He fled across the Indus and took refuge in the mountains of Pakhlī and Dhamtōr, where in 1831 he encountered a detachment of Sikhs under the command of Shēr Singh, and in the combat he and Ḥājī Isma'īl were slain. His sect is, however, by no means extinct; the Wahhābī doctrines have continued to gain ground in India, and to give rise to much controversial writing, down to our own day.

The translation of the Quran by 'Abdu-l-Qādir was finished in 1803, and first published by Sayyid 'Abdullāh, a fervent disciple of Sayyid Aḥmad, at Hūghlī in 1829. The *Tambīhu-l-ghāfilīn*, or "Awakener of the Heedless," a work in Persian by Sayyid Aḥmad, was rendered into Urdū by 'Abdullāh, and published at the same press in 1830. Hājī Ismā'īl was the author of a treatise in Urdū entitled *Taqwiyatu-l-Īmān* ("Confirmation of the Faith"), which had great vogue among the following of the Sayyid. Other works by the disciples of the *Tarīqah-e Muḥammadiyyah* (as the new preaching was called) are the *Targhīb-i Jihād* ("Incitation to Holy War"), *Hidāyatu-l-Mūminīn* ("Guide of the Believers"), *Mūziḥu-l-Kabāir wa-l-Bid'ah* ("Exposition of Mortal Sins and Heresy"), *Naṣlhatu-l-Muslimīn* ("Admonition to Muslims"), and the *Mi'at Masāil*, or "Hundred Questions."

Printing was first used for vernacular works by the College Press at Fort William, at the end of the 18th and the beginning of the 19th century, and all the compositions prepared for Dr Gilchrist and his successors which have been mentioned were thus given to the public. But the expense of this method of reproduction long precluded its extensive use in India, and movable types, though well suited for alphabets derived from the Sanskrit, were not equally applicable to the flowing and graceful characters of Persian. Lithography was introduced about 1837, when the first press was set up at Delhi, and immediately gave a powerful stimulus to the multiplication of literature, both original and editions of older works. In 1832 the vernaculars were substituted for Persian as the official language of the courts and the acts of the legislature, and this at once led to the transfer to the former of a mass of technical and forensic terms which had previously been only to a limited extent in popular use. Thirdly, the spread of education in subjects of Western learning, for which text-books (many of them translations from English) were required, not only greatly enlarged the vocabulary of the common speech, but led by degrees to the use of a simpler and more direct style, and the abandonment wholesale of the florid and artificial ornament which was the legacy of the Persian literature upon which Urdū prose had at first modelled itself. Lastly, the establishment of a vernacular newspaper press, which lithography had rendered possible, placed within the reach of a continually widening public the means of becoming acquainted with new ideas in every department of culture, and practised the writers who contributed to it in the art of wielding their mother-tongue with effect in its application to European themes.

All these revolutionary agencies were at work, though in a tentative and limited fashion, when the great change, following on the Mutiny of 1857, of the transfer of the government of India from the Company to the Crown inaugurated a new era. Since 1860 their operation has become extremely rapid and far-reaching. The use of lithography both for Urdū and Hindī annually gives birth to hundreds of works. The extension of education through both public and private agency has created an immense mass of school-books, and the spread of instruction in English and the activity of translators have filled the vernaculars with a multitude of new words drawn from that language. The newspaper press, in Urdū and Hindī, now counts over two hundred journals, the majority issued in the United Provinces of Agra and Oudh and in the Punjab, but a few at Madras, Hyderabad, Bangalore, Bombay and Calcutta. Of this great body of literary production it is possible to speak only in general terms. Style and vocabulary are still in a somewhat fluid and unsettled condition, and the subjects treated are almost as various as they are in European literatures. Much, indeed, of the work produced has scarcely any claim to literary excellence, and in the crowd of writers we may content ourselves with mentioning only a few whose influence and authority make it probable that they will hereafter be known as leaders in the new culture.

One of the first effects of the new literary inspiration seemed to be the extinction of poetical composition as previously practised. With the deaths of Ẓauq (1854) and Ghālib (1869) of the Delhi school, and those of Anīs (1875) and Dabīr (1876) of Lucknow, the end of Urdū poetry appeared to have come. The new age was intensely practical and eager to engage in the race for material and political advancement, and had no time for sentiment, or taste for mystical conceits. Moreover, poetical composition in India, as in other Eastern countries, has always owed much to the patronage of courts and princes. The thrones of Delhi and Lucknow had passed away, and the new rulers showed little interest in this form of achievement. Only at Hyderabad in the Deccan, under the patronage of the Nizam, were laureates still honoured; the last of these, Mirzā Khān Dāgh (1831–1905), enjoyed a wide reputation as a graceful and eloquent master of the poetic art.

But prose and material prosperity did not succeed in monopolizing the genius of the people. The great movement of reform and liberalism in Islām led by Sir Sayyid Aḥmad Khān (1817–1898) found its bard in Sayyid Alṭāf Ḥusain of Pānipāṭ, poetically styled Ḥālī—an ambiguous *nom-de-plume* now generally taken in the sense of "modern," or "up-to-date." Ḥālī in his youth was a pupil of the famous Ghālib, whose life he has written and of whose writings he has published an able criticism. At the age of forty he came under the influence of Sir Sayyid Aḥmad Khān, and from that time devoted his great poetic gifts to the service of his co-religionists. He has published much verse, of which an interesting specimen will be found in the edition of his *Rubā'īs* or quatrains (101 in number), with an English translation, by Mr G. E. Ward (Oxford, 1904); in this is included a famous poem addressed to his muse, setting forth his ideals in poetry—simplicity, avoidance of exaggeration and unreality, direct and emotional appeal to the heart, and above all sincerity. There can be no doubt that he has succeeded in becoming the leader of a new poetic school, which shows much vigour and promise.

Perhaps the most memorable of all Ḥālī's compositions is his long poem in six-line stanzas (called *musaddas*) on "the flow and ebb of Islam" (1879), which has had an extraordinary influence in stimulating enthusiasm in the cause of progress among the Musalmāns of the north of India. In it he draws, in simple and direct but searching and eloquent language, a rapid sketch of the glories of Islam in the past, its principles and precepts, and the sources of its strength; and then turns to contrast with this picture the degradation and decay into which it had, when he wrote, fallen in Hindōstān. Never have the vices and shortcomings of a people been lashed by one of themselves with more vigorous denunciation, or with more earnestness of moral purpose. In his preface he

[1] To be carefully distinguished from the reformer of the same name who flourished half a century later.

SpinSmart Software http://www.spinsmart.com

explains how the poem came to be written—after a youth spent in heedlessness and unsettlement, at the instigation of Sir Sayyid Aḥmad Khān, and in the cause of that great reformer. The poem is still recited and imitated by Muslims in the Punjab and United Provinces, though the picture which it presents of Indian Musalmāns is no longer wholly applicable to the community. Ḥālī has recently completed a life of Sir Sayyid Aḥmad Khān in two volumes, entitled *Ḥayāt-i Jāvīd* ("eternal life"), a work of great merit.

Another writer whose work, though chiefly in prose, deals with poetry and poetic style, is Maulavī Muḥammad Ḥusain Āzād, lately professor of Arabic at the Government College, Lahore. He has not himself composed much verse; but his biographies of Urdū poets, with criticisms of their works, entitled *Āb-i Ḥayāt* ("Water of Life," Lahore, 1883), is by far the best book dealing with the subject. His prose style is much admired. As Ḥālī was the pupil of Ghālib, so was Āzād that of Ẕauq, of whose poems he has published a revised and annotated edition. His other works in prose are *Qiṣaṣ-i Hind*, episodes of Indian history arranged for schools; *Nairang-i Khayāl*, an allegory dealing with human life; and *Darbār-i Akbarī*, an account of the reign of Akbar.

Sir Sayyid Aḥmad Khān's life and work are dealt with elsewhere. Among his literary achievements may be mentioned the *Āṣārus-Ṣanādid* ("Vestiges of Princes"), an excellent account of Delhi and its monuments, which has passed through several editions since it was first lithographed in 1847. His essays and occasional papers, published in the *Alīgarh Institute Gazette* (started in 1864), and afterwards (from 1870 onwards) in a periodical entitled *Tahẕībul-Akhlāq* (or "Muhammadan Social Reformer"), handle all the problems of religious, social and educational advancement among Indian Musalmāns—the cause with which his life was identified. His great *Commentary on the Qur'ān*, in seven volumes, the last finished only a few days before his death in 1898, is carried to the end of *Sūrah* xx., a little more than half the book. In him Urdū prose found its most powerful wielder for the diffusion of modern ideas, and the movement which he set on foot has been the spring of the best literature in the language during recent years.

Another excellent writer of Urdū is Shamsul-'Ulamā Maulavī Naẕīr Aḥmad of Delhī, who is the author of a series of novels describing domestic life, of a somewhat didactic character, which have had a wide popularity, and from their admirable moral tone have been specially serviceable in the education of Indian women. These are entitled the *Mir'ātul-'Arūs* (or "Brides' Mirror"); *Taubatun-Naṣūḥ* ("the Repentance of Naṣūḥ"), *Banātun-Na'sh* ("the Seven Stars of the Great Bear"), *Ibnul-Waqt* ("Son of the Age"), and *Ayāmā* ("Widows"). But Naẕīr Aḥmad is a man of many sides; before he took to novel-writing he was the principal translator into Urdū of the *Indian Penal Code* (1861), which is reckoned a masterpiece in the exact rendering of European legal ideas; and more lately he gave to the world the best Urdū version of the Quran. He has been a popular lecturer on social subjects, displaying a rich vein of humour, and in his old age even ventured upon verse. During the latter portion of his life he was most closely associated with Sir Sayyid Aḥmad Khān.

The novel is one of the most noteworthy features of recent literary composition in Urdū. India has from time immemorial been rich in stories and romances of adventure; but the description of actual life and character in action, as the modern novel is understood in Europe, is quite a new development. The most admired production of this kind in Urdū is a work entitled *Fisāna-e Āzād*, by Paṇḍit Ratan-nāth Sarshār of Lucknow. The story, which is very long, is remarkable for the faithful and vivid pictures of Lucknow society which it presents, and its exact and lifelike delineation of character; it appeared originally as a *feuilleton* of the *Awadh Akhbār*, of which paper the author was at the time editor. Another good writer in the same branch of literature is Maulavī 'Abdul-Ḥalīm Sharar, also a native of the neighbourhood of Lucknow, but settled at Hyderabad. He was editor of a monthly periodical called the *Dil-gudāz* ("melter of hearts"), which contained essays and papers in European style, and in it his novels, which are all of an historical character, in the style of Sir Walter Scott, originally appeared. The best are *'Azīz and Virginā*, a tale of the Crusades, and *Manṣūr and Mōhinā*, a story of which the scene is laid in India at the time of the invasions of Sultan Maḥmūd of Ghaznī.

Although Urdū chiefly represents Musalmān culture, its use is by no means confined to adherents of that faith. It has just been mentioned that the most popular Urdū novelist is a Hindū (a Brāhman from Kashmīr); and the statistics of the vernacular press show that this form of the language is widely used by Hindūs as well as Musalmāns. Thus, of eighty periodicals in Urdū published in the United Provinces, twenty-nine are conducted by Hindūs; similarly, in the Punjab, of forty-eight Urdū journals, twenty are edited by Hindus.

"High Hindī" has scarcely adapted itself to modern requirements with the thoroughness displayed by Urdū. It is taught in the schools where the population is mainly Hindū, and books of science have been written in it with a terminology borrowed from Sanskrit, in place of the Persian terms used in the other dialect. But Sanskrit is far removed from the daily life of the people, and the majority of works in this style are read only by Paṇḍits, the great bulk of them dealing with religion, philosophy and the ancient literature. There are thirty-seven Hindī and four Hindī-Urdu journals in the United Provinces; but many of them are exclusively religious in their character, and several, though written in Dēvanāgarī, employ a mixed language which admits Persian words freely. The old dialects of literature, Awadhī and Braj-bhāshā, are now only used for poetry; High Hindī has been a complete failure for this purpose.

The most noticeable authors in Hindī since the middle of the 19th century have been Bābū Harishchandra and Rājā Śiva Prasād, both of Benares. The former, during his short life (1850–1885), was an enthusiastic cultivator of the old poetic art, using the dialects just mentioned. He published in the *Sundarī Tilak* an anthology of the best Hindī poetry, and in the *Kabi-bachan-Sudhā* ("ambrosia of the words of poets") and the magazine called *Harishchandrikā* a quantity of old texts, with much added matter. He also wrote a volume of biographies of famous men, European and Indian, and many critical studies, historical and literary. In history especially he cleared up many problems, and traced the lines for further investigation. In his *Kashmīr Kusum*, or history of Kashmīr, a list is given of about a hundred works by him. He was also the real founder of the modern Hindī drama; he wrote plays himself, and inspired others. Rājā Śiva Prasād (1823–1895) served for many years in the educational department, and published a number of works intended for use in schools, which have greatly contributed to the formation of a sound vernacular form of Hindī, not excessively Sanskritized, and not rejecting current Persian forms. The society at Benares called the *Nāgarī Prachārinī Sabhā* ("Society for promoting the use of the Nāgarī character") has, since the death of Harishchandra, been active in procuring the publication of works in Hindī, and has issued many useful books, besides conducting a systematic search for old MSS.

BIBLIOGRAPHY.—The best account in English of Hindī literature is Dr G. A. Grierson's *Modern Vernacular Literature of Hindōstān*, issued by the Asiatic Society of Bengal in 1889; the dates in this work, which is founded on indigenous compilations, have, however, in many cases to be received with caution. Before it appeared, Garcin de Tassy's *Histoire de la littérature Hindouie et Hindoustanie*, and his annual summaries of the progress made from 1850 to 1877, were our chief authority, and may still be consulted with advantage. For the religious literature of the Vaishnava sects, Professor H. H. Wilson's *Essay on the Religious Sects of the Hindus* (vol. i. of his collected works) has not yet been superseded.

For Urdū poets, Professor Āzād's *Āb-i Ḥayāt* (in Urdū) is the most trustworthy record. For the new school of Urdū literature reference may be made to a series of lectures (in English) by Shaikh 'Abdul-Qādir of Lahore, printed in 1898. The catalogues by Professor Blumhardt of Hindōstānī and Hindī books in the libraries of the British Museum and the India Office will give a good idea of the volume of the recent productions of the press in those languages. (C. J. L.)

HINDU CHRONOLOGY. The subject of Hindu chronology divides naturally into three parts: the calendar, the eras, and other reckonings.

I. The Calendar

The Hindus have had from very ancient times the system of lunisolar cycles, made by the combination of solar years, regulated by the course of the sun, and lunar years, regulated by the course of the moon, but treated in such a manner as to keep the beginning of the lunar year near the beginning of the solar year. The exact manner in which they arranged the details of their earliest calendar is still a subject of research. We deal here with their calendar as it now stands, in a form which was developed from about A.D. 400 under the influence of the Greek astronomy which had been introduced into India at no very long time previously.

The Hindu calendar, then, is determined by years of two kinds, solar and lunar. For civil purposes, solar years are used in Bengal, including Orissa, and in the Tamil and Malayāḷam districts of Madras, and lunar years throughout the rest of India. But the lunar year regulates everywhere the general religious rites and festivals, and the details of private and domestic life, such as the selection of auspicious occasions for marriages and for starting on journeys, the choice of lucky moments for shaving, and so on. Consequently, the details of the lunar year are shown even in the almanacs which follow the solar year. On the other hand, certain details of the solar year, such as the course of the sun through the signs and other divisions of the zodiac, are shown in the almanacs which follow the lunar year. We will treat the solar year first, because it governs the lunisolar system, and the explanation of it will greatly simplify the process of explaining the lunar calendar.

SpinSmart Software http://www.spinsmart.com

The civil solar year is determined by the astronomical solar year. The latter professes to begin at the vernal equinox, but the actual position is as follows. In our Western astronomy the signs of the zodiac have, in consequence of the precession of the equinoxes, drawn away to a large extent from the constellations from which they derived their names; with the result that the sun now comes to the vernal equinox, at the first point of the sign Aries, not in the constellation Aries, but at a point in Pisces, about 28 degrees before the beginning of Aries. The Hindus, however, have disregarded precession in connexion with their calendar from the time (A.D. 499, 522, or 527, according to different schools) when, by their system, the signs coincided with the constellations; and their sign Aries, called Mēsha by them, is still their constellation Aries, beginning, according to them, at or near the star ζ Piscium. Their astronomical solar year is, in fact, not the tropical year, in the course of which the sun really passes from one vernal equinox to the next, but a sidereal year, the period during which the earth makes one revolution in its orbit round the sun with reference to the first point of Mēsha; its beginning is the moment of the Mēsha-saṁkrānti, the entrance of the sun into the sidereal sign Mēsha, instead of the tropical sign Aries; and it begins, not with the true equinox, but with an artificial or nominal equinox.

The astronomical solar year.

The length of this sidereal solar year was determined in the following manner. The astronomer selected what the Greeks termed an *exeligmos*, the Romans an *annus magnus* or *mundanus*, a period in the course of which a given order of things is completed by the sun, moon, and planets returning to a state of conjunction from which they have started. The usual Hindu *exeligmos* has been the Great Age of 4,320,000 sidereal solar years, the aggregate of the Kṛita or golden age, the Trētā or silver age, the Dvāpara or brazen age, and the Kali or iron age, in which we now are; but it has sometimes been the Kalpa or aeon, consisting according to one view of 1000, according to another view of 1008, Great Ages. He then laid down the number of revolutions, in the period of his *exeligmos*, of the *nakshatras*, certain stars and groups of stars which will be noticed more definitely in our account of the lunar year; that is, the number of rotations of the earth on its axis, or, in other words, the number of sidereal days. A deduction of the number of the years from the number of the sidereal days gave, as remainder, the number of civil days in the *exeligmos*. And, this remainder being divided by the number of the years, the quotient gave the length of the sidereal solar year: refinements, suggested by experience, inference, or extraneous information, were made by increasing or decreasing the number of sidereal days assigned to the *exeligmos*. The Hindus now recognize three standard sidereal solar years determined in that manner. (1) A year of 365 days 6 hrs. 12 min. 30 sec. according to the *Āryabhaṭīya*, otherwise called the *First Ārya-Siddhānta*, which was written by the astronomer Āryabhaṭa (b. A.D. 476): this year is used in the Tamil and Malayāḷam districts, and, we may add, in Ceylon. (2) A year of 365 days 6 hrs. 12 min. 30·915 sec. according to the *Rājamṛigā ka*, a treatise based on the *Brāhma-Siddhānta* of Brahmagupta (b. A.D. 598) and attributed to king Bhōja, of which the epoch, the point of time used in it for calculations, falls in A.D. 1042: this year is used in parts of Gujarāt (Bombay) and in Rājputānā and other western parts of Northern India. (3) A year of 365 days 6 hrs. 12 min. 36·56 sec. according to the present *Sūrya-Siddhānta*, a work of unknown authorship which dates from probably about A.D. 1000: this year is used in almost all the other parts of India. It may be remarked that, according to modern science, the true mean sidereal solar year measures 365 days 6 hrs. 9 min. 9·6 sec., and the mean tropical year measures 365 days 5 hrs. 48 min. 46·054440 sec.

The result of the use of this sidereal solar year is that the beginning of the Hindu astronomical solar year, and with it the civil solar year and the lunar year and the nominal incidence of the seasons, has always been, and still is, travelling slowly forward in our calendar year by an amount which varies according to the particular authority.[1] For instance, Āryabhaṭa's year exceeds the Julian year by 12 min. 30 sec. This amounts to exactly one day in 115⅕ years, and five days in 576 years. Thus, if we take the longer period and confine ourselves to a time when the Julian calendar (old style) was in use, according to Āryabhaṭa the Mēsha-saṁkrānti began to occur in A.D. 603 on 20th March, and in A.D. 1179 on 25th March. The intermediate advances arrange themselves into four steps of one day each in 116 years, followed by one step of one day in 112 years: thus, the Mēsha-saṁkrānti began to occur on 21st March in A.D. 719, on 22nd March in A.D. 835, on 23rd March in A.D. 951, and on 24th March in A.D. 1067 (whence 112 years take us to 25th March in A.D. 1179). It is now occurring sometimes on 11th April, sometimes on the 12th; having first come to the 12th in A.D. 1871.

The civil solar year exists in more varieties than one. The principal variety, conveniently called the Mēshādi year, *i.e.* "the year beginning at the Mēsha-saṁkrānti," is the only one that we need notice at this point. The beginning of it is determined directly by the astronomical solar year; and for religious purposes it begins, with that year, at the moment of the Mēsha-saṁkrānti. Its first civil day, however, may be either the day on which the *saṁkrānti* occurs, or the next day, or even the day after that: this is determined partly by the time of day or night at which the *saṁkrānti* occurs, which, moreover, of course varies in accordance with the locality as well as the particular authority that is followed; partly by differing details of practice in different parts of the country. In these circumstances an exact equivalent of the Mēshādi civil solar year cannot be stated; but it may be taken as now beginning on or closely about the 12th of April.

The civil solar year.

The solar year is divided into twelve months, in accordance with the successive *saṁkrāntis* or entrances of the sun into the (sidereal) signs of the zodiac, which, as with us, are twelve in number. The names of the signs in Sanskṛit are as follows: Mēsha, the ram (Aries); Vṛishabha, the bull (Taurus); Mithuna, the pair, the twins (Gemini); Karka, Karkaṭa, Karkaṭaka, the crab (Cancer); Siṁha, the lion (Leo); Kanyā, the maiden (Virgo); Tulā, the scales (Libra); Vṛiśchika, the scorpion (Scorpio); Dhanus, the bow (Sagittarius); Makara, the sea-monster (Capricornus); Kumbha, the water-pot (Aquarius); and Mīna, the fishes (Pisces). The solar months are known in some parts by the names of the signs or by corrupted forms of them; and these are the best names for them for general use, because they lead to no confusion. But they have elsewhere another set of names, preserving the connexion of them with the lunar months: the Sanskṛit forms of these names are Chaitra, Vaiśākha, Jyaishṭha, Āshāḍha, Śrāvaṇa, Bhādrapada, Āśvina or Āśvayuja, Kārttika, Mārgaśira or Mārgaśīrsha (also known as Agrahāyaṇa), Pausha, Māgha, and Phālguna: in some localities these names are used in corrupted forms, and in others vernacular names are substituted for some of them; and, while in some parts the name Chaitra is attached to the month Mēsha, in other parts it is attached to the month Mīna, and so on throughout the series in each case. The astronomical solar month runs from the moment of one *saṁkrānti* of the sun to the moment of the next *saṁkrānti*; and, as the signs of the Hindu zodiac are all of equal length, 30 degrees, as with us, while the speed of the sun (the motion of the earth in its orbit round the sun) varies according to the time of the year, the length of the month is variable: the shortest month is Dhanus; the

The solar month.

[1] The disregard of precession, and the consequent travelling forward of the year through the natural seasons, is, of course, a serious defect in the Hindu calendar, the principles of which are otherwise good. Accordingly, an attempt was made by a small band of reformers to rectify this state of things by introducing a precessional calendar, taking as the first lunar month the synodic lunation in which the sun enters the tropical Aries, instead of the sidereal Mēsha; and the publication was started, in or about 1886, of the Sāyana-Pañchāng or "Precessional Almanac."

Further, the Hindu sidereal solar year is in excess of the true mean sidereal year by (if we use Āryabhaṭa's value) 3 min. 20·4 sec. If we take this, for convenience, at 3 min. 20 sec., the excess amounts to exactly one day in 432 years. And so even the sidereal Mēsha-saṁkrānti is now found to occur three or four days later than the day on which it should occur. Accordingly, another reformer had begun, in or about 1865, to publish the Navīn athavā Paṭwardhanī Pañchāng, the "New or Paṭwardhanī Almanac," in which he determined the details of the year according to the proper Mēsha-saṁkrānti.

SpinSmart Software http://www.spinsmart.com

longest is Mithuna. The civil solar month begins with its first civil day, which is determined, in different localities, in the same manner with the first civil day of the Mēshādi year, as indicated above. The civil month is of variable length; partly for that reason, partly because of the variation in the length of the astronomical month. No exact equivalents of the civil months, therefore, can be stated; but, speaking approximately, we may say that, while the month Mēsha now begins on or closely about 12th April, the beginning of a subsequent month may come as late as the 16th day of the English month in which it falls.

The seasons.

The solar year is also divided into six seasons, the Sanskrit names of which are Vasanta, spring; Grīshma, the hot weather; Varshā, the rainy season; Śarad, autumn; Hēmanta, the cold weather; and Śiśira, the dewy season. Vasanta begins at the Mīna-saṁkrānti; the other seasons begin at each successive second *saṁkrānti* from that. Originally, this scheme was laid out with reference to the true course of the sun, and the starting-point of it was the real winter solstice, with Śiśira, as the first season, beginning then: now, owing partly to the disregard of precession, partly to our introduction of New Style, each season comes about three weeks too late; Vasanta begins on or about 12th March, instead of 19th or 20th February, and so on with the rest. It may be added that in early times the year was also divided into three or four, and even into five or seven, seasons; and there appears to have been also a practice of reckoning the seasons according to the lunar months, which, however, would only give a very varying arrangement, in addition to neglecting the point that the seasons are naturally determined by the course of the sun, not of the moon. But there is now recognized only the division into six seasons, determined as stated above.

The solstitial divisions of the year.

The solar year is also divided into two parts called Uttarāyaṇa, the period during which the sun is moving to the north, and Dakshiṇāyana, the period during which it is moving to the south. The Uttarāyaṇa begins at the nominal winter solstice, as marked by the Makara-saṁkrānti; and the day on which this solstice occurs, usually 12th January at present, is still a special occasion of festivity and rejoicing; the Dakshiṇāyana begins at the nominal summer solstice, as marked by the Karka-saṁkrānti. It may be added here that, while the Hindus disregard precession in the actual computation of their years and the regulation of their calendar, they pay attention to it in certain other respects, and notably as regards the solstices: the precessional solstices are looked upon as auspicious occasions, as well as the non-precessional solstices, and are customarily shown in the almanacs; and some of the almanacs show also the other precessional *saṁkrāntis* of the sun.

The civil day.

The civil days of the solar month begin at sunrise. They are numbered 1, 2, 3, &c., in unbroken succession to the end of the month. And, the length of the month being variable for the reasons stated above, the number of the civil days may range from twenty-nine to thirty-two.

The week-day.

The civil days are named after the weekdays, of which the usual appellations (there are various synonyms in each case, and some of the names are used in corrupted forms) are in Sanskrit Ādityavāra or Ravivāra, the day of the sun, sometimes called Ādivāra, the beginning-day (Sunday); Sōmavāra, the day of the moon (Monday); Maṅgalavāra, the day of Mars (Tuesday); Budhavāra, the day of Mercury (Wednesday); Bṛihaspativāra or Guruvāra, the day of Jupiter (Thursday); Śukravāra, the day of Venus (Friday); and Śanivāra, the day of Saturn (Saturday). It may be mentioned, as a matter of archaeological interest, that, while some of the astronomical books perhaps postulate an earlier knowledge of the "lords of the days," and other writings indicate a still earlier use of the period of seven days, the first proved instance of the use of the name of a weekday is of the year A.D. 484, and is furnished by an inscription in the Saugor district, Central India.

Divisions of the day.

The divisions of the civil day, as far as we need note them, are 60 *vipalas* = 1 *pala* = 24 seconds; 60 *palas* = 1 *ghaṭikā* = 24 minutes; 60 *ghaṭikās* = 24 hours = 1 day. There is also the *muhūrta* = 2 *ghaṭikās* = 48 minutes: this is the nearest approach to the "hour." The comparative value of these measures of time may perhaps be best illustrated thus: $2\frac{1}{2}$ *muhūrtas* = 2 hours; $2\frac{1}{2}$ *ghaṭikās* = 1 hour; $2\frac{1}{2}$ *palas* = 1 minute; $2\frac{1}{2}$ *vipalas* = 1 second.

Civil time.

As their civil day begins at sunrise, the Hindus naturally count all their times, in *ghaṭikās* and *palas*, from that moment. But the moment is a varying one, though not in India to anything like the extent to which it is so in European latitudes; and under the British Government the Hindus have recognized the advantage, and in fact the necessity, especially in connexion with their lunar calendar, of having a convenient means of referring their own times to the time which prevails officially. Consequently, some of the almanacs have adopted the European practice of showing the time of sunrise, in hours and minutes, from midnight; and some of them add the time of sunset from noon.

The lunar year.

The lunar year consists primarily of twelve lunations or lunar months, of which the present Sanskṛit names, generally used in more or less corrupted forms, are Chaitra, Vaiśākha, &c., to Phālguna, as given above in connexion with the solar months. It is of two principal varieties, according as it begins with a certain day in the month Chaitra, or with the corresponding day in Kārttika: the former variety is conveniently known as the Chaitrādi year; the latter as the Kārttikādi year. For religious purposes the lunar year begins with its first lunar day: for civil purposes it begins with its first civil day, the relation of which to the lunar day will be explained below. Owing to the manner in which, as we shall explain, the beginning of the lunar year is always shifting backwards and forwards, it is not practicable to lay down any close equivalents for comparison: but an indication may be given as follows. The first civil day of the Chaitrādi year is the day after the new-moon conjunction which occurs next after the entrance of the sun into Mīna, and it now falls from about 13th March to about 11th April: the first civil day of the Kārttikādi year is the first day after the new-moon conjunction which occurs next after the entrance of the sun into Tulā, and it now falls from about 17th October to about 15th November.

The lunar month.

The present names of the lunar months, indicated above, were derived from the *nakshatras*, which are certain conspicuous stars and groups of stars lying more or less along the neighbourhood of the ecliptic. The *nakshatras* are regarded sometimes as twenty-seven in number, sometimes as twenty-eight, and are grouped in twelve sets of two or three each, beginning, according to the earlier arrangement of the list, with the pair Kṛittikā and Rōhiṇī, and including in the sixth place Chitrā and Svāti, and ending with the triplet Rēvatī, Aśvinī and Bharaṇī. They are sometimes styled lunar mansions, and are sometimes spoken of as the signs of the lunar zodiac; and it is, no doubt, chiefly in connexion with the moon that they are now taken into consideration. But they mark divisions of the ecliptic: according to one system, twenty-seven divisions, each of 13 degrees 20 minutes; according to two other systems, twenty-seven or twenty-eight unequal divisions, which we need not explain here. The almanacs show the course of the sun through them, as well as the course of the moon; and the course of the sun was marked by them only, before the time when the Hindus began to use the twelve signs of the solar zodiac. So there is nothing exclusively lunar about them. The present names of the lunar months were derived from the *nakshatras* in the following manner: the full-moon which occurred when the moon was in conjunction with Chitrā (the star α Virginis) was named Chaitrī, and the lunar month, which contained the Chaitrī full-moon, was named Chaitra; and so on with the others. The present names have superseded another set of names which were at one time in use concurrently with them; these other names are Madhu (=Chaitra), Mādhava, Śukra, Śuchi, Nabhas, Nabhasya, Isha, Ūrja (=Kārttika), Sahas, Sahasya, Tapas, and Tapasya (=Phālguna): they seem to have marked originally solar season-months of the solar year, rather than lunar months of the lunar year.

A lunar month may be regarded as ending either with the new-moon, which is called *amāvāsyā*, or with the full-moon, which is called *pūrṇamāsī*, *pūrṇimā*: a month of the former kind is termed *amānta*, "ending with the new-moon," or *śuklādi*, "beginning with the bright fortnight;" a month of the latter kind is termed *pūrṇimānta*, "ending with the full-moon," or *kṛishṇādi*, "beginning with the dark fortnight." For all purposes of the calendar, the *amānta* month is used in Southern India, and the *pūrṇimānta* month in Northern India. But only the *amānta* month, the period of the synodic revolution of the moon, is recognized in Hindu astronomy, and for the purpose of naming the lunations and adjusting the lunar to the solar year by the intercalation and suppression of lunar months; and the rule is that the lunar Chaitra is the *amānta* or synodic month at the first moment of which the sun is in the sign Mīna, and in the course of which the sun enters Mēsha: the other months follow in the same way; and the lunar Kārttika is the *amānta* month at the first moment of which the sun is in Tulā, and in the course of which the sun enters Vṛiśchika. The connexion between the lunar and the solar months is maintained by the point that the name Chaitra is applied according to one practice to the solar Mīna, in which the lunar Chaitra begins, and according to another practice to the solar Mēsha, in which the lunar Chaitra ends. Like the lunar year, the lunar month begins for religious purposes with its first lunar day, and for civil purposes with its first civil day.

One mean lunar year of twelve lunations measures very nearly 354 days 8 hrs. 48 min. 34 sec.; and one Hindu solar year measures 365 days 6 hrs. 12 min. 30 sec. according to Āryabhaṭa, or slightly more according to the other two authorities. Consequently, the beginning of a lunar year pure and simple would be always travelling backwards through the solar year, by about eleven days on

SpinSmart Software http://www.spinsmart.com

each occasion, and would in course of time recede entirely through the solar year, as it does in the Mahommedan calendar. The Hindus prevent that in the following manner. The length of the Hindu astronomical solar month, measured by the *saṁkrāntis* of the sun, its successive entrances into the signs of the zodiac, ranges, in accordance with periodical variations in the speed of the sun, from about 29 days 7 hrs. 38 min. up to about 31 days 15 hrs. 28 min. The length of the *amānta* or synodic lunar month ranges, in accordance with periodical variations in the speed of the moon and the sun, from about 29 days 19 hrs. 30 min. down to about 29 days 7 hrs. 20 min. Consequently, it happens from time to time that there are two new-moon conjunctions, so that two lunations begin, in one astronomical solar month, between two *saṁkrāntis* of the sun, while the sun is in one and the same sign of the zodiac, and there is no *saṁkrānti* in the lunation ending with the second new-moon: when this is the case, there are two lunations to which the same name is applicable, and so there is an additional or intercalated month, in the sense that a name is repeated: thus, when two new-moons occur while the sun is in Mēsha, the lunation ending with the first of them, during which the sun has entered Mēsha, is Chaitra; the next lunation, in which there is no *saṁkrānti*, is Vāiśākha, because it begins when the sun is in Mēsha; and the next lunation after that is again Vaiśākha, for the same reason, and also because the sun enters Vṛishabha in the course of it: in these circumstances, the first of the two Vaiśākhas is called Adhika-Vaiśākha, "the additional or intercalated Vaiśākha," and the second is called simply Vaiśākha, or sometimes Nija-Vaisākha, "the natural Vaiśākha." On the other hand, it occasionally happens, in an autumn or winter month, that there are two *saṁkrāntis* of the sun in one and the same *amānta* or synodic lunar month, between two new-moon conjunctions, so that no lunation begins between the two *saṁkrāntis*: when this is the case, there is one lunation to which two names are applicable, and there is a suppressed month, in the sense that a name is omitted: thus, if the sun enters both Dhanus and Makara during one synodic lunation, that lunation is Mārgaśira, because the sun was in Vṛiśchika at the first moment of it and enters Dhanus in the course of it;[1] the next lunation is Māgha, because the sun is in Makara by the time when it begins and will enter Kumbha in the course of it; and the name Pausha, between Mārgaśira and Māgha, is omitted. When a month is thus suppressed, there is always one intercalated month, and sometimes two, in the same Chaitrādi lunar year, so that the lunar year never contains less than twelve months, and from time to time consists of thirteen months. There are normally seven intercalated months, rising to eight when a month is suppressed, in 19 solar years, which equal very nearly 235 lunations;[2] and there is never less than one year without an intercalated month between two years with intercalated months, except when there is only one such month in a year in which a month is suppressed; then there is always an intercalated month in the next year also. The suppression of a month takes place at intervals of 19 years and upwards, regarding which no definite statement can conveniently be made here. It may be added that an intercalated Chaitra or Kārttika takes the place of the ordinary month as the first month of the year; an intercalated month is not rejected for that purpose, though it is tabooed from the religious and auspicious points of view.

Intercalation and suppression of lunar months.

The manner in which this arrangement of intercalated and suppressed months works out, so as to prevent the beginning of the Chaitrādi lunar year departing far from the beginning of the Mēshādi solar year, may be illustrated as follows. In A.D. 1815 the Mēsha-saṁkrānti occurred on 11th April; and the first civil day of the Chaitrādi year was 10th April. In A.D. 1816 and 1817 the first civil day of the Chaitrādi year fell back to 29th March and 18th March. In A.D. 1817, however, there was an intercalated month, Śrāvaṇa; with the result that in A.D. 1818 the first civil day of the Chaitrādi year advanced to 6th April. And, after various shiftings of the same kind—including in A.D. 1822 an intercalation of Āśvina and a suppression of Pausha, followed in A.D. 1823, when the first civil day of the Chaitrādi year had fallen back to 13th March, by an intercalation of Chaitra itself—in A.D. 1834, when the Mēsha-saṁkrānti occurred again on 11th April, the first civil day of the Chaitrādi year was again 10th April.

The lunar month is divided into two fortnights (*paksha*), called bright and dark, or, in Indian terms, *śukla* or *śuddha*, *śudi*, *sudi*, and *krishṇa* or *bahula*, *badi*, *vadi*: the bright fortnight, *śukla-paksha*, is the period of the waxing moon, ending at the full-moon; the dark fortnight, *kṛishṇa-paksha*, is the period of the waning moon, ending at the new-moon. In the *amānta* or *śuklādi* month, the bright fortnight precedes the dark; in the *pūrṇimānta* or *kṛishṇādi* month, the dark fortnight comes first; and the result is that, whereas, for instance, the bright fortnight of Chaitra is the same period of time throughout India, the preceding dark fortnight is known in Northern India as the dark fortnight of Chaitra, but in Southern India as the dark fortnight of Phālguna. This, however, does not affect the period covered by the lunar year; the Chāitradi and Kārttikādi years begin everywhere with the bright fortnight of Chaitra and Kārttika respectively; simply, by the *amānta* system the dark fortnights of Chaitra and Kārttika are the second fortnights, and by the *pūrṇimānta* system they are the last fortnights, of the years. Like the month, the fortnight begins for religious purposes with its first lunar day, and for civil purposes with its first civil day.

The lunar fortnight.

The lunar fortnights are divided each into fifteen *tithis* or lunar days.[3] The *tithi* is the time in which the moon increases her distance from the sun round the circle by twelve degrees; and the almanacs show each *tithi* by its ending-time; that is, by the moment, expressed in *ghaṭikās* and *palas*, after sunrise, at which the moon completes that distance. In accordance with that the *tithi* is usually used and cited with the weekday on which it ends; but there are special rules regarding certain rites, festivals, &c., which sometimes require the *tithi* to be used and cited with the weekday on which it begins or is current at a particular time. The first *tithi* of each fortnight begins immediately after the moment of new-moon and full-moon respectively; the last *tithi* ends at the moment of full-moon and new-moon. The *tithis* are primarily denoted by the numbers 1, 2, 3, &c., for each fortnight; but, while the full-moon *tithi* is always numbered 15, the new-moon *tithi* is generally numbered 30, even where the *pūrṇimānta* month is used. The *tithis* may be cited either by their figures or by the Sanskṛit ordinal words *prathamā*, "first," *dvitīyā*, "second," &c., or corruptions of them. But usually the first *tithi* of either fortnight is cited by the term *pratipad*, *pratipadā*, and the new-moon and full-moon *tithis* are cited by the terms *amāvāsyā* and *pūrṇimā*; or here, again, corruptions of the Sanskṛit terms are used. And special names are sometimes prefixed to the numbers of the *tithis*, according to the rites, festivals, &c., prescribed for them, or events or merits assigned to them: for instance, Vaiśākha śukla 3 is Akshaya or Akshayya-tṛitīyā, the third *tithi* which ensures permanence to acts performed on it; Bhādrapada śukla 4 is Gaṇēśa-chaturthī, the fourth *tithi* dedicated to the worship of the god Gaṇēśa, Gaṇapati, and the *amānta* Bhādrapada or *pūrṇimānta* Āśvina kṛishṇa 13 is Kaliyugādi-trayōdaśī, as being regarded (for some reason which is not apparent) as the anniversary of the beginning of the Kaliyuga, the present Age. The first *tithi* of the year is styled Saṁvatsara-pratipadā, which term answers closely to our "New Year's Day."

The lunar day.

The civil days of the lunar month begin, like those of the solar month, at sunrise, and bear in the same way the names of the weekdays. But they are numbered in a different manner; fortnight by fortnight and according to the *tithis*. The general rule is that the civil day takes the number of the *tithi* which is current at its sunrise. And the results are as follows. As the motions of the sun and the moon vary periodically, a *tithi* is of variable length, ranging, according to the Hindu calculations, from 21 hrs. 34 min. 24 sec. to 26 hrs. 6 min. 24 sec.: it may, therefore, be either shorter or longer than a civil day, the duration of which is practically 24 hours (one minute, roughly, more or less, according to the time of the year). A *tithi* may end at any moment during the civil day; and ordinarily it ends on the civil day after that on which it begins, and covers only one sunrise and gives its number to the day on which it ends. It may, however, begin on

The civil day.

[1] It might also be called Pausha, because the sun enters Makara in the course of it; and it may be observed that, in accordance with a second rule which formerly existed, it would have been named Pausha because it ends while the sun is in Makara, and the omitted name would have been Mārgaśira. But the more important condition of the present rule, that Pausha begins while the sun is in Dhanus, is not satisfied.

[2] The well-known Metonic cycle, whence we have by rearrangement our system of Golden Numbers, naturally suggests itself; and we have been told sometimes that that cycle was adopted by the Hindus, and elsewhere that the intercalation of a month by them generally takes place in the years 3, 5, 8, 11, 14, 16, and 19 of each cycle, differing only in respect of the 14th year, instead of the 13th, from the arrangement which is said to have been fixed by Meton. As regards the first point, however, there is no evidence that a special period of 19 years was ever actually used by the Hindus during the period with which we are dealing, beyond the extent to which it figures as a component of the number of years, $19 \times 150 = 2850$, forming the lunisolar cycle of an early work entitled *Rōmaka-Siddhānta*; and, as was recognized by Kalippos not long after the time of Meton himself, the Metonic cycle has not, for any length of time, the closeness of results which has been sometimes supposed to attach to it; it requires to be readjusted periodically. As regards the second point, the precise years of the intercalated months depend upon, and vary with, the year that we may select as the apparent first year of a set of 19 years, and it is not easy to arrange the Hindu years in sets answering to a direct continuation of the Metonic cycle.

[3] It is customary to render the term *tithi* by "lunar day:" it is, in fact, explained as such in Sanskṛit works; and, as the *tithis* do mark the age of the moon by periods approximating to 24 hours, they are, in a sense, lunar days. But the *tithi* must not be confused with the lunar day of western astronomy, which is the interval, with a mean duration of about 24 hrs. 54 min., between two successive meridian passages of the moon.

SpinSmart Software http://www.spinsmart.com

one civil day and end on the next but one, and so cover two sunrises; and it is then treated as a repeated *tithi*, in the sense that its number is repeated: for instance, if the seventh *tithi* so begins and ends, the civil day on which it begins is numbered 6, from the *tithi* which is current at the sunrise of that day and ends on it; the day covered entirely by the seventh *tithi* is numbered 7, because that *tithi* is current at its sunrise; the next day, at the sunrise of which the seventh *tithi* is still current and during which it ends, is again numbered 7; and the number 8 falls to the next day after that, when the eighth *tithi* is current at sunrise.[1] On the other hand, a *tithi* may begin and end during one and the same civil day, so as not to touch a sunrise at all: in this case, it exists for any practical purposes for which it may be wanted (it is, however, to be avoided if possible, as being an unlucky occasion), but it is suppressed or expunged for the numbering of the civil day, in the sense that its number is omitted; for instance, if the seventh *tithi* begins and ends during one civil day, that day is numbered 6 from, as before, the *tithi* which is current at its sunrise and ends when the seventh *tithi* begins; the next day is numbered 8, because the eighth *tithi* is current at its sunrise; and there is, in this case, no civil day bearing the number seven. In consequence of this method of numbering, it sometimes happens, as the result of the suppression of a *tithi*, that the day of a full-moon is numbered 14 instead of 15; that the day of a new-moon is numbered 14 instead of 30; and that the first day of a fortnight, and even the first day of a lunar year, is numbered 2 instead of 1.

There are, on an average, thirteen suppressed *tithis* and seven repeated *tithis* in twelve lunar months; and so the lunar year averages 354 days, rising to about 384 when a month is intercalated. It occasionally happens that there are two suppressions of *tithis* in one and the same fortnight; and the almanacs show such a case in the bright fortnight of Jyaishṭha, A.D. 1878: but this occurs only after very long intervals.

The Karana.

The *tithi* is divided into two *karanas*; each *karana* being the time in which the moon increases her distance from the sun by six degrees. But this is a detail of astrological rather than chronological interest. So, also, are two other details to which a prominent place is given in the lunar calendars; to *yōga*, or time in which the joint motion in longitude, the sum of the motions of the sun and the moon, is increased by 13 degrees 20 minutes; and the *nakshatra*, the position of the moon as referred to the ecliptic by means of the stars and groups of stars which have been mentioned above under the lunar month.

In the Indian calendar everything depends upon exact times, which differ, of course, on every different meridian; and (to cite what is perhaps the most frequent and generally important occurrence) suppression and repetition may affect one *tithi* and civil day in one locality, and another *tithi* and civil day in another locality not very far distant. Consequently, neither for the lunar nor for the solar calendar is there any almanac which is applicable to even the whole area in which any particular length of the astronomical solar year prevails; much less, for the whole of India. Different almanacs are prepared and published for places of leading importance; details for minor places, when wanted, have to be worked out by the local astrologer, the modern representative of an ancient official known as Sāṁvatsara, the "clerk of the year."

II. Eras

As far as the available evidence goes (and we have no reason to expect to discover anything opposed to it), any use of eras, in the sense of continuous reckonings which originated in historical occurrences or astronomical epochs and were employed for official and other public chronological purposes, did not prevail in India before the 1st century B.C. Prior to that time, there existed, indeed, in connexion with the sacrificial calendar, a five-years lunisolar cycle, and possibly some extended cycles of the same nature; and there was in Buddhist circles a record of the years elapsed since the death of Buddha, which we shall mention again further on. But, as is gathered from books and is well illustrated by the edicts of Aśōka (reigned 264–227 B.C.) and the inscriptions of other rulers, the years of the reign of each successive king were found sufficient for the public dating of proclamations and the record of events. There is no known case in which any Indian king, of really ancient times, deliberately applied himself to the foundation of an era: and we have no reason for thinking that such a thing was ever done, or that any Hindu reckoning at all owes its existence to a recognition of historical requirements. The eras which came into existence from the 1st century B.C. onwards mostly had their origin in the fortuitous extension of regnal reckonings. The usual course has been that, under the influence of filial piety, pride in ancestry, loyalty to a paramount sovereign, or some other such motive, the successor of some king continued the regnal reckoning of his predecessor, who was not necessarily the first king in the dynasty, and perhaps did not even reign for any long time, instead of starting a new reckoning, beginning again with the year 1, according to the years of his own reign. Having thus run for two reigns, the reckoning was sufficiently well established to continue in the same form, and to eventually develop into a generally accepted local era, which might or might not be taken over by subsequent dynasties ruling afterwards over the same territory. In these circumstances, we find the establisher of any particular era in that king who first continued his predecessor's regnal reckoning, instead of replacing it by his own; but we regard as the founder of the era that king whose regnal reckoning was so continued. We may add here that it was only in advanced stages that any of the Hindu eras assumed specific names: during the earlier period of each of them, the years were simply cited by the term *saṁvatsara* or *varsha*, "the year (bearing such-and-such a number)," or by the abbreviations *saṁvat* and *sam*, without any appellative designation.

The Buddhist and Jaia religious reckonings.

The Hindus have had two religious reckonings, which it will be convenient to notice first. Certain statements in the Ceylonese chronicles, the *Dīpavaṁsa* and *Mahāvaṁsa*, endorsed by an entry in a record of Aśōka, show that in the 3rd century B.C. there existed among the Buddhists a record of the time elapsed since the death of Buddha in 483 B.C., from which it was known that Aśōka was anointed to the sovereignty 218 years after the death. The reckoning, however, was confined to esoteric Buddhist circles, and did not commend itself for any public use; and the only known inscriptional use of it, which also furnishes the latest known date recorded in it, is found in the Last Edict of Aśōka, which presents his dying speech delivered in 226 B.C., 256 years after the death of Buddha. In Ceylon, where, also the original reckoning was not maintained, there was devised in the 12th century A.D. a reckoning styled Buddhavarsha, "the years of Buddha," which still exists, and which purports to run from the death of Buddha, but has set up an erroneous date for that event in 544 B.C. This later reckoning spread from Ceylon to Burma and Siam, where, also, it is still used. It did not obtain any general recognition in India, because, when it was devised, Buddhism had practically died out there, except at Bōdh-Gayā. But, as there seems to have been constant intercourse between Bōdh-Gayā and Ceylon as well as other foreign Buddhist countries, we should not be surprised to find an occasional instance of its use at Bōdh-Gayā: and it is believed that one such instance, belonging to A.D. 1270, has been obtained.

The Jains have had, and still maintain, a reckoning from the death of the founder of their faith, Vīra, Mahāvīra, Vardhamāna, which event is placed by them in 528 B.C. This reckoning figures largely in the Jain books, which put forward dates in it for very early times. But the earliest known synchronous date in it—by which we mean a date given by a writer who recorded the year in which he himself was writing—is one of the year 980, or, according to a different view mentioned in the passage itself, of the year 993. This reckoning, again, did not commend itself for any official or other public use. And the only known inscriptional instances of the use of it are modern ones, of the 19th century. While it is certain that the Jain reckoning, as it exists, has its initial point in 528 B.C. it has not yet been determined whether that is actually the year in which Vīra died. All that can be said on this point is that the date is not inconsistent with certain statements in Buddhist books, which mention, by a Prākṛit name of which the Sanskṛit form is Nirgrantha-Jñātaputra, a contemporary of Buddha, in whom there is recognized the original of the Jain Vīra, Mahāvīra, or Vardhamāna, and who, the same books say, died while Buddha was still alive. But there are some indications that Nirgrantha-Jñātaputra may have died only a short time before Buddha himself; and the event may

[1] We illustrate the ordinary occurrences. But there are others. Thus, a repeated *tithi* may occasionally be followed by a suppressed one: in this case the numbering of the civil days would be 6, 7, 7, 9, &c., instead of 6, 7, 7, 8, 9, &c. Or it may occasionally be preceded by a suppressed one: in this case the numbering would be 5, 7, 7, 8, &c., instead of 5, 6, 7, 7,8, &c.

SpinSmart Software http://www.spinsmart.com

easily have been set back to 528 B.C. in circumstances, attending a determination of the reckoning long after the occurrence, analogous to those in which the Ceylonese Buddhavarsha set up the erroneous date of 544 B.C. for the death of Buddha.

Bygone Eras of royal origin.

In the class of eras of royal origin, brought into existence in the manner indicated above, the Hindus have had various reckonings which have now mostly fallen into disuse. We may mention them, without giving them the detailed treatment which the more important of the still existing reckonings demand.

The Kalachuri or Chēdi era, commencing in A.D. 248 or 249, is known best from inscriptional records, bearing dates which range from the 10th to the 13th century A.D., of the Kalachuri kings of the Chēdi country in Central India; and it is from them that it derived the name under which it passes. In earlier times, however, we find this era well established, without any appellation, in Western India, in Gujarāt and the Ṭhāṇa district of Bombay, where it was used by kings and princes of the Chalukya, Gurjara, Sēndraka, Kaṭachchuri and Traikūṭaka families. It is traced back there to A.D. 457, at which time there was reigning a Traikūṭaka king named Dahrasēna. Beyond that point, we have at present no certain knowledge about it. But it seems probable that the founder of it may be recognized in an Ābhīra king Īśvarasēna, or else in his father Śivadatta, who was reigning at Nāsik in or closely about A.D. 248–49.

The Gupta era, commencing in A.D. 320, was founded by Chandragupta I., the first paramount king in the great Gupta dynasty of Northern India. When the Guptas passed away, their reckoning was taken over by the Maitraka kings of Valabhī, who succeeded them in Kāṭhiāwār and some of the neighbouring territories; and so it became also known as the Valabhī era.

From Halsi in the Belgaum district, Bombay, we have a record of the Kadamba king Kākusthavarman, which was framed during the time when he was the Yuvarāja or anointed successor to the sovereignty, and may be referred to about A.D. 500. It is dated in "the eightieth victorious year," and thus indicates the preservation of a reckoning running from the foundation of the Kadamba dynasty by Mayūravarman, the great-grandfather of Kākusthavarman. But no other evidence of the existence of this era has been obtained.

The records of the Gāṅga kings of Kaliṅganagara, which is the modern Mukhaliṅgam-Nagarikaṭakam in the Gañjām district, Madras, show the existence of a Gāṅga era which ran for at any rate 254 years. And various details in the inscriptions enable us to trace the origin of the Gāṅga kings to Western India, and to place the initial point of their reckoning in A.D. 590, when a certain Satyāśraya-Dhruvarāja-Indravarman, an ancestor and probably the grandfather of the first Gāṅga king Rājasiṁha-Indravarman I., commenced to govern a large province in the Koṅkaṇ under the Chalukya king Kīrtivarman I.

An era commencing in A.D. 605 or 606 was founded in Northern India by the great king Harshavardhana, who reigned first at Ṭhāṇēsar and then at Kanauj, and who was the third sovereign in a dynasty which traced its origin to a prince named Naravardhana. A peculiarity about this era is that it continued in use for apparently four centuries after Harshavardhana, in spite of the fact that his line ended with him.

The inscriptions assert that the Western Chālukya king Vikrama or Vikramāditya VI. of Kalyāṇi in the Nizam's dominions, who reigned from A.D. 1076 to 1126, abolished the use of the Śaka era in his dominions in favour of an era named after himself. What he or his ministers did was to adopt, for the first time in that dynasty, the system of regnal years, according to which, while the Śaka era also remained in use, most of the records of his time are dated, not in that era, but in the year so-and-so of the Chālukya-Vikrama-kāla or Chālukya-Vikrama-varsha, "the time or years of the Chālukya Vikrama." There is some evidence that this reckoning survived Vikramāditya VI. for a short time. But his successors introduced their own regnal reckonings; and that prevented it from acquiring permanence.

In Tirhut, there is still used a reckoning which is known as the Lakshmaṇasēna era from the name of the king of Bengal by whom it was founded. There is a difference of opinion as to the exact initial point of this reckoning; but the best conclusion appears to be that which places it in A.D. 1119. This era prevailed at one time throughout Bengal: we know this from a passage in the *Akbarnāma*, written in A.D. 1584, which specifies the Śaka era as the reckoning of Gujarāt and the Dekkan, the Vikrama era as the reckoning of Mālwā, Delhi, and those parts, and the Lakshmaṇasēna era as the reckoning of Bengal.

The last reckoning that we have to mention here is one known as the Rājyābhishēka-Śaka, "the era of the anointment to the sovereignty," which was in use for a time in Western India. It dated from the day Jyaishṭha śukla 13 of the Śaka year 1597 current, =6 June, A.D. 1674, when Śivajī, the founder of the Marāṭhā kingdom, had himself enthroned.

There are four reckonings which it is difficult at present to class exactly. Two inscriptions of the 15th and 17th centuries, recently brought to notice from Jēsalmēr in Rājputānā, present a reckoning which postulates an initial point in A.D. 624 or in the preceding or the following year, and bears an appellation, Bhāṭika, which seems to be based on the name of the Bhaṭṭi tribe, to which the rulers of Jēsalmēr belong. No historical event is known, referable to that time, which can have given rise to an era. It is possible that the apparent initial date represents an epoch, at the end of the Śaka year 546 or thereabouts, laid down in some astronomical work composed then or soon afterwards and used in the Jēsalmēr territory. But it seems more probable that it is a purely fictitious date, set up by an attempt to evolve an early history of the ruling family.

Miscellaneous Eras.

In the Tinnevelly district of Madras, and in the territories of the same presidency in which the Malayālam language prevails, namely, South Kanara below Mangalore, the Malabar district, and the Cochin and Travancore states, there is used a reckoning which is known sometimes as the Kollam or Kōlamba reckoning, sometimes as the era of Paraśurāma. The years of it are solar: in the southern parts of the territory in which it is current, they begin with the month Siṁha; in the northern parts, they begin with the next month, Kanyā. The initial point of the reckoning is in A.D. 825; and the year 1076 commenced in A.D. 1900. The popular view about this reckoning is that it consists of cycles of 1000 years; that we are now in the fourth cycle; and that the reckoning originated in 1176 B.C. with the mythical Paraśurāma, who exterminated the Kshatriya or warrior caste, and reclaimed the Koṅkaṇ countries, Western India below the Ghauts, from the ocean. But the earliest known date in it, of the year 149, falls in A.D. 973; and the reckoning has run on in continuation of the thousand, instead of beginning afresh in A.D. 1825. It seems probable, therefore, that the reckoning had no existence before A.D. 825. The years are cited sometimes as "the Kollam year (of such-and-such a number)," sometimes as "the year (so-and-so) after Kollam appeared;" and this suggests that the reckoning may possibly owe its origin to some event, occurring in A.D. 825, connected with one or other of the towns and ports named Kollam, on the Malabar coast; perhaps Northern Kollam in the Malabar district, perhaps Southern Kollam, better known as Quilon, in Travancore. But the introduction of Paraśurāma into the matter, which would carry back (let us say) the foundation of Kollam to legendary times, may indicate, rather, a purely imaginative origin. Or, again, since each century of the Kollam reckoning begins in the same year A.D. with a century of the Saptarshi reckoning (see below under III. Other Reckonings), it is not impossible that this reckoning may be a southern offshoot of the Saptarshi reckoning, or at least may have had the same astrological origin.

In Nēpāl there is a reckoning, known as the Nēwār era and commencing in A.D. 879, which superseded the Gupta and Harsha eras there. One tradition attributes the foundation of it to a king Rāghavadēva; another says that, in the time and with the permission of a king Jayadēvamalla, a merchant named Sākhwāl paid off, by means of wealth acquired from sand which turned into gold, all the debts then existing in the country, and introduced the new era in commemoration of the occurrence. It is possible that the era may have been founded by some ruler of Nēpāl: but nothing authentic is known about the particular names mentioned in connexion with it. This era appears to have been discarded for state and official purposes, in favour of the Śaka era, in A.D. 1768, when the Gūrkhas became masters of Nēpāl; but manuscripts show that in literary circles it has remained in use up to at any rate A.D. 1875.

Inscriptions disclose the use in Kāṭhiāwār and Gujarāt, in the 12th and 13th centuries, of a reckoning, commencing in A.D. 1114, which is known as the Siṁha-saṁvat. No historical occurrence is known, on which it can have been based; and the origin of it is obscure.

Three great Eras in general use.

The eras mentioned above have for the most part served their purposes and died out. But there are three great reckonings, dating from a very respectable antiquity, which have held their own and survived to the present day. These are the Kaliyuga, Vikrama, and Śaka eras. It will be convenient to treat the Kaliyuga first, though, in spite of having the greatest apparent antiquity, it is the latest of the three in respect of actual date of origin.

The Kaliyuga Era of 3102 B.C.

The Kaliyuga era is the principal astronomical reckoning of the Hindus. It is frequently, if not generally, shown in the almanacs: but it can hardly be looked upon as being now in practical use for civil purposes; and, as regards the custom of previous times as far as we can judge it from the inscriptional use, which furnishes a good guide, the position is as follows: from Southern India we have one such instance of A.D. 634, one of A.D. 770, three of the 10th century, and then, from the 12th century onwards, but more particularly from the 14th, a certain number of instances, not exactly very small in itself, but extremely so in comparison

SpinSmart Software http://www.spinsmart.com

with the number of cases of the use of the Vikrama and Śaka eras and other reckonings: from Northern India the earliest known instance of is A.D. 1169 or 1170, and the later ones number only four. Its years are by nature sidereal solar years, commencing with the Mēsha-saṁkrānti, the entrance of the sun into the Hindu constellation and sign Mēsha, *i.e.* Aries (for this and other technical details, see above, under the Calendar);[1] but they were probably cited as lunar years in the inscriptional records which present the reckoning; and the almanacs appear to treat them either as Mēshādi civil solar years with solar months, or as Chaitrādi lunar years with lunar months *amānta* (ending with the new-moon) or *pūrṇimānta* (ending with the full-moon) as the case may be, according to the locality. Its initial point lies in 3102 B.C.; and the year 5002 began in A.D. 1900.[2]

This reckoning is not an historical era, actually running from 3102 B.C. It was devised for astronomical purposes at some time about A.D. 400, when the Hindu astronomers, having taken over the principles of the Greek astronomy, recognized that they required for purposes of computation a specific reckoning with a definite initial occasion. They found that occasion in a conjunction of the sun, the moon, and the five planets which were then known, at the first point of their sign Mēsha. There was not really such a conjunction; nor, apparently, is it even the case that the sun was actually at the first point of Mēsha at the moment arrived at. But there was an approach to such a conjunction, which was turned into an actual conjunction by taking the mean instead of the true positions of the sun, the moon, and the planets. And, partly from the reckoning which has come down to us, partly from the astronomical books, we know that the moment assigned to the assumed conjunction was according to one school the midnight between Thursday the 17th, and Friday the 18th, February, 3102 B.C., and according to another school the sunrise on the Friday.

The reckoning thus devised was subsequently identified with the Kaliyuga as the iron age, the last and shortest, with a duration of 432,000 years, of the four ages in each cycle of ages in the Hindu system of cosmical periods. Also, traditional history was fitted to it by one school, represented notably by the Purāṇas, which, referring the great war between the Pāṇḍavas and the Kurus, which is the topic of the Mahābhārata, to the close of the preceding age, the Dvāpara, placed on the last day of that age the culminating event which ushered in the Kali age; namely, the death of Kṛishṇa (the return to heaven of Vishṇu on the termination of his incarnation as Kṛishṇa), which was followed by the abdication of the Pāṇḍava king Yudhishṭhira, who. having installed his grand-nephew Parikshit as his successor, then set out on his own journey to heaven. Another school, however, placed the Pāṇḍavas and the Kurus 653 years later, in 2449 B.C. A third school places in 3102 B.C. the anointment of Yudhishṭhira to the sovereignty, and treats that event as inaugurating the Kali age; from this point of view, the first 3044 years of the Kaliyuga—the period from its commencement in 3102 B.C. to the commencement of the first historical era, the so-called Vikrama era, in 58 B.C.—are also known as "the era of Yudhishṭhira."

The Vikrama Era of 58 B. C.

The Vikrama era, which is the earliest of all the Hindu eras in respect of order of foundation, is the dominant era and the great historical reckoning of Northern India—that is, of the territory on the north of the rivers Narbadā and Mahānadī—to which part of the country its use has always been practically confined. Like, indeed, the Kaliyuga and Śaka eras, it is freely cited in almanacs in any part of India; and it is sometimes used in the south by immigrants from the north: but it is, by nature, so essentially foreign to the south that the earliest known inscriptional instance of the use of it in Southern India only dates from A.D. 1218, and the very few later instances that have been obtained, prior to the 15th century A.D., come, along with the instance of A.D. 1218, from the close neighbourhood of the dividing-line between the north and the south. The Vikrama era has never been used for astronomical purposes. Its years are lunar, with lunar months, but seem liable to be sometimes regarded as solar, with solar months, when they are cited in almanacs of Southern India which present the solar calendar. Originally they were Kārttikādi, with *pūrṇimānta* months (ending with the full-moon). They now exist in the following three varieties: in Kāṭhiāwār and Gujarāt, they are chiefly Kārttikādi, with *amānta* months (ending with the new-moon); and they are shown in this form in almanacs for the other parts of the Bombay Presidency: but there is also found in Kāṭhiāwār and that neighbourhood an Āshāḍhādi variety, commencing with Āshāḍha śukla 1, similarly with *amānta* months; in the rest of Northern India, they are Chaitrādi, with *pūrṇimānta* months. The era has its initial point in 58 B.C., and its first civil day, Kārttika śukla 1, is 19th September in that year if we determine it with reference to the Hindu Tulā-saṁkrānti, or 18th October if we determine it with reference to the tropical equinox. The years of the three varieties, Chaitrādi, Āshaḍhādi, and Kārttikādi, all commence in the same year A.D.; and the year 1958 began in A.D. 1900.

Hindu legend connects the foundation of this era with a king Vikrama or Vikramāditya of Ujjain in Mālwā, Central India: one version is that he began to reign in 58 B.C.; another is that he died in that year, and that the reckoning commemorates his death. Modern research, however, based largely on the inscriptional records, has shown that there was no such king, and that the real facts are very different. The era owes its existence to the Kushan king Kaṇishka, a foreign invader, who established himself in Northern India and commenced to reign there in B.C. 58.[3] He was the founder of it, in the sense that the opening years of it were the years of his reign. It was established and set going as an era by his successor, who continued the reckoning so started, instead of breaking it by introducing another according to his own regnal years. And it was perpetuated as an era, and transmitted as such to posterity by the Mālavas, the people from whom the modern territory Mālwā derived its name, who were an important section of the subjects of Kaṇishka and his successors. In consonance with that, records ranging in date from A.D. 473 to 879 style it "the reckoning of the Mālavas, the years of the Mālava lords, the Mālava time or era." Prior to that, it had no specific name; the years of it were simply cited, in ordinary Hindu fashion, by the term *saṁvatsara*, "the year (of such-and-such a number)," or by its abbreviations *saṁvat* and *saṁ*: and the same was frequently done in later times also, and is habitually done in the present day; and so, in modern times, this era has often been loosely styled "the Saṁvat era." The idea of a king Vikrama in connexion with it appears to date from only the 9th or 10th century A.D.

The Śaka Era of A.D. 78.

The Śaka era, though it actually had its origin in the south-west corner of Northern India, is the dominant era and the great historical reckoning of Southern India; that is, of the territory below the rivers Narbadā and Mahānadī. It is also the subsidiary astronomical reckoning, largely used, from the 6th century A.D. onwards, in the *Karaṇas*, the works dealing with practical details of the calendar, for laying down epochs or points of time furnishing convenient bases for computation. As a result of that, it came to be used in past times for general purposes also, to a limited extent, in parts of Northern India where it was not indigenous. And it is now used more or less freely, and is cited in almanacs everywhere. Its years are usually lunar, Chaitrādi, and its months are *pūrṇimānta* (ending with the full-moon) in Northern India, and *amānta* (ending with the new-moon) in Southern India; but in times gone by it was sometimes treated for purposes of calculation as having astronomical solar years, and it is now treated as having Mēsh di civil solar years and solar months in those parts of India where that form of the solar calendar prevails. It has its initial point in A.D. 78; and its first civil day, Chaitra śukla 1, is 3rd March

[1] It is always to be borne in mind that, as already explained, while the Hindu Mēsha answers to our Aries, it does not coincide with either the sign or the constellation Aries.

[2] We select A.D. 1900 as a gauge-year, in preference to the year in which we are writing, because its figures are more convenient for comparative purposes. In accordance with the general tendency of the Hindus to cite expired years, the almanacs would mostly show 5001 (instead of 5002) as the number for the Kaliyuga year answering to A.D. 1900–1901. And, for the same reason, this reckoning has often been called the Kaliyuga era of 3101 B.C. There is, perhaps, no particular objection to that, provided that we then deal with the Vikrama and Śaka eras on the same lines, and bear in mind that in each case the initial point of the reckoning really lies in the preceding year. But we prefer to treat these reckonings with exact correctness.

[3] It may be remarked that there are about twelve different views regarding the date of Kaṇishka and the origin of the Vikrama era. Some writers hold that Kaṇishka began to reign in A.D. 78, and founded the so-called Śaka era beginning in that year; one writer would place his initial date about A.D. 123, others would place it in A.D. 278. The view maintained by the present writer was held at one time by Sir A. Cunningham: and, as some others have already begun to recognize, evidence is now steadily accumulating in support of the correctness of it.

SpinSmart Software http://www.spinsmart.com

in that year, as determined with reference either to the Hindu Mīna-saṁkrānti or to the entrance of the sun into the tropical Pisces. The year 1823 began in A.D. 1900.

Regarding the origin of the Śaka era, there was current in the 10th and 11th centuries A.D. a belief which, ignoring the difference of a hundred and thirty-five years between the two reckonings, connected the legendary king Vikrāmaditya of Ujjain, mentioned above under the Vikrama era, with the foundation of this era also. The story runs, from this point of view, that the Śakas were a barbarous people who established themselves in the western and north-western dominions of that king, but were met in battle and destroyed by him, and that the era was established in celebration of that event. The modern belief, however, ascribes the foundation of this era to a king Śālivāhana of Pratishṭhāna, which is the modern Paiṭhaṇ, on the Gōdāvarī, in the Nizam's dominions. But in this case, again, research has shown that the facts are very different. Like the Vikrama era, the Śaka era owes its existence to foreign invaders. It was founded by the Chhaharāta or Kshaharāta king Nahapāna, who appears to have been a Pahlava or Palhava, *i.e.* of Parthian extraction, and who reigned from A.D. 78 to about 125.[1] He established himself first in Kāṭhiāwār, but subsequently brought under his sway northern Gujarāt (Bombay) and Ujjain, and, below the Narbadā, southern Gujarāt, Nāsik and probably Khāndēsh. His capital seems to have been Dōhad, in the Pañch Mahāls. And he had two viceroys: one, named Bhūmaka, of the same family with himself, in Kāṭhiāwār; and another, Chashṭana, son of Ghsamotika, at Ujjain. Soon after A.D. 125, Nahapāna was overthrown, and his family was wiped out, by the Sātavāhana-Sātakarṇi king Gautamīputra-Śrī-Sātakarṇi, who thereby recovered the territories on the south of the Narbadā, and perhaps secured for a time Kāṭhiāwār and some other parts on the north of that river. Very soon, however, Chashṭana, or else his son Jayadāman, established his sway over all the territory which had belonged to Nahapāna on the north of the Narbadā; founded a line of Hinduized foreign kings, who ruled there for more than three centuries; and, continuing Nahapāna's regnal reckoning, established the era to which the name Śaka eventually became attached. Inscriptions and coins show that, up to at least the second decade of its fourth century, this reckoning had no specific appellation; its years were simply cited, in the usual fashion, as *varsha*, "the year (of such-and-such a number)." The reckoning was then taken up by the astronomers. And we find it first called Śakakāla, "the time or era of the Śakas," in an epochal date, the end of the year 427, falling in A.D. 505, which was used by the astronomer Varāhamihira (d. A.D. 587) in his Pañchasiddhāntikā. That this name came to be attached to it appears to be due to the points that, along with some of the Pahlavas or Palhavas and the Yavanas or descendants of the Asiatic Greeks, some of the Śakas, the Scythians, had made their way into Kāṭhiāwār and neighbouring parts by about A.D. 100, and that the Śakas incidentally came to acquire prominence in the memory of the Hindus regarding these occurrences, in such a manner that their name was selected when the occasion arose to devise an appellation for an era the exact origin of which had been forgotten. The name of the imaginary king Śālivāhana first figures in connexion with the era in a record of A.D. 1272, and seems plainly to have been introduced in imitation of the coupling of the name Vikrama, Vikramāditya, with the era of B.C. 58.

That the Śaka era, though it had its origin in the south-west corner of Northern India, is essentially an era of Southern India, is proved by its inscriptional and numismatic history. During the period before the time when it was taken up by the astronomers, it is found only in the inscriptions of Nahapāna, and in the similar records and on the coins of the descendants of Chashṭana. After that same time, it figures first in a record of the Chalukya king Kīrtivarman I., at Bādāmi in the Bijāpūr district, Bombay, which is dated on the full-moon day of the month Kārttika, falling in A.D. 578, "when there had elapsed five centuries of the years of the anointment of the Śaka king to the sovereignty." And from this date onwards the records of a large part of Southern India are mostly dated in this era, by various expressions all of which include the term Śaka or Śāka. In Northern India the case is very different. We have a record dated in the month Kārttika, the Śaka year 631 (expired), falling in A.D. 709: it comes from Multāī in the Bētūl district, Central Provinces, that is, from the south of the Narbadā; but it belongs to Gujarāt (Bombay), and perhaps to the north, though more probably to the south, of that province. But, setting that aside, the earliest inscriptional instance of the use of this era in Northern India, outside Kāṭhiāwār and Gujarāt, is found in a record of A.D. 862 at Dēōgaṛh near Lalitpūr, the headquarters town of the Lalitpūr district, United Provinces of Agra and Oude; here, however, the record is primarily dated, with the full details of the month, &c., in "Saṁvat 919," that is, in the Vikrama year 919; it is only as a subsidiary detail that the Śaka year 784 is given in a separate passage at the end of the record, a sort of postscript. From this date onwards the era is found in other records of Northern India, but to any appreciable extent only from A.D. 1137, and to only a very small extent in comparison with the Vikrama and other northern eras; and the cases in which it was used exclusively there, without being coupled with one or other of the northern reckonings, are still more conspicuously few. In short, the general position is that the Śaka era has been essentially foreign to Northern India until recent times; it was used there quite exceptionally and sporadically, and in very few cases indeed at any appreciable distance from the dividing-line between the north and the south. That it found its way into Northern India, outside Kāṭhiāwār and northern Gujarāt at all, is unquestionably due to its use by the astronomers. It also travelled, across the sea, by the 7th century A.D. to Cambodia, and somewhat later to Java; to which parts it was doubtless taken in almanacs, or in invoices, statements of account, &c., by the persons engaged in the trade between Broach and the far east via Tagara (Tēr) and the east coast. It also found its way in subsequent times to Assam and Ceylon, and more recently still to Nēpāl.

[1] See the preceding note.

III. Other Reckonings

We come now to certain reckonings consisting of cycles, and will take first the cycles of Guru or Bṛihaspati, Jupiter. This planet, a very conspicuous object in eastern skies, requires a period of 4332·6 days, = 50·4 days less than twelve Julian years, to make a circuit of the heavens, and has provided the Hindus with two reckonings, each in more than one variety; a cycle of twelve years, and a cycle of sixty years. The years of Jupiter, in all their varieties, are usually styled *saṁvatsara*; and it is convenient to use this term here, in order to preserve clearly the distinction between them and the solar and lunar years. The *saṁvatsaras* have no divisions of their own; the months, days, &c., cited with them are those of the ordinary solar or lunar calendar, as the case may be.

The Cycles of Jupiter.

The older reckoning of Jupiter appears to be that of the 12-years cycle, which is found in two varieties; in both of them the *saṁvatsaras* bear, according to certain rules which need not be explained here, the same names with the lunar months, Chaitra, Vaiśākha, &c. In one variety, each *saṁvatsara* runs from one of the planet's heliacal risings—that is, from the day on which it becomes visible as a morning star on the eastern horizon—to the next such rising; and the length of such a *saṁvatsara*, according to the Hindu data, is from 392 to 405 days, with an average of 399 days. Inscriptional instances of the use of this cycle are found in six of the Gupta records of Northern India, ranging from A.D. 475 to 528.

The 12-years Cycle.

In the other variety of the 12-years cycle, which is mentioned in astronomical works from the time of Āryabhaṭa onwards (b. A.D. 476), the *saṁvatsaras* are regulated by Jupiter's course with reference to his mean motion and mean longitude: a *saṁvatsara* of this variety commences when Jupiter thus enters a sign of the zodiac, and lasts for the time occupied by him in traversing that sign from the same point of view; and the period taken by him to do that—that is, the duration of such a *saṁvatsara*—is slightly in excess, according to the Hindu data, of 361·02 days, which amount is very close to the actual fact, 361·05 days. Inscriptional instances of the use of this cycle are perhaps found in two records of Southern India of the Kadamba series, belonging to about A.D. 575.

The 12-years mean-sign cycle seems to be still used in some parts. And the heliacal risings of Jupiter, as also, indeed, those of the other planets, are shown in almanacs for astrological purposes. In either variety, however, the 12-years cycle is now chiefly of antiquarian interest.

SpinSmart Software http://www.spinsmart.com

The cycle of Jupiter now in general use is a cycle of sixty years, the *saṁvatsaras* of which bear certain special names, Prabhava, Vibhava, Śukla, Pramōda, &c., again in accordance with certain rules which we need not explain here. This cycle exists in three varieties.

The 60-years cycle.

According to the original constitution of this cycle, the *saṁvatsaras* are determined as in the second or mean-sign variety of the 12-years cycle: each *saṁvatsara* commences when Jupiter enters a sign of the zodiac with reference to his mean motion and longitude; and it lasts for slightly more than 361·02 days. This variety is traced back in inscriptional records to A.D. 602, and is still used in Northern India.

Now, the *saṁvatsaras* are calculated by means of the astronomical solar year commencing with the Mēsha-saṁkrānti, the entrance of the sun into the sign Mēsha (Aries). The process gives the number of the *saṁvatsara* last expired before any particular Mēsha-saṁkrānti, with a remainder denoting the portion of the current *saṁvatsara* elapsed up to the same time; and the remainder, reduced to months, &c., gives the moment of the commencement of the current *saṁvatsara*, by reckoning back from the Mēsha-saṁkrānti. As the result, apparently, of unwillingness to take the trouble to work out the full details, at some time about A.D. 800 a practice arose, in some quarters, according to which that *saṁvatsara* of the 60-years cycle which was current at any particular Mēsha-saṁkrānti was taken as coinciding with the astronomical solar year beginning at that *saṁkrānti*, and with the Chaitrādi lunar year belonging to that same solar year. And this practice set up a lunisolar variety of the cycle, in connexion with which we have to notice the following point. While the duration of a mean-sign *saṁvatsara* is closely about 361·02 days, the length of the Hindu astronomical solar year is closely about 365.258 days. It consequently happens, after every 85 or 86 years, that a mean-sign *saṁvatsara* begins and ends between two successive Mēsha-saṁkrāntis. In the mean-sign cycle, such a *saṁvatsara* retains its existence unaffected; and the names Prabhava, Vibhava, &c., run on without any interruption. According to the lunisolar system, however, the position is different; the *saṁvatsara* beginning and ending between the two Mēsha-saṁkrāntis is expunged or suppressed, in the sense that its name is omitted and is replaced by the next name on the list. The second variety of the 60-years cycle, thus started, ran on alongside of the mean-sign variety, and, being eventually transferred, with that variety, to Northern India, is now known as the northern lunisolar variety. It preserves a connexion between the *saṁvatsaras* and the movements of Jupiter: but the connexion is an imperfect one; and both in this variety, and still more markedly in the remaining one still to be described, the *saṁvatsaras* practically became mere appellations for the solar and lunar years.

Meanwhile, just after A.D. 900, another development occurred, and there was started a third variety, which is now known as the southern lunisolar variety. The precise year in which this happened depends on the particular authority that we follow. If we take the elements adopted in the Sūrya-Siddhānta as the proper data for that time and for the locality—Western India below the Narbadā—to which the early history of the cycle belongs, the position was as follows. At the Mēsha-saṁkrānti in A.D. 908 there was current, by the mean-sign system, the *saṁvatsara* No. 2, Vibhava: but No. 4, Pramōda, was current by the same system at the Mēsha-saṁkrānti in A.D. 909; and No. 3, Śukla, began and ended between the two Mēsha-saṁkrāntis. Accordingly, No. 2, Vibhava, was the lunisolar *saṁvatsara* for the Mēshādi solar year and the Chaitrādi lunar year commencing in A.D. 908; and by the strict lunisolar system, which was adhered to by some people and is now known as the northern lunisolar system, it was followed in A.D. 909 by No. 4, Pramōda, the name of the intermediate *saṁvatsara*, No. 3, Śukla, being passed over. On the other hand, whether through oversight, or whatever the reason may have been, by other people the name of No. 3, Śukla, was not passed over, but that *saṁvatsara* was taken as the lunisolar *saṁvatsara* for the Mēshādi solar year and the Chaitrādi lunar year beginning in A.D. 909, and No. 4, Pramōda, followed it in A.D. 910. On subsequent similar occasions, also, there was, in the same quarters, no passing over of the name of any *saṁvatsara*. And this practice established itself in Southern India, to the exclusion there of the mean-sign and the northern lunisolar varieties; the discrepancy between the last-mentioned variety and the variety thus set up continuing, of course, to increase by one *saṁvatsara* after every 85 or 86 years. In this variety, the southern lunisolar variety, all connexion between the *saṁvatsaras* and the movements of Jupiter has now been lost.

The present position of the 60-years cycle in its three varieties may be illustrated thus. In Northern India, by the mean-sign system the *saṁvatsara* No. 46, Paridhāvin, began, according to different authorities, in August, September or October, A.D. 1899. Consequently, by the northern or expunging lunisolar system, that same *saṁvatsara*, No. 46, Paridhāvin, coincided with the Mēshādi civil solar year beginning with or just after 12th April, and with the Chaitrādi lunar year beginning with 31st March, A.D. 1900. But by the southern or non-expunging lunisolar system those same solar and lunar years were No. 34, Sarvarin.

The treatment of the cycles of Jupiter in the Sanskṛit books shows that it was primarily from the astrological point of view that they appealed to the Hindus; it was only as a secondary consideration that they acquired anything of a chronological nature. For the practical application of any of them to historical purposes, it is, of course, necessary that, along with the mention of a *saṁvatsara*, there should always be given the year of some known era, or some other specific guide to the exact period to which that *saṁvatsara* is to be referred. But it is fortunately the case that the *saṁvatsaras* have been but rarely cited in the inscriptional records without such a guide, of some kind or another.

The Saptarshi reckoning is used in Kashmīr, and in the Kāṇgṛa district and some of the Hill states on the south-east of Kashmir; some nine centuries ago it was also in use in the Punjab, and apparently in Sind. In addition to being cited by such expressions as Saptarshi-saṁvat, "the year (so-and-so) of the Saptarshis," and Śāstra-saṁvatsara, "the year (so-and-so) of the scriptures," it is found mentioned as Lōkakāla, "the time or era of the people," and by other terms which mark it as a vulgar reckoning. And it appears that modern popular names for it are Pahāṛī-saṁvat and Kachchā-saṁvat, which we may render by "the Hill era" and "the crude era." The years of this reckoning are lunar, Chaitrādi; and the months are *pūrṇimānta* (ending with the full-moon). As matters stand now, the reckoning has a theoretical initial point in 3077 B.C.; and the year 4976, more usually called simply 76, began in A.D. 1900; but there are some indications that the initial point was originally placed one year earlier.

The Saptarshi reckoning.

The idea at the bottom of this reckoning is a belief that the Saptarshis, "the Seven Ṛishis or Saints," Marīchi and others, were translated to heaven, and became the stars of the constellation Ursa Major, in 3076 B.C. (or 3077); and that these stars possess an independent movement of their own, which, referred to the ecliptic, carries them round at the rate of 100 years for each *nakshatra* or twenty-seventh division of the circle. Theoretically, therefore, the Saptarshi reckoning consists of cycles of 2700 years; and the numbering of the years should run from 1 to 2700, and then commence afresh. In practice, however, it has been treated quite differently. According to the general custom, which has distinctly prevailed in Kashmīr from the earliest use of the reckoning for chronological purposes, and is illustrated by Kalhaṇa in his history of Kashmīr, the *Rājataraṁgiṇī*, written in A.D. 1148–1150, the numeration of the years has been centennial; whenever a century has been completed, the numbering has not run on 101, 102, 103, &c., but has begun again with 1, 2, 3, &c. Almanacs, indeed, show both the figures of the century and the full figures of the entire reckoning, which is treated as running from 3076 B.C., not from 376 B.C. as the commencement of a new cycle, the second; thus, an almanac for the year beginning in A.D. 1793 describes that year as "the year 4869 according to the course of the Seven Ṛishis, and similarly the year 69." And elsewhere sometimes the full figures are found, sometimes the abbreviated ones; thus, while a manuscript written in A.D. 1648 is dated in "the year 24" (for 4724), another, written in A.D. 1224 is dated in "the year 4300." But, as in the *Rājataraṁgiṇī*, so also in inscriptions, which range from A.D. 1204 onwards, only the abbreviated figures have hitherto been found. Essentially, therefore, the Saptarshi reckoning is a centennial reckoning, by suppressed or omitted hundreds, with its earlier centuries commencing in 3076, 2976 B.C., and so on, and its later centuries commencing in A.D. 25, 125, 225, &c.; on precisely the same lines with those according to which we may use, *e.g.* 98 to mean A.D. 1798, and 57 to mean A.D. 1857, and 9 to mean A.D. 1909. And the practical difficulties attending the use of such a system for chronological purposes are obvious; isolated dates recorded in such a fashion cannot be allocated without some explicit clue to

SpinSmart Software http://www.spinsmart.com

the centuries to which they belong. Fortunately, however, as regards Kashmīr, we have the necessary guide in the facts that Kalhaṇa recorded his own date in the Śaka era as well as in this reckoning, and gave full historical details which enable us to determine unmistakably the equivalent of the first date in this reckoning cited by him, and to arrange with certainty the chronology presented by him from that time.

The belief underlying this reckoning according to the course of the Seven Ṛishis is traced back in India, as an astrological detail, to at least the 6th century A.D. But the reckoning was first adopted for chronological purposes in Kashmīr and at some time about A.D. 800; the first recorded date in it is one of "the year 89," meaning 3889, = A.D. 813–814, given by Kalhaṇa. It was introduced into India between A.D. 925 and 1025.

The Grahaparivṛitti cycle.

The Grahaparivṛitti is a reckoning which is used in the southernmost parts of Madras, particularly in the Madura district. It consists of cycles of 90 Mēshādi solar years, and is said, in conformity with its name, which means "the revolution of planets," to be made up by the sum of the days in 1 revolution of the sun, 22 of Mercury, 5 of Venus, 15 of Mars, 11 of Jupiter, and 29 of Saturn. The first cycle is held to have commenced in 24 B.C., the second in A.D. 67, and so on; and, in accordance with that view, the year 34, which began in A.D. 1900, was the 34th year of the 22nd cycle.

No inscriptional use of this cycle has come to notice. There seems no substantial reason for believing that the reckoning was really started in 24 B.C. The alleged constitution of the cycle, which appears to be correct within about twelve days, and might possibly be made apparently exact, suggests an astrological origin. And, if a guess may be hazarded, we would conjecture that the reckoning is an offshoot of the southern lunisolar variety of the 60-years cycle of Jupiter, and had its real origin in some year in which a Prabhava *samvatsara* of that variety commenced, and to which the first year of a Grahaparivṛitti cycle can be referred: that was the case in A.D. 967 and at each subsequent 180th year.

The Oṅko cycle.

In part of the Gañjām district, Madras, there is a reckoning, known as the Oṅko or Aṅka, *i.e.* literally "the number or numbers," consisting of lunar years, each commencing with Bhādrapada śukla 12, which run theoretically in cycles of 59 years. But the reckoning has the peculiarity that, whether the explanation is to be found in a superstition about certain numbers or in some other reason, the year 6, and any year the number of which ends with 6 or 0 (except the year 10), is omitted from the numbering; so that, for instance, the year 7 follows next after the year 5. The origin of the reckoning is not known. But the use of it seems to be traceable in records of the Gaṅga kings who reigned in that part of the country and in Orissa in the 12th and following centuries. And the initial day, Bhādrapada śukla 12, which figures again in the Vilayāti and Amli reckoning of Orissa (see farther on), is perhaps to be accounted for on the view that this day was the day of the anointment, in the 7th century, of the first Gāṅga king, Rājasiṁha-Indravarman I.

The Maghī reckoning.

In the Chittagong district, Bengal, there is a solar reckoning, known by the name Maghī, of which the year 1262 either began or ended in A.D. 1900; so that it has an initial point in A.D. 639 or 638. It appears that Chittagong was conquered by the king of Arakan in the 9th century, and remained usually in the possession of the Maghs—the Arakanese or a class of them—till A.D. 1666, when it was finally annexed to the Mogul empire. In these circumstances it is plain that the Magh reckoning took its name from the Maghs; its year, which is Mēshādi, from Bengal; and its numbering from the Sakkarāj, the ordinary era of Arakan and Burma, which has its initial point in A.D. 638.

Hinduized offshoots of the Hijra era.

The Hijra (Hegira) era, the reckoning from the flight of Mahomet, which dates from the 16th of July, A.D. 662, is, of course, used by the Mahommedans in India, and is customarily shown, with the details of its calendar, in the Hindu almanacs. An account of it does not fall within the scope of this article. But we have to mention it because we come now to certain Hinduized reckonings which are hybrid offshoots of it. We need only say, however, in explanation of some of the following figures, that the years of the Hijra era are purely lunar, consisting of twelve lunar months and no more; with the result that the initial day of the year is always travelling backwards through the Julian year, and makes a complete circuit in thirty-four years. The reckonings derived from it, which we have to describe, have apparent initial points in A.D. 591, 593, 594, and 600. They had their real origin, however, in the 14th, 16th, and 17th centuries.

The emperor Akbar succeeded to the throne in February, A.D. 1556, in the Hijra year 963, which ran from 16th November 1555 to 3rd November 1556. Amongst the reforms aimed at by him and his officials, one was to abolish, or at least minimize, by introducing uniformity of numbering, the confusion due to the existence of various reckonings, both Mahommedan and Hindu. And one step taken in that direction was to assign to the Hindu year the same number with the Hijra year. It is believed that this was first done by the Persian clerks of the revenue and financial offices at an early time in Akbar's reign, and that it received authoritative sanction in the Hijra year 971 (21st August 1563 to 8th August 1564). At any rate, the innovation was certainly first made in Upper India; and the numbering started there was introduced into Bengal and those parts as Akbar extended his dominions, but without interfering with local customs as to the commencement of the Hindu year. The result is that we now have the following reckonings, the years of which are used as revenue years:—

The Fasli reckoning of Upper India.

In the United Provinces and the Punjab, there is an Āśvinādi lunar reckoning, known as the Fasli, according to which the year 1308 began in A.D. 1900; so that the reckoning has an apparent initial point in A.D. 593. The name of this reckoning is derived from *faṣl*, "a harvest," of which there are two; the *faṣl-i-rabī* or "spring harvest," commencing in February, and the *faṣl-i-kharīf*, or "autumn harvest" commencing in October. The years of this reckoning begin with the *pūrṇimānta* Āśvina krishna 1, which now falls in September. A peculiar feature of it is that, though the months are lunar, they are not divided into fortnights, and the numbering of the days runs on, as in the Mahommedan month, from the first to the end of the month without being affected by any expunction and repetition of *tithis*; and, for this and other reasons, it seems that in this case a new form of Hindu year was devised, of such a kind as to enable the agriculturists to realize their produce and pay their assessments comfortably within the year. The Hijra era has, of course, now drawn somewhat widely away from this and the other reckonings derived from it; the Hijra year commencing in A.D. 1900 was 1318, ten years in advance of the Fasli year.

The Vilāyati-san and Amli-san of Orissa.

In Orissa and some other parts of Bengal, there is a reckoning, or two almost identical reckonings, the facts of which are not quite clear. According to one account, the term Amli-san, "the official year," is only another name of the Vilāyati-san, "the year received from the *vilāyat* or province of Hindustān." But we are also told that the Vilāyati-san is a Kanyādi solar year, whereas the Amli-san, though it too has solar months, changes its number on the lunar day Bhādrapada śukla 12 (mentioned above in connexion with the Oṅko cycle of Orissa), which comes sometimes in Kanyā, but sometimes in the preceding month, Siṁha. Elsewhere, again, it is the Vilāyati-san which is shown as changing its number on Bhādrapada śukla 12. In either case, the year 1308 of this reckoning, also, began in A.D. 1900; and so, like the Fasli of Upper India, this reckoning, too, has an apparent initial point in A.D. 593. The day Bhādrapada śukla 12 now usually falls in September, but may come during the last three days of August. The first day of the solar month Kanyā now falls on 15th or 16th September.

The Bengāli-san.

In Bengal there is in more general use a Mēshādi solar reckoning, known as the Bengāli-san or "Bengal year," according to which the year 1307 began in A.D. 1900; so that this reckoning has an apparent initial point in A.D. 594. The initial day of the year is the first day of the solar month Mēsha, now falling on 12th or 13th April.

The Fasli of Bombay and Madras.

The system of Fasli reckonings was introduced into Southern India under the emperor Shāh Jahān, at some time in the Hijra year 1046, which ran from 26th May, A.D. 1636, to 15th May, A.D. 1637. But the numbering which was current in Northern India was not taken over. A new start was made; and, as the year of the Hijra had gone back, during the intervening seventy-three Julian years, by two years and a quarter (less by only five days) from the date of its commencement in the year 971, the Fasli reckoning of Southern India began with a nominal year 1046 (instead of 971+73=1044), commencing in A.D. 1636. The Fasli reckoning of Southern India exists in two varieties. The years of the Bombay Fasli are popularly known as Mṛigasāl years, because they commence when the sun enters the *nakshatra* Mṛigaśiras, which occurs now on 6th or 7th June.

SpinSmart Software http://www.spinsmart.com

the reckoning seems to have taken over this initial day from the Marāṭhā Sūr-san (see below). The Fasli years of Madras originally began at the Karka-saṁkrānti, the nominal summer solstice: under the British government, the commencement of them was first fixed to 12th July, on which day the *saṁkrānti* was then usually occurring; but it was afterwards changed to 1st July as a more convenient date. The years of the Bombay and Madras Fasli have no division of their own into months, fortnights, &c.; the year is always used along with one or other of the real Hindu reckonings, and the details are cited according to that reckoning.

The Marāṭhā Sūr-san or Arabī-san.

Another offshoot of the Hijra era, but one of earlier date and not belonging to the class of Fasli reckonings, is found, in the Marāṭhā country, in the Sūr-san or Shahūr-san, "the year of months," also known as Arabī-san, "the Arab year." This reckoning, which is met with chiefly in old *sanads* or charters, appears to have branched off in or closely about the Hijra year 745, which ran from 15th May, A.D. 1344, to 3rd May, A.D. 1345; but the exact circumstance in which it originated is not known. The years of this reckoning begin, like those of the Bombay Fasli, with the entrance of the sun into the *nakshatra* Mṛigaśiras, which now occurs on 6th or 7th June; but the months and days are those of the Hijra year. The Sūr-san year 1301 began in A.D. 1900; and so the reckoning has an apparent initial point in A.D. 600. A peculiarity attending this reckoning is that, whatever may be the vernacular of a clerk, he uses the Arabic numeral words in reading out the year; and the same words are given alongside of the figures in the Hindu almanacs.

AUTHORITIES.—The Hindu astronomy had already begun to attract attention before the close of the 18th century. The investigation, however, of the calendar and the eras, along with the verification of dates, was started by Warren, whose *Kala Sankalita* was published in 1825. The inquiry was carried on by Prinsep in his *Useful Tables* (1834–1836) by Cowasjee Patell in his *Chronology* (1866), and by Cunningham in his *Book of Indian Eras* (1883). But Warren's processes, though mostly giving accurate results, were lengthy and troublesome; and calculations made on the lines laid down by his successors gave results which might or might not be correct, and could only be cited as approximate results. The exact calculation of Hindu dates by easy processes was started by Shankar Balkrishna Dikshit, in an article published in the *Indian Antiquary*, vol. 16 (1887). This was succeeded by methods and tables devised by Jacobi, which were published in the next volume of the same journal. There then followed several contributions in the same line by other scholars, some for exact, others for closely approximate, results, and some valuable articles by Kielhorn on some of the principal Hindu eras and other reckonings, which were published in the same journal, vols. 17 (1888) to 26 (1897). And the treatment of the matter culminated for the time being in the publication, in 1896, of Sewell and Dikshit's *Indian Calendar*, which contains an appendix by Schram on eclipses of the sun in India, and was supplemented in 1898 by Sewell's *Eclipses of the Moon in India*. The present article is based on the above-mentioned and various detached writings, supplemented by original research. For the exact calculation of Hindu dates and the determination of the European equivalents of them, use may be made either of Sewell and Dikshit's works mentioned above, or of the improved tables by Jacobi which were published in the *Epigraphia Indica*, vols. 1 and 2 (1892–1894). (J. F. F.)

HINDUISM, a term generally employed to comprehend the social institutions, past and present, of the Hindus who form the great majority of the people of India; as well as the multitudinous crop of their religious beliefs which has grown up, in the course of many centuries, on the foundation of the Brahmanical scriptures. The actual proportion of the total population of India (294 millions) included under the name of "Hindus" has been computed in the census report for 1901 at something like 70% (206 millions); the remaining 30% being made up partly of the followers of foreign creeds, such as Mahommedans, Parsees, Christians and Jews, partly of the votaries of indigenous forms of belief which have at various times separated from the main stock, and developed into independent systems, such as Buddhism, Jainism and Sikhism; and partly of isolated hill and jungle tribes, such as the Santals, Bhils (Bhilla) and Kols, whose crude animistic tendencies have hitherto kept them, either wholly or for the most part, outside the pale of the Brahmanical community. The name "Hindu" itself is of foreign origin, being derived from the Persians, by whom the river Sindhu was called Hindhu, a name subsequently applied to the inhabitants of that frontier district, and gradually extended over the upper and middle reaches of the Gangetic valley, whence this whole tract of country between the Himalaya and the Vindhya mountains, west of Bengal, came to be called by the foreign conquerors "Hindustan," or the abode of the Hindus; whilst the native writers called it "Aryavarta," or the abode of the Aryas.

But whilst, in its more comprehensive acceptation, the term Hinduism would thus range over the entire historical development of Brahmanical India, it is also not infrequently used in a narrower sense, as denoting more especially the modern phase of Indian social and religious institutions—from the earlier centuries of the Christian era down to our own days—as distinguished from the period dominated by the authoritative doctrine of pantheistic belief, formulated by the speculative theologians during the centuries immediately succeeding the Vedic period (see BRAHMANISM). In this its more restricted sense the term may thus practically be taken to apply to the later bewildering variety of popular sectarian forms of belief, with its social concomitant, the fully developed caste-system. But, though one may at times find it convenient to speak of "Brahmanism and Hinduism," it must be clearly understood that the distinction implied in the combination of these terms is an extremely vague one, especially from the chronological point of view. The following considerations will probably make this clear.

Connexion with Brahmanism.

The characteristic tenet of orthodox Brahmanism consists in the conception of an absolute, all-embracing spirit, the Brahma (neutr.), being the one and only reality, itself unconditioned, and the original cause and ultimate goal of all individual souls (*jīva*, *i.e.* living things). Coupled with this abstract conception are two other doctrines, viz. first, the transmigration of souls (*saṁsāra*), regarded by Indian thinkers as the necessary complement of a belief in the essential sameness of all the various spiritual units, however contaminated, to a greater or less degree, they may be by their material embodiment; and in their ultimate re-union with the *Paramātman*, or Supreme Self; and second, the assumption of a triple manifestation of the ceaseless working of that Absolute Spirit as a creative, conservative and destructive principle, represented respectively by the divine personalities of Brahma (masc.), Vishṇu and Śiva, forming the *Trimūrti* or Triad. As regards this latter, purely exoteric, doctrine, there can be little doubt of its owing its origin to considerations of theological expediency, as being calculated to supply a sufficiently wide formula of belief for general acceptance; and the very fact of this divine triad including the two principal deities of the later sectarian worship, Vishṇu and Śiva, goes far to show that these two gods at all events must have been already in those early days favourite objects of popular adoration to an extent sufficient to preclude their being ignored by a diplomatic priesthood bent upon the formulation of a common creed. Thus, so far from sectarianism being a mere modern development of Brahmanism, it actually goes back to beyond the formulation of the Brahmanical creed. Nay, when, on analysing the functions and attributes of those two divine figures, each of them is found to be but a compound of several previously recognized deities, sectarian worship may well be traced right up to the Vedic age. That the theory of the triple manifestation of the deity was indeed only a compromise between Brahmanical aspirations and popular worship, probably largely influenced by the traditional sanctity of the number three, is sufficiently clear from the fact that, whilst Brahma, the creator, and at the same time the very embodiment of Brahmanical class pride, has practically remained a mere figurehead in the actual worship of the people, Siva, on the other hand, so far from being merely the destroyer, is also the unmistakable representative of generative and reproductive power in nature. In fact, Brahma, having performed his legitimate part in the mundane evolution by his original creation of the universe, has retired into the background, being, as it were, looked upon as *functus officio*, like a venerable figure of a former generation, whence in epic poetry he is commonly styled *pitāmaha*, "the grandsire." But despite the artificial character of the *Trimūrti*, it has retained to this day at least its theoretical validity in orthodox Hinduism, whilst it has also undoubtedly exercised considerable influence in shaping sectarian belief, in promoting feelings of toleration towards the claims

SpinSmart Software http://www.spinsmart.com

of rival deities; and in a tendency towards identifying divine figures newly sprung into popular favour with one or other of the principal deities, and thus helping to bring into vogue that notion of avatars, or periodical descents or incarnations of the deity, which has become so prominent a feature of the later sectarian belief.

Under more favourable political conditions,[1] the sacerdotal class might perhaps, in course of time, have succeeded in imposing something like an effective common creed on the heterogeneous medley of races and tribes scattered over the peninsula, just as they certainly did succeed in establishing the social prerogative of their own order over the length and breadth of India. They were, however, fated to fall far short of such a consummation; and at all times orthodox Brahmanism has had to wink at, or ignore, all manner of gross superstitions and repulsive practices, along with the popular worship of countless hosts of godlings, demons, spirits and ghosts, and mystic objects and symbols of every description. Indeed, according to a recent account by a close observer of the religious practices prevalent in southern India, fully four-fifths of the people of the Dravidian race, whilst nominally acknowledging the spiritual guidance of the Brahmans, are to this day practically given over to the worship of their nondescript local village deities (*grāma-devatā*), usually attended by animal sacrifices frequently involving the slaughter, under revolting circumstances, of thousands of victims. Curiously enough these local deities are nearly all of the female, not the male sex. In the estimation of these people "Siva and Vishnu may be more dignified beings, but the village deity is regarded as a more present help in trouble, and more intimately concerned with the happiness and prosperity of the villagers. The origin of this form of Hinduism is lost in antiquity, but it is probable that it represents a pre-Aryan religion, more or less modified in various parts of south India by Brahmanical influence. At the same time, many of the deities themselves are of quite recent origin, and it is easy to observe a deity in making even at the present day."[2] It is a significant fact that, whilst in the worship of Siva and Vishnu, at which no animal sacrifices are offered, the officiating priests are almost invariably Brahmans, this is practically never the case at the popular performance of those "gloomy and weird rites for the propitiation of angry deities, or the driving away of evil spirits, when the pujaris (or ministrants) are drawn from all other castes, even from the Pariahs, the out-caste section of Indian society."

Caste.

As from the point of view of religious belief, so also from that of social organization no clear line of demarcation can be drawn between Brahmanism and Hinduism. Though it was not till later times that the network of class divisions and subdivisions attained anything like the degree of intricacy which it shows in these latter days, still in its origin the caste-system is undoubtedly coincident with the rise of Brahmanism, and may even be said to be of the very essence of it.[3] The cardinal principle which underlies the system of caste is the preservation of purity of descent, and purity of religious belief and ceremonial usage. Now, that same principle had been operative from the very dawn of the history of Aryanized India. The social organism of the Aryan tribe did not probably differ essentially from that of most communities at that primitive stage of civilization; whilst the body of the people—the *Viś* (or aggregate of *Vaiśyas*)—would be mainly occupied with agricultural and pastoral pursuits, two professional classes—those of the warrior and the priest—had already made good their claim to social distinction. As yet, however, the tribal community would still feel one in race and traditional usage. But when the fair-coloured Aryan immigrants first came in contact with, and drove back or subdued the dark-skinned race that occupied the northern plains—doubtless the ancestors of the modern Dravidian people—the preservation of their racial type and traditionary order of things would naturally become to them a matter of serious concern. In the extreme north-western districts—the Punjab and Rajputana, judging from the fairly uniform physical features of the present population of these parts—they seem to have been signally successful in their endeavour to preserve their racial purity, probably by being able to clear a sufficiently extensive area of the original occupants for themselves with their wives and children to settle upon. The case was, however, very different in the adjoining valley of the Jumna and Ganges, the sacred *Madhya-desa* or Middle-land of classical India. Here the Aryan immigrants were not allowed to establish themselves without undergoing a considerable admixture of foreign blood. It must remain uncertain whether it was that the thickly-populated character of the land scarcely admitted of complete occupation, but only of a conquest by an army of fighting men, starting from the Aryanized region—who might, however, subsequently draw women of their own kin after them—or whether, as has been suggested, a second Aryan invasion of India took place at that time through the mountainous tracts of the upper Indus and northern Kashmir, where the nature of the road would render it impracticable for the invading bands to be accompanied by women and children. Be this as it may, the physical appearance of the population of this central region of northern India—Hindustan and Behar—clearly points to an intermixture of the tall, fair-coloured, fine-nosed Aryan with the short-sized, dark-skinned, broad-nosed Dravidian; the latter type becoming more pronounced towards the lower strata of the social order.[4] Now, it was precisely in this part of India that mainly arose the body of literature which records the gradual rise of the Brahmanical hierarchy and the early development of the caste-system.

The problem that now lay before the successful invaders was how to deal with the indigenous people, probably vastly outnumbering them, without losing their own racial identity. They dealt with them in the way the white race usually deals with the coloured race—they kept them socially apart. The land being appropriated by the conquerors, husbandry, as the most respectable industrial occupation, became the legitimate calling of the Aryan settler, the *Vaiśya*; whilst handicrafts, gradually multiplying with advancing civilization and menial service, were assigned to the subject race. The generic name applied to the latter was *Śūdra*, originally probably the name of one of the subjected tribes. So far the social development proceeded on lines hardly differing from those with which one is familiar in the history of other nations. The Indo-Aryans, however, went a step farther. What they did was not only to keep the native race apart from social intercourse with themselves, but to shut them out from all participation in their own higher aims, and especially in their own religious convictions and ceremonial practices. So far from attempting to raise their standard of spiritual life, or even leaving it to ordinary intercourse to gradually bring about a certain community of intellectual culture and religious sentiment, they deliberately set up artificial barriers in order to prevent their own traditional modes of worship from being contaminated with the obnoxious practices of the servile race. The serf, the *Śūdra*, was not to worship the gods of the Aryan freemen. The result was the system of four castes (*varṇa*, *i.e.* "colour"; or *jāti*, "gens"). Though the Brahman, who by this time had firmly secured his supremacy over the *kshatriya*, or noble, in matters spiritual as well as in legislative and administrative functions, would naturally be the prime mover in this regulation of the social

[1] "It is, perhaps, by surveying India that we at this day can best represent to ourselves and appreciate the vast external reform worked upon the heathen world by Christianity, as it was organized and executed throughout Europe by the combined authority of the Holy Roman Empire and the Church Apostolic." Sir Alfred C. Lyall, *Asiatic Studies*, i. 2.

[2] Henry Whitehead, D.D., bishop of Madras, *The Village Deities of Southern India* (Madras, 1907).

[3] "The effect of caste is to give all Hindu society a religious basis." Sir A. C. Lyall, *Brahmanism*.

[4] Thus, in Berar, "there is a strong non-Aryan leaven in the dregs of the agricultural class, derived from the primitive races which have gradually melted down into settled life, and thus become fused with the general community, while these same races are still distinct tribes in the wild tracts of hill and jungle." Sir Alfred C. Lyall, *As. St.*, i. 6.

SpinSmart Software http://www.spinsmart.com

order, there seems no reason to believe that the other two upper classes were not equally interested in seeing their hereditary privileges thus perpetuated by divine sanction. Nothing, indeed, is more remarkable in the whole development of the caste-system than the jealous pride which every caste, from the highest to the lowest, takes in its own peculiar occupation and sphere of life. The distinctive badge of a member of the three upper castes was the sacred triple cord or thread (*sūtra*)—made of cotton, hemp or wool, according to the respective caste—with which he was invested at the *upanayana* ceremony, or initiation into the use of the sacred *sāvitri*, or prayer to the sun (also called *gāyatri*), constituting his second birth. Whilst the Arya was thus a *dvi-ja*, or twice-born, the Sudra remained unregenerate during his lifetime, his consolation being the hope that, on the faithful performance of his duties in this life, he might hereafter be born again into a higher grade of life. In later times, the strict adherence to caste duties would naturally receive considerable support from the belief in the transmigration of souls, already prevalent before Buddha's time, and from the very general acceptance of the doctrine of *karma* ("deed"), or retribution, according to which a man's present station and manner of life are the result of the sum-total of his actions and thoughts in his former existence; as his actions here will again, by the same automatic process of retribution, determine his status and condition in his next existence. Though this doctrine is especially insisted upon in Buddhism, and its designation as a specific term (Pali, *Kamma*) may be due to that creed, the notion itself was doubtless already prevalent in pre-Buddhist times. It would even seem to be necessarily and naturally implied in Brahmanical belief in metempsychosis; whilst in the doctrine of Buddha, who admits no soul, the theory of the net result or fruit of a man's actions serving hereafter to form or condition the existence of some new individual who will have no conscious identity with himself, seems of a peculiarly artificial and mystic character. But, be this as it may, "the doctrine of *karma* is certainly one of the firmest beliefs of all classes of Hindus, and the fear that a man shall reap as he has sown is an appreciable element in the average morality . . . the idea of forgiveness is absolutely wanting; evil done may indeed be outweighed by meritorious deeds so far as to ensure a better existence in the future, but it is not effaced, and must be atoned for" (*Census Report*, i. 364).

In spite, however, of the artificial restrictions placed on the intermarrying of the castes, the mingling of the two races seems to have proceeded at a tolerably rapid rate. Indeed, the paucity of women of the Aryan stock would probably render these mixed unions almost a necessity from the very outset; and the vaunted purity of blood which the caste rules were calculated to perpetuate can scarcely have remained of more than a relative degree even in the case of the Brahman caste. Certain it is that mixed castes are found referred to at a comparatively early period; and at the time of Buddha—some five or six centuries before the Christian era—the social organization would seem to have presented an appearance not so very unlike that of modern times. It must be confessed, however, that our information regarding the development of the caste-system is far from complete, especially in its earlier stages. Thus, we are almost entirely left to conjecture on the important point as to the original social organization of the subject race. Though doubtless divided into different tribes scattered over an extensive tract of land, the subjected aborigines were slumped together under the designation of Sudras, whose duty it was to serve the upper classes in all the various departments of manual labour, save those of a downright sordid and degrading character which it was left to *vratyas* or outcasts to perform. How, then, was the distribution of crafts and habitual occupations of all kinds brought about? Was the process one of spontaneous growth adapting an already existing social organization to a new order of things; or was it originated and perpetuated by regulation from above? Or was it rather that the status and duties of existing offices and trades came to be determined and made hereditary by some such artificial system as that by which the Theodosian Code succeeded for a time in organizing the Roman society in the 5th century of our era? "It is well known" (says Professor Dill) "that the tendency of the later Empire was to stereotype society, by compelling men to follow the occupation of their fathers, and preventing a free circulation among different callings and grades of life. The man who brought the grain from Africa to the public stores at Ostia, the baker who made it into loaves for distribution, the butchers who brought pigs from Samnium, Lucania or Bruttium, the purveyors of wine and oil, the men who fed the furnaces of the public baths, were bound to their callings from one generation to another. It was the principle of rural serfdom applied to social functions. Every avenue of escape was closed. A man was bound to his calling not only by his father's but also by his mother's condition. Men were not permitted to marry out of their gild. If the daughter of one of the baker caste married a man not belonging to it, her husband was bound to her father's calling. Not even a dispensation obtained by some means from the imperial chancery, not even the power of the Church could avail to break the chain of servitude." It can hardly be gainsaid that these artificial arrangements bear a very striking analogy to those of the Indian caste-system; and if these class restrictions were comparatively short-lived on Italian ground, it was not perhaps so much that so strange a plant found there an ethnic soil less congenial to its permanent growth, but because it was not allowed sufficient time to become firmly rooted; for already great political events were impending which within a few decades were to lay the mighty empire in ruins. In India, on the other hand, the institution of caste—even if artificially contrived and imposed by the Indo-Aryan priest and ruler—had at least ample time allowed it to become firmly established in the social habits, and even in the affections, of the people. At the same time, one could more easily understand how such a system could have found general acceptance all over the Dravidian region of southern India, with its merest sprinkling of Aryan blood, if it were possible to assume that class arrangements of a similar kind must have already been prevalent amongst the aboriginal tribes prior to the advent of the Aryan. Whether a more intimate acquaintance with the manners and customs of those rude tribes that have hitherto kept themselves comparatively free from Hindu influences may yet throw some light on this question, remains to be seen. But, by this as it may, the institution of caste, when once established, certainly appears to have gone on steadily developing; and not even the long period of Buddhist ascendancy, with its uncompromising resistance to the Brahman's claim to being the sole arbiter in matters of faith, seems to have had any very appreciable retardant effect upon the progress of the movement. It was not only by the formation of ever new endogamous castes and sub-castes that the system gained in extent and intricacy, but even more so by the constant subdivision of the castes into numerous exogamous groups or septs, themselves often involving gradations of social status important enough to seriously affect the possibility of intermarriage, already hampered by various other restrictions. Thus a man wishing to marry his son or daughter had to look for a suitable match outside his sept, but within his caste. But whilst for his son he might choose a wife from a lower sept than his own, for his daughter, on the other hand, the law of hypergamy compelled him, if at all possible, to find a husband in a higher sept. This would naturally lead to an excess of women over men in the higher septs, and would render it difficult for a man to get his daughter respectably married without paying a high price for a suitable bridegroom and incurring other heavy marriage expenses. It can hardly be doubted that this custom has been largely responsible for the crime of female infanticide, formerly so prevalent in India; as it also probably is to some extent for infant marriages, still too common in some parts of India, especially Bengal; and even for the all but universal repugnance to the re-marriage of widows, even when these had been married in early childhood and had never joined their husbands. Yet violations of these

SpinSmart Software http://www.spinsmart.com

rules are jealously watched by the other members of the sept, and are liable—in accordance with the general custom in which communal matters are regulated in India—to be brought before a special council (*panchāyat*), originally consisting of five (*pancha*), but now no longer limited to that number, since it is chiefly the greater or less strictness in the observance of caste rules and the orthodox ceremonial generally that determine the status of the sept in the social scale of the caste. Whilst community of occupation was an important factor in the original formation of non-tribal castes, the practical exigencies of life have led to considerable laxity in this respect—not least so in the case of Brahmans who have often had to take to callings which would seem altogether incompatible with the proper spiritual functions of their caste. Thus, "the prejudice against eating cooked food that has been touched by a man of an inferior caste is so strong that, although the Shastras do not prohibit the eating of food cooked by a Kshatriya or Vaiśya, yet the Brahmans, in most parts of the country, would not eat such food. For these reasons, every Hindu household—whether Brahman, Kshatriya or Sudra—that can afford to keep a paid cook generally entertains the services of a Brahman for the performance of its *cuisine*—the result being that in the larger towns the very name of Brahman has suffered a strange degradation of late, so as to mean only a cook" (Jogendra Nath Bhattacharya, *Hindu Castes and Sects*). In this caste, however, as in all others, there are certain kinds of occupation to which a member could not turn for a livelihood without incurring serious defilement. In fact, adherence to the traditional ceremonial and respectability of occupation go very much hand-in-hand. Thus, amongst agricultural castes, those engaged in vegetable-growing or market-gardening are inferior to the genuine peasant or yeoman, such as the Jat and Rajput; whilst of these the Jat who practises widow-marriage ranks below the Rajput who prides himself on his tradition of ceremonial orthodoxy—though racially there seems little, if any, difference between the two; and the Rajput, again, is looked down upon by the Babhan of Behar because he does not, like himself, scruple to handle the plough, instead of invariably employing low-caste men for this manual labour. So also when members of the Baidya, or physician, caste of Bengal, ranging next to that of the Brahman, farm land on tenure, "they will on no account hold the plough, or engage in any form of manual labour, and thus necessarily carry on their cultivation by means of hired servants" (H. H. Risley, *Census Report*).

The scale of social precedence as recognized by native public opinion is concisely reviewed (*ib.*) as revealing itself "in the facts that particular castes are supposed to be modern representatives of one or other of the original castes of the theoretical Hindu system; that Brahmans will take water from certain castes; that Brahmans of high standing will serve particular castes; that certain castes, though not served by the best Brahmans, have nevertheless got Brahmans of their own whose rank varies according to circumstances; that certain castes are not served by Brahmans at all but have priests of their own; that the status of certain castes has been raised by their taking to infant-marriage or abandoning the re-marriage of widows; that the status of others has been modified by their pursuing some occupations in a special or peculiar way; that some can claim the services of the village barber, the village palanquin-bearer, the village midwife, &c., while others cannot; that some castes may not enter the courtyards of certain temples; that some castes are subject to special taboos, such as that they must not use the village well, or may draw water only with their own vessels, that they must live outside the village or in a separate quarter, that they must leave the road on the approach of a high-caste man and must call out to give warning of their approach." . . "The first point to observe is the predominance throughout India of the influence of the traditional system of four original castes. In every scheme of grouping the Brahman heads the list. Then come the castes whom popular opinion accepts as the modern representatives of the Kshatriyas; and these are followed by the mercantile groups supposed to be akin to the Vaiśyas. When we leave the higher circles of the twice-born, the difficulty of finding a uniform basis of classification becomes apparent. The ancient designation Sudra finds no great favour in modern times, and we can point to no group that is generally recognized as representing it. The term is used in Bombay, Madras and Bengal to denote a considerable number of castes of moderate respectability, the higher of whom are considered 'clean' Sudras, while the precise status of the lower is a question which lends itself to endless controversy." . . . In northern and north-western India, on the other hand, "the grade next below the twice-born rank is occupied by a number of castes from whose hands Brahmans and members of the higher castes will take water and certain kinds of sweetmeats. Below these again is rather an indeterminate group from whom water is taken by some of the higher castes, not by others. Further down, where the test of water no longer applies, the status of the caste depends on the nature of its occupation and its habits in respect of diet. There are castes whose touch defiles the twice-born, but who do not commit the crowning enormity of eating beef In western and southern India the idea that the social state of a caste depends on whether Brahmans will take water and sweetmeats from its members is unknown, for the higher castes will as a rule take water only from persons of their own caste and sub-caste. In Madras especially the idea of ceremonial pollution by the proximity of an unclean caste has been developed with much elaboration. Thus the table of social precedence attached to the Cochin report shows that while a Nayar can pollute a man of a higher caste only by touching him, people of the Kammalan group, including masons, blacksmiths, carpenters and workers in leather, pollute at a distance of 24 ft., toddy-drawers at 36 ft., Pulayan or Cheruman cultivators at 48 ft., while in the case of the Paraiyan (Pariahs) who eat beef the range of pollution is no less than 64 ft."

In this bewildering maze of social grades and class distinctions, the Brahman, as will have been seen, continues to hold the dominant position, being respected and even worshipped by all the others. "The more orthodox Sudras carry their veneration for the priestly class to such a degree that they will not cross the shadow of a Brahman, and it is not unusual for them to be under a vow not to eat any food in the morning, before drinking *Bipracharanamrita*, *i.e.* water in which the toe of a Brahman has been dipped. On the other hand, the pride of the Brahmans is such that they do not bow to even the images of the gods worshipped in a Sudra's house by Brahman priests" (Jog. Nath Bh.). There are, however, not a few classes of Brahmans who, for various reasons, have become degraded from their high station, and formed separate castes with whom respectable Brahmans refuse to intermarry and consort. Chief amongst these are the Brahmans who minister for "unclean" Sudras and lower castes, including the makers and dealers in spirituous liquors; as well as those who officiate at the great public shrines or places of pilgrimage where they might be liable to accept forbidden gifts, and, as a matter of fact, often amass considerable wealth; and those who officiate as paid priests at cremations and funeral rites, when the wearing apparel and bedding of the deceased are not unfrequently claimed by them as their perquisites.

As regards the other two "twice-born" castes, several modern groups do indeed claim to be their direct descendants, and in vindication of their title make it a point to perform the *upanayana* ceremony and to wear the sacred thread. But though the Brahmans, too, will often acquiesce in the reasonableness of such claims, it is probably only as a matter of policy that they do so, whilst in reality they regard the other two higher castes as having long since disappeared and been merged by miscegenation in the Sudra mass. Hence, in the later classical Sanskrit literature, the term *dvija*, or twice-born, is used simply as a synonym for a Brahman. As regards the numerous groups included under the term of Sudras, the distinction between "clean" and "unclean" Sudras is of especial importance for the upper classes, inasmuch as only the former—of whom nine distinct castes are usually recognized—are as a rule considered fit for employment in household service.

The picture thus presented by Hindu society—as made up of a confused congeries of social groups of the most varied standing, each held together and kept separate from others by a traditional body of ceremonial rules and by the notion of social gradations being due to a divinely instituted order of things—finds something like a counterpart in the religious life of the people. As in the social sphere, so also in the sphere of religious belief, we find the whole scale of types represented from the lowest to the highest; and here as there, we meet with the same failure of welding the confused mass into a well-ordered whole. In their theory of a triple manifestation of an impersonal deity, the Brahmanical theologians, as we have seen, had indeed elaborated a doctrine which might have seemed to form a reasonable, authoritative creed for

Theology.

storm-god Rudra, the "Roarer," with certain additional features derived from other deities, especially Pushan, the guardian of flocks and bestower of prosperity, worked up therewith. The exact process of the evolution of the two deities and their advance in popular favour are still somewhat obscure. In the epic poems which may be assumed to have taken their final shape in the early centuries before and after the Christian era, their popular character, so strikingly illustrated by their inclusion in the Brahmanical triad, appears in full force; whilst their cult is likewise attested by the coins and inscriptions of the early centuries of our era. The co-ordination of the two gods in the Trimurti does not by any means exclude a certain rivalry between them; but, on the contrary, a supreme position as the true embodiment of the Divine Spirit is claimed for each of them by their respective votaries, without, however, an honourable, if subordinate, place being refused to the rival deity, wherever the latter, as is not infrequently the case, is not actually represented as merely another form of the favoured god. Whilst at times a truly monotheistic fervour manifests itself in the adoration of these two gods, the polytheistic instincts of the people did not fail to extend the pantheon by groups of new deities in connexion with them. Two of such new gods actually pass as the sons of Siva and his consort Parvati, viz. Skanda—also called Kumara (the youth), Karttikeya, or Subrahmanya (in the south)—the six-headed war-lord of the gods; and Ganese, the lord (or leader) of Siva's troupes of attendants, being at the same time the elephant-headed, paunch-bellied god of wisdom; whilst a third, Kama (Kamadeva) or Kandarpa, the god of love, gets his popular epithet of Ananga, "the bodiless," from his having once, in frolicsome play, tried the power of his arrows upon Siva, whilst engaged in austere practices, when a single glance from the third (forehead) eye of the angry god reduced the mischievous urchin to ashes. For his chief attendant, the great god (Mahadeva, Maheśvara) has already with him the "holy" Nandi—presumably, though his shape is not specified, identical in form as in name with Siva's sacred bull of later times, the appropriate symbol of the god's reproductive power. But, in this repect, we also meet in the epics with the first clear evidence of what in after time became the prominent feature of the worship of Siva and his consort all over India, viz. the feature represented by the *linga*, or phallic symbol.

As regards Vishnu, the epic poems, including the supplement to the Mahabharata, the Harivamsa, supply practically the entire framework of legendary matter on which the later Vaishnava creeds are based. The theory of Avataras which makes the deity—also variously called Narayana, Purushottama, or Vasudeva—periodically assume some material form in order to rescue the world from some great calamity, is fully developed; the ten universally recognized "descents" being enumerated in the larger poem. Though Siva, too, assumes various forms, the incarnation theory is peculiarly characteristic of Vaishnavism; and the fact that the principal hero of the Ramayana (Rama), and one of the prominent warriors of the Mahabharata (Krishna) become in this way identified with the supreme god, and remain to this day the chief objects of the adoration of Vaishnava sectaries, naturally imparts to these creeds a human interest and sympathetic aspect which is wholly wanting in the worship of Siva. It is, however, unfortunately but too true that in some of these creeds the devotional ardour has developed features of a highly objectionable character.

Even granting the reasonableness of the triple manifestation of the Divine Spirit, how is one to reconcile all these idolatrous practices, this worship of countless gods and godlings, demons and spirits indwelling in every imaginable object round about us, with the pantheistic doctrine of the *Ekam Advitiyam*, "the One without a Second"? The Indian theosophist would doubtless have little difficulty in answering that question. For him there is only the One Absolute Being, the one reality that is all in all; whilst all the phenomenal existences and occurrences that crowd upon our senses are nothing more than an illusion of the individual soul estranged for a time from its divine source—an illusion only to be dispelled in the end by the soul's fuller knowledge of its own true nature and its being one with the eternal fountain of blissful being. But to the man of ordinary understanding, unused to the rarefied atmosphere of abstract thought, this conception of a transcendental, impersonal Spirit and the unreality of the phenomenal world can have no meaning: what he requires is a deity that stands in intimate relation to things material and to all that affects man's life. Hence the exoteric theory of manifestations of the Supreme Spirit; and that not only the manifestations implied in the triad of gods representing the cardinal processes of mundane existence—creation, preservation, and destruction or regeneration—but even such as would tend to supply a rational explanation for superstitious imaginings of every kind. For "the Indian philosophy does not ignore or hold aloof from the religion of the masses: it underlies, supports and interprets their polytheism. This may be accounted the keystone of the fabric of Brahmanism, which accepts and even encourages the rudest forms of idolatry, explaining everything by giving it a higher meaning. It treats all the worships as outward, visible signs of some spiritual truth, and is ready to show how each particular image or rite is the symbol of some aspect of universal divinity. The Hindus, like the pagans of antiquity, adore natural objects and forces—a mountain, a river or an animal. The Brahman holds all nature to be the vesture or cloak of indwelling, divine energy, which inspires everything that produces awe or passes man's understanding" (Sir Alfred C. Lyall, *Brahminism*).

During the early centuries of our era, whilst Buddhism, where countenanced by the political rulers, was still holding its own by the side of Brahmanism, sectarian belief in the Hindu gods seems to have made steady progress. The caste-system, always calculated to favour unity of religious practice within its social groups, must naturally have contributed to the advance of sectarianism. Even greater was the support it received later on from the Puranas, a class of poetical works of a partly legendary, partly discursive and controversial character, mainly composed in the interest of special deities, of which eighteen principal (*maha-purana*) and as many secondary ones (*upa-purana*) are recognized, the oldest of which may go back to about the 4th century of our era. It was probably also during this period that the female element was first definitely admitted to a prominent place amongst the divine objects of sectarian worship, in the shape of the wives of the principal gods viewed as their *sakti*, or female energy, theoretically identified with the *Maya*, or cosmic Illusion, of the idealistic Vedanta, and the *Prakriti*, or plastic matter, of the materialistic Sankhya philosophy, as the primary source of mundane things. The connubial relations of the deities may thus be considered "to typify the mystical union of the two eternal principles, spirit and matter, for the production and reproduction of the universe." But whilst this privilege of divine worship was claimed for the consorts of all the gods, it is principally to Siva's consort, in one or other of her numerous forms, that adoration on an extensive scale came to be offered by a special sect of votaries, the *Saktas*.

Sectarianism.

In the midst of these conflicting tendencies, an attempt was made, about the latter part of the 8th century, by the distinguished Malabar theologian and philosopher Sankara Acharya to restore the Brahmanical creed to something like its pristine purity, and thus once more to bring about a uniform system of orthodox Hindu belief. Though himself, like most Brahmans, apparently by predilection a follower of Siva, his aim was the revival of the doctrine of the Brahma as the one self-existent Being and the sole cause of the universe; coupled with the recognition of the practical worship of the orthodox pantheon, especially the gods of the Trimurti, as manifestations of the supreme deity. The practical result of his labours was the foundation of a new sect, the *Smartas*, *i.e.* adherents of the *smriti* or tradition, which has a numerous following amongst southern Brahmans, and, whilst professing Sankara's doctrines, is usually classed as one of the Saiva sects, its members adopting the horizontal sectarial mark peculiar to Saivas, consisting in their case of a triple line, the *tripundra*, prepared from the ashes of burnt cow-dung and painted on the forehead. Sankara also founded four Maths, or convents, for Brahmans; the chief one being that of Sringeri in Mysore, the spiritual head (*Guru*) of which wields considerable power, even that of excommunication, over the Saivas of southern India. In northern India, the professed followers of Sankara are mainly limited to certain classes of mendicants

Sankara.

SpinSmart Software http://www.spinsmart.com

and ascetics, although the tenets of this great Vedanta teacher may be said virtually to constitute the creed of intelligent Brahmans generally.

Whilst Sankara's chief title to fame rests on his philosophical works, as the upholder of the strict monistic theory of Vedanta, he doubtless played an important part in the partial remodelling of the Hindu system of belief at a time when Buddhism was rapidly losing ground in India. Not that there is any evidence of Buddhists ever having been actually persecuted by the Brahmans, or still less of Sankara himself ever having done so; but the traditional belief in some personal god, as the principal representative of an invisible, all-pervading deity, would doubtless appeal more directly to the minds and hearts of the people than the colourless ethical system promulgated by the Sakya saint. Nor do Buddhist places of worship appear as a rule to have been destroyed by Hindu sectaries, but they seem rather to have been taken over by them for their own religious uses; at any rate there are to this day not a few Hindu shrines, especially in Bengal, dedicated to Dharmaraj, "the prince of righteousness," as the Buddha is commonly styled. That the tenets and practices of so characteristic a faith as Buddhism, so long prevalent in India, cannot but have left their marks on Hindu life and belief may readily be assumed, though it is not so easy to lay one's finger on the precise features that might seem to betray such an influence. If the general tenderness towards animals, based on the principle of *ahimsa*, or inflicting no injury on sentient beings, be due to Buddhist teaching, that influence must have made itself felt at a comparatively early period, seeing that sentiments of a similar nature are repeatedly urged in the Code of Manu. Thus, in v. 46-48, "He who does not willingly cause the pain of confinement and death to living beings, but desires the good of all, obtains endless bliss. He who injures no creature obtains without effort what he thinks of, what he strives for, and what he fixes his mind on. Flesh-meat cannot be procured without injury to animals, and the slaughter of animals is not conducive to heavenly bliss: from flesh-meat, therefore, let man abstain." Moreover, in view of the fact that Jainism, which originated about the same time as Buddhism, inculcates the same principle, even to an extravagant degree, it seems by no means improbable that the spirit of kindliness towards living beings generally was already widely diffused among the people when these new doctrines were promulgated. To the same tendency doubtless is due the gradual decline and ultimate discontinuance of animal sacrifices by all sects except the extreme branch of Sakti-worshippers. In this respect, the veneration shown to serpents and monkeys has, however, to be viewed in a somewhat different light, as having a mythical background; whilst quite a special significance attaches to the sacred character assigned to the cow by all classes of Hindus, even those who are not prepared to admit the claim of the Brahman to the exalted position of the earthly god usually conceded to him. In the Veda no tendency shows itself as yet towards rendering divine honour to the cow; and though the importance assigned her in an agricultural community is easily understood, still the exact process of her deification and her identification with the mother earth in the time of Manu and the epics requires further elucidation. An idealized type of the useful quadruped—likewise often identified with the earth—presents itself in the mythical Cow of Plenty, or "wish-cow" (Kamadhenu, or Kamadugha, *i.e.* wish-milker), already appearing in the Atharvaveda, and in epic times assigned to Indra, or identified with Surabhi, "the fragrant," the sacred cow of the sage Vasishtha. Possibly the growth of the legend of Krishna—his being reared at Go-kula (cow-station); his tender relations to the *gopis*, or cow-herdesses, of Vrindavana; his epithets *Gopala*, "the cowherd," and *Govinda*, "cow-finder," actually explained as "recoverer of the earth" in the great epic, and the *go-loka*, or "cow-world," assigned to him as his heavenly abode—may have some connexion with the sacred character ascribed to the cow from early times.

Worship.

Since the time of Sankara, or for more than a thousand years, the gods Vishnu and Siva, or *Hari* and *Hara* as they are also commonly called—with their wives, especially that of the latter god—have shared between them the practical worship of the vast majority of Hindus. But, though the people have thus been divided between two different religious camps, sectarian animosity has upon the whole kept within reasonable limits. In fact, the respectable Hindu, whilst owning special allegiance to one of the two gods as his *ishṭā devatā* (favourite deity), will not withhold his tribute of adoration from the other gods of the pantheon. The high-caste Brahman will probably keep at his home a śālagrām stone, the favourite symbol of Vishnu, as well as the characteristic emblems of Siva and his consort, to both of which he will do reverence in the morning; and when he visits some holy place of pilgrimage, he will not fail to pay his homage at both the Saiva and the Vaishnava shrines there. Indeed, "sectarian bigotry and exclusiveness are to be found chiefly among the professional leaders of the modern brotherhoods and their low-caste followers, who are taught to believe that theirs are the only true gods, and that the rest do not deserve any reverence whatever" (Jog. Nath). The same spirit of toleration shows itself in the celebration of the numerous religious festivals. Whilst some of these—*e.g.* the *Sankranti* (called *Pongal, i.e.* "boiled rice," in the south), which marks the entrance of the sun into the sign of Capricorn and the beginning of its northward course (*uttarāyana*) on the 1st day of the month Māgha (*c.* Jan. 12); the *Gaṇeśa-caturthī*, or 4th day of the light fortnight of Bhadra (August-September), considered the birthday of Ganesa, the god of wisdom; and the *Holi*, the Indian Saturnalia in the month of Phālguṇa (February to March)—have nothing of a sectarian tendency about them; others again, which are of a distinctly sectarian character—such as the *Krishna-janmāshṭamī*, the birthday of Krishna on the 8th day of the dark half of Bhadra, or (in the south) of Śrāvaṇa (July-August), the *Durgapuja* and the *Dipavali*, or lamp feast, celebrating Krishna's victory over the demon Narakasura, on the last two days of Aśvina (September-October)—are likewise observed and heartily joined in by the whole community irrespective of sect. Widely different, however, as is the character of the two leading gods are also the modes of worship practised by their votaries.

Siva has at all times been the favourite god of the Brahmans,[1] and his worship is accordingly more widely extended than that of his rival, especially in southern India. Indeed there is hardly a village in India which cannot boast of a shrine dedicated to Siva, and containing the emblem of his reproductive power; for almost the only form in which the "Great God" is adored is the *Linga*, consisting usually of an upright cylindrical block of marble or other stone, mostly resting on a circular perforated slab. The mystic nature of these emblems seems, however, to be but little understood by the common people; and, as H. H. Wilson remarks, "notwithstanding the acknowledged purport of this worship, it is but justice to state that it is unattended in Upper India by any indecent or indelicate ceremonies, and it requires a rather lively imagination to trace any resemblance in its symbols to the objects they are supposed to represent." In spite, however, of its wide diffusion, and the vast number of shrines dedicated to it, the worship of Siva has never assumed a really popular character, especially in northern India, being attended with scarcely any solemnity or display of emotional spirit. The temple, which usually stands in the middle of a court, is as a rule a building of very moderate dimensions, consisting either of a single square chamber, surmounted by a pyramidal structure, or of a chamber for the linga and a small vestibule. The worshipper, having first circumambulated the shrine as often as he pleases, keeping it at his right-hand side, steps up to the threshold of the sanctum, and presents his offering of flowers or fruit, which the officiating priest receives; he then prostrates himself, or merely lifts his hands—joined so as to leave a hollow space between the palms—to his forehead, muttering a short prayer, and takes his departure. Amongst the many thousands of Lingas, twelve are usually regarded as of especial sanctity, one of which, that of Somnath in Gujarat, where Siva is worshipped as "the lord of Soma," was, however, shattered by Mahmud of Ghazni; whilst another, representing Siva as *Visvesvara*, or "Lord of the Universe," is the chief object of adoration at Benares, the great centre of Siva-worship. The Saivas of southern India, on the other hand, single out as peculiarly sacred five of their temples which are supposed to enshrine as many characteristic aspects (linga) of the god in the form of the five elements, the most holy of these being the shrine of Chidambaram (*i.e.* "thought-ether") in S. Arcot, supposed to contain the ether-linga. According to Pandit S. M. Natesa (*Hindu Feasts, Fasts and Ceremonies*), "the several forms of the god Siva in these sacred shrines are considered to be the bodies or casements of the soul whose

[1] Siva is said to have first appeared in the beginning of the present age as Sveta, the White, for the purpose of benefiting the Brahmans, and he is invariably painted white; whilst Vishnu, when pictured, is always of a dark-blue colour.

SpinSmart Software http://www.spinsmart.com

natural bases are the five elements—earth, water, fire, air and ether. The apprehension of God in the last of these five as ether is, according to the Saiva school of philosophy, the highest form of worship, for it is not the worship of God in a tangible form, but the worship of what, to ordinary minds, is vacuum, which nevertheless leads to the attainment of a knowledge of the all-pervading without physical accessories in the shape of any linga, which is, after all, an emblem. That this is the case at Chidambaram is known to every Hindu, for if he ever asks the priests to show him the God in the temple he is pointed to an empty space in the holy of holies, which has been termed the Akasa, or ether-linga." But, however congenial this refined symbolism may be to the worshipper of a speculative turn of mind, it is difficult to see how it could ever satisfy the religious wants of the common man little given to abstract conceptions of this kind.

From early times, detachment from the world and the practice of austerities have been regarded in India as peculiarly conducive to a spirit of godliness, and ultimately to a state of ecstatic communion with the deity. On these grounds it was actually laid down as a rule for a man solicitous for his spiritual welfare to pass the last two of the four stages (*āśrama*) of his life in such conditions of renunciation and self-restraint. Though there is hardly a sect which has not contributed its share to the element of religious mendicancy and asceticism so prevalent in India, it is in connexion with the Siva-cult that these tendencies have been most extensively cultivated. Indeed, the personality of the stern God himself exhibits this feature in a very marked degree, whence the term *mahāyogī* or "great ascetic" is often applied to him.

Mendicant orders.

Of Saiva mendicant and ascetic orders, the members of which are considered more or less followers of Sankara Acharya, the following may be mentioned: (1) *Daṇḍīs*, or staff-bearers, who carry a wand with a piece of red cloth, containing the sacred cord, attached to it, and also wear one or more pieces of cloth of the same colour. They worship Siva in his form of Bhairava, the "terrible." A sub-section of this order are the Dandi Dasnamis, or Dandi of ten names, so called from their assuming one of the names of Sankara's four disciples, and six of their pupils. (2) *Yogis* (or popularly, Jogis), *i.e.* adherents of the Yoga philosophy and the system of ascetic practices enjoined by it with the view of mental abstraction and the supposed attainment of superhuman powers—practices which, when not merely pretended, but rigidly carried out, are only too apt to produce vacuity of mind and wild fits of frenzy. In these degenerate days their supernatural powers consist chiefly in conjuring, sooth-saying, and feats of jugglery, by which they seldom fail in imposing upon a credulous public. (3) *Sannyasis*, devotees who "renounce" earthly concerns, an order not confined either to the Brahmanical caste or to the Saiva persuasion. Those of the latter are in the habit of smearing their bodies with ashes, and wearing a tiger-skin and a necklace or rosary of *rudraksha* berries (Elaeocarpus Ganitrus, lit. "Rudra's eye"), sacred to Siva, and allowing their hair to grow till it becomes matted and filthy. (4) *Parama-hamsas*, *i.e.* "supreme geese (or swans)," a term applied to the world-soul with which they claim to be identical. This is the highest order of asceticism, members of which are supposed to be solely engaged in meditating on the Brahma, and to be "equally indifferent to pleasure or pain, insensible of heat or cold, and incapable of satiety or want." Some of them go about naked, but the majority are clad like the Dandis. (5) *Aghora Panthis*, a vile and disreputable class of mendicants, now rarely met with. Their filthy habits and disgusting practices of gross promiscuous feeding, even to the extent of eating offal and dead men's flesh, look almost like a direct repudiation of the strict Brahmanical code of ceremonial purity and cleanliness, and of the rules regulating the matter and manner of eating and drinking; and they certainly make them objects of loathing and terror wherever they are seen.

On the general effect of the manner of life led by *Sadhus* or "holy men," a recent observer (J. C. Oman, *Mystics, Ascetics and Saints of India*, p. 273) remarks: "*Sadhuism*, whether perpetuating the peculiar idea of the efficiency of austerities for the acquisition of far-reaching powers over natural phenomena, or bearing its testimony to the belief in the indispensableness of detachment from the world as a preparation for the ineffable joy of ecstatic communion with the Divine Being, has undoubtedly tended to keep before men's eyes, as the highest ideal, a life of purity, self-restraint, and contempt of the world and human affairs. It has also necessarily maintained amongst the laity a sense of the righteous claims of the poor upon the charity of the more affluent members of the community. Moreover, *sadhuism*, by the multiplicity of the independent sects which have arisen in India, has engendered and favoured a spirit of tolerance which cannot escape the notice of the most superficial observer."

An independent Saiva sect, or, indeed, the only strictly Saiva sect, are the *Vīra Śaivas*, more commonly called *Lingayats* (popularly Lingaits) or *Lingavats*, from their practice of wearing on their person a phallic emblem of Siva, made of copper or silver, and usually enclosed in a case suspended from the neck by a string. Apparently from the movable nature of their badge, their *Gurus* are called *Jangamas* ("movable"). This sect counts numerous adherents in southern India; the Census Report of 1901 recording nearly a million and a half, including some 70 or 80 different, mostly endogamous, castes. The reputed founder, or rather reformer, of the sect was Basava (or Basaba), a Brahman of the Belgaum district who seems to have lived in the 11th or 12th century. According to the Basava-purana he early in life renounced his caste and went to reside at Kalyana, then the capital of the Chalukya kingdom, and later on at Sangamesvara near Ratnagiri, where he was initiated into the Vīra Saiva faith which he subsequently made it his life's work to propagate. His doctrine, which may be said to constitute a kind of reaction against the severe sacerdotalism of Sankara, has spread over all classes of the southern community, most of the priests of Saiva temples there being adherents of it; whilst in northern India its votaries are only occasionally met with, and then mostly as mendicants, leading about a neatly caparisoned bull as representing Siva's sacred bull *Nandi*. Though the Lingayats still show a certain animosity towards the Brahmans, and in the Census lists are accordingly classes as an independent group beside the Hindus, still they can hardly be excluded from the Hindu community, and are sure sooner or later to find their way back to the Brahmanical fold.

Lingayats.

Vishnu, whilst less popular with Brahmans than his rival, has from early times proved to the lay mind a more attractive object of adoration on account of the genial and, so to speak, romantic character of his mythical personality. It is not, however, so much the original figure of the god himself that enlists the sympathies of his adherents as the additional elements it has received through the theory of periodical "descents" (*avatāra*) or incarnations applied to this deity. Whilst the Saiva philosophers do not approve of the notion of incarnations, as being derogatory to the dignity of the deity, the Brahmans have nevertheless thought fit to adopt it as apparently a convenient expedient for bringing certain tendencies of popular worship within the pale of their system, and probably also for counteracting the Buddhist doctrines; and for this purpose Vishnu would obviously offer himself as the most attractive figure in the Brahmanical trinity. Whether the incarnation theory started from the original solar nature of the god suggestive of regular visits to the world of men, or in what other way it may have originated, must remain doubtful. Certain, however, it is that at least one of his Avatars is clearly based on the Vedic conception of the sun-god, viz. that of the dwarf who claims as much ground as he can cover by three steps, and then gains the whole universe by his three mighty strides. Of the ten or more Avatars, assumed by different authorities, only two have entered to any considerable extent into the religious worship of the people, viz. those of *Rama* (or Ramachandra) and *Krishna*, the favourite heroes of epic romance. That these two figures would appeal far more strongly to the hearts and feelings of the people, especially the warlike Kshatriyas,[1] than the austere Siva is only what might have been expected; and, indeed, since the time of the epics their cult seems never to have lacked numerous adherents. But, on the other hand, the essentially human nature of these two gods

Avatars.

[1] As in the case of Siva's traditional white complexion, it may not be without significance, from a racial point of view, that Vishnu, Rama and Krishna have various darker shades of colour attributed to them, viz. blue, hyacinthine, and dark azure or dark brown respectively. The names of the two heroes meaning simply "black" or "dark," the blue tint may originally have belonged to Vishnu, who is also called *pītavasas*, dressed in yellow garment, *i.e.* the colours of sky and sun combined.

SpinSmart Software http://www.spinsmart.com

would naturally tend to modify the character of the relations between worshipper and worshipped, and to impart to the modes and forms of adoration features of a more popular and more human kind. And accordingly it is exactly in connexion with these two incarnations of Vishnu, especially that of Krishna, that a new spirit was infused into the religious life of the people by the sentiment of fervent devotion to the deity, as it found expression in certain portions of the epic poems, especially the *Bhagavadgita*, and in the *Bhagavatapurana* (as against the more orthodox Vaishnava works of this class such as the Vishnu-purana), and was formulated into a regular doctrine of faith in the *Sandilya-sutra*, and ultimately translated into practice by the Vaishnava reformers.

The first successful Vaishnava reaction against Sankara's reconstructed creed was led by Ramanuja, a southern Brahman of the 12th century. His followers, the Ramanujas, or Sri-Vaishnavas as they are usually called, worship Vishnu (Narayana) with his consort Sri or Lakshmi (the goddess of beauty and fortune), or their incarnations Rama with Sita and Krishna with Rukmini. Ramanuja's doctrine, which is especially directed against the Linga-worship, is essentially based on the tenets of an old Vaishnava sect, the Bhagavatas or Pancharatras, who worshipped the Supreme Being under the name of Vasudeva (subsequently identified with Krishna, as the son of Vasudeva, who indeed is credited by some scholars with the foundation of that monotheistic creed). The sectarial mark of the Ramanujas resembles a capital U (or, in the case of another division, a Y), painted with a white clay called gopi-chandana, between the hair and the root of the nose, with a red or yellow vertical stroke (representing the female element) between the two white lines. They also usually wear, like all Vaishnavas, a necklace of *tulasi*, or basil wood, and a rosary of seeds of the same shrub or of the lotus. Their most important shrines are those of Srirangam near Trichinopoly, Mailkote in Mysore, Dvaraka (the city of Krishna) on the Kathiawar coast, and Jagannath in Orissa; all of them decorated with Vishnu's emblems, the tulasi plant and salagram stone. The Ramanuja Brahmans are most punctilious in the preparation of their food and in regard to the privacy of their meals, before taking which they have to bathe and put on woollen or silk garments. Whilst Sankara's mendicant followers were prohibited to touch fire and had to subsist entirely on the charity of Brahman householders, Ramanuja, on the contrary, not only allowed his followers to use fire, but strictly forbade their eating any food cooked, or even seen, by a stranger. On the speculative side, Ramanuja also met Sankara's strictly monistic theory by another recognizing Vishnu as identical with Brahma as the Supreme Spirit animating the material world as well as the individual souls which have become estranged from God through unbelief, and can only attain again conscious union with him through devotion or love (*bhakti*). His tenets are expounded in various works, especially in his commentaries on the Vedanta-sutras and the Bhagavadgita. The followers of Ramanuja have split into two sects, a northern one, recognizing the Vedas as their chief authority, and a southern one, basing their tenets on the Nalayir, a Tamil work of the Upanishad order. In point of doctrine, they differ in their view of the relation between God Vishnu and the human soul; whilst the former sect define it by the *ape* theory, which makes the soul cling to God as the young ape does to its mother, the latter explain it by the *cat* theory, by which Vishnu himself seizes and rescues the souls as the mother cat does her young ones.

Ramanujas.

Madhva Acharya, another distinguished Vedanta teacher and founder of a Vaishnava sect, born in Kanara in A.D. 1199, was less intolerant of the Linga cult than Ramanuja, but seems rather to have aimed at a reconciliation of the Saiva and Vaishnava forms of worship. The *Madhvas* or *Madhvacharis* favour Krishna and his consort as their special objects of adoration, whilst images of Siva, Parvati, and their son Ganesa are, however, likewise admitted and worshipped in some of their temples, the most important of which is at Udipi in South Kanara, with eight monasteries connected with it. This shrine contains an image of Krishna which is said to have been rescued from the wreck of a ship which brought it from Dvaraka, where it was supposed to have been set up of old by no other than Krishna's friend Arjuna, one of the five Pandava princes. Followers of the Madhva creed are but rarely met with in Upper India. Their sectarial mark is like the U of the Sri-Vaishnavas, except that their central line is black instead of red or yellow. Madhva—who after his initiation assumed the name Anandatirtha—composed numerous Sanskrit works, including commentaries on the Brahma sutras (*i.e.* the Vedanta aphorisms), the Gita, the Rigveda and many Upanishads. His philosophical theory was a dualistic one, postulating distinctness of nature for the divine and the human soul, and hence independent existence, instead of absorption, after the completion of mundane existence.

Madhvas.

The Ramanandis or Ramavats (popularly Ramats) are a numerous northern sect of similar tenets to those of the Ramanujas. Indeed its founder, Ramananda, who probably flourished in the latter part of the 14th century, according to the traditional account, was originally a Sri-Vaishnava monk, and, having come under the suspicion of laxity in observing the strict rules of food during his peregrinations, and been ordered by his superior (Mahant) to take his meals apart from his brethren, left the monastery in a huff and set up a schismatic math of his own at Benares. The sectarial mark of his sect differs but slightly from that of the parent stock. The distinctive features of their creed consist in their making Rama and Sita, either singly or conjointly, the chief objects of their adoration, instead of Vishnu and Lakshmi, and their attaching little or no importance to the observance of privacy in the cooking and eating of their food. Their mendicant members, usually known as Vairagis, are, like the general body of the sect, drawn from all castes without distinction. Thus, the founder's twelve chief disciples include, besides Brahmans, a weaver, a currier, a Rajput, a Jat and a barber—for, they argue, seeing that Bhagavan, the Holy One (Vishnu), became incarnate even in animal form, a Bhakta (believer) may be born even in the lowest of castes. Ramananda's teaching was thus of a distinctly levelling and popular character; and, in accordance therewith, the Bhakta-malā and other authoritative writings of the sect are composed, not in Sanskrit, but in the popular dialects. A follower of this creed was the distinguished poet Tulsidas, the composer of the beautiful Hindi version of the Ramayana and other works which "exercise more influence upon the great body of Hindu population than the whole voluminous series of Sanskrit composition" (H. H. Wilson).

Ramats.

The traditional list of Ramananda's immediate disciples includes the name of Kabir, the weaver, a remarkable man who would accordingly have lived in the latter part of the 15th century, and who is claimed by both Hindus and Moslems as having been born within their fold. The story goes that, having been deeply impressed by Ramananda's teaching, he sought to attach himself to him; and, one day at Benares, in stepping down the ghat at daybreak to bathe in the Ganges, and putting himself in the way of the teacher, the latter, having inadvertently struck him with his foot, uttered his customary exclamation "Ram Ram," which, being also the initiatory formula of the sect, was claimed by Kabir as such, making him Ramananda's disciple. Be this as it may, Kabir's own reformatory activity lay in the direction of a compromise between the Hindu and the Mahommedan creeds, the religious practices of both of which he criticized with equal severity. His followers, the Kabir Panthis ("those following Kabir's path"), though neither worshipping the gods of the pantheon, nor observing the rites and ceremonial of the Hindus, are nevertheless in close touch with the Vaishnava sects, especially the Ramavats, and generally worship Rama as the supreme deity, when they do not rather address their homage, in hymns and otherwise, to the founder of their creed himself. Whilst very numerous, particularly amongst the low-caste population, in western, central and northern India, resident adherents of Kabir's doctrine are rare in Bengal and the south; although

Kabir.

SpinSmart Software http://www.spinsmart.com

"there is hardly a town in India where strolling beggars may not be found singing songs of Kabir in the original or as translated into the local dialects." The mendicants of this creed, however, never actually solicit alms; and, indeed, "the quaker-like spirit of the sect, their abhorrence of all violence, their regard for truth and the inobtrusiveness of their opinions render them very inoffensive members of the state" (H. H. Wilson). The doctrines of Kabir are taught, mostly in the form of dialogues, in numerous Hindi works, composed by his disciples and adherents, who, however, usually profess to give the teacher's own words.

The peculiar conciliatory tendencies of Kabir were carried on with even greater zeal from the latter part of the 15th century by one of his followers, Nanak Shah, the promulgator of the creed of the *Nanak Shahis* or *Sikhs*—*i.e.* (Sanskr.) *sishya*, disciples, whose guru, or teacher, he called himself—a peaceful sect at first until, in consequence of Mahommedan persecution, a martial spirit was infused into it by the tenth, and last, guru, Govind Shah, changing it into a political organization. Whilst originally more akin in its principles to the Moslem faith, the sect seems latterly to have shown tendencies towards drifting back to the Hindu pale.

Of Ramananda's disciples and successors several others, besides Kabir, have established schismatic divisions of their own, which do not, however, offer any very marked differences of creed. The most important of these, the Dadu Panthi sect, founded by Dadu about the year 1600, has a numerous following in Ajmir and Marwar, one section of whom, the Nagas, engage largely in military service, whilst the others are either householders or mendicants. The followers of this creed wear no distinctive sectarial mark or badge, except a skull-cap; nor do they worship any visible image of any deity, the repetition (*japa*) of the name of Rama being the only kind of adoration practised by them.

Although the Vaishnava sects hitherto noticed, in their adoration of Vishnu and his incarnations, Krishna and Ramachandra, usually associate with these gods their wives, as their *saktis*, or female energies, the sexual element is, as a rule, only just allowed sufficient scope to enhance the emotional character of the rites of worship. In some of the later Vaishnava creeds, on the other hand, this element is far from being kept within the bounds of moderation and decency. The favourite object of adoration with adherents of these sects is Krishna with his mate—but not the devoted friend and counsellor of the Pandavas and deified hero of epic song, nor the ruler of Dvaraka and wedded lord of Rukmini, but the juvenile Krishna, Govinda or Bala Gopala, "the cowherd lad," the foster son of the cowherd Nanda of Gokula, taken up with his amorous sports with the *Gopis*, or wives of the cowherds of Vrindavana (Brindaban, near Mathura on the Yamuna), especially his favourite mistress Radha or Radhika. This episode in the legendary life of Krishna has every appearance of being a later accretion. After barely a few allusions to it in the epics, it bursts forth full-blown in the Harivansa, the Vishnu-purana, the Narada-Pancharatra and the Bhagavata-purana, the tenth canto of which, dealing with the life of Krishna, has become, through vernacular versions, especially the Hindi *Prem-sagar*, or "ocean of love," a favourite romance all over India, and has doubtless helped largely to popularize the cult of Krishna. Strange to say, however, no mention is as yet made by any of these works of Krishna's favourite Radha; it is only in another Purana—though scarcely deserving that designation—that she makes her appearance, viz. in the Brahma-vaivarta, in which Krishna's amours in Nanda's cow-station are dwelt upon in fulsome and wearisome detail; whilst the poet Jayadeva, in the 12th century, made her love for the gay and inconstant boy the theme of his beautiful, if highly voluptuous, lyrical drama, *Gita-govinda*.

Eroticism and Krishna worship.

The earliest of the sects which associate Radha with Krishna in their worship is that of the Nimavats, founded by Nimbaditya or Nimbarka (*i.e.* "the sun of the Nimba tree"), a teacher of uncertain date, said to have been a Telugu Brahman who subsequently established himself at Mathura (Muttra) on the Yamuna, where the headquarters of his sect have remained ever since. The Mahant of their monastery at Dhruva Kshetra near Mathura, who claims direct descent from Nimbarka, is said to place the foundation of that establishment as far back as the 5th century—doubtless an exaggerated claim; but if Jayadeva, as is alleged, and seems by no means improbable, was really a follower of Nimbarka, this teacher must have flourished, at latest, in the early part of the 12th century. He is indeed taken by some authorities to be identical with the mathematician Bhaskara Acharya, who is known to have completed his chief work in A.D. 1150. It is worthy of remark, in this respect, that—in accordance with Ramanuja's and Nimbarka's philosophical theories—Jayadeva's presentation of Krishna's fickle love for Radha is usually interpreted in a mystical sense, as allegorically depicting the human soul's striving, through love, for reunion with God, and its ultimate attainment, after many backslidings, of the longed-for goal. As the chief authority of their tenets, the Nimavats recognize the Bhagavata-purana; though several works, ascribed to Nimbarka—partly of a devotional character and partly expository of Vedanta topics—are still extant. Adherents of this sect are fairly numerous in northern India, their frontal mark consisting of the usual two perpendicular white lines, with, however, a circular black spot between them.

Of greater importance than the sect just noticed, because of their far larger following, are the two sects founded early in the 16th century by Vallabha (Ballabha) Acharya and Chaitanya. In the forms of worship favoured by votaries of these creeds the emotional and erotic elements are allowed yet freer scope than in those that preceded them; and, as an effective auxiliary to these tendencies, the use of the vernacular dialects in prayers and hymns of praise takes an important part in the religious service. The Vallabhacharis, or, as they are usually called, from the title of their spiritual heads, the Gokulastha Gosains, *i.e.* "the cow-lords (*gosvamin*) residing in Gokula," are very numerous in western and central India. Vallabha, the son of a Telinga Brahman, after extensive journeyings all over India, settled at Gokula near Mathura, and set up a shrine with an image of Krishna Gopala. About the year 1673, in consequence of the fanatical persecutions of the Mogul emperor, this image was transferred to Nathdvara in Udaipur (Mewar), where the shrine of Srinatha ("the lord of Sri," *i.e.* Vishnu) continues to be the chief centre of worship for adherents of this creed; whilst seven other images, transferred from Mathura at the same time, are located at different places in Rajputana. Vallabha himself went subsequently to reside at Benares, where he died. In the doctrine of this Vaishnava prophet, the adualistic theory of Sankara is resorted to as justifying a joyful and voluptuous cult of the deity. For, if the human soul is identical with God, the practice of austerities must be discarded as directed against God, and it is rather by a free indulgence of the natural appetites and the pleasures of life that man's love for God will best be shown. The followers of his creed, amongst whom there are many wealthy merchants and bankers, direct their worship chiefly to Gopal Lal, the boyish Krishna of Vrindavana, whose image is sedulously attended like a revered living person eight times a day—from its early rising from its couch up to its retiring to repose at night. The sectarial mark of the adherents consists of two red perpendicular lines, meeting in a semicircle at the root of the nose, and having a round red spot painted between them. Their principal doctrinal authority is the Bhagavata-purana, as commented upon by Vallabha himself, who was also the author of several other Sanskrit works highly esteemed by his followers. In this sect, children are solemnly admitted to full membership at the early age of four, and even two, years of age, when a rosary, or necklace, of 108 beads of basil (tulsi) wood is passed round their necks, and they are taught the use of the octo-syllabic formula *Sri-Krishnah saranam mama*, "Holy Krishna is my refuge." Another special feature of this sect is that their spiritual heads, the Gosains, also called Maharajas, so far from submitting themselves to self-discipline and austere practices, adorn themselves in splendid garments, and allow themselves to be habitually regaled by their adherents with choice kinds of food; and being regarded as the living representatives of the "lord of the Gopis" himself, they claim and receive in their own persons all acts of attachment and worship due to the deity, even, it is alleged, to the extent of complete self-surrender. In the final judgment of the famous libel case of the Bombay Maharajas, before the Supreme Court of Bombay, in January 1862, these improprieties were severely commented upon; and though so unsparing a critic of Indian sects as Jogendra Nath seems not to believe in actual immoral practices on the part of the Maharajas, still he admits that "the corrupting influence of a religion, that can make its female votaries address amorous songs to their spiritual guides, must be very great."

A modern offshoot of Vallabha's creed, formed with the avowed object of purging it of its objectionable features, was started, in the early years of the 19th century, by Sahajananda, a Brahman of the Oudh country, who subsequently assumed the name of Svami Narayana. Having entered on his missionary labours at Ahmadabad, and afterwards removed to Jetalpur, where he had a meeting with Bishop Heber, he subsequently settled at the village of Wartal, to the north-west of Baroda, and erected a temple to Lakshmi-Narayana, which, with another at Ahmadabad, forms the two chief centres of the sect, each being presided over by a Maharaja. Their worship is addressed to Narayana, *i.e.* Vishnu, as the Supreme Being, together with Lakshmi, as well as to Krishna and Radha. The sect is said to be gaining ground in Gujarat. Chaitanya, the

SpinSmart Software http://www.spinsmart.com

founder of the great Vaishnava sect of Bengal, was the son of a high-caste Brahman of Nadiya, the famous Bengal seat of Sanskrit learning, where he was born in 1485, two years after the birth of Martin Luther, the German reformer. Having married in due time, and a second time after the death of his first wife, he lived as a "householder" (*grihastha*) till the age of 24, when he renounced his family ties and set out as a religious mendicant (*vairagin*), visiting during the next six years the principal places of pilgrimage in northern India, and preaching with remarkable success his doctrine of Bhakti, or passionate devotion to Krishna, as the Supreme Deity. He subsequently made over to his principal disciples the task of consolidating his community, and passed the last twelve years of his life at Puri in Orissa, the great centre of the worship of Vishnu as Jagannatha, or "lord of the world," which he remodelled in accordance with his doctrine, causing the mystic songs of Jayadeva to be recited before the images in the morning and evening as part of the daily service; and, in fact, as in the other Vaishnava creeds, seeking to humanize divine adoration by bringing it into accord with the experience of human love. To this end, music, dancing, singing-parties (*sankirtan*), theatricals—in short anything calculated to produce the desired impression—would prove welcome to him. His doctrine of Bhakti distinguishes five grades of devotional feeling in the *Bhaktas*, or faithful adherents: viz. (*santi*) calm contemplation of the deity; (*dasya*) active servitude; (*sakhya*) friendship or personal regard; (*vatsalya*) tender affection as between parents and children; (*madhurya*) love or passionate attachment, like that which the Gopis felt for Krishna. Chaitanya also seems to have done much to promote the celebration on an imposing scale of the great Puri festival of the Ratha-yatra, or "car-procession," in the month of Ashadha, when, amidst multitudes of pilgrims, the image of Krishna, together with those of his brother Balarama and his sister Subhadra, is drawn along, in a huge car, by the devotees. Just as this festival was, and continues to be, attended by people from all parts of India, without distinction of caste or sex, so also were all classes, even Mahommedans, admitted by Chaitanya as members of his sect. Whilst numerous observances are recommended as more or less meritorious, the ordinary form of worship is a very simple one, consisting as it does mainly of the constant repetition of names of Krishna, or Krishna and Radha, which of itself is considered sufficient to ensure future bliss. The partaking of flesh food and spirituous liquor is strictly prohibited. By the followers of this sect, also, an extravagant degree of reverence is habitually paid to their *gurus* or spiritual heads. Indeed, Chaitanya himself, as well as his immediate disciples, have come to be regarded as complete or partial incarnations of the deity to whom adoration is due, as to Krishna himself; and their modern successors, the Gosains, share to the fullest extent in the devout attentions of the worshippers. Chaitanya's movement, being chiefly directed against the vile practices of the Saktas, then very prevalent in Bengal, was doubtless prompted by the best and purest of intentions; but his own doctrine of divine, though all too human, love was, like that of Vallabha, by no means free from corruptive tendencies,—yet, how far these tendencies have worked their way, who would say? On this point, Dr W. W. Hunter—who is of opinion that "the death of the reformer marks the beginning of the spiritual decline of Vishnu-worship," observes (*Orissa*, i. 111), "The most deplorable corruption of Vishnu-worship at the present day is that which has covered the temple walls with indecent sculptures, and filled its innermost sanctuaries with licentious rites" . . . yet . . . "it is difficult for a person not a Hindu to pronounce upon the real extent of the evil. None but a Hindu can enter any of the larger temples, and none but a Hindu priest really knows the truth about their inner mysteries"; whilst the well-known native scholar Babu Rajendralal Mitra points out (*Antiquities of Orissa*, i. 111) that "such as they are, these sculptures date from centuries before the birth of Chaitanya, and cannot, therefore, be attributed to his doctrines or to his followers. As a Hindu by birth, and a Vaishnava by family religion, I have had the freest access to the innermost sanctuaries and to the most secret of scriptures. I have studied the subject most extensively, and have had opportunities of judging which no European can have, and I have no hesitation in saying that, 'the mystic songs' of Jayadeva and the 'ocean of love' notwithstanding, there is nothing in the rituals of Jagannatha which can be called licentious." Whilst in Chaitanya's creed, Krishna, in his relations to Radha, remains at least theoretically the chief partner, an almost inevitable step was taken by some minor sects in attaching the greater importance to the female element, and making Krishna's love for his mistress the guiding sentiment of their faith. Of these sects, it will suffice to mention that of the Radha-Vallabhis, started in the latter part of the 16th century, who worship Krishna as Radha-vallabha, "the darling of Radha." The doctrines and practices of these sects clearly verge upon those obtaining in the third principal division of Indian sectarians which will now be considered.

The Saktas, as we have seen, are worshippers of the *sakti*, or the female principle as a primary factor in the creation and reproduction of the universe. And as each of the principal gods is supposed to have associated with him his own particular *sakti*, as an indispensable complement enabling him to properly perform his cosmic functions, adherents of this persuasion might be expected to be recruited from all sects. To a certain extent this is indeed the case; but though Vaishnavism, and especially the Krishna creed, with its luxuriant growth of erotic legends, might have seemed peculiarly favourable to a development in this direction, it is practically only in connexion with the Saiva system that an independent cult of the female principle has been developed; whilst in other sects—and, indeed, in the ordinary Saiva cult as well—such worship, even where it is at all prominent, is combined with, and subordinated to, that of the male principle. What has made this cult attach itself more especially to the Saiva creed is doubtless the character of Siva as the type of reproductive power, in addition to his function as destroyer which, as we shall see, is likewise reflected in some of the forms of his Sakti. The theory of the god and his Sakti as cosmic principles is perhaps already foreshadowed in the Vedic couple of Heaven and Earth, whilst in the speculative treatises of the later Vedic period, as well as in the post-Vedic Brahmanical writings, the assumption of the self-existent being dividing himself into a male and a female half usually forms the starting-point of cosmic evolution.[1] In the later Saiva mythology this theory finds its artistic representation in Siva's androgynous form of Ardha-narisa, or "half-woman-lord," typifying the union of the male and female energies; the male half in this form of the deity occupying the right-hand, and the female the left-hand side. In accordance with this type of productive energy, the Saktas divide themselves into two distinct groups, according to whether they attach the greater importance to the male or to the female principle; viz. the *Dakshinacharis*, or "right-hand-observers" (also called *Dakshina-margis*, or followers "of the right-hand path"), and the *Vamacharis*, or "left-hand-observers" (or *Vama-margis*, followers "of the left path"). Though some of the Puranas, the chief repositories of sectarian doctrines, enter largely into Sakta topics, it is only in the numerous Tantras that these are fully and systematically developed. In these works, almost invariably composed in the form of a colloquy, Siva, as a rule, in answer to questions asked by his consort Parvati, unfolds the mysteries of this occult creed.

Saktas.

The principal seat of Sakta worship is the north-eastern part of India—Bengal, Assam and Behar. The great majority of its adherents profess to follow the right-hand practice; and apart from the implied purport and the emblems of the cult, their mode of adoration does not seem to offer any very objectionable features. And even amongst the adherents of the left-hand mode of worship, many of these are said to follow it as a matter of family tradition rather than of religious conviction, and to practise it in a sober and temperate manner; whilst only an extreme section—the so-called *Kaulas* or *Kulinas*, who appeal to a spurious Upanishad, the Kaulopanishad, as the divine authority of their tenets—persist in carrying on the mystic and licentious rites taught in many of the Tantras. But strict secrecy being enjoined in the performance of these rites, it is not easy to check any statements made on this point. The Sakta cult is, however, known to be especially prevalent—though apparently not in a very extreme form—amongst members of the very respectable Kayastha or writer caste of Bengal, and as these are largely employed as clerks and accountants in Upper India, there is reason to fear that their vicious practices are gradually being disseminated through them.

The divine object of the adoration of the Saktas, then, is Siva's wife—the *Devi* (goddess), *Mahadevi* (great goddess), or *Jagan-mata* (mother of the world)—in one or other of her numerous forms, benign or terrible. The forms in which she is worshipped in Bengal are of the latter category, viz. *Durga*, "the unapproachable," and *Kali*, "the black one," or, as some take it, the wife of *Kala*, "time," or death the great dissolver, viz. Siva. In honour of the former, the *Durga-puja* is celebrated

[1] This notion not improbably took its origin in the mystic cosmogonic hymn, Rigv. x. 129, where it is said that—"that one (existent, neutr.) breathed breathless by (or with) its *svadha* (? inherent power, or nature), beyond that there was nothing whatever . . . that one live (germ) which was enclosed in the void was generated by the power of heat (or fervour); desire then first came upon it, which was the first seed of the mind . . . fertilizing forces there were, *svadha* below, *prayati* (? will) above."

SpinSmart Software http://www.spinsmart.com

a community already strongly imbued with pantheistic notions; yet, at best, that creed could only appeal to the sympathies of a comparatively limited portion of the people. Indeed, the sacerdotal class themselves had made its universal acceptance an impossibility, seeing that their laws, by which the relations of the classes were to be regulated, aimed at permanently excluding the entire body of aboriginal tribes from the religious life of their Aryan masters. They were to be left for all time coming to their own traditional idolatrous notions and practices. However, the two races could not, in the nature of things, be permanently kept separate from each other. Indeed, even prior to the definite establishment of the caste-system, the mingling of the lower race with the upper classes, especially with the aristocratic landowners and still more so with the yeomanry, had probably been going on to such an extent as to have resulted in two fairly well-defined intermediate types of colour between the priestly order and the servile race and to have facilitated the ultimate division into four "colours" (*varna*). In course of time the process of intermingling, as we have seen, assumed such proportions that the priestly class, in their pride of blood, felt naturally tempted to recognize, as of old, only two "colours," the Aryan Brahman and the non-Aryan Sudra. Under these conditions the religious practices of the lower race could hardly have failed in the long run to tell seriously upon the spiritual life of the lay body of the Brahmanical community. To what extent this may have been the case, our limited knowledge of the early phases of the sectarian worship of the people does not enable us to determine. But, on the other hand, the same process of racial intermixture also tended to gradually draw the lower race more or less under the influence of the Brahmanical forms of worship, and thus contributed towards the shaping of the religious system of modern Hinduism. The grossly idolatrous practices, however, still so largely prevalent in the Dravidian South, show how superficial, after all, that influence has been in those parts of India where the admixture of Aryan blood has been so slight as to have practically had no effect on the racial characteristics of the people. These present-day practices, and the attitude of the Brahman towards them, help at all events to explain the aversion with which the strange rites of the subjected tribes were looked upon by the worshippers of the Vedic pantheon. At the same time, in judging the apparently inhuman way in which the Sudras were treated in the caste rules, one has always to bear in mind the fact that the belief in metempsychosis was already universal at the time, and seemed to afford the only rational explanation of the apparent injustice involved in the unequal distribution of the good things in this world; and that, if the Sudra was strictly excluded from the religious rites and beliefs of the superior classes, this exclusion in no way involved the question of his ultimate emancipation and his union with the Infinite Spirit, which were as certain in his case as in that of any other sentient being. What it did make impossible for him was to attain that union immediately on the cessation of his present life, as he would first have to pass through higher and purer stages of mundane existence before reaching that goal; but in this respect he only shared the lot of all but a very few of the saintliest in the higher spheres of life, since the ordinary twice-born would be liable to sink, after his present life, to grades yet lower than that of the Sudra.

To what extent the changes, which the religious belief of the Aryan classes underwent in post-Vedic times, may have been due to aboriginal influences is a question not easily answered, though the later creeds offer only too many features in which one might feel inclined to suspect influences of that kind. The literary documents, both in Sanskrit and Pali, dating from about the time of Buddha onwards—particularly the two epic poems, the *Mahabharata* and *Ramayana*—still show us in the main the *personnel* of the old pantheon; but the character of the gods has changed; they have become anthropomorphized and almost purely mythological figures. A number of the chief gods, sometimes four, but generally eight of them, now appear as *lokapalas* or world-guardians, having definite quarters or intermediate quarters of the compass assigned to them as their special domains. One of them, Kubera, the god of wealth, is a new figure; whilst another, Varuna, the most spiritual and ethical of Vedic deities—the king of the gods and the universe; the nightly, star-spangled firmament—has become the Indian Neptune, the god of waters. Indra, their chief, is virtually a kind of superior raja, residing in *svarga*, and as such is on visiting terms with earthly kings, driving about in mid-air with his charioteer Matali. As might happen to any earth-lord, Indra is actually defeated in battle by the son of the demon-king of Lanka (Ceylon), and kept there a prisoner till ransomed by Brahma and the gods conferring immortality on his conqueror. A quaint figure in the pantheon of the heroic age is Hanuman, the deified chief of monkeys—probably meant to represent the aboriginal tribes of southern India—whose wonderful exploits as Rama's ally on the expedition to Lanka Indian audiences will never weary of hearing recounted. The Gandharvas figure already in the Veda, either as a single divinity, or as a class of genii, conceived of as the body-guard of Soma and as connected with the moon. In the later Vedic times they are represented as being fond of and dangerous to, women; the Apsaras, apparently originally water-nymphs, being closely associated with them. In the heroic age the Gandharvas have become the heavenly minstrels plying their art at Indra's court, with the Apsaras as their wives or mistresses. These fair damsels play, however, yet another part, and one far from complimentary to the dignity of the gods. In the epics considerable merit is attached to a life of seclusion and ascetic practices by means of which man is considered capable of acquiring supernatural powers equal or even superior to those of the gods—a notion perhaps not unnaturally springing from the pantheistic conception. Now, in cases of danger being threatened to their own ascendancy by such practices, the gods as a rule proceed to employ the usually successful expedient of despatching some lovely nymph to lure the saintly men back to worldly pleasures. Seeing that the epic poems, as repeated by professional reciters, either in their original Sanskrit text, or in their vernacular versions, as well as dramatic compositions based on them, form to this day the chief source of intellectual enjoyment for most Hindus, the legendary matter contained in these heroic poems, however marvellous and incredible it may appear, still enters largely into the religious convictions of the people. "These popular recitals from the Ramayan are done into Gujarati in easy, flowing narrative verse . . . by Premanand, the sweetest of our bards. They are read out by an intelligent Brahman to a mixed audience of all classes and both sexes. It has a perceptible influence on the Hindu character. I believe the remarkable freedom from infidelity which is to be seen in most Hindu families, in spite of their strange gregarious habits, can be traced to that influence; and little wonder" (B. M. Malabari, *Gujarat and the Gujaratis*). Hence also the universal reverence paid to serpents (*naga*) since those early days; though whether it simply arose from the superstitious dread inspired by the insidious reptile so fatal to man in India, or whether the verbal coincidence with the name of the once-powerful non-Aryan tribe of Nagas had something to do with it must remain doubtful. Indian myth represents them as a race of demons sprung from Kadru, the wife of the sage Kasyapa, with a jewel in their heads which gives them their sparkling look; and inhabiting one of the seven beautiful worlds below the earth (and above the hells), where they are ruled over by three chiefs or kings, Sesha, Vasuki and Takshaka; their fair daughters often entering into matrimonial alliances with men, like the mermaids of western legend.

In addition to such essentially mythological conceptions, we meet in the religious life of this period with an element of more serious aspect in the two gods, on one or other of whom the religious fervour of the large majority of Hindus has ever since concentrated itself, viz. Vishnu and Siva. Both these divine figures have grown out of Vedic conceptions—the genial Vishnu mainly out of a not very prominent solar deity of the same name; whilst the stern Siva, *i.e.* the kind or gracious one—doubtless a euphemistic name—has his prototype in the old fierce

SpinSmart Software http://www.spinsmart.com

during ten days at the time of the autumnal equinox, in commemoration of her victory over the buffalo-headed demon Mahishasura; when the image of the ten-armed goddess, holding a weapon in each hand, is worshipped for nine days, and cast into the water on the tenth day, called the Dasahara, whence the festival itself is commonly called Dasara in western India. *Kali*, on the other hand, the most terrible of the goddess's forms, has a special service performed to her, at the *Kali-puja*, during the darkest night of the succeeding month; when she is represented as a naked black woman, four-armed, wearing a garland of heads of giants slain by her, and a string of skulls round her neck, dancing on the breast of her husband (Mahakala), with gaping mouth and protruding tongue; and when she has to be propitiated by the slaughter of goats, sheep and buffaloes. On other occasions also Vamacharis commonly offer animal sacrifices, usually one or more kids; the head of the victim, which has to be severed by a single stroke, being always placed in front of the image of the goddess as a blood-offering (*buli*), with an earthen lamp fed with ghee burning above it, whilst the flesh is cooked and served to the guests attending the ceremony, except that of buffaloes, which is given to the low-caste musicians who perform during the service. Even some adherents of this class have, however, discontinued animal sacrifices, and use certain kinds of fruit, such as coco-nuts or pumpkins, instead. The use of wine, which at one time was very common on these occasions, seems also to have become much more restricted; and only members of the extreme section would still seem to adhere to the practice of the so-called five *m's* prescribed by some of the Tantras, viz. *mamsa* (flesh), *matsya* (fish), *madya* (wine), *maithuna* (sexual union), and *mudra* (mystical finger signs)—probably the most degrading cult ever practised under the pretext of religious worship.

In connexion with the principal object of this cult, Tantric theory has devised an elaborate system of female figures representing either special forms and personifications or attendants of the "Great Goddess." They are generally arranged in groups, the most important of which are the *Mahavidyas* (great sciences), the 8 (or 9) *Mataras* (mothers) or *Mahamataras* (great mothers), consisting of the wives of the principal gods; the 8 *Nayikas* or mistresses; and different classes of sorceresses and ogresses, called *Yoginis*, *Dakinis* and *Sakinis*. A special feature of the Sakti cult is the use of obscure Vedic *mantras*, often changed so as to be quite meaningless and on that very account deemed the more efficacious for the acquisition of superhuman powers; as well as of mystic letters and syllables called *bija* (germ), of magic circles (*chakra*) and diagrams (*yantra*), and of amulets of various materials inscribed with formulae of fancied mysterious import.

This survey of the Indian sects will have shown how little the character of their divine objects of worship is calculated to exert that elevating and spiritualizing influence, so characteristic of true religious devotion. In all but a few of the minor groups religious fervour is only too apt to degenerate into that very state of sexual excitation which devotional exercises should surely tend to repress. If the worship of Siva, despite the purport of his chief symbol, seems on the whole less liable to produce these undesirable effects than that of the rival deity, it is doubtless due partly to the real nature of that emblem being little realized by the common people, and partly to the somewhat repellent character of the "great god," more favourable to evoking feelings of awe and terror than a spirit of fervid devotion. All the more are, however, the gross stimulants, connected with the adoration of his consort, calculated to work up the carnal instincts of the devotees to an extreme degree of sensual frenzy. In the Vaishnava camp, on the other hand, the cult of Krishna, and more especially that of the youthful Krishna, can scarcely fail to exert an influence which, if of a subtler and more insinuating, is not on that account of a less demoralizing kind. Indeed, it would be hard to find anything less consonant with godliness and divine perfection than the pranks of this juvenile god; and if poets and thinkers try to explain them away by dint of allegorical interpretation, the plain man will not for all their refinements take these amusing adventures any the less *au pied de la lettre*. No fault, in this respect, can assuredly be found with the legendary Rama, a very paragon of knightly honour and virtue, even as his consort Sita is the very model of a noble and faithful wife; and yet this cult has perhaps retained even more of the character of mere hero-worship than that of Krishna. Since by the universally accepted doctrine of *karman* (deed) or *karmavipaka* ("the maturing of deeds") man himself—either in his present, or some future, existence—enjoys the fruit of, or has to atone for, his former good and bad actions, there could hardly be room in Hindu pantheism for a belief in the remission of sin by divine grace or vicarious substitution. And accordingly the "descents" or incarnations of the deity have for their object, not so much the spiritual regeneration of man as the deliverance of the world from some material calamity threatening to overwhelm it. The generally recognized principal Avatars do not, however, by any means constitute the only occasions of a direct intercession of the deity in worldly affairs, but—in the same way as to this day the eclipses of the sun and moon are ascribed by the ordinary Hindu to these luminaries being temporarily swallowed by the dragon *Rahu* (or *Graha*, "the seizer")—so any uncommon occurrence would be apt to be set down as a special manifestation of divine power; and any man credited with exceptional merit or achievement, or even remarkable for some strange incident connected with his life or death, might ultimately come to be looked upon as a veritable incarnation of the deity, capable of influencing the destinies of man, and might become an object of local adoration or superstitious awe and propitiatory rites to multitudes of people. That the transmigration theory, which makes the spirit of the departed hover about for a time in quest of a new corporeal abode, would naturally lend itself to superstitious notions of this kind can scarcely be doubted. Of peculiar importance in this respect is the worship of the *Pitris* ("fathers") or deceased ancestors, as entering largely into the everyday life and family relations of the Hindus. At stated intervals to offer reverential homage and oblations of food to the forefathers up to the third degree is one of the most sacred duties the devout Hindu has to discharge. The periodical performance of the commemorative rite of obsequies called *Sraddha*—*i.e.* an oblation "made in faith" (*sraddha*, Lat. *credo*)—is the duty and privilege of the eldest son of the deceased, or, failing him, of the nearest relative who thereby establishes his right as next of kin in respect of inheritance; and those other relatives who have the right to take part in the ceremony are called *sapinda*, *i.e.* sharing in the *pindas* (or balls of cooked rice, constituting along with libations of water the usual offering to the Manes)—such relationship being held a bar to intermarriage. The first *Sraddha* takes place as soon as possible after the *antyeshti* ("final offering") or funeral ceremony proper, usually spread over ten days; being afterwards repeated once a month for a year, and subsequently at every anniversary and otherwise voluntarily on special occasions. Moreover, a simple libation of water should be offered to the Fathers twice daily at the morning and evening devotion called *sandhya* ("twilight"). It is doubtless a sense of filial obligation coupled with sentiments of piety and reverence that gave rise to this practice of offering gifts of food and drink to the deceased ancestors. Hence also frequent allusion is made by poets to the anxious care caused to the Fathers by the possibility of the living head of the family being afflicted with failure of offspring; this dire prospect compelling them to use but sparingly their little store of provisions, in case the supply should shortly cease altogether. At the same time one also meets with frank avowals of a superstitious fear lest any irregularity in the performance of the obsequial rites should cause the Fathers to haunt their old home and trouble the peace of their undutiful descendant, or even prematurely draw him after them to the Pitri-loka or world of the Fathers, supposed to be located in the southern region. Terminating as it usually does with the feeding and feeing of a greater or less number of Brahmans and the feasting of members of the performers' own caste, the Sraddha, especially its first performance, is often a matter of very considerable expense; and more than ordinary benefit to the deceased is supposed to accrue from it when it takes place at a spot of recognized sanctity, such as one of the great

General conclusions.

SpinSmart Software http://www.spinsmart.com

places of pilgrimage like Prayaga (Allahabad, where the three sacred rivers, Ganga, Yamuna and Sarasvati, meet), Mathura, and especially Gaya and Kasi (Benares). But indeed the *tirtha-yatra*, or pilgrimage to holy bathing-places, is in itself considered an act of piety conferring religious merit in proportion to the time and trouble expended upon it. The number of such places is legion and is constantly increasing. The banks of the great rivers such as the Ganga (Ganges), the Yamuna (Jumna), the Narbada, the Krishna (Kistna), are studded with them, and the water of these rivers is supposed to be imbued with the essence of sanctity capable of cleansing the pious bather of all sin and moral taint. To follow the entire course of one of the sacred rivers from the mouth to the source on one side and back again on the other in the sun-wise (pradakshina) direction—that is, always keeping the stream on one's right-hand side—is held to be a highly meritorious undertaking which it requires years to carry through. No wonder that water from these rivers, especially the Ganges, is sent and taken in bottles to all parts of India to be used on occasion as healing medicine or for sacramental purposes. In Vedic times, at the *Rajasuya*, or inauguration of a king, some water from the holy river Sarasvati was mixed with the sprinkling water used for consecrating the king. Hence also sick persons are frequently conveyed long distances to a sacred river to heal them of their maladies; and for a dying man to breathe his last at the side of the Ganges is devoutly believed to be the surest way of securing for him salvation and eternal bliss.

Such probably was the belief of the ordinary Hindu two thousand years ago, and such it remains to this day. In the light of facts such as these, who could venture to say what the future of Hinduism is likely to be? Is the regeneration of India to be brought about by the modern theistic movements, such as the Brahma-samaj and Arya-samaj, as so close and sympathetic an observer of Hindu life and thought as Sir A. Lyall seems to think? "The Hindu mind," he remarks, "is essentially speculative and transcendental; it will never consent to be shut up in the prison of sensual experience, for it has grasped and holds firmly the central idea that all things are manifestations of some power outside phenomena. And the tendency of contemporary religious discussion in India, so far as it can be followed from a distance, is towards an ethical reform on the old foundations, towards searching for some method of reconciling their Vedic theology with the practices of religion taken as a rule of conduct and a system of moral government. One can already discern a movement in various quarters towards a recognition of impersonal theism, and towards fixing the teaching of the philosophical schools upon some definitely authorized system of faith and morals, which may satisfy a rising ethical standard, and may thus permanently embody that tendency to substitute spiritual devotion for external forms and caste rules which is the characteristic of the sects that have from time to time dissented from orthodox Brahminism."

HINDU KUSH, a range of mountains in Central Asia. Throughout 500 m. of its length, from its roots in the Pamir regions till it fades into the Koh-i-Baba to the west of Kabul, this great range forms the water-divide between the Kabul and the Oxus basins, and, for the first 200 m. reckoning westwards, the southern boundary of Afghanistan. It may be said to spring from the head of the Taghdumbash Pamir, where it unites with the great meridional system of Sarikol stretching northwards, and the yet more impressive mountain barrier of Muztagh, the northern base of which separates China from the semi-independent territory of Kanjut. The Wakhjir pass, crossing the head of the Taghdumbash Pamir into the sources of the river Hunza, almost marks the trijunction of the three great chains of mountains. As the Hindu Kush strikes westwards, after first rounding the head of an Oxus tributary (the Ab-i-Panja, which Curzon considers to be the true source of the Oxus), it closely overlooks the trough of that glacier-fed stream under its northern spurs, its crest at the nearest point being separated from the river by a distance which cannot much exceed 10 m. As the river is here the northern boundary of Afghanistan, and the crest of the Hindu Kush the southern boundary, this distance represents the width of the Afghan kingdom at that point.

Physiography.—For the first 100 m. of its length the Hindu Kush is a comparatively flat-backed range of considerable width, permitting the formation of small lakes on the crest, and possessing no considerable peaks. It is crossed by many passes, varying in height from 12,500 ft. to 17,500 ft., the lowest and the easiest being the well-known group about Baroghil, which has from time immemorial offered a line of approach from High Asia to Chitral and Jalalabad. As the Hindu Kush gradually recedes from the Ab-i-Panja and turns south-westwards it gains in altitude, and we find prominent peaks on the crest which measure more than 24,000 ft. above sea-level. Even here, however, the main central water-divide, or axis of the chain, is apparently not the line of highest peaks, which must be looked for to the south, where the great square-headed giant called Tirach Mir dominates Chitral from a southern spur. For some 40 or 50 m. of this south-westerly bend, bearing away from the Oxus, where the Hindu Kush overlooks the mountain wilderness of Badakshan to the west, the crest is intersected by many passes, of which the most important is the Dorah group (including the Minjan and the Mandal), which rise to about 15,000 ft., and which are, under favourable conditions, practicable links between the Oxus and Chitral basins.

Kafiristan section.

From the Dorah to the Khawak pass (or group of passes, for it is seldom that one line of approach only is to be found across the Hindu Kush), which is between 11,000 and 12,000 ft. in altitude, the water-divide overlooks Kafiristan and Badakshan. Here its exact position is matter of conjecture. It lies amidst a wild, inaccessible region of snow-bound crests, and is certainly nowhere less than 15,000 ft. above sea-level. There is a tradition that Timur attempted the passage of the Hindu Kush by one of the unmapped passes hereabouts, and that, having failed, he left a record of his failure engraved on a rock in the pass.

Passes.

The Khawak, at the head of the Panjshir tributary of the Kabul river, leading straight from Badakshan to Charikar and the city of Kabul, is now an excellent kafila route, the road having been engineered under the amir Abdur Rahman's direction, and it is said to be available for traffic throughout the year. From the Khawak to the head of the Ghorband (a river of the Hindu Kush which, rising to the north-west of Kabul, flows north-east to meet the Panjshir near Charikar, whence they run united into the plains of Kohistan) the Hindu Kush is intersected by passes at intervals, all of which were surveyed, and several utilized, during the return of the Russo-Afghan boundary commission from the Oxus to Kabul in 1886. Those utilized were the Kaoshan (the "Hindu Kush" pass *par excellence*), 14,340 ft.; the Chahardar (13,900 ft.), which is a link in one of the amir of Afghanistan's high roads to Turkestan; and the Shibar (9800 ft.), which is merely a diversion into the upper Ghorband of that group of passes between Bamian and the Kabul plains which are represented by the Irak, Hajigak, Unai, &c. About this point it is geographically correct to place the southern extremity of the Hindu Kush, for here commences the Koh-i-Baba system into which the Hindu Kush is merged.

General conformation.

The general conformation of the Hindu Kush system south of the Khawak, no less than such fragmentary evidence of its rock composition as at present exists to the north, points to its construction under the same conditions of upheaval and subsequent denudation as are common to the western Himalaya and the whole of the trans-Indus borderland. Its upheaval above the great sea which submerged all the north-west of the Indian peninsula long after the Himalaya had massed itself as a formidable mountain chain, belongs to a comparatively recent geologic period, and the same thrust upwards of vast masses of cretaceous limestone has disturbed the overlying recent beds of shale and clays with very similar results to those which have left so marked an impress on the Baluch frontier. Successive flexures or ridges are ranged in more or less parallel lines, and from between the bands of hard, unyielding rock of older formation the soft beds of recent shale have been washed out, to be carried through the enclosing ridges by rifts which break across their axes. The Hindu Kush is, in fact, but the face of a great upheaved mass of plateau-land lying beyond it northwards, just as the Himalaya forms the southern face of the great central table-land of Tibet, and its general physiography, exhibiting long, narrow, lateral valleys and transverse lines of "antecedent" drainage, is

SpinSmart Software http://www.spinsmart.com

similar. There are few passes across the southern section of the Hindu Kush (and this section is, from the politico-geographical point of view, more important to India than the whole Himalayan system) which have not to surmount a succession of crests or ridges as they cross from Afghan Turkestan to Afghanistan. The exceptions are, of course, notable, and have played an important part in the military history of Asia from time immemorial. From a little ice-bound lake called Gaz Kul, or Karambar, which lies on the crest of the Hindu Kush near its northern origin at the head of the Taghdumbash Pamir, two very important river systems (those of Chitral and Hunza) are believed to originate. The lake really lies on the watershed between the two, and is probably a glacial relic. Its contribution to either infant stream appears to depend on conditions of overflow determined by the blocking of ice masses towards one end. It marks the commencement of the water-divide which primarily separates the Gilgit basin from that of the Yashkun, or Chitral, river, and subsequently divides the drainage of Swat and Bajour from that of the Chitral (or Kunar). The Yashkun-Chitral-Kunar river (it is called by all three names) is the longest affluent of the Kabul, and it is in many respects a more important river than the Kabul. Throughout its length it is closely flanked on its left bank by this main water-divide, which is called Moshabar or Shandur in its northern sections, and owns a great variety of names where it divides Bajour from the Kunar valley. It is this range, crowned by peaks of 22,000 ft. altitude and maintaining an average elevation of some 10,000 ft. throughout its length of 250 m., that is the real barrier of the north—not the Hindu Kush itself. Across it, at its head, are the glacial passes which lead to the foot of the Baroghil. Of these Darkot, with a glacial staircase on each side, is typical. (See GILGIT.) Those passes (the Kilik and Mintaka) from the Pamir regions, which lead into the rocky gorges and defiles of the upper affluents of the Hunza to the east of the Darkot, belong rather to the Muztagh system than to the Hindu Kush. Other passes across this important water-divide are the Shandur (12,250 ft.), between Gilgit and Mastuj; the Lowarai (10,450 ft.), between the Panjkora and Chitral valleys; and farther south certain lower crossings which once formed part of the great highway between Kabul and India.

Deep down in the trough of the Chitral river, about midway between its source and its junction with the Kabul at Jalalabad, is the village and fort of Chitral (*q.v.*). Facing Chitral, on the right bank of the river, and extending for some 70 m. from the Hindu Kush, is the lofty snow-clad spur of the Hindu Kush known as Shawal, across which one or two difficult passes lead into the Bashgol valley of Kafiristan. This spur carries the boundary of Afghanistan southwards to Arnawai (some 50 m. below Chitral), where it crosses the river to the long Shandur watershed. South of Arnawai the Kunar valley becomes a part of Afghanistan (see KUNAR). The value of Chitral as an outpost of British India may be best gauged by its geographical position. It is about 100 m. (direct map measurement) from the outpost of Russia at Langar Kisht on the river Panja, with the Dorah pass across the Hindu Kush intervening. The Dorah may be said to be about half-way between the two outposts, and the mountain tracks leading to it on either side are rough and difficult. The Dorah, however, is not the only pass which leads into the Chitral valley from the Oxus. The Mandal pass, a few miles south of the Dorah, is the connecting link between the Oxus and the Bashgol valley of Kafiristan; and the Bashgol valley leads directly to the Chitral valley at Arnawai, about 50 m. below Chitral. Nor must we overlook the connexion between north and south of the Hindu Kush which is afforded by the long narrow valley of the Chitral (or Yashkun) itself, leading up to the Baroghil pass. This route was once made use of by the Chinese for purposes of pilgrimage, if not for invasion. Access to Chitral from the north is therefore but a matter of practicable tracks, or passes, in two or three directions, and the measure of practicability under any given conditions can best be reckoned from Chitral itself. By most authorities the possibility of an advance in force from the north, even under the most favourable conditions, is considered to be exceedingly small; but the tracks and passes of the Hindu Kush are only impracticable so long as they are left as nature has made them.

Chitral.

Historical Notices.—Hindu Kush is the Caucasus of Alexander's historians. It is also included in the Paropamisus, though the latter term embraces more, Caucasus being apparently used only when the alpine barrier is in question. Whether the name was given in mere vanity to the barrier which Alexander passed (as Arrian and others repeatedly allege), or was founded also on some verbal confusion, cannot be stated. It was no doubt regarded (and perhaps not altogether untruly) as a part of a great alpine zone believed to traverse Asia from west to east, whether called Taurus, Caucasus or Imaus. Arrian himself applies Caucasus distinctly to the Himalaya also. The application of the name Tanais to the Syr seems to indicate a real confusion with Colchian Caucasus. Alexander, after building an Alexandria at its foot (probably at Hupian near Charikar), crossed into Bactria, first reaching Drapsaca, or Adrapsa. This has been interpreted as Anderab, in which case he probably crossed the Khawak Pass, but the identity is uncertain. The ancient Zend name is, according to Rawlinson, Paresina, the essential part of Paropamisus; this accounts for the great Asiastic *Parnassus* of Aristotle, and the *Pho-lo-sin-a* of Hsüan Tsang.

The name Hindu Kush is used by Ibn Batuta, who crossed (*c.* 1332) from Anderab, and he gives the explanation of the name which, however doubtful, is still popular, as (Pers.) Hindu-Killer, "because of the number of Indian slaves who perished in passing" its snows. Baber always calls the range Hindu Kush, and the way in which he speaks of it shows clearly that it was a range that was meant, not a solitary pass or peak (according to modern local use, as alleged by Elphinstone and Burnes). Probably, however, the title was confined to the section from Khawak to Koh-i-Baba. The name has by some later Oriental writers been modified into Hindu *Koh* (mountain), but this is factitious, and throws no more light on the origin of the title. The name seems to have become known to European geographers by the Oriental translations of the two Petis de la Croix, and was taken up by Delisle and D'Anville. Rennell and Elphinstone familiarized it. Burnes first crossed the range (1832). A British force was stationed at Bamian beyond it in 1840, with an outpost at Saighan.

The Hindu Kush, formidable as it seems, and often as it has been the limit between petty states, has hardly ever been the boundary of a considerable power. Greeks, White Huns, Samanidae of Bokhara, Ghaznevides, Mongols, Timur and Timuridae, down to Saddozais and Barakzais, have ruled both sides of this great alpine chain.

AUTHORITIES.—Information about the Hindu Kush and Chitral is now comparatively exact. The Russo-Afghan Boundary Commission of 1884 and the Chitral expedition of 1895 opened up a vast area for geographical investigation, and the information collected is to be found in the reports and gazetteers of the Indian government. The following are the chief recent authorities:—Report of the Russo-Afghan Boundary Commission (1886); Report of Lockhart's Mission (1886); Report of Asmar Boundary Commission (1895); Report of Pamir Boundary Commission (1896); J. Biddulph, *Tribes of the Hindu Kush* (Calcutta, 1880); W. M'Nair, "Visit to Kafiristan," vol. vi. *R.G.S. Proc.*, 1884; F. Younghusband, "Journeys on the Pamirs, &c.," vol. xiv. *R.G.S. Proc.*, 1892; Colonel Durand, *Making a Frontier* (London, 1899); Sir G. Robertson, *Chitral* (London, 1899). (T. H. H.*)

HINDUR, or NALAGARH, one of the Simla hill states, under the government of the Punjab, India. Pop. (1901) 52,551; area, 256 sq. m.; estimated revenue, £8600. The country was overrun by the Gurkhas for some years before 1815, when they were driven out by the British, and the raja was confirmed in possession of the territory. The principal products are grain and opium.

HINGANGHAT, a town of British India in Wardha district, Central Provinces, 21 m. S.W. of Wardha town. Pop (1901) 12,662. It is a main seat of the cotton trade, the cotton here produced in the rich Wardha valley having given its name to one of the best indigenous staples of India. The principal native traders are Marwaris, many of whom have large transactions and export on their own account; but the greater number act as middle-men. There are two cotton-mills and several ginning and pressing factories.

HINGE (in Mid. Eng. *henge* or *heeng*, from *hengen*, to hang), a movable joint, particularly that by which a door or window "hangs" from its side-post, or by which a lid or cover is attached to that which it closes; also any device which allows two parts to be joined together and move upon each other (see JOINERY). Figuratively the word is used of that on which something depends, a cardinal or turning point, a crisis.

HINGHAM, a township of Plymouth county, Massachusetts, U.S.A., on Massachusetts Bay. Pop (1890) 4564; (1900) 5059 (969 being foreign-born); (1905, state census) 4819; (1910) 4965. Area, about 30 sq. m. The township is traversed by the New York, New Haven & Hartford railway, and contains the villages of Hingham, West Hingham, Hingham Center, and South Hingham. Derby Academy, a co-educational school

SpinSmart Software http://www.spinsmart.com

founded and endowed with about £12,000 in 1784 by Sarah Derby (1714–1790), was opened in 1791. Hingham has a public library (1868), with 12,000 volumes in 1908. The Old Meeting House, erected in 1681, is one of the oldest church buildings in the country used continuously. Manufactures were relatively much more important in the 17th and 18th centuries than since. There were settlers here as early as 1633, some of them—notably Edmund Hobart, ancestor of Bishop John Henry Hobart,—being natives of Hingham, Norfolk, England, whence the name; and in 1635 common land called Barecove became the township of Hingham.

See *History of the Town of Hingham* (4 vols., Hingham, 1893).

HINRICHS, HERMANN FRIEDRICH WILHELM (1794–1861), German philosopher, studied theology at Strassburg, and philosophy at Heidelberg under Hegel (*q.v.*), who wrote a preface to his *Religion im innern Verhältniss zur Wissenschaft* (Heidelberg, 1722). He became a *Privatdozent* in 1819, and held professorships at Breslau (1822) and Halle (1824).

WORKS.—(1) Philosophical: *Grundlinien der Philosophie der Logik* (Halle, 1826); *Genesis des Wissens* (Heidelberg, 1835). (2) On aesthetics: *Vorlesungen über Goethes Faust* (Halle, 1825); *Schillers Dichtungen nach ihrem historischen Zusammenhang* (Leipzig, 1837–1839). By these works he became a recognized exponent of orthodox Hegelianism. (3) Historical: *Geschichte der Rechts- und Staatsprinzipien seit der Reformation bis auf die Gegenwart* (Leipzig, 1848–1852); *Die Könige* (2nd ed., Leipzig, 1853).

HINSCHIUS, PAUL (1835–1898), German jurist, was the son of Franz Sales August Hinschius (1807–1877), and was born in Berlin on the 25th of December 1835. His father was not only a scientific jurist, but also a lawyer in large practice in Berlin. After working under his father, Hinschius in 1852 began to study jurisprudence at Heidelberg and Berlin, the teacher who had most influence upon him being Aemilius Ludwig Richter (1808–1864), to whom he afterwards ascribed the great revival of the study of ecclesiastical law in Germany. In 1855 Hinschius took the degree of *doctor utriusque juris*, and in 1859 was admitted to the juridical faculty of Berlin. In 1863 he went as professor extraordinarius to Halle, returning in the same capacity to Berlin in 1865; and in 1868 became professor ordinarius at the university of Kiel, which he represented in the Prussian Upper House (1870–1871). He also assisted his father in editing the *Preussische Anwaltszeitung* from 1862 to 1866 and the *Zeitschrift für Gesetzgebung und Rechtspflege in Preussen* from 1867 to 1871. In 1872 he was appointed professor ordinarius of ecclesiastical law at Berlin. In the same year he took part in the conferences of the ministry of ecclesiastical affairs, which issued in the famous "Falk laws." In connexion with the developments of the *Kulturkampf* which resulted from the "Falk laws," he wrote several treatises: *e.g.* on "The Attitude of the German State Governments towards the Decrees of the Vatican Council" (1871), on "The Prussian Church Laws of 1873" (1873), "The Prussian Church Laws of the years 1874 and 1875" (1875), and "The Prussian Church Law of 14th July 1880" (1881). He sat in the Reichstag as a National Liberal from 1872 to 1878, and again in 1881 and 1882, and from 1889 onwards he represented the university of Berlin in the Prussian Upper House. He died on the 13th of December 1898.

The two great works by which Hinschius established his fame are the *Decretales Pseudo-Isidorianae et capitula Angilramni* (2 parts, Leipzig, 1863) and *Das Kirchenrecht der Katholiken und Protestanten in Deutschland*, vols. i.-vi. (Berlin, 1869–1877). The first of these, for which during 1860 and 1861 he had gathered materials in Italy, Spain, France, England, Scotland, Ireland, Holland and Belgium, was the first critical edition of the False Decretals. His most monumental work, however, is the *Kirchenrecht*, which remains incomplete. The six volumes actually published (*System des katholischen Kirchenrechts*) cover only book i. of the work as planned; they are devoted to an exhaustive historical and analytical study of the Roman Catholic hierarchy and its government of the church. The work is planned with special reference to Germany; but in fact its scheme embraces the whole of the Roman Catholic organization in its principles and practice. Unfortunately even this part of the work remains incomplete; two chapters of book i. and the whole of book ii., which was to have dealt with "the rights and duties of the members of the hierarchy," remain unwritten; the most notable omission is that of the ecclesiastical law in relation to the regular orders. Incomplete as it is, however, the *Kirchenrecht* remains a work of the highest scientific authority. Epoch-making in its application of the modern historical method to the study of ecclesiastical law in its theory and practice, it has become the model for the younger school of canonists.

See the articles *s.v.* by E. Seckel in Herzog-Hauck, *Realencyklopädie* (3rd ed., 1900), and by Ulrich Steitz in the *Allgemeine deutsche Biographie*, vol. 50 (Leipzig, 1905).

HINTERLAND (German for "the land behind"), the region lying behind a coast or river line, or a country dependent for trade or commerce on any other region. In the purely physical sense "interior" on "back country" is more commonly used, but the word has gained a distinct political significance. It first came into prominence during 1883–1885, when Germany insisted that she had a right to exercise jurisdiction in the territory behind those parts of the African coast that she had occupied. The "doctrine of the hinterland" was that the possessor of the littoral was entitled to as much of the back country as geographically, economically or politically was dependent upon the coast lands, a doctrine which, in the space of ten years, led to the partition of Africa between various European powers.

HINTON, JAMES (1822–1875), English surgeon and author, son of John Howard Hinton (1791–1873), Baptist minister and author of the *History and Topography of the United States* and other works, was born at Reading in 1822. He was educated at his grandfather's school near Oxford, and at the Nonconformist school at Harpenden, and in 1838, on his father's removal to London, was apprenticed to a woollen-draper in Whitechapel. After retaining this situation about a year he became clerk in an insurance office. His evenings were spent in intense study, and this, joined to the ardour, amounting to morbidness, of his interest in moral problems, so affected his health that in his nineteenth year he resolved to seek refuge from his own thoughts by running away to sea. His intention having, however, been discovered, he was sent, on the advice of the physician who was consulted regarding his health, to St Bartholomew's Hospital to study for the medical profession. After receiving his diploma in 1847, he was for some time assistant surgeon at Newport, Essex, but the same year he went out to Sierra Leone to take medical charge of the free labourers on their voyage thence to Jamaica, where he stayed some time. He returned to England in 1850, and entered into partnership with a surgeon in London, where he soon had his interest awakened specially in aural surgery, and gave also much of his attention to physiology. He made his first appearance as an author in 1856 by contributing papers on physiological and ethical subjects to the *Christian Spectator*; and in 1859 he published *Man and his Dwelling-place*. A series of papers entitled "Physiological Riddles," in the *Cornhill Magazine*, afterwards published as *Life in Nature* (1862), as well as another series entitled *Thoughts on Health* (1871), proved his aptitude for popular scientific exposition. After being appointed aural surgeon to Guy's Hospital in 1863, he speedily acquired a reputation as the most skilful aural surgeon of his day, which was fully borne out by his works, *An Atlas of Diseases of the membrana tympani* (1874), and *Questions of Aural Surgery* (1874). But his health broke down, and in 1874 he gave up practice; and he died at the Azores of acute inflammation of the brain on the 16th of December 1875. In addition to the works already mentioned, he was the author of *The Mystery of Pain* (1866) and *The Place of the Physician* (1874). On account of their fresh and vigorous discussion of many of the important moral and social problems of the time, his writings had a wide circulation on both sides of the Atlantic.

His *Life and Letters*, edited by Ellice Hopkins, with an introduction by Sir W. W. Gull, appeared in 1878.

HIOGO [HYOGO], a town of Japan in the province of Settsu, Nippon, on the western shore of the bay of Osaka, adjoining the foreign settlement of Kobe, 21 m. W. of Osaka by rail. The

SpinSmart Software http://www.spinsmart.com

growth of its prosperity has been very remarkable. Its population, including that of Kobe, was 135,639 in 1891, and 285,002 in 1903. From 1884 to the close of the century its trade increased nearly eightfold, and the increase was not confined to a few staples of commerce, but was spread over almost the whole trade, in which silk and cotton fabrics, floor-mats, straw-plaits, matches, and cotton yarns are specially important. Kobe owes much of its prosperity to the fact of serving largely as the shipping port of Osaka, the chief manufacturing town in Japan. The foreign community, exclusive of Chinese, exceeds 1000 persons. Kobe is considered the brightest and healthiest of all the places assigned as foreign settlements in Japan, its pure, dry air and granite subsoil constituting special advantages. It is in railway communication with all parts of the country, and wharves admit of steamers of large size loading and discharging cargo without the aid of lighters. The area originally appropriated for a foreign settlement soon proved too restricted, and foreigners received permission to lease lands and houses direct from Japanese owners beyond the treaty limits, a privilege which, together with that of building villas on the hills behind the town, ultimately involved some diplomatic complications. Kobe has a shipbuilding yard, and docks in its immediate neighbourhood.

Hiogo has several temples of interest, one of which has near it a huge bronze statue of Buddha, while by the Minatogawa, which flows into the sea between Hiogo and Kobe, a temple commemorates the spot where Kusunoki Masashige, the mirror of Japanese loyalty, met his death in battle in 1336. The temple of Ikuta was erected on the site of the ancient fane built by Jingo on her return from Korea in the 3rd century.

Hiogo's original name was Bako. Its position near the entrance of the Inland Sea gave it some maritime importance from a very early period, but it did not become really prominent until the 12th century, when Kiyomori, chief of the Taira clan, transferred the capital from Kioto to Fukuhara, in Hiogo's immediate neighbourhood, and undertook various public works for improving the place. The change of capital was very brief, but Hiogo benefited permanently from the distinction.

HIP. (1) (From O. Eng. *hype*, a word common in various forms to many Teutonic languages; cf. Dutch *heup*, and Ger. *Hüfte*), the projecting part of the body formed by the top of the thigh-bone and the side of the pelvis, in quadrupeds generally known as the haunch (see JOINTS). (2) (O. Eng. *hēope*, from same root as M.H. Ger. *hiefe*, a thorn-bush), the fruit of the dog-rose (*Rosa canina*); "hips" are usually joined with "haws," the fruit of the hawthorn.

HIP-KNOB, in architecture, the finial on the hip of a roof, between the barge-boards of a gable.

HIPPARCHUS (fl. 146–126 B.C.), Greek astronomer, was born at Nicaea in Bithynia early in the 2nd century B.C. He observed in the island of Rhodes probably from 161, certainly from 146 until about 126 B.C., and made the capital discovery of the precession of the equinoxes in 130 (see ASTRONOMY: *History*). The outburst of a new star in 134 B.C. is stated by Pliny (*Hist. nat.* ii. 26) to have prompted the preparation of his catalogue of 1080 stars, substantially embodied in Ptolemy's *Almagest*. Hipparchus founded trigonometry, and compiled the first table of chords. Scientific geography originated with his invention of the method of fixing terrestrial positions by circles of latitude and longitude. There can be little doubt that the fundamental part of his astronomical knowledge was derived from Chaldaea. None of his many works has survived except a Commentary on the *Phaenomena* of Aratus and Eudoxus, published by P. Victorius at Florence in 1567, and included by D. Petavius in his *Uranologium* (Paris, 1630). A new edition was published by Carolus Manitius (Leipzig, 1894).

Marie, *Hist. des sciences*, i. 207; G. Cornewall Lewis, *Astronomy of the Ancients*, p. 207; R. Grant, *Hist. of Phys. Astronomy*, pp. 318, 437; F. Boll, *Sphaera*, p. 61 (Leipzig, 1903); R. Wolf, *Geschichte der Astronomie*, p. 45; J. F. Montucla, *Hist. des mathématiques*, t. i. p. 257; J. A. Schmidt, *Variorum philosophicorum decas*, cap. i. (Jenae, 1691). (A. M. C.)

HIPPASUS OF METAPONTUM, Pythagorean philosopher, was one of the earliest of the disciples of Pythagoras. He is mentioned both by Diogenes Laërtius and by Iamblichus, but nothing is known of his life. Diogenes says that he left no writings, but other authorities make him the author of a μυστικὸς λόγος directed against the Pythagoreans. According to Aristotle (*Metaphysica*, i. 3), he was an adherent of the Heraclitean fire-doctrine, whereas the Pythagoreans maintained the theory that number is the principle of everything. He seems to have regarded the soul as composed of igneous matter, and so approximates the orthodox Pythagorean doctrine of the central fire, or Hestia, to the more detailed theories of Heraclitus. In spite of this divergence, Hippasus is always regarded as a Pythagorean.

See Diogenes viii. 84; Brandis, *History of Greek and Roman Philosophy*; also PYTHAGORAS.

HIPPEASTRUM, in botany, a genus of the natural order Amaryllidaceae, containing about 50 species of bulbous plants, natives of tropical and sub-tropical South America. In cultivation they are generally known as *Amaryllis*. The handsome funnel-shaped flowers are borne in a cluster of two to many, at the end of a short hollow scape. The species and the numerous hybrids which have been obtained artificially, show a great variety in size and colour of the flower, including the richest deep crimson and blood-red, white, or with striped, mottled or blended colours. They are of easy culture, and free-blooming habit. Like other bulbs they are increased by offsets, which should be carefully removed when the plants are at rest, and should be allowed to attain a fair size before removal. These young bulbs should be potted singly in February or March, in mellow loamy soil with a moderate quantity of sand, about two-thirds of the bulb being kept above the level of the soil, which should be made quite solid. They should be removed to a temperature of 60° by night and 70° by day, very carefully watered until the roots have begun to grow freely, after which the soil should be kept moderately moist. As they advance the temperature should be raised to 70° at night, and to 80° or higher with sun heat by day. They do not need shading, but should have plenty of air, and be syringed daily in the afternoon. When growing they require a good supply of water. After the decay of the flowers they should be returned to a brisk moist temperature of from 70° to 80° by day during summer to perfect their leaves, and then be ripened off in autumn. Through the winter they should have less water, but must not be kept entirely dry. The minimum temperature should now be about 55°, to be increased 10° or 15° in spring. As the bulbs get large they will occasionally need shifting into larger pots. Propagation is also readily effected by seeds for raising new varieties. Seeds are sown when ripe in well drained pans of sandy loam at a temperature of about 65°. The seedlings when large enough to handle are placed either singly in very small pots or several in a pot or shallow pan, and put in a bottom heat, in a moist atmosphere with a temperature from 60° to 70°. *H. Ackermanni*, with large, handsome, crimson flowers—itself a hybrid—is the parent of many of the large-flowered forms; *H. equestre* (Barbados lily), with yellowish-green flowers tipped with scarlet, has also given rise to several handsome forms; *H. aulicum* (flowers crimson and green), *H. pardinum* (flowers creamy-white spotted with crimson), and *H. vittatum* (flowers white with red stripes, a beautiful species and the parent of many varieties), are stove or warm greenhouse plants. These kinds, however, are now only regarded as botanical curiosities, and are rarely grown in private or commercial establishments. They have been ousted by the more gorgeous looking hybrids, which have been evolved during the past 100 years. *H. Johnsoni* is named after a Lancashire watchmaker who raised it in 1799 by crossing *H. Reginae* with *H. vittatum*. Since that time other species have been used for hybridizing, notably *H. reticulatum*, *H. aulicum*, *H. solandriflorum*, and sometimes *H. equestre* and *H. psittacinum*. The finest forms since 1880 have been evolved from *H. Leopoldi* and *H. pardinum*. (J. Ws.)

HIPPED ROOF, the name given in architecture to a roof which slopes down on all four sides instead of terminating on

SpinSmart Software http://www.spinsmart.com

two sides against a vertical gable. Sometimes a compromise is made between the two, half the roof being hipped and half resting on the vertical wall; this gives much more room inside the roof, and externally a most picturesque effect, which is one of the great attractions of domestic architecture in the south of England, and is rarely found in other countries.

HIPPEL, THEODOR GOTTLIEB VON (1741–1796), German satirical and humorous writer, was born on the 31st of January 1741, at Gerdauen in East Prussia, where his father was rector of a school. He enjoyed an excellent education at home, and in his sixteenth year he entered Königsberg university as a student of theology. Interrupting his studies, he went, on the invitation of a friend, to St Petersburg, where he was introduced at the brilliant court of the empress Catherine II. Returning to Königsberg he became a tutor in a private family; but, falling in love with a young lady of high position, his ambition was aroused, and giving up his tutorship he devoted himself with enthusiasm to legal studies. He was successful in his profession, and in 1780 was appointed chief burgomaster in Königsberg, and in 1786 privy councillor of war and president of the town. As he rose in the world, however, his inclination for matrimony vanished, and the lady who had stimulated his ambition was forgotten. He died at Königsberg on the 23rd of April 1796, leaving a considerable fortune. Hippel had extraordinary talents, rich in wit and fancy; but his was a character full of contrasts and contradictions. Cautiousness and ardent passion, dry pedantry and piety, morality and sensuality; simplicity and ostentation composed his nature; and, hence, his literary productions never attained artistic finish. In his *Lebensläufe nach aufsteigender Linie* (1778–1781) he intended to describe the lives of his father and grandfather, but he eventually confined himself to his own. It is an autobiography, in which persons well known to him are introduced, together with a mass of heterogeneous reflections on life and philosophy. *Kreuz- und Querzüge des Ritters A bis Z* (1793–1794) is a satire levelled against the follies of the age—ancestral pride and the thirst for orders, decoration and the like. Among others of his better known works are *Über die Ehe* (1774) and *Über die bürgerliche Verbesserung der Weiber* (1792). Hippel has been called the forerunner of Jean Paul Richter, and has some resemblance to this author, in his constant digressions and in the interweaving of scientific matter in his narrative. Like Richter he was strongly influenced by Laurence Sterne.

In 1827–1838 a collected edition of Hippel's works in 14 vols., was issued at Berlin. *Über die Ehe* has been edited by E. Brenning (Leipzig, 1872), and the *Lebensläufe nach aufsteigender Linie* has in a modernized edition by A. von Öttingen (1878), gone through several editions. See J. Czerny, *Sterne, Hippel und Jean Paul* (Berlin, 1904).

HIPPIAS OF ELIS, Greek sophist, was born about the middle of the 5th century B.C. and was thus a younger contemporary of Protagoras and Socrates. He was a man of great versatility and won the respect of his fellow-citizens to such an extent that he was sent to various towns on important embassies. At Athens he made the acquaintance of Socrates and other leading thinkers. With an assurance characteristic of the later sophists, he claimed to be regarded as an authority on all subjects, and lectured, at all events with financial success, on poetry, grammar, history, politics, archaeology, mathematics and astronomy. He boasted that he was more popular than Protagoras, and was prepared at any moment to deliver an extempore address on any subject to the assembly at Olympia. Of his ability there is no question, but it is equally certain that he was superficial. His aim was not to give knowledge, but to provide his pupils with the weapons of argument, to make them fertile in discussion on all subjects alike. It is said that he boasted of wearing nothing which he had not made with his own hands. Plato's two dialogues, the *Hippias major* and *minor*, contain an exposé of his methods, exaggerated no doubt for purposes of argument but written with full knowledge of the man and the class which he represented. Ast denies their authenticity, but they must have been written by a contemporary writer (as they are mentioned in the literature of the 4th century), and undoubtedly represent the attitude of serious thinkers to the growing influence of the professional Sophists. There is, however, no question that Hippias did a real service to Greek literature by insisting on the meaning of words, the value of rhythm and literary style. He is credited with an excellent work on Homer, collections of Greek and foreign literature, and archaeological treatises, but nothing remains except the barest notes. He forms the connecting link between the first great sophists, Protagoras and Prodicus, and the innumerable eristics who brought their name into disrepute.

For the general atmosphere in which Hippias moved see SOPHISTS; also histories of Philosophy (*e.g.* Windelband, Eng. trans. by Tufts, pt. 1, c. 2, §§ 7 and 8).

HIPPO, a Greek philosopher and natural scientist, classed with the Ionian or physical school. He was probably a contemporary of Archelaus and lived chiefly in Athens. Aristotle declared that he was unworthy of the name of philosopher, and, while comparing him with Thales in his main doctrine, adds that his intellect was too shallow for serious consideration. He held that the principle of all things is moisture (*τὸ ὑγρόν*); that fire develops from water, and from fire the material universe. Further he denied all existence save that of material things as known through the senses, and was, therefore, classed among the "Atheists." The gods are merely great men canonized by popular tradition. It is said that he composed his own epitaph, wherein he claims for himself a place in this company.

HIPPOCRAS, an old medicinal drink or cordial, made of wine mixed with spices—such as cinnamon, ginger and sugar—and strained through woollen cloths. The early spelling usual in English was *ipocras*, or *ypocras*. The word is an adaptation of the Med. Lat. *Vinum Hippocraticum*, or wine of Hippocrates, so called, not because it was supposed to be a receipt of the physician, but from an apothecary's name for a strainer or sieve, "Hippocrates' sleeve" (see W. W. Skeat, *Chaucer*, note to the *Merchant's Tale*).

HIPPOCRATES, Greek philosopher and writer, termed the "Father of Medicine," was born, according to Soranus, in Cos, in the first year of the 80th Olympiad, *i.e.* in 460 B.C. He was a member of the family of the Asclepiadae, and was believed to be either the nineteenth or seventeenth in direct descent from Aesculapius. It is also claimed for him that he was descended from Hercules through his mother, Phaenarete. He studied medicine under Heraclides, his father, and Herodicus of Selymbria; in philosophy Gorgias of Leontini and Democritus of Abdera were his masters. His earlier studies were prosecuted in the famous Asclepion of Cos, and probably also at Cnidos. He travelled extensively, and taught and practised his profession at Athens, probably also in Thrace, Thessaly, Delos and his native island. He died at Larissa in Thessaly, his age being variously stated as 85, 90, 104 and 109. The incidents of his life are shrouded by uncertain traditions, which naturally sprang up in the absence of any authentic record; the earliest biography was by one of the Sorani, probably Soranus the younger of Ephesus, in the 2nd century; Suidas, the lexicographer, wrote of him in the 11th, and Tzetzes in the 12th century. In all these biographies there is internal evidence of confusion; many of the incidents related are elsewhere told of other persons, and certain of them are quite irreconcilable with his character, so far as it can be judged of from his writings and from the opinions expressed of him by his contemporaries; we may safely reject, for instance, the legends that he set fire to the library of the Temple of Health at Cnidos, in order to destroy the evidence of plagiarism, and that he refused to visit Persia at the request of Artaxerxes Longimanus, during a pestilential epidemic, on the ground that he would in so doing be assisting an enemy. He is referred to by Plato (*Protag.* p. 283; *Phaedr.* p. 211) as an eminent medical authority, and his opinion is also quoted by Aristotle. The veneration in which he was held by the Athenians serves to dissipate the calumnies which have been thrown on his character by Andreas, and the whole tone of his writings bespeaks a man of the highest integrity and purest morality.

Born of a family of priest-physicians, and inheriting all its traditions and prejudices, Hippocrates was the first to cast

SpinSmart Software http://www.spinsmart.com

superstition aside, and to base the practice of medicine on the principles of inductive philosophy. It is impossible to trace directly the influence exercised upon him by the great men of his time, but one cannot fail to connect his emancipation of medicine from superstition with the widespread power exercised over Greek life and thought by the living work of Socrates, Plato, Aeschylus, Sophocles, Euripides, Herodotus and Thucydides. It was a period of great intellectual development, and it only needed a powerful mind such as his to bring to bear upon medicine the same influences which were at work in other sciences. It must be remembered that his training was not altogether bad, although superstition entered so largely into it. He had a great master in Democritus, the originator of the doctrine of atoms, and there is every reason to believe that the various "asclepia" were very carefully conducted hospitals for the sick, possessing a curious system of case-books, in the form of votive tablets, left by the patients, on which were recorded the symptoms, treatment and result of each case. He had these records at his command; and he had the opportunity of observing the system of training and the treatment of injuries in the gymnasia. One of his great merits is that he was the first to dissociate medicine from priest-craft, and to direct exclusive attention to the natural history of disease. How strongly his mind revolted against the use of charms, amulets, incantations and such devices appears from his writings; and he has expressly recorded, as underlying all his practice, the conviction that, however diseases may be regarded from the religious point of view, they must all be scientifically treated as subject to natural laws (*De aëre*, 29). Nor was he anxious to maintain the connexion between philosophy and medicine which had for long existed in a confused and confusing fashion.[1] His knowledge of anatomy, physiology and pathology was necessarily defective, the respect in which the dead body was held by the Greeks precluding him from practising dissection; thus we find him writing of the tissues without distinguishing between the various textures of the body, confusing arteries, veins and nerves, and speaking vaguely of the muscles as "flesh." But when we come to study his observations on the natural history of disease as presented in the living subject, we recognize at once the presence of a great clinical physician. Hippocrates based his principles and practice on the theory of the existence of a spiritual restoring essence or principle, φύσις, the *vis medicatrix naturae*, in the management of which the art of the physician consisted. This art could, he held, be only obtained by the application of experience, not only to disease at large, but to disease in the individual. He strongly deprecated blind empiricism; the aphorism "ἡ πεῖρα σφαλερή, ἡ κρίσις χαλεπή" (whether it be his or not), tersely illustrates his position. Holding firmly to the principle, νούσων φύσιες ἰητροί, he did not allow himself to remain inactive in the presence of disease; he was not a merely "expectant" physician; as Sydenham puts it, his practice was "the support of enfeebled and the coercion of outrageous nature." He largely employed powerful medicines and blood-letting both ordinary and by cupping. He advises, however, great caution in their application. He placed great dependence on diet and regimen, and here, quaint as many of his directions may now sound, not only in themselves, but in the reasons given, there is much which is still adhered to at the present day. His treatise Περὶ ἀέρων, ὑδάτων, καὶ τόπων (*Airs, Waters, and Places*) contains the first enunciation of the principles of public health. Although the treatises Περὶ κρισίμων cannot be accepted as authentic, we find in the Προγνωστικόν evidence of the acuteness of observation in the manner in which the occurrence of critical days in disease is enunciated. His method of reporting cases is most interesting and instructive; in them we can read how thoroughly he had separated himself from the priest-physician. Laennec, to whom we are indebted for the practice of auscultation, freely admits that the idea was suggested to him by study of Hippocrates, who, treating of the presence of morbid fluids in the thorax, gives very particular directions, by means of succussion, for arriving at an opinion regarding their nature. Laennec says, "Hippocrate avait tenté l'auscultation immédiate." Although the treatise Περὶ νούσων is doubtfully from the pen of Hippocrates, it contains strong evidence of having been the work of his grandson, representing the views of the Father of Medicine. Although not accurate in the conclusions reached at the time, the value of the method of diagnosis is shown by the retention in modern medicine of the name and the practice of "Hippocratic succussion." The power of graphic description of phenomena in the Hippocratic writings is illustrated by the retention of the term "facies Hippocratica," applied to the appearance of a moribund person, pictured in the *Prognostics*. In surgery his writings are important and interesting, but they do not bear the same character of caution as the treatises on medicine; for instance, in the essay *On Injuries of the Head*, he advocates the operation "of trephining" more strongly and in wider classes of cases than would be warranted by the experience of later times.

The *Hippocratic Collection* consists of eighty-seven treatises, of which a part only can be accepted as genuine. The collection has been submitted to the closest criticism in ancient and modern times by a large number of commentators (for full list of the early commentators, see Adams's *Genuine Works of Hippocrates*, Sydenham Society, i. 27, 28). The treatises have been classified according to (1) the direct evidence of ancient writers, (2) peculiarities of style and method, and (3) the presence of anachronisms and of opinions opposed to the general Hippocratic teaching—greatest weight being attached to the opinions of Erotian and Galen. The general estimate of commentators is thus stated by Adams: "The peculiar style and method of Hippocrates are held to be conciseness of expression, great condensation of matter, and disposition to regard all professional subjects in a practical point of view, to eschew subtle hypotheses and modes of treatment based on vague abstractions." The treatises have been grouped in the four following sections: (1) genuine; (2) those consisting of notes taken by students and collected after the death of Hippocrates; (3) essays by disciples; (4) those utterly spurious. Littré accepts the following thirteen as absolutely genuine: (1) *On Ancient Medicine* (Περὶ ἀρχαίης ἰητρικῆς); (2) *The Prognostics* (Προγνωστικόν); (3) *The Aphorisms* ('Αφορισμοί); (4) *The Epidemics*, i. and iii. ('Επιδημιῶν α′ καὶ γ′); (5) *On Regimen in Acute Diseases* (Περὶ διαίτης ὀξέων); (6) *On Airs, Waters, and Places* (Περὶ ἀέρων, ὑδάτων, καὶ τόπων); (7) *On the Articulations* (Περὶ ἄρθρων); (8) *On Fractures* (Περὶ ἀγμῶν); (9) *The Instruments of Reduction* (Μοχλικός); (10) *The Physician's Establishment, or Surgery* (Κατ' ἰητρεῖον); (11) *On Injuries of the Head* (Περὶ τῶν ἐν κεφαλῇ τρωμάτων); (12) *The Oath* ("Ορκος); (13) *The Law* (Νόμος). Of these Adams accepts as certainly genuine the 2nd, 6th, 5th, 3rd (7 books), 4th, 7th, 8th, 9th and 12th, and as "pretty confidently acknowledged as genuine, although the evidence in their favour is not so strong," the 1st, 10th and 13th, and, in addition, (14) *On Ulcers* (Περὶ ἑλκῶν); (15) *On Fistulae* (Περὶ συρίγγων); (16) *On Hemorrhoids* (Περὶ αἱμορροΐδων); (17) *On the Sacred Disease* (Περὶ ἱερῆς νούσου). According to the sceptical and somewhat subjective criticism of Ermerins, the whole collection is to be regarded as spurious except *Epidemics*, books i. and iii. (with a few interpolations), *On Airs, Waters, and Places*, *On Injuries of the Head* ("insigne fragmentum libri Hippocratei"), the former portion of the treatise *On Regimen in Acute Diseases*, and the "obviously Hippocratic" fragments of the *Coan Prognostics*. Perhaps also the *Oath* may be accepted as genuine; its comparative antiquity is not denied. The *Aphorisms* are certainly later and inferior. In the other non-Hippocratic writings Ermerins thinks he can distinguish the hands of no fewer than nineteen different authors, most of them anonymous, and some of them very late.

The earliest Greek edition of the Hippocratic writings is that which was published by Aldus and Asulanus at Venice in 1526 (folio); it was speedily followed by that of Frobenius, which is much more accurate and complete (fol., Basel, 1538). Of the numerous subsequent editions, probably the best was that of Foesius (Frankfort, 1595, 1621, Geneva, 1657), until the publication of the great works of Littré, *Œuvres complètes d'Hippocrate, traduction nouvelle avec le texte grec en regard, collationnée sur les manuscrits et toutes les éditions, accompagnée d'une introduction, de commentaires médicaux, de variantes, et de notes philologiques* (10 vols., Paris, 1839–1861), and of F. Z. Ermerins, *Hippocratis et aliorum medicorum veterum reliquiae* (3 vols., Utrecht, 1859–1864). See also Adams (as cited above), and Reinhold's *Hippocrates* (2 vols., Athens, 1864–1867). Daremberg's edition of the *Œuvres choisies* (2nd ed., Paris, 1855) includes the *Oath*, the *Law*, the *Prorrhetics*, book i., the *Prognostics*, *On Airs, Waters, and Places*, *Epidemics*, books i. and iii., *Regimen*, and *Aphorisms*. Of the separate works attributed to Hippocrates the editions and translations are almost innumerable; of the *Prognostics*, for example, seventy editions are known, while of the *Aphorisms* there are said to exist as many as three hundred. For some notice of the Arabic, Syriac and Hebrew translations of works

[1] "Hippocrates Cous, primus quidem ex omnibus memoria dignus, ab studio sapientiae disciplinam hanc separavit, vir et arte et facundia insignis" (Celsus, *De medicina*).

SpinSmart Software http://www.spinsmart.com

professedly by Hippocrates (Ibukrat or Bukrat), the number of which greatly exceeds that of the extant Greek originals, reference may be made to Flügel's contribution to the article "Hippokrates" in the *Encyklopädie* of Ersch and Gruber. They have been partially catalogued by Fabricius in his *Bibliotheca Graeca*. (J. B. T.)

HIPPOCRENE (the "fountain of the horse," ἡ ἵππου κρήνη), the spring on Mt Helicon, in Boeotia, which, like the other spring there, Aganippe, was sacred to the Muses and Apollo, and hence taken as the source of poetic inspiration. The spring, surrounded by an ancient wall, is now known as *Kryopegadi* or the cold spring. According to the legend, it was produced by the stamping of the hoof of Bellerophon's horse Pegasus. The same story accounts for the Hippocrene in Troezen and the spring Peirene at Corinth.

HIPPODAMUS, of Miletus, a Greek architect of the 5th century B.C. It was he who introduced order and regularity into the planning of cities, in place of the previous intricacy and confusion. For Pericles he planned the arrangement of the harbour-town Peiraeus at Athens. When the Athenians founded Thurii in Italy he accompanied the colony as architect, and afterwards, in 408 B.C., he superintended the building of the new city of Rhodes. His schemes consisted of series of broad, straight streets, cutting one another at right angles.

HIPPODROME (Gr. ἱππόδρομος, from ἵππος, horse, and δρόμος, racecourse), the course provided by the Greeks for horse and chariot racing; it corresponded to the Roman *circus*, except that in the latter only four chariots ran at a time, whereas ten or more contended in the Greek games, so that the width was far greater, being about 400 ft., the cource being 600 to 700 ft. long. The Greek hippodrome was usually set out on the slope of a hill, and the ground taken from one side served to form the embankment on the other side. One end of the hippodrome was semicircular, and the other end square with an extensive portico, in front of which, at a lower level, were the stalls for the horses and chariots. The modern hippodrome is more for equestrian and other displays than for horse racing. The Hippodrome in Paris somewhat resembles the Roman amphitheatre, being open in the centre to the sky, with seats round on rising levels.

HIPPOLYTUS, in Greek legend, son of Theseus and Hippolyte, queen of the Amazons (or of her sister Antiope), a famous hunter and charioteer and favourite of Artemis. His stepmother Phaedra became enamoured of him, but, finding her advances rejected, she hanged herself, leaving a letter in which she accused Hippolytus of an attempt upon her virtue. Theseus thereupon drove his son from his presence with curses and called upon his father Poseidon to destroy him. While Hippolytus was driving along the shore at Troezen (the scene of the *Hippolytus* of Euripides), a sea-monster (a bull or *phoca*) sent by Poseidon emerged from the waves; the horses were scared, Hippolytus was thrown out of the chariot, and was dragged along, entangled in the reins, until he died. According to a tradition of Epidaurus, Asclepius restored him to life at the request of Artemis, who removed him to Italy (see VIRBIUS). At Troezen, where he had a special sanctuary and priest, and was worshipped with divine honours, the story of his death was denied. He was said to have been rescued by the gods at the critical moment, and to have been placed amongst the stars as the Charioteer (Auriga). It was also the custom of the Troezenian maidens to cut off a lock of their hair and to dedicate it to Hippolytus before marriage (see Frazer on Pausanias ii. 32. 1). Well-known classical parallels to the main theme are Bellerophon and Antea (or Stheneboea) and Peleus and Astydamia. The story was the subject of two plays by Euripides (the later of which is extant), of a tragedy by Seneca and of Racine's *Phèdre*. A trace of it has survived in the legendary death of the apocryphal martyr Hippolytus, a Roman officer who was torn to pieces by wild horses as a convert to Christianity (see J. J. Döllinger, *Hippolytus and Callistus*, Eng. tr. by A. Plummer, 1876, pp. 28-39, 51-60).

According to the older explanations, Hippolytus represented the sun, which sets in the sea (cf. the scene of his death and the story of Phaëthon), and Phaedra the moon, which travels behind the sun, but is unable to overtake it. It is more probable, however, that he was a local hero famous for his chastity, perhaps originally a priest of Artemis, worshipped as a god at Troezen, where he was closely connected and sometimes confounded with Asclepius. It is noteworthy that, in a speech put into the mouth of Theseus by Euripides, the father, who of course believes his wife's story and regards Hippolytus as a hypocrite, throws his son's pretended misogyny and asceticism (Orphism) in his teeth. This seems to point to a struggle between a new ritual and that of Poseidon, the chief deity of Troezen, in which the representative of the intruding religion meets his death through the agency of the offended god, as Orpheus (*q.v.*) was torn to pieces by the votaries of the jealous Dionysus. According to S. Reinach (*Archiv für Religionswissenschaft*, x., 1907, p. 47), the Troezenian Hippolytus was a horse, the hypostasis of an equestrian divinity periodically torn to pieces by the faithful, who called themselves, and believed themselves to be, horses. Death was followed by resuscitation, as in the similar myths of Adonis (the sacred boar), Orpheus (the fox), Pentheus (the fawn), Phaëthon (the white sun-horse).

Kalkmann, *De Hippolytis Euripideis* (Bonn, 1882); and (for representations in art) "Über Darstellung der Hippolytussage" in *Archäologische Zeitung* (xli. 1883); J. E. Harrison, *Mythology and Monuments of Ancient Athens* (1890), cl.

HIPPOLYTUS, a writer of the early Church. The mystery which enveloped the person and writings of Hippolytus,[1] one of the most prolific ecclesiastical writers of early times, had some light thrown upon it for the first time about the middle of the 19th century by the discovery of the so-called *Philosophumena* (see below). Assuming this writing to be the work of Hippolytus, the information given in it as to the author and his times can be combined with other traditional dates to form a tolerably clear picture. Hippolytus must have been born in the second half of the 2nd century, probably in Rome. Photius describes him in his *Bibliotheca* (cod. 121) as a disciple of Irenaeus, and from the context of this passage it is supposed that we may conclude that Hippolytus himself so styled himself. But this is not certain, and even if it were, it does not necessarily imply that Hippolytus enjoyed the personal teaching of the celebrated Gallic bishop; it may perhaps merely refer to that relation of his theological system to that of Irenaeus which can easily be traced in his writings. As a presbyter of the church at Rome under Bishop Zephyrinus (199–217), Hippolytus was distinguished for his learning and eloquence. It was at this time that Origen, then a young man, heard him preach (Hieron. *Vir. ill.* 61; cp. Euseb. *H.E.* vi. 14, 10). It was probably not long before questions of theology and church discipline brought him into direct conflict with Zephyrinus, or at any rate with his successor Calixtus I. (*q.v.*). He accused the bishop of favouring the Christological heresies of the Monarchians, and, further, of subverting the discipline of the Church by his lax action in receiving back into the Church those guilty of gross offences. The result was a schism, and for perhaps over ten years Hippolytus stood as bishop at the head of a separate church. Then came the persecution under Maximinus the Thracian. Hippolytus and Pontius, who was then bishop, were transported in 235 to Sardinia, where it would seem that both of them died. From the so-called chronograph of the year 354 (*Catalogus Liberianus*) we learn that on the 13th of August, probably in 236, the bodies of the exiles were interred in Rome and that of Hippolytus in the cemetery on the Via Tiburtina. So we must suppose that before his death the schismatic was received again into the bosom of the Church, and this is confirmed by the fact that his memory was henceforth celebrated in the Church as that of a holy martyr. Pope Damasus I. dedicated to him one of his famous epigrams, and Prudentius (*Peristephanon*, 11) drew a highly coloured picture of his gruesome death, the details of which are certainly purely legendary: the myth of Hippolytus the son of Theseus was transferred to the Christian martyr. Of the historical Hippolytus little remained in the memory of after

[1] According to the legend St Hippolytus was a Roman soldier who was converted by St Lawrence.

ages. Neither Eusebius (*H.E.* vi. 20, 2) nor Jerome (*Vir. ill.* 61) knew that the author so much read in the East and the Roman saint were one and the same person. The notice in the *Chronicon Paschale* preserves one slight reminiscence of the historical facts, namely, that Hippolytus's episcopal see was situated at Portus near Rome. In 1551 a marble statue of a seated man was found in the cemetery of the Via Tiburtina: on the sides of the seat were carved a paschal cycle, and on the back the titles of numerous writings. It was the statue of Hippolytus, a work at any rate of the 3rd century; at the time of Pius IX. it was placed in the Lateran Museum, a record in stone of a lost tradition.

Hippolytus's voluminous writings, which for variety of subject can be compared with those of Origen, embrace the spheres of exegesis, homiletics, apologetics and polemic, chronography and ecclesiastical law. His works have unfortunately come down to us in such a fragmentary condition that it is difficult to obtain from them any very exact notion of his intellectual and literary importance. Of his exegetical works the best preserved are the *Commentary on the Prophet Daniel* and the *Commentary on the Song of Songs*. In spite of many instances of a want of taste in his typology, they are distinguished by a certain sobriety and sense of proportion in his exegesis. We are unable to form an opinion of Hippolytus as a preacher, for the *Homilies on the Feast of Epiphany* which go under his name are wrongly attributed to him. He wrote polemical words directed against the pagans, the Jews and heretics. The most important of these polemical treatises is the *Refutation of all Heresies*, which has come to be known by the inappropriate title of the *Philosophumena*. Of its ten books, the second and third are lost; Book i. was for a long time printed (with the title *Philosophumena*) among the works of Origen; Books iv.-x. were found in 1842 by the Greek Minoides Mynas, without the name of the author, in a MS. at Mount Athos. It is nowadays universally admitted that Hippolytus was the author, and that Books i. and iv.-x belong to the same work. The importance of the work has, however, been much overrated; a close examination of the sources for the exposition of the Gnostic system which is contained in it has proved that the information it gives is not always trustworthy. Of the dogmatic works, that on *Christ and Antichrist* survives in a complete state. Among other things it includes a vivid account of the events preceding the end of the world, and it was probably written at the time of the persecution under Septimius Severus, *i.e.* about 202. The influence of Hippolytus was felt chiefly through his works on chronographic and ecclesiastical law. His chronicle of the world, a compilation embracing the whole period from the creation of the world up to the year 234, formed a basis for many chronographical works both in the East and West. In the great compilations of ecclesiastical law which arose in the East since the 4th century (see below: also APOSTOLIC CONSTITUTIONS) much of the material was taken from the writings of Hippolytus; how much of this is genuinely his, how much of it worked over, and how much of it wrongly attributed to him, can no longer be determined beyond dispute even by the most learned investigation.

BIBLIOGRAPHY.—The edition of J. A. Fabricius, *Hippolyti opera graece et latine* (2 vols., Hamburg, 1716–1718, reprinted in Gallandi, *Bibliotheca veterum patrum* (vol. ii., 1766), and Migne, *Cursus patrol. ser. Graeca*, vol. x.) is out of date. The preparation of a complete critical edition has been undertaken by the Prussian Academy of Sciences. The task is one of extraordinary difficulty, for the textual problems of the various writings are complex and confused: the Greek original is extant in a few cases only (the *Commentary on Daniel*, the *Refutation, on Antichrist*, parts of the *Chronicle*, and some fragments); for the rest we are dependent on fragments of translations, chiefly Slavonic, all of which are not even published. Of the Academy's edition one volume was published at Berlin in 1897, containing the *Commentaries on Daniel* and on the *Song of Songs*, the treatise on *Antichrist*, and the *Lesser Exegetical* and *Homiletic Works*, edited by Nathanael Bonwetsch and Hans Achelis. The *Commentary on the Song of Songs* has also been published by Bonwetsch (Leipzig, 1902) in a German translation based on a Russian translation by N. Marr of the Grusian (Georgian) text, and he added to it (Leipzig, 1904) a translation of various small exegetical pieces, which are preserved in a Georgian version only (*The Blessing of Jacob*, *The Blessing of Moses*, *The Narrative of David and Goliath*). A great part of the original of the *Chronicle* has been published by Adolf Bauer (Leipzig, 1905) from the *Codex Matritensis Graecus*, 221. For the *Refutation* we are still dependent on the editions of Miller (Oxford, 1851), Duncker and Schneidewin (Göttingen, 1859), and Cruice (Paris, 1860). An English translation is to be found in the *Ante-Nicene Christian Library* (Edinburgh, 1868–1869).

(Leipzig, 1902); Adhémar d'Alès, *La Théologie de Saint Hippolyte* (Paris, 1906). (G. K.)

HIPPOLYTUS, THE CANONS OF. This book stands at the head of a series of Church Orders, which contain instructions in regard to the choice and ordination of Christian ministers, regulations as to widows and virgins, conditions of reception of converts from heathenism, preparation for and administration of baptism, rules for the celebration of the eucharist, for fasting, daily prayers, charity suppers, memorial meals, first-fruits, &c. We shall give (1) a description of the book as we have it at present; (2) a brief statement of its relation to allied documents; (3) some remarks on the evidence for its date and authorship.

1. We possess the *Canons of Hippolytus* only in an Arabic version, itself made from a Coptic version of the original Greek. Attention was called to the book by Wansleben and Ludolf towards the end of the 17th century, but it was only in 1870 that it was edited by Haneberg, who added a Latin translation, and so made it generally accessible. In 1891 H. Achelis reproduced this translation in a revised form, embodying it in a synopsis of allied documents. He suspected much interpolation and derangement of order, and consequently rearranged its contents with a free hand. In 1900 a German translation was made by H. Riedel, based on fresh MSS. These showed that the book, as hitherto edited, had been thrown into disorder by the displacement of two pages near the end; they also removed other difficulties upon which the theory of interpolation had been based. Further discoveries, to be spoken of presently, have added to our materials for the study of the book.

The book is attributed to "Hippolytus, the chief of the bishops of Rome," and is divided into thirty-eight canons, to which short headings are prefixed. This division is certainly not original, but it is convenient for purposes of reference. Canon 1 is prefatory; it contains a brief confession of faith in the Trinity, and especially in the Word, the Son of God; and it speaks of the expulsion of heretics from the Church. Canons 2-5 give regulations for the selection and ordination of bishops, presbyters and deacons. The bishop is chosen by the whole congregation: "one of the bishops and presbyters" is to lay hands upon him and say a prayer which follows (3): he is at once to proceed with "the offering," taking up the eucharistic service at the point where the *sursum corda* comes in. A presbyter (4) is to be ordained with the same prayer as a bishop, "with the exception of the word bishop"; but he is given no power of ordination (this appears to be inconsistent with c. 2). The duties of a deacon are described, and the prayer of his ordination follows (5). Canons 6-9 deal with various classes in the Church. One who has suffered punishment for the faith (6) is to be counted a presbyter without ordination: "his confession is his ordination." Readers and sub-deacons (7) are given the Gospel, but are not ordained by laying-on of hands. A claim to ordination on the ground of gifts of healing (8) is to be admitted, if the facts are clear and the healing is from God. Widows are not ordained (9): "ordination is for men only." Canons 10-15 describe conditions for the admission of converts. Certain occupations are incompatible with Christian life: only under compulsion may a Christian be a soldier. Canons 16-18 deal chiefly with regulations concerning women. Canon 19 is a long one dealing with catechumens, preparation for baptism, administration of that sacrament, and of the eucharist for the newly baptized. The candidate is twice anointed: first, with the oil of exorcism, after he has said, with his face westward, "I renounce thee, O devil, and all thy following"; and, again, immediately after the baptism. As he stands in the water, he declares his faith in response to an interrogatory creed; and after each of the three clauses he is immersed. After the second anointing the bishop gives thanks "for that Thou hast made them worthy that they should be born again, and hast poured out Thy Holy Ghost upon them, so that they may belong, each one of them, to the body of the Church": he signs them with the cross on their foreheads, and kisses them. The eucharist then proceeds: "the bishop gives them of the body of Christ and says, This is the body of Christ, and they answer Amen"; and similarly for the cup.

SpinSmart Software http://www.spinsmart.com

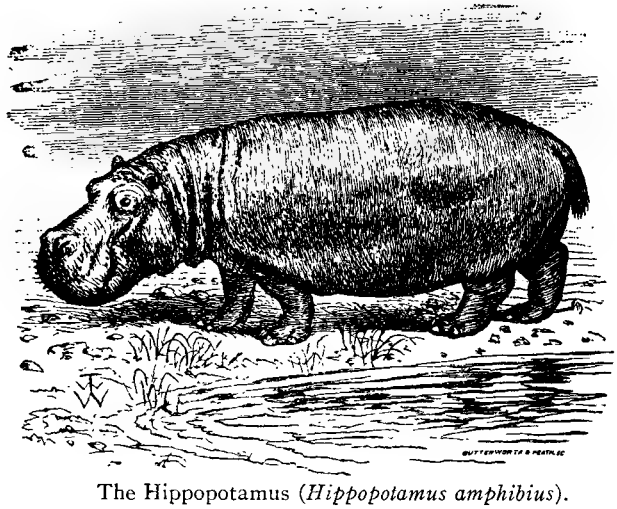
Milk and honey are then given to them as being "born a second time as little children." A warning is added against eating anything before communicating. Canons 20-22 deal with fast-days, daily services in church, and the fast of the passover-week. Canon 23 seems as if it closed the series, speaking, as it does, of "our brethren the bishops" who in their cities have made regulations "according to the commands of our fathers the apostles": "let none of our successors alter them; because it saith that the teaching is greater than the sea, and hath no end." We pass on, however, to regulations about the sick (24) who are to be visited by the bishop, "because it is a great thing for the sick that the high-priest should visit them (for the shadow of Peter healed the sick)." Canons 25-27 deal again with prayers and church-services. The "seven hours" are specified, with reasons for their observance (25): attendance at sermons is urged (26), "for the Lord is in the place where his lordship is proclaimed" (comp. *Didachè* 4, part of the *Two Ways*). When there are no prayers in church, reading at home is enjoined (27): "let the sun each morning see the book upon thy knees" (comp. Ath. *Ad virg.*, § 12, "Let the sun when he ariseth see the book in thy hands"). Prayer must be preceded by the washing of the hands. "No believer must take food before communicating, especially on fast-days": only believers may communicate (28). The sacred elements must be guarded, "lest anything fall into the cup, and it be a sin unto death for the presbyters." No crumb must be dropped, "lest an evil spirit get possession of it." Canons 30-35 contain various rules, and specially deal with suppers for the poor (*i.e. agapae*) and memorial feasts. Then we have a prayer for the offering of first-fruits (36); a direction that ministers shall wear fair garments at "the mysteries" (37); and a command to watch during the night of the resurrection (38). The last canon hereupon passes into a general exhortation to right living, which forms a sixth part of the whole book. In Riedel's translation we read this for the first time as a connected whole. It falls into two parts, and describes, first, the true life of ordinary Christians, warning them against an empty profession, and laying down many precepts of morality; and then it addresses itself to the "ascete" who "wishes to belong to the rank of the angels," and who lives a life of solitude and poverty. He is encouraged by an exposition, on somewhat strange lines, of the temptations of our Lord, and is specially warned against spiritual pride and contempt of other men. The book closes with an appeal for love and mutual service, based on the parables in St Matthew xxv.

2. It is impossible to estimate the position of the Canons of Hippolytus without some reference to allied documents (see Apostolical Constitutions). (*a*) The most important of these is what is now commonly called the *Egyptian Church Order*. This is preserved to us in Coptic and Aethiopic versions, of which Achelis, in his synopsis, gives German translations. The subject-matter and arrangement of these canons correspond generally to those of Hippolytus; but many of the details are modified to bring them into accord with a later practice. A new light was thrown on the criticism of this work by Hauler's discovery (1900) of a Latin version (of which, unfortunately, about half is missing) in the Verona palimpsest, from which he has also given us large Latin fragments of the *Didascalia* (which underlies books i.-vi. of the Apostolic Constitutions, and which hitherto we have only known from the Syriac). The Latin of the Egyptian Church Order is somewhat more primitive than the Coptic, and approaches more nearly, at some points, to the *Canons of Hippolytus*. It has a preface which refers to a treatise *Concerning Spiritual Gifts*, as having immediately preceded it; but neither this nor the Coptic-Aethiopic form has either the introduction or concluding exhortation which is found in the *Canons of Hippolytus*. (*b*) The *Testament of the Lord* is a document in Syriac, of which the opening part had been published by Lagarde, and of which Rahmani (1899) has given us the whole. It professes to contain instructions given by our Lord to the apostles after the resurrection. After an introduction containing apocalyptical matter, it passes on to give elaborate directions for the ordering of the Church, embodying, in a much-expanded form, the Egyptian Church Order, and showing a knowledge of the preface to that document which appears in the Latin version. It cannot be placed with probability earlier than the latter part of the 4th century. (*c*) The *Apostolic Constitutions* is a composite document, which probably belongs to the end of the 4th century. Its first six books are an expanded edition of a *Didascalia* which we have already mentioned: its seventh book similarly expands and modifies the *Didachè*; its eighth book begins by treating of "spiritual gifts," and then in c. 3 passes on to expand in like manner the Egyptian Church Order. The hand which has wrought up all these documents has been shown to be that of the interpolator of the Ignatian Epistles in the longer Greek recension. (*d*) The *Canons of Basil* is the title of an Arabic work, of which a German translation has been given us by Riedel, who thinks that they have come through Coptic from an original Greek book. They embody, in a modified form, considerable portions of the Canons of Hippolytus.

3. We now approach the difficult questions of date and authorship. Much of the material has been quite recently brought to light, and criticism has not had time to investigate and pronounce upon it. Some provisional remarks, therefore, are all that can prudently be made. It seems plain that we have two lines of tradition: (1) The Canons of Hippolytus, followed by the Canons of Basil; (2) the Egyptian Church Order, itself represented (*a*) by the Latin version, the Testament of the Lord, and the Apostolic Constitutions, which are linked together by the same preface (or portions of it); (*b*) by the Coptic and Aethiopic versions. Now, the preface of the Latin version points to a time when the canons were embodied in a *corpus* of similar materials, or, at the least, were preceded by a work on "Spiritual Gifts." The Canons of Hippolytus have a wholly different preface, and also a long exhortation at the close. The question which criticism must endeavour to answer is, whether the Canons of Hippolytus are the original from which the Egyptian Church Order is derived, or whether an earlier body of canons lies behind them both. At present it is probably wise to assume that the latter is the true explanation. For the Canons of Hippolytus appear to contain contradictory regulations (*e.g.* cc. 2 and 4 of the presbyters), and also suggest that they have received a considerable supplement (after c. 23). There is, however, no doubt that they present us with a more primitive stage of Church life than we find in the Egyptian Church Order. The mention of subdeacons (which, after Riedel's fresh manuscript evidence, cannot now be dismissed as due to interpolation) makes it difficult to assign a date much earlier than the middle of the 3rd century.

The Puritan severity of the canons well accords with the temper of the writer to whom the Arabic title attributes them; and it is to be noted that the exhortation at the close contains a quotation from 2 Peter actually attributed to the apostle, and Hippolytus is perhaps the earliest author who can with certainty be said to have used this epistle. But the general style of Hippolytus, which is simple, straightforward and strong, is in marked contrast with that of the closing passage of the canons; moreover, his mind, as presented to us in his extant writings, appears to be a much larger one than that of the writer of these canons; it is as difficult to think of Hippolytus as it would be to think of Origen in such a connexion. How, then, are we to account for the attribution? There is evidence to show that Hippolytus was highly reverenced throughout the East: his writings, which were in Greek, were known, but his history was entirely unknown. He was supposed to be "a pupil (γνώριμος) of apostles" (Palladius, 4th century), and the Arabic title calls him "chief of the bishops of Rome," *i.e.* archbishop of Rome. It is hard to trust this attribution more than the attribution of a Coptic discourse on the *Dormitio Mariae* to "Evodius, archbishop of the great city Rome, who was the second after Peter the apostle" (*Texts and Studies*, iv. 2-44)—Evodius being by tradition first bishop of Antioch. A whole group of books on Church Order bears the name of Clement of Rome; and the attribution of our canons to Hippolytus may be only an example of the same tendency. The fact that Hippolytus wrote a treatise *Concerning Spiritual Gifts*, and that some such treatise is not only referred to in the Latin preface to the Egyptian Church Order, but is actually found at the beginning of book viii. of the Apostolic Constitutions, introduces an interesting complication; but we cannot here pursue the matter further. Dom Morin's ingenious attribution of the canons to Dionysius of Alexandria (on the ground of Eusebius, *H.E.* vi. 46., 5) cannot be accepted in view of the broader church policy which that writer represents. If the Hippolytean authorship be given up, it is probable that Egypt will make

SpinSmart Software http://www.spinsmart.com



the strongest claim to be the locality in which the canons were compiled in their present form.

The authorities of chief practical importance are H. Achelis, *Texte u. Unters.* vi. 4 (1891); Rahmani, *Testamentum Domini* (1899); Hauler, *Didascaliae Apostolorum* (1900); Riedel, *Kirchenrechtsquellen des Patriarchats Alexandrien* (1900). (J. A. R.)

HIPPONAX, of Ephesus, Greek iambic poet. Expelled from Ephesus in 540 B.C. by the tyrant Athenagoras, he took refuge in Clazomenae, where he spent the rest of his life in poverty. His deformed figure and malicious disposition exposed him to the caricature of the Chian sculptors Bupalus and Athenis, upon whom he revenged himself by issuing against them a series of satires. They are said to have hanged themselves like Lycambes and his daughters when assailed by Archilochus, the model and predecessor of Hipponax. His coarseness of thought and feeling, his rude vocabulary, his want of grace and taste, and his numerous allusions to matters of merely local interest prevented his becoming a favourite in Attica. He was considered the inventor of parody and of a peculiar metre, the *scazon* or *choliambus*, which substitutes a spondee for the final iambus of an iambic senarius, and is an appropriate form for the burlesque character of his poems.

Fragments in Bergk, *Poëtae lyrici Graeci*; see also B. J. Peltzer, *De parodica Graecorum poësi* (1855), containing an account of Hipponax and the fragments.

HIPPOPOTAMUS ("river-horse," Gr. ἵππος, horse and ποταμός, river), the name of the largest representative of the non-ruminating artiodactyle ungulate mammals, and its living and extinct relatives. The common hippopotamus (*Hippopotamus amphibius*), which formerly inhabited all the great rivers of Africa but whose range has now been much restricted, is most likely the *behemoth* of Scripture, and may very probably in Biblical times have been found in the Jordan valley, since at a still earlier (Pleistocene) epoch it ranged over a large part of Europe. It typifies not only a genus, but likewise a family, *Hippopotamidae*, distinguished from its relatives the pigs and peccaries, or *Suidae*, by the following assemblage of characters: Muzzle very broad and rounded. Feet short and broad, with four subequal toes, bearing short rounded hoofs, and all reaching the ground in walking. Incisors not rooted but continuously growing; those of the upper jaw curved and directed downwards; those of the lower straight and procumbent. Canines very large, curved, continuously growing; upper ones directed downwards. Premolars $\frac{4}{4}$; molars $\frac{3}{3}$. Stomach complex. No caecum.

The Hippopotamus (*Hippopotamus amphibius*).

In form the hippopotamus is a huge, unwieldy creature, measuring in the largest specimens fully 14 ft. from the extremity of the upper lip to the tip of the tail, while it ordinarily attains a length of 12 ft., with a height of 5 ft. at the shoulders, and a girth round the thickest part of the body almost equal to its length. The small ears are exceedingly flexible, and kept in constant motion when the animal is seeking to catch a distant sound; the eyes are placed high up on the head, but little below the level of the ears; while the gape is wide, and the upper lip thick and bulging so as to cover over even its large tusks when the mouth is closed. The molars, which show trefoil-shaped grinding-surfaces are well adapted for masticating vegetable substances, while the formidable array of long spear-like incisors and curved chisel-edged canines or tusks root up rank grass like an agricultural implement. The legs are short, so that the body is but little elevated above the ground; and the feet, which are small in proportion to the size of the animal, terminate in four short toes each bearing a small hoof. With the exception of a few tufts of hair on the lips, on the sides of the head and neck, and at the extremity of the short robust tail, the skin of the hippopotamus, some portions of which are 2 in. in thickness, is destitute of covering. Hippopotamuses are gregarious animals, living in herds of from 20 to 40 individuals on the banks and in the beds of rivers, in the neighbourhood of which they most readily find appropriate food. This consists chiefly of grass and of aquatic plants, of which these animals consume enormous quantities, the stomach being capable of containing from 5 to 6 bushels. They feed principally by night, remaining in the water during the day, although in districts where they are little disturbed they are less exclusively aquatic. In such remote quarters they put their heads boldly out of the water to blow, but when rendered suspicious they become exceedingly cautious in this respect, only exposing their nostrils above the water, and even this they prefer doing amid the shelter of water plants. In spite of their enormous size and uncouth form, they are expert swimmers and divers, and can remain easily under the water from five to eight minutes. They walk on the bottoms of rivers, beneath at least 1 ft. of water. At nightfall they come on land to feed; and when, as often happens on the banks of the Nile, they reach cultivated ground, they do immense damage to growing crops, destroying by their ponderous tread even more than they devour. To scare away these unwelcome visitors the natives in such districts are in the habit of kindling fires at night. Although hippopotamuses do not willingly go far from the water on which their existence depends, they occasionally travel long distances by night in search of food, and in spite of their clumsy appearance are able to climb steep banks and precipitous ravines with ease. Of a wounded hippopotamus which Sir S. Baker saw leaving the water and galloping inland, he writes: "I never could have imagined that so unwieldy an animal could have exhibited such speed. No man could have had a chance of escape." The hippopotamus does not confine itself to rivers and lakes, but has been known to prefer the waters of the ocean as its home during the day. Of a mild and inoffensive disposition, it seeks to avoid collision with man; when wounded, however, or in defence of its young, it exhibits great ferocity, and native canoes are capsized and occasionally demolished by its infuriated attacks; the bellowing grunt then becoming loud enough to be heard a mile away. As among elephants, so also among hippopotamuses there are "rogues"—old bulls which have become soured in solitude, and are at all times dangerous. Assuming the offensive on every occasion, they attack all and sundry without shadow of provocation; and the natives avoid their haunts, which are usually well known.

The only other living species is the pygmy hippopotamus, *H.* (*Choeropsis*) *liberiensis*, of West Africa, an animal not larger than a clumsily made pig of full dimensions, and characterized by having generally one (in place of two) pair of incisors. It is much less aquatic than its giant relative, having, in fact, the habits of a pig.

A small extinct species (*H. lemerlei*) inhabited Madagascar at a comparatively recent date; while other dwarf kinds were natives of Crete (*H. minutus*) and Malta and Sicily (*H. pentlandi*) during the Pleistocene. A large form of the ordinary species (*H. amphibius major*) was distributed over Europe as far north as Yorkshire at the same epoch; while an allied species (*H. palaeindicus*) inhabited Pleistocene India. Contemporary with the latter was, however, a species (*H. namadicus*) with three pairs of incisors; and "hexaprotodont" hippopotamuses are

SpinSmart Software http://www.spinsmart.com

also characteristic of the Pliocene of India and Burma (*H. sivalensis* and *H. iravadicus*), and of Algeria, Egypt and southern Europe (*H. hipponensis*).

For the ancestral genera of the hippopotamus line, see ARTIODACTYLA. (R. L.*)

HIPPURIC ACID (Gr. *ἵππος*, horse, *οὖρον*, urine), benzoyl glycocoll or benzoyl amidoacetic acid, $C_9H_9NO_3$ or $C_6H_5CO{\cdot}NH{\cdot}CH_2{\cdot}CO_2H$, an organic acid found in the urine of horses and other herbivorae. It is excreted when many aromatic compounds, such as benzoic acid and toluene, are taken internally. J. v. Liebig in 1829 showed that it differed from benzoic acid, and in 1839 determined its constitution, while in 1853 V. Dessaignes (*Ann.* 87, p. 325) synthesized it by acting with benzoyl chloride on zinc glycocollide. It is also formed by heating benzoic anhydride with glycocoll (Th. Curtius, *Ber.*, 1884, 17, p. 1662), and by heating benzamide with monochloracetic acid. It crystallizes in rhombic prisms which are readily soluble in hot water, melt at 187° C. and decompose at about 240° C. It is readily hydrolysed by hot caustic alkalis to benzoic acid and glycocoll. Nitrous acid converts it into benzoyl glycollic acid, $C_6H_5CO{\cdot}O{\cdot}CH_2{\cdot}CO_2H$. Its ethyl ester reacts with hydrazine to form hippuryl hydrazine, $C_6H_5CO{\cdot}NH{\cdot}CH_2{\cdot}CO{\cdot}NH{\cdot}NH_2$, which was used by Curtius for the preparation of azoimide (*q.v.*).

HIPURNIAS, a tribe of South American Indians, 2000 or 3000 in number, living on the river Purus, western Brazil. Their houses are long, low and narrow: the side walls and roof are one, poles being fixed in the ground and then bent together so as to meet and form a pointed arch for the cross-sections. They use small bark canoes. Their chief weapons are poisoned arrows. They have a native god called Guintiniri.

HIRA, the capital of an Arabian kingdom, founded in the 2nd century A.D., on the western edge of Irak, was situated at 32° N., 44° 20′ E., about 4 m. S.E. of modern Nejef, by the Sa'ade canal, on the shore of the Bahr Nejef or Assyrium Stagnum. Its kings governed the western shore of the lower Euphrates and of the Persian Gulf, their kingdom extending inland to the confines of the Nejd. This Lakhmid kingdom was more or less dependent, during the four centuries of its existence, on the Sassanian empire, to which it formed a sort of buffer state towards Arabia. After the battle of Kadesiya and the founding of Kufa by the Arabs, Hira lost its importance and fell into decay. The ruin mounds covering the ancient site, while extensive, are insignificant in appearance and give no indications of the existence of important buildings.

HIRADO, an island belonging to Japan, 19½ m. long and 6 m. wide, lying off the west coast of the province of Hizen, Kiushiu, in 33° 15′ N. and 129° 25′ E. It is celebrated as the site of the original Dutch factory—often erroneously written Firando—and as the place where one of the finest blue-and-white porcelains of Japan (*Hiradoyaki*) was produced in the 17th and 18th centuries. The kilns are still active.

HIRE-PURCHASE AGREEMENT, in the law of contract, a form of bailment of goods, on credit, which has extended very considerably of late years. Originally applied to the sale of the more expensive kinds of goods, such as pianos and articles of furniture, the hire-purchase agreement has now been extended to almost every description. The agreement is usually in writing, with a stipulation that the payments to purchase shall be by weekly, monthly or other instalments. The agreement is virtually one to purchase, but in order that the vendor may be able to recover the goods at any time on non-payment of an instalment, it is treated as an agreement to let and hire, with a provision that when the last instalment has been paid the goods shall become the property of the hirer. A clause provides that in case of default of any instalment, or breach of any part of the agreement, all previous payments shall be forfeited to the lender, who can forcibly recover the goods. Such agreements, therefore, do not pass the property in the goods, which remains in the lender until all the instalments have been paid. But the terms of the agreement may sometimes purposely obscure the nature of the transaction between the parties, where, for example, the hire-purchase is merely to create a security for money. In such a case a judge will look to the true nature of the transaction. If it is not a real letting and hiring, the agreement will require registration under the Bills of Sale Acts. If the agreement contains words to the effect that a person has "bought or agreed to buy" goods, the transaction comes under the Factors Act 1889, and the person in possession of the goods may dispose of them and give a good title. The doctrine of reputed ownership, by which a bankrupt is deemed the reputed owner of goods in his apparent possession, has been somewhat modified by trade customs, in accordance with which property is frequently let out on the hire-purchase system (see BANKRUPTCY).

HIRING (from O. Eng. *hýrian*, a word common to many Teutonic languages cf. Ger. *heuern*, Dutch *huren*, &c.), in law, a contract by which one man grants the use of a thing to another in return for a certain price. It corresponds to the *locatio-conductio* of Roman law. That contract was either a letting of a thing (*locatio-conductio rei*) or of labour (*locatio operarum*). The distinguishing feature of the contract was the price. Thus the contracts of *mutuum*, *commodatum*, *depositum* and *mandatum*, which are all gratuitous contracts, become, if a price is fixed, cases of *locatio-conductio*. In modern English law the term can scarcely be said to be used in a strictly technical sense. The contracts which the Roman law grouped together under the head of *locatio-conductio*—such as those of landlord and tenant, master and servant, &c.—are not in English law treated as cases of hiring but as independent varieties of contract. Neither in law books nor in ordinary discourse could a tenant farmer be said to hire his land. Hiring would generally be applied to contracts in which the services of a man or the use of a thing are engaged for a short time.

Hiring Fairs, or *Statute Fairs*, still held in Wales and some parts of England, were formerly an annual fixture in every important country town. These fairs served to bring together masters and servants. The men and maids seeking work stood in rows, the males together and the females together, while masters and mistresses walked down the lines and selected those who suited them. Originally these hiring-fairs were always held on Martinmas Day (11th of November). Now they are held on different dates in different towns, usually in October or November. In Cumberland the men seeking work stood with straws in their mouths. In Lincolnshire the bargain between employer and employed was closed by the giving of the "fasten-penny," the earnest money, usually a shilling, which "fastened" the contract for a twelvemonth. Some few days after the Statute Fair it was customary to hold a second called a Mop Fair or Runaway Mop. "Mop" (from Lat. *mappa*, napkin, or small cloth) meant in Old English a tuft or tassel, and the fair was so called, it is suggested, in allusion to tufts or badges worn by those seeking employment. Thus the carter wore whipcord on his hat, the cowherd a tuft of cow's hair, and so on. Another possible explanation would be to take the word "mop" in its old provincial slang sense of "a fool," mop fair being the fools' fair, a sort of last chance offered to those who were too dull or slovenly-looking to be hired at the statute fair. Perhaps "runaway" suggests the idea of those absent through drunkenness, or those who simply feared to face the ordeal of the larger hiring and so ran away.

HIROSAKI, a town of Japan in the province of Michmoku or Rikuchiu, north Nippon, 22 m. S.W. of Aomori by rail. Pop. about 37,000. The fine isolated cone of Iwakisan, a mountain of pilgrimage, rises to the west. Hirosaki is a very old place, formerly residence of a great daimio (or daimyo) and capital of a vast principality, and still the seat of a high court with jurisdiction over the surrounding districts of Aomori and Akita. Like most places in north Nippon, it is built with continuous verandas extending from house to house, and affording a promenade completely sheltered from the snows of winter. Apples of fine flavour grow in the district, which also enjoys some reputation for its peculiar green lacquer-ware.

HIROSHIGE (1797–1858), Japanese artist, was one of the principal members of that branch of the *Ukiyo-ye* or Popular School of Painting in Japan, a school which chiefly made

SpinSmart Software http://www.spinsmart.com

colour-prints. His family name was Andō Tokitarō; that under which he is known having been, in accordance with Japanese practice, adopted by him in recognition of the fact that he was a pupil of Toyohiro. The earliest reference to him is in the account given by an inhabitant of the Lu-chu islands of a visit to Japan; where a sketch of a procession drawn with great skill by Hiroshige at the age of ten years only is mentioned as one of the remarkable sights seen. At the age of fifteen he applied unsuccessfully to be admitted to the studio of the elder Toyokuni; but was eventually received by Toyohiro. On the death of the latter in 1828, he began to practise on his own account, but finding small encouragement at Yedo (Tōkyō) he removed to Kiōto, where he published a set of landscapes. He soon returned to Yedo, where his work soon became popular, and was imitated by other artists. He died in that city on the 6th day of the 9th month of the year, Ansei 5th, at the age of sixty-two, and was buried at Asakusa. One of his pupils, Hironobu, received from him the name of Hiroshige II. and another, Ando Tokubei, that of Hiroshige III. All three were closely associated with the work signed with the name of the master. Hiroshige II. some time after the year 1863 fell into disgrace and was compelled to leave Yedo for Nagasaki, where he died; Hiroshige III. then called himself Hiroshige II. He died in 1896. The earlier prints by these artists, whose work can hardly be separated, are of extraordinary merit. They applied the process of colour block printing to the purposes of depicting landscape, with a breadth, skill and suitability of convention that has been equalled only by Hokusai in Japan, and by no European. Most of their subjects were derived from the neighbourhood of Yedo, or were scenes on the old high road —the Tokaidō—that ran from that city to Kiōto. The two elder of the name were competent painters, and pictures and drawings by them are occasionally to be met with.

See E. F. Strange, "Japanese Colour-prints" (*Victoria and Albert Museum Handbook*, 1904). (E. F. S.)

HIROSHIMA, a city and seaport of Japan, capital of the government of its name in central Nippon. Pop. (1903) 113,545. It is very beautifully situated on a small plain surrounded by hills, the bay being studded with islands. In its general aspect it resembles Osaka, from which it is 190 m. W. by rail, and next to that place and Hiogo it is the most important commercial centre on the Inland Sea. The government has an area of about 3000 sq. m., with a population of about 1,500,000. Hiroshima is famous all over Japan owing to its association with the neighbouring islet of Itaku-Shima, "Island of Light," which is dedicated to the goddess Bentin and regarded as one of the three wonders of Japan. The chief temple dates from the year 587, and the island, which is inhabited largely by priests and their attendants, is annually visited by thousands of pilgrims. But the hallowed soil is never tilled, so that all provisions have to be brought from the surrounding districts.

HIRPINI (from an Oscan or Sabine stem *hirpo-*, "wolf"), an inland Samnite tribe in the south of Italy, whose territory was bounded by that of the Lucani on the S., the Campani on the S.W., the Appuli (Apuli) and Frentani on the E. and N.E. On the N. we find them, politically speaking, identified with the Pentri and Caracēni, and with them constituting the Samnite alliance in the wars of the 4th century B.C. (see SAMNITES). The Roman policy of separation cut them off from these allies by the foundation of Beneventum in 268 B.C., and henceforward they are a separate unit; they joined Hannibal in 216 B.C., and retained their independence until, after joining in the Social war, which in their part of Italy can hardly be said to have ceased till the final defeat of the Samnites by Sulla in 83 B.C., they received the Roman franchise. Of their Oscan speech, besides the evidence of their place-names, only a few fragments survive (R. S. Conway, *The Italic Dialects*, pp. 170 ff.; and for *hirpo-*, *ib.* p. 200). In the ethnology of Italy the Hirpini appear from one point of view as the purest type of Safine stock, namely, that in which the proportion of ethnica formed with the suffix *-no-* is highest, thirty-three out of thirty-six tribal or municipal epithets being formed thereby (*e.g. Caudini, Compsani*) and only one with the suffix *-ti-* (*Abellinates*), where it is clearly secondary. On the significance of this see SABINI. (R. S. C.)

HIRSAU (formerly *Hirschau*), a village of Germany, in the kingdom of Württemberg, on the Nagold and the Pforzheim-Horb railway, 2 m. N. of Calw. Pop. 800. Hirsau has some small manufactures, but it owes its origin and historical interest to its former Benedictine monastery, *Monasterium Hirsaugiense*, at one period one of the most famous in Europe. Its picturesque ruins, of which only the chapel with the library hall are still in good preservation, testify to the pristine grandeur of the establishment. It was founded about 830 by Count Erlafried of Calw, at the instigation of his son, Bishop Notting of Vercelli, who enriched it with, among other treasures, the body of St Aurelius. Its first occupants (838) were a colony of fifteen monks from Fulda, disciples of Hrabanus Maurus and Walafrid Strabo, headed by the abbot Liudebert. During about a century and a half, under the fostering care of the counts of Calw, it enjoyed great prosperity, and became an important seat of learning; but towards the end of the 10th century the ravages of the pestilence combined with the rapacity of its patrons, and the selfishness and immorality of its inmates, to bring it to the lowest ebb. After it had been desolate and in ruins for upwards of sixty years it was rebuilt in 1059, and under Abbot William—Wilhelm von Hirsau—abbot from 1069 to 1091, it more than regained its former splendour. By his *Constitutiones Hirsaugienses*, a new religious order, the Ordo Hirsaugiensis, was formed, the rule of which was afterwards adopted by many monastic establishments throughout Germany, such as those of Blaubeuren, Erfurt and Schaffhausen. The friend and correspondent of Pope Gregory VII., and of Anselm of Canterbury, Abbot William took active part in the politico-ecclesiastical controversies of his time; while a treatise from his pen, *De musica et tonis*, as well as the *Philosophicarum et astronomicarum institutionum libri iii.*, bears witness to his interest in science and philosophy. About the end of the 12th century the material and moral welfare of Hirsau was again very perceptibly on the decline; and it never afterwards again rose into importance. In consequence of the Reformation it was secularized in 1558; in 1692 it was laid in ruins by the French. The *Chronicon Hirsaugiense*, or, as in the later edition it is called, *Annales Hirsaugienses* of Abbot Trithemius (Basel, 1559; St Gall, 1690), is, although containing much that is merely legendary, an important source of information, not only on the affairs of this monastery, but also on the early history of Germany. The *Codex Hirsaugiensis* was edited by A. F. Gfrörer and printed at Stuttgart in 1843.

HIRSCH, MAURICE DE, BARON HIRSCH AUF GEREUTH, in the baronage of Bavaria (1831–1896), capitalist and philanthropist (German by birth, Austro-Hungarian by domicile), was born at Munich, 9th December 1831. His grandfather, the first Jewish landowner in Bavaria, was ennobled with the *prädikat* "auf Gereuth" in 1818; his father, who was banker to the Bavarian king, was created a baron in 1869. The family for generations has occupied a prominent position in the German Jewish community. At the age of thirteen young Hirsch was sent to Brussels to school, but when seventeen years old he went into business. In 1855 he became associated with the banking house of Bischoffsheim & Goldschmidt, of Brussels, London and Paris. He amassed a large fortune, which he increased by purchasing and working railway concessions in Austria, Turkey and the Balkans, and by speculations in sugar and copper. While living in great splendour in Paris and London and on his estates in Hungary, he devoted much of his time to schemes for the relief of his Hebrew co-religionists in lands where they were persecuted and oppressed. He took a deep interest in the educational work of the Alliance Israélite Universelle, and on two occasions presented the society

SpinSmart Software http://www.spinsmart.com

with gifts of a million francs. For some years he regularly paid the deficits in the accounts of the Alliance, amounting to several thousand pounds a year. In 1889 he capitalized his donations and presented the society with securities producing an annual income of £16,000. On the occasion of the fortieth anniversary of the emperor Francis Joseph's accession to the Austrian throne he gave £500,000 for the establishment of primary and technical schools in Galicia and the Bukowina. The greatest charitable enterprise on which he embarked was in connexion with the persecution of the Jews in Russia (see ANTI-SEMITISM). He gave £10.000 to the funds raised for the repatriation of the refugees in 1882, but, feeling that this was a very lame conclusion to the efforts made in western Europe for the relief of the Russian Jews, he offered the Russian Government £2,000,000 for the endowment of a system of secular education to be established in the Jewish pale of settlement. The Russian Government was willing to accept the money, but declined to allow any foreigner to be concerned in its control or administration. Thereupon Baron de Hirsch resolved to devote the money to an emigration and colonization scheme which should afford the persecuted Jews opportunities of establishing themselves in agricultural colonies outside Russia. He founded the Jewish Colonization Association as an English society, with a capital of £2,000,000, and in 1892 he presented to it a further sum of £7,000,000. On the death of his wife in 1899 the capital was increased to £11,000,000, of which £1,250,000 went to the Treasury, after some litigation, in death duties. This enormous fund, which is probably the greatest charitable trust in the world, is now managed by delegates of certain Jewish societies, chiefly the Anglo-Jewish Association of London and the Alliance Israélite Universelle of Paris, among whom the shares in the association have been divided. The association, which is prohibited from working for profit, possesses large colonies in South America, Canada and Asia Minor. In addition to its vast agricultural work it has a gigantic and complex machinery for dealing with the whole problem of Jewish persecution, including emigration and distributing agencies, technical schools, co-operative factories, savings and loan banks and model dwellings in the congested Russian jewries. It also subventions and assists a large number of societies all over the world whose work is connected with the relief and rehabilitation of Jewish refugees. Besides this great organization, Baron de Hirsch founded in 1891 a benevolent trust in the United States for the benefit of Jewish immigrants, which he endowed with £493,000. His minor charities were on a princely scale, and during his residence in London he distributed over £100,000 among the local hospitals. It was in this manner that he disposed of the whole gross proceeds derived from his successes on the English turf, of which he was a lavish patron. He raced, as he said himself, " for the London hospitals," and in 1892, when his filly, La Flêche, won the Oaks, St Leger and One Thousand Guineas, his donations from this source amounted to about £40,000. Baron de Hirsch married on 28th June 1855 Clara, daughter of Senator Bischoffsheim of Brussels (b. 1833), by whom he had a son and daughter, both of whom predeceased him. He died at Ogyalla, near Komorn, in Hungary, 21st April 1896. The baroness, who seconded her husband's charitable work with great munificence—their total benefactions have been estimated at £18,000,000,—died at Paris on the 1st of April 1899.

For details of Baron de Hirsch's chief charities see the annual reports of the Alliance Israélite Universelle and of the " Administration Centrale " of the Jewish Colonization Association. (L. W.)

HIRSCH, SAMSON RAPHAEL (1808–1888), Jewish theologian, was born in Hamburg in 1808 and died at Frankfort-on-the-Main in 1888. He opposed the reform tendency of Geiger (*q.v.*), and presented Jewish orthodoxy in a new and attractive light. His philosophical conception of tradition, associated as it was with conservatism in ritual practice, created what is often known as the Frankfort " Neo-Orthodoxy." Hirsch exercised a profound influence on the Synagogue and undoubtedly stemmed the tide of liberalism. His famous *Nineteen Letters* (1836), with which the Neo-Orthodoxy began, were translated into English by Drachmann (New York, 1899). Other works by Hirsch were *Horeb*, and commentaries on the Pentateuch and Psalms. These are marked by much originality, but their exegesis is fanciful. Three volumes of his essays have been published (1902–1908); these were collected as *Gesammelte Schriften* from his periodical *Jeschurun*.

For Hirsch's religious philosophy see S. A. Hirsch, *A Book of Essays* (London, 1905). (I. A.)

HIRSCHBERG, a town of Germany, in the Prussian province of Silesia, beautifully situated at the confluence of the Bober and Zacken, 1120 ft. above the sea-level, 48 m. S.E. of Görlitz, on the railway to Glatz, with branches to Grünthal and Schmiedeberg. Pop. (1905) 19,317. It is surrounded by pleasant promenades occupying the site of its former fortifications. It possesses an Evangelical church, the church of the Holy Cross, one of the six *Gnaden Kirchen* for the Silesian Protestants stipulated for in the agreement at Altranstädt between Charles XII. of Sweden and the emperor Joseph I. in 1707, four Roman Catholic churches, one of which dates from the 14th century, a synagogue, several schools, an orphanage and an asylum. The town is the principal emporium of commerce in the Silesian mountains, and its industries include the carding and spinning of wool, and the manufacture of linen and cotton fabrics, yarn, artificial flowers, paper, cement, porcelain, sealing-wax, blacking, chemicals and cider. There is also a lively trade in corn, wine and agricultural produce. The town is celebrated for its romantic surroundings, including the Cavalierberg, from which there is a splendid view, the Hausberg, the Helicon, crowned by a small Doric temple, the Kreuzberg, with walks commanding beautiful views, and the Sattler ravine, over which there is a railway viaduct. Hirschberg was in existence in the 11th century, and obtained town rights in 1108 from Duke Boleslaus of Poland. It withstood a siege by the Hussites in 1427, and an attack of the imperial troops in 1640. The foundation of its prosperity was laid in the 16th century by the introduction of the manufacture of linen and veils.

Hirschberg is also the name of a town of Thuringia on the Saale with manufactures of leather and knives. Pop. 2000.

HIRSON, a town of northern France in the department of Aisne, 35 m. by rail N.E. of Laon, on the Oise. Pop. (1906) 8335. It occupies an important strategic position close to the point of intersection of several railway lines, and not far from the Belgian frontier. For its defence there are a permanent fort and two batteries, near the railway junction. The town carries on the manufacture of glass bottles, tiles, iron and tin goods, wool-spinning and brewing.

HIRTIUS, AULUS (*c.* 90–43 B.C.), Roman historian and statesman. He was with Julius Caesar as legate in Gaul, but after the civil war broke out in 49 he seems to have remained in Rome to protect Caesar's interests. He was also a personal friend of Cicero. He was nominated with C. Vibius Pansa by Caesar for the consulship of 43; and after the dictator's assassination in March 44, he and his colleague supported the senatorial party against M. Antonius, with whom Hirtius had at first sided. The consuls set out for Mutina, where Antonius was besieging Decimus Brutus. On the 15th of April, Pansa was attacked by Antonius at Forum Gallorum, about 8 m. from Mutina, and lost his life in the engagement. Hirtius, however, compelled Antonius to retire on Mutina, where another battle took place on the 25th (or 27th) of April, in which Hirtius was slain. Of the continuations of Caesar's *Commentaries*—the eighth book of the Gallic war, the history of the Alexandrian, African and Spanish wars—the first is generally allowed to be by Hirtius; the Alexandrian war is perhaps by him (or Oppius); the last two are supposed to have been written at his request, by persons who had taken part in the events described, with a view to subsequent revision and incorporation in his proposed work on military commanders. The language of Hirtius is good, but his style is monotonous and lacks vigour.

Hirtius and the other continuators of Caesar are discussed in M. Schanz, *Geschichte der römischen Literatur*, i.; also R. Schneider, *Bellum Africanum* (1905). For the history of the period see under ANTONIUS; Cicero's *Letters* (ed. Tyrrell and Purser); G. Boissier, *Cicero and his Friends* (Eng. trans., 1897).

HISHĀM IBN AL-KALBĪ [Abū-l Mundhir Hishām ibn Maḥommed ibn us-Sā'ib ul-Kalb] d. *c.* 819), Arabic historian,

SpinSmart Software http://www.spinsmart.com

was born in Kufa, but spent much of his life in Bagdad. Like his father, on whose authority he relied largely, he collected information about the genealogies and history of the ancient Arabs. According to the *Fihrist* (see NADĪM) he wrote 140 works. As independent works they have almost entirely ceased to exist, but his account of the genealogies of the Arabs is continually quoted in the *Kitāb ul-Aghāni*.

Large extracts from another of his works, the *Kitāb ul-Asnām*, are contained in the *Khizānat ul-Adab* (iii. 242-246) and in the geography of Yāqūt (*q.v.*). These latter have been translated with comments by J. Wellhausen in his *Reste des arabischen Heidentums* (2nd ed., Berlin, 1897). (G. W. T.)

HISPELLUM (mod. Spello, *q.v.*), an ancient town of Umbria, Italy, 3 m. N. of Fulginiae, on the road between it and Perusia, 1030 ft. above sea-level. It does not appear to be mentioned before the time of Augustus, who founded a colony there (*Colonia Iulia Hispellum*) and extended its territory to the springs of the Clitumnus, which had originally belonged to the territory of Mevania. It received the name of Flavia Constans by a rescript of the emperor Constantine, a copy of which on a marble tablet is still preserved at Spello. The gate by which the town is entered is ancient and has three portrait statues above it; two other gates and a part of the city wall, built of rectangular blocks of local limestone, may still be seen, as also the ruins of what is possibly a triumphal arch (attributed to Augustus) and an amphitheatre, and perhaps of a theatre, close to the modern high-road, outside the town. (T. As.)

HISSAR, a district in Central Asia, lying between 66° 30′ and 70° E. and 39° 15′ and 37° N. and dependent on the amir of Bokhara. It forms that part of the basin of the Amu-darya or Oxus which lies on the north side of the river, opposite the Afghan province of Balkh. The western prolongation of the Tian-shan, which divides the basin of the Zarafshan from that of the upper Amu, after rising to a height of 12,300 ft., bifurcates in 67° 45′ E. The main chain, the southern arm of this bifurcation, designated the Hissar range, but sometimes called also Koh-i-tau, forms the N. and N.W. boundaries of Hissar. On the W. it is wholly bounded by the desert; the Amu limits it on the S. and S.E.; and Karateghin and Darvaz complete the boundary on the E. Until 1875 it was one of the least known tracts of Central Asia. Hissar is traversed from north to south by four tributaries of the Amu, viz. the Surkhab or Vakhsh, Kafirnihan, Surkhan and Shirabad-darya, which descend from the snowy mountains to the north and form a series of fertile valleys, disposed in a fan-shape, within which lie the principal towns. In the N.W. boundary range between Khuzar and Derbent is situated the defile formerly called the Iron Gate (Caspian Gates, Bāb-al-Hadīd, Dar Ahanīn and in Chinese T'ie-mēn-kuan) but now styled Buzghol-khana or the Goat-house. It was also called Kohluga, said to be a Mongol word meaning barrier. This pass is described as a deep but narrow chasm in a transverse range, whose rocks overhang and threaten to choke the tortuous and gloomy corridor (in places but five paces wide) which affords the only exit from the valley. In ancient times it was a vantage point of much importance and commanded one of the chief routes between Turkestan and India. Hsüan Tsang, the Chinese traveller, who passed through it in the 7th century, states that there were then two folding doors or gates, cased with iron and hung with bells, placed across the pass. Clavijo, the Spanish ambassador to the court of Timur, heard of this when he passed through the defile nearly 800 years later, but the gates had then disappeared.

The Surkhan valley is highly cultivated, especially in its upper portion. It supplies Bokhara with corn and sheep, but its chief products are rice and flax. The town of Hissar (pop. 15,000) commands the entrance into the fertile valleys of the Surkhan and Kafirnihan, just as Kabadian at the southern end of the latter defends them from the south. Hissar was long famous for its damascened swords and its silk goods. Kulab produces wheat in abundance, and gold is brought thither from the surrounding districts. Kabadian is a large, silk-producing town, and is surrounded with rice-fields.

The population consists principally of Uzbegs and Tajiks, the former predominating and gradually pushing the Tajiks into the hills. On the banks of the Amu there are Turkomans who work the ferries, drive sheep and accompany caravans. Lyuli (gipsies), Jews, Hindus and Afghans are other elements of the population. The climate of the valleys of Hissar and Kulab is pleasant, as they are protected by mountains to the north and open towards the south. They produce all the cereals and garden plants indigenous to Central Asia. Cotton is grown in the district of Shirabad; and cotton, wheat, flax, sheep and rock-salt are all exported.

History.—This country was anciently part of the Persian empire of the Achaemenidae, and probably afterwards of the Graeco-Bactrian kingdom, and then subject to the invading Asiatic tribes who broke up that kingdom, *e.g.* the Yue-chi. It was afterwards conquered by the Ephthalites or White Huns, who were subdued by the Turks in the early part of the 7th century. It then became subject successively to the Mahommedan invaders from Persia, and after to the Mongol dynasty of Jenghiz Khan, and to Timur and his successors. It subsequently became a cluster of Uzbeg states and was annexed by the amir of Bokhara (*q.v.*) in 1869–1870, soon after the Russian occupation of Samarkand. (J. T. Be.; C. El.)

HISSAR, a town and district of British India, in the Delhi division of the Punjab. The town is situated on the Rajputana railway and the Western Jumna canal, 102 m. W.N.W. of Delhi. Pop. (1901) 17,647. It was founded in 1356 by the emperor Feroz Shah, who constructed the canal to supply it with water; but this fell into decay during the 18th century, owing to the constant inroads of marauders. Hissar was almost completely depopulated during the famine of 1783, but was afterwards occupied by the famous Irish adventurer George Thomas, who built a fort and collected inhabitants. It is now chiefly known for its cattle and horse fairs, and has a cotton factory.

The DISTRICT comprises an area of 5217 sq. m. It forms the western border district of the great Bikanir desert, and consists for the most part of sandy plains dotted with shrub and brushwood, and broken by undulations towards the south, which rise into hills of rock like islands out of a sea of sand. The Ghaggar is its only river, whose supply is uncertain, depending much on the fall of rain in the lower Himalayas; its overflow in times of heavy rain is caught by *jhils*, which dry up in the hot season. The Western Jumna canal crosses the district from east to west, irrigating many villages. The soil is in places hard and clayey, and difficult to till; but when sufficiently irrigated it is highly productive. Old mosques and other buildings exist in parts of the district. Hissar produces a breed of large milk-white oxen, which are in great request for the carriages of natives. The district has always been subject to famine. The first calamity of this kind of which there is authentic record was in 1783; and Hissar has suffered severely in more recent famines. Its population in 1901 was 781,717, showing practically no increase in the decade, whereas in the previous decade there had been an increase of 15%. The climate is very dry, hot westerly winds blowing from the middle of March till July. Cotton weaving, ginning and pressing are carried on. The district is served by the Rajputana-Malwa, the Southern Punjab and the Jodhpur-Bikanir railways. The chief trading centres are Bhiwani, Hansi, Hissar and Sirsa.

Before the Mahommedan conquest, the semi-desert tract of which Hissar district now forms part was the retreat of Chauhan Rajputs. Towards the end of the 18th century the Bhattis of Bhattiana gained ascendancy after bloody struggles. To complete the ruin brought on by these conflicts, nature lent her aid in the great famine of 1783. Hissar passed nominally to the British in 1803, but they could not enforce order till 1810. Early in the mutiny of 1857 Hissar was wholly lost for a time to British rule, and all Europeans were either murdered or compelled to fly. The Bhattis rose under their hereditary chiefs, and the majority of the Mahommedan population followed their example. Before Delhi had been recovered, the rebels were utterly routed.

HISTIAEUS (d. 494 B.C.), tyrant of Miletus under the Persian king Darius Hystaspis. According to Herodotus he rendered great service to Darius while he was campaigning in Scythia by persuading his fellow-despots not to destroy the bridge over the Danube by which the Persians must return. Choosing his own reward for this service, he became possessor of territory near Myrcinus (afterwards Amphipolis), rich in timber and minerals. The success of his enterprise led to his being invited to Susa, where in the midst of every kind of honour he was virtually a prisoner of Darius, who had reason to dread his growing power in Ionia. During this period the Greek cities were left under native despots supported by Persia, Aristagoras, son-in-law of Histiaeus, being ruler of Miletus in his stead. This prince, having failed against Naxos in a joint expedition with the satrap Artaphernes, began to stir up the Ionians to revolt, and this result was brought to pass, according to Herodotus, by a secret message from Histiaeus. The revolt assumed a formidable character and Histiaeus persuaded Darius that he alone could quell it. He was allowed to leave Susa, but on his arrival at the coast found himself suspected by the satrap, and was ultimately driven to establish himself (Herodotus says as a pirate; more probably in charge of the Bosporus route) at Byzantium. After the total failure of the revolt at the battle of Lade, he made various attempts to re-establish himself, but was captured by the Persian Harpagus and crucified by Artaphernes at Sardis. His head was embalmed and sent to Darius, who gave it honourable burial. The theory of Herodotus that the Ionian revolt was caused by the single message of Histiaeus is incredible; there is evidence to show that the Ionians had been meditating since about 512 a patriotic revolt against the Persian domination and the "tyrants" on whom it rested (see Grote, *Hist. of Greece*, ed. 1907, especially p. 122 note; art. IONIA, and authorities; also S. Heinlein in *Klio*, 1909, pp. 341-351).

HISTOLOGY (Gr. *ἱστός*, web, tissue, properly the web-beam of the loom, from *ἱστάναι*, to make to stand), the science which deals with the structure of the tissues of plants and animals (see CYTOLOGY).

HISTORY. The word "history" is used in two senses. It may mean either the record of events, or events themselves. Originally (see below) limited to inquiry and statement, it was only in comparatively modern times that the meaning of the word was extended to include the phenomena which form or might form their subject. It was perhaps by a somewhat careless transference of ideas that this extension was brought about. Now indeed it is the commoner meaning. We speak of the "history of England" without reference to any literary narrative. We term kings and statesmen the "makers of history," and sometimes say that the historian only records the history which they make. History in this connexion is obviously not the record, but the thing to be recorded. It is unfortunate that such a double meaning of the word should have grown up, for it is productive of not a little confusion of thought.

History in the wider sense is all that has happened, not merely all the phenomena of human life, but those of the natural world as well. It includes everything that undergoes change; and as modern science has shown that there is nothing absolutely static, therefore the whole universe, and every part of it, has its history. The discovery of ether brought with it a reconstruction of our ideas of the physical universe, transferring the emphasis from the mathematical expression of static relationships to a dynamic conception of a universe in constant transformation; matter in equipoise became energy in gradual readjustment. Solids are solids no longer. The universe is in motion in every particle of every part; rock and metal merely a transition stage between crystallization and dissolution. This idea of universal activity has in a sense made physics itself a branch of history. It is the same with the other sciences—especially the biological division, where the doctrine of evolution has induced an attitude of mind which is distinctly historical.

But the tendency to look at things historically is not merely the attitude of men of science. Our outlook upon life differs in just this particular from that of preceding ages. We recognize the unstable nature of our whole social fabric, and are therefore more and more capable of transforming it. Our institutions are no longer held to be inevitable and immutable creations. We do not attempt to fit them to absolute formulae, but continually adapt them to a changing environment. Even modern architecture, notably in America, reflects the consciousness of change. The permanent character of ancient or medieval buildings was fitted only to a society dominated by static ideals. Now the architect builds, not for all time, but for a set of conditions which will inevitably cease in the not distant future. Thus our whole society not only bears the marks of its evolution, but shows its growing consciousness of the fact in the most evident of its arts. In literature, philosophy and political science, there is the same historical trend. Criticism no longer judges by absolute standards; it applies the standards of the author's own environment. We no longer condemn Shakespeare for having violated the ancient dramatic laws, nor Voltaire for having objected to the violations. Each age has its own expression, and in judging each we enter the field of history. In ethics, again, the revolt against absolute standards limits us to the relative, and morals are investigated on the basis of history, as largely conditioned by economic environment and the growth of intellectual freedom. Revelation no longer appeals to scientific minds as a source of knowledge. Experience on the other hand is history. As for political science, we do not regard the national state as that ultimate and final product which men once saw in the Roman Empire. It has hardly come into being before forces are evident which aim at its destruction. Internationalism has gained ground in Europe in recent years; and Socialism itself, which is based upon a distinct interpretation of history, is regarded by its followers as merely a stage in human progress, like those which have gone before it. It is evident that Freeman's definition of history as "past politics" is miserably inadequate. Political events are mere externals. History enters into every phase of activity, and the economic forces which urge society along are as much its subject as the political result.

In short the historical spirit of the age has invaded every field. The world-picture presented in this encyclopaedia is that of a dynamic universe, of phenomena in process of ceaseless change. Owing to this insistent change all things which happen, or seem to happen, are history in the broader sense of the word. The encyclopaedia itself is a history of them in the stricter sense,—the description and record of this universal process. This narrower meaning is the subject of the rest of this article.

The word "history" comes from the Gr. *ἱστορία*, which was used by the Ionians in the 6th century B.C. for the search for knowledge in the widest sense. It meant inquiry, investigation, not narrative. It was not until two centuries later that the *historikos*, the reciter of stories, superseded the *historeōn* (*ἱστορέων*), the seeker after knowledge. Thus history began as a branch of scientific research,—much the same as what the Athenians later termed philosophy. Herodotus himself was as much a scientific explorer as a reciter of narrative, and his life-long investigation was *historiē* in his Ionian speech. Yet it was Herodotus himself who first hinted at the new use of the word, applied merely to the details accumulated during a long search for knowledge. It is not until Aristotle, however, that we have it definitely applied to the literary product instead of the inquiry which precedes it. From Aristotle to modern times, history (Lat. *historia*) has been a form of literature. It is only in the scientific environment of to-day that we recognize once more, with those earliest of the forerunners of Herodotus, that history involves two distinct operations, one of which, investigation, is in the field of science, while the other, the literary presentation, is in the field of art.

The history of history itself is therefore two-fold. History as art flourishes with the arts. It calls upon the imagination and the literary gifts of expression. Its history does not run parallel with the scientific side, but rather varies in inverse ratio with scientific activity. Those periods which have been dominated by the great masters of style have been less interested in the criticism of the historian's methods of investigation than in the beauty of his rhetoric. The scientific historian, deeply interested

SpinSmart Software http://www.spinsmart.com

in the search for truth, is generally but a poor artist, and his uncoloured picture of the past will never rank in literature beside the splendid distortions which glow in the pages of a Michelet or Macaulay. History the art, in so far as it is conditioned upon genius, has no single traceable line of development. Here the product of the age of Pericles remains unsurpassed still; the works of Herodotus and Thucydides standing along with those of Pheidias as models for all time. On the other hand, history the science has developed so that it has not only gained recognition among historians as a distinct subject, but it has raised with it a group of auxiliary sciences which serve either as tools for investigation or as a basis for testing the results. The advance in this branch of history in the 19th century was one of its greatest achievements. The vast gulf which lies between the history of Egypt by Herodotus and that by Flinders Petrie is the measure of its achievement. By the mechanism now at his disposal the scientific explorer can read more history from the dust-heaps of Ābydos than the greatest traveller of antiquity could gather from the priests of Saïs. In tracing the history of history we must therefore keep in mind the double aspect.

History itself, this double subject, the science and the art combined, begins with the dawn of memory and the invention of speech. It is wrong to term those ages *pre-historic* whose history has not come down to us, including in one category the pre-literary age and the literary whose traces have been lost. Even the pre-literary had its history, first in myth and then in saga. The saga, or epos, was a great advance upon the myth, for in it the deeds of men replace or tend to replace the deeds of the gods. But we are still largely in the realm of imagination. Poetry, as Thucydides complained, is a most imperfect medium for fact. The bard will exaggerate or distort his story. True history, as a record of what really has happened, first reached maturity in prose. Therefore, although much of the past has been handed down to us in epic, in ballad and in the legends of folk-lore, we must turn from them to what became history in the narrower sense.

The earliest prose origins of history are the inscriptions. Their inadequacy is evident from two standpoints. Their permanence depends not upon their importance, but upon the durability of the substance on which they are inscribed. A note for a wedding ring baked into the clay of Babylon has been preserved, while the history of the greatest events has perished. In the second place they are sealed to all but those who know how to read them, and so they lie forgotten for centuries while oral tradition flourishes,—being within the reach of every man. It is only recently that archaeology, turning from the field of art, has undertaken to interpret for us this first written history. The process by which the modern fits together all the obtainable remains of an antiquity, and reconstructs even that past which left no written record, lies outside the field of this article. But such enlargement of the field of history is a modern scientific product, and is to be distinguished from the imperfect beginnings of history-writing which the archaeologist is able to decipher.

Next to the inscriptions,—sometimes identical with them,—are the early chronicles. These are of various kinds. Family chronicles preserved the memory of heroic ancestors whose deeds in the earliest age would have passed into the keeping of the bards. Such family archives were perhaps the main source for Roman historians. But they are not confined to Rome or Greece. Genealogies also pass from the bald verse, which was the vehicle for oral transmission, to such elaborate tables as those in which Manetho has preserved the dynasties of Egyptian Pharaohs.

In this field the priest succeeds the poet. The temple itself became the chief repository of records. There were simple religious annals, votive tablets recording miracles accomplished at a shrine, lists of priests and priestesses, accounts of benefactions, of prodigies and portents. In some cases, as in Rome, the pontiffs kept a kind of register, not merely of religious history, but of important political events as well. Down to the time of the Gracchi (131 B.C.) the Pontifex Maximus inscribed the year's events upon annual tablets of wood which were preserved in the Regia, the official residence of the pontiff in the Forum. These pontifical "annals" thus came to be a sort of civic history. Chronicles of the Greek cities were commonly ascribed to mythical authors, as for instance that of Miletus, the oldest, to Cadmus the inventor of letters. But they were continued and edited by men in whom the critical spirit was awakening, as when the chroniclers of Ionian towns began the criticism of Homer.

The first historians were the logographi of these Ionian cities; men who carried their inquiry (*historiē*) beyond both written record and oral tradition to a study of the world around them. Their "saying" (*logos*) was gathered mostly from contemporaries; and upon the basis of a widened experience they became critics of their traditions. The opening lines of Hecataeus of Miletus begin the history of the true historic spirit in words which read like a sentence from Voltaire. "Hecataeus of Miletus thus speaks: I write as I deem true, for the traditions of the Greeks seem to me manifold and laughable." Those words mark an epoch in the history of thought. They are the introduction to historical criticism and scientific investigation. Whatever the actual achievement of Hecataeus may have been, from his time onward the scientific movement was set going. Herodotus of Heraclea struggled to rationalize mythology, and established chronology on a solid basis. And finally Herodotus, a professional story-teller, rose to the height of genuine scientific investigation. Herodotus' inquiry was not simply that of an idle tourist. He was a critical observer, who tested his evidence. It is easy for the student now to show the inadequacy of his sources, and his failure here or there to discriminate between fact and fable. But given the imperfect medium for investigation and the absence of an archaeological basis for criticism, the work of Herodotus remains a scientific achievement, as remarkable for its approximation to truth as for the vastness of its scope. Yet it was Herodotus' chief glory to have joined to this scientific spirit an artistic sense which enabled him to cast the material into the truest literary form. He gathered all his knowledge of the ancient world, not simply for itself, but to mass it around the story of the war between the east and west, the Greeks and the Persians. He is first and foremost a story-teller; his theme is like that of the bards, a heroic event. His story is a vast prose epos, in which science is to this extent subordinated to art. "This is the showing forth of the Inquiry of Herodotus of Halicarnassus, to the end that neither the deeds of men may be forgotten by lapse of time, nor the works, great and marvellous, which have been produced, some by Hellenes, some by Barbarians, may lose their renown, and especially that the causes may be remembered for which these waged war with one another" (*i.e.* the Persian war).

In Thucydides a higher art than that of Herodotus was combined with a higher science. He scorned the story-teller "who seeks to please the ear rather than to speak the truth," and yet his rhetoric is the culmination of Greek historical prose. He withdrew from vulgar applause, conscious that his narrative would be considered "disappointing to the ear," yet he recast the materials out of which he constructed it in order to lift that narrative into the realm of pure literature. Speeches, letters and documents are reworded to be in tone with the rest of the story. It was his art, in fact, which really created the Peloponnesian war out of its separate parts. And yet this art was merely the language of a scientist. The "laborious task" of which he speaks is that of consulting all possible evidence, and weighing conflicting accounts. It is this which makes his rhetoric worth while, "an everlasting possession, not a prize competition which is heard and forgotten."

From the sublimity of Thucydides, and Xenophon's straightforward story, history passed with Theopompus and Ephorus into the field of rhetoric. A revival of the scientific instinct of investigation is discernable in Timaeus the Sicilian, at the end of the 4th century, but his attack upon his predecessors was the text of a more crushing attack upon himself by Polybius, who declares him lacking in critical insight and biased by passion. Polybius' comments upon Timaeus reach the dignity of a treatise upon history. He protests against its use for controversial pamphlets which distort the truth. "Directly a man assumes the moral attitude of an historian he ought to forget all

SpinSmart Software http://www.spinsmart.com

considerations, such as love of one's friends, hatred of one's enemies He must sometimes praise enemies and blame friends. For as a living creature is rendered useless if deprived of its eyes, so if you take truth from History, what is left but an improfitable tale" (bk. xii. 14). These are the words of a Ranke. Unfortunately Polybius, like most modern scientific historians, was no artist. His style is the very opposite of that of Isocrates and the rhetoricians. It is often only clear in the light of inscriptions, so closely does it keep to the sources. The style found no imitator; history passed from Greece to Rome in the guise of rhetoric. In Dionysius of Halicarnassus the rhetoric was combined with an extensive study of the sources; but the influence of the Greek rhetoricians upon Roman prose was deplorable from the standpoint of science. Cicero, although he said that the duty of the historian is to conceal nothing true, to say nothing false, would in practice have written the kind of history that Polybius denounced. He finds fault with those who are *non exornatores rerum sed tantum narratores*. History for him is the mine from which to draw argument in oratory and example in education. It is not the subject of a scientific curiosity.

It should be noted before we pass to Rome that with the expansion of Hellenism the subject of historians expanded as well. Universal history was begun by Ephorus, the rhetorician, and formed the theme of Polybius and Deodorus. Exiled Greeks were the first to write histories of Rome worthy of the name. The Alexandrian Eratosthenes placed chronology upon the scientific basis of astronomy, and Apollodorus drew up the most important *chronica* of antiquity.

History-writing in Rome,—except for the Greek writers resident there,—was until the first half of the 1st century B.C. in the form of annals. Then came rhetorical ornamentation,—and the Ciceronian era. The first Roman historian who rose to the conception of a science and art combined was Sallust, the student of Thucydides. The Augustan age produced in Livy a great popular historian and natural artist and a trained rhetorician (in the speeches),—but as uncritical and inaccurate as he was brilliant. From Livy to Tacitus the gulf is greater than from Herodotus to Thucydides. Tacitus is at least a consummate artist. His style ranges from the brilliancy of his youth to the sternness and sombre gravity of age, passing almost to poetic expression in its epigrammatic terseness. Yet in spite of his searching study of authorities, his keen judgment of men, and his perception of underlying principles of moral law, his view was warped by the heat of faction, which glows beneath his external objectivity. After him Roman history-writing speedily degenerated. Suetonius' *Lives of the Caesars* is but a superior kind of journalism. But his gossip of the court became the model for historians, whose works, now lost, furnish the main source for the *Historia Augusta*. The importance to us of this uncritical collection of biographies is sufficient comment on the decline of history-writing in the latter empire. Finally, from the 4th century the epitomes of Eutropius and Festus served to satisfy the lessening curiosity in the past and became the handbooks for the middle ages. The single figure of Ammianus Marcellinus stands out of this age like a belated disciple of Tacitus. But the world was changing from antique to Christian ideals just as he was writing, and with him we leave this outline of ancient history.

The 4th and 5th centuries saw a great revolution in the history of history. The story of the pagan past slipped out of mind, and in its place was set, by the genius of Eusebius, the story of the world force which had superseded it, Christianity, and of that small fraction of antiquity from which it sprang,—the Jews. Christianity from the first had forced thinking men to reconstruct their philosophy of history, but it was only after the Church's triumph that its point of view became dominant in historiography. Three centuries more passed before the pagan models were quite lost to sight. But from the 7th century to the 17th—from Isidore of Seville and the English Bede for a thousand years,—mankind was to look back along the line of Jewish priests and kings to the Creation. Egypt was of interest only as it came into Israelite history, Babylon and Nineveh were to illustrate the judgments of Yahweh, Tyre and Sidon to reflect the glory of Solomon. The process by which the "gentiles" have been robbed of their legitimate history was the inevitable result of a religion whose sacred books make them lay figures for the history of the Jews. Rejected by the Yahweh who became the Christian God, they have remained to the present day, in Sunday schools and in common opinion, not nations of living men, with the culture of arts and sciences, but outcasts who do not enter into the divine scheme of the world's history. When a line was drawn between pagan and Christian back to the creation of the world, it left outside the pale of inquiry nearly all antiquity. But it must be remembered that that antiquity was one in which the German nations had no personal interest. Scipio and the Gracchi were essentially unreal to them. The one living organization with which they came into touch was the Church. So Cicero and Pompey paled before Joshua and Paul. Diocletian, the organizing genius, became a bloodthirsty monster, and Constantine, the murderer, a saint.

Christian history begins with the triumph of the Church. With Eusebius of Caesarea the apologetic pamphlets of the age of persecutions gave way to a calm review of three centuries of Christian progress. Eusebius' biography of Constantine shows what distortion of fact the father of Church history permitted himself, but the Ecclesiastical History was fortunately written for those who wanted to know what really happened, and remains to-day an invaluable repository of Christian antiquities. With the continuations of Socrates, Sozomen and Theodoret, and the Latin manual which Cassiodorus had woven from them (the *Historia tripartita*), it formed the body of Church history during all the middle ages. An even greater influence, however, was exercised by Eusebius' *Chronica*. Through Jerome's translation and additions, this scheme of this world's chronology became the basis for all medieval world chronicles. It settled until our own day the succession of years from the Creation to the birth of Christ,—fitting the Old Testament story into that of ancient history. Henceforth the Jewish past,—that one path back to the beginning of the world,—was marked out by the absolute laws of mathematics and revelation. Jerome had marked it out; Sulpicius Severus, the biographer of St Martin, in his *Historia sacra*, adorned it with the attractions of romance. Sulpicius was admirably fitted to interpret the miraculous Bible story to the middle ages. But there were few who could write like him, and Jerome's *Chronicle* itself, or rather portions of it, became, in the age which followed, a sort of universal preface for the monastic chronicler. For a time there were even attempts to continue "imperial chronicles," but they were insignificant compared with the influence of Eusebius and Jerome.

From the first, Christianity had a philosophy of history. Its earliest apologists sought to show how the world had followed a divine plan in its long preparation for the life of Christ. From this central fact of all history, mankind should continue through war and suffering until the divine plan was completed at the judgment day. The fate of nations is in God's hands; history is the revelation of His wisdom and power. Whether He intervenes directly by miracle, or merely sets His laws in operation, He is master of men's fate. This idea, which has underlain all Christian philosophy of history, from the first apologists who prophesied the fall of the Empire and the coming of the millennium, down to our own day, received its classic statement in St Augustine's *City of God*. The terrestrial city, whose eternity had been the theme of pagan history, had just fallen before Alaric's Goths. Augustine's explanation of its fall passes in review not only the calamities of Roman history—combined with a pathetic perception of its greatness,—but carries the survey back to the origin of evil at the creation. Then over against this *civitas terrena* he sets the divine city which is to be realized in Christendom. The Roman Empire,—the last general form of the earthly city,—gives way slowly to the heavenly. This is the main thread of Augustine's philosophy of history. The mathematical demonstration of its truth was left by Augustine for his disciple, Paulus Orosius.

Orosius' *Seven Books of Histories against the Pagans*, written

SpinSmart Software http://www.spinsmart.com

as a supplement to the *City of God*, is the first attempt at a Christian "World History." This manual for the middle ages arranged the rise and fall of empires with convincing exactness. The history of antiquity, according to it, begins with Ninus. His realm was overthrown by the Medes in the same year in which the history of Rome began. From the first year of Ninus' reign until the rebuilding of Babylon by Semiramis there were sixty-four years; the same between the first of Procas and the building of Rome. Eleven hundred and sixty-four years after each city was built, it was taken,—Babylon by Cyrus, Rome by Alaric, and Cyrus' conquest took place just when Rome began the Republic. But before Rome becomes a world empire, Macedon and Carthage intervene, guardians of Rome's youth (*tutor curatorque*). This scheme of the four world-monarchies, which was to prevail through all the middle ages, was developed through seven books filled with the story of war and suffering. As it was Orosius' aim to show that the world had improved since the coming of Christ, he used Trogus Pompeius' war history, written to exalt Roman triumphs, to show the reverse of victory,—disaster and ruin. Livy, Caesar, Tacitus and Suetonius were plundered for the story of horrors; until finally even the Goths in Spain shine by contrast with the pagan heroes; and through the confusion of the German invasions one may look forward to Christendom,—and its peace.

The commonest form of medieval historical writing was the chronicle, which reaches all the way from monastic annals, mere notes on Easter tables, to the dignity of national monuments. Utterly lacking in perspective, and dominated by the idea of the miraculous, they are for the most part a record of the trivial or the marvellous. Individual historians sometimes recount the story of their own times with sober judgment, but seldom know how to test their sources when dealing with the past. Contradictions are often copied down without the writer noticing them; and since the middle ages forged and falsified so many documents,—monasteries, towns and corporations gaining privileges or titles of possession by the bold use of them,—the narrative of medieval writers cannot be relied upon unless we can verify it by collateral evidence. Some historians, like Otto of Freising, Guibert of Nogent or Bernard Gui, would have been scientific if they had had our appliances for comparison. But even men like Roger Bacon, who deplored the inaccuracy of texts, had worked out no general method to apply in their restoration. Toward the close of the middle ages the vernacular literatures were adorned with Villani's and Froissart's chronicles. But the merit of both lies in their journalistic qualities of contemporary narrative. Neither was a history in the truest sense.

The Renaissance marked the first great gain in the historic sense, in the efforts of the humanists to realize the spirit of the antique world. They did not altogether succeed; antiquity to them meant largely Plato and Cicero. Their interests were literary, and the un-Ciceronian centuries were generally ignored. Those in which the foundations of modern Europe were laid, which produced parliaments, cathedrals, cities, Dante and Chaucer, were grouped alike on one dismal level and christened the middle ages. The perspective of the humanists was only one degree better than that of the middle ages. History became the servant to literature, an adjunct to the classics. Thus it passed into the schools, where text-books still in use devote 200 pages to the Peloponnesian war and two to the Athens of Pericles.

But if the literary side of humanism has been a barrier to the progress of scientific history, the discovery and elucidation of texts first made that progress possible. Historical criticism soon awoke. Laurentius Valla's brilliant attack on the "Donation of Constantine" (1440), and Ulrich von Hutten's rehabilitation of Henry IV. from monkish tales mark the rise of the new science. One sees at a glance what an engine of controversy it was to be; yet for a while it remained but a phase of humanism. It was north of the Alps that it parted company with the grammarians. Classical antiquity was an Italian past, the German scholars turned back to the sources of their national history. Aeneas Sylvius Piccolomini (Pius II.) had discovered Otto of Freising and Jordanes. Maximilian I. encouraged the search for manuscripts, and Vienna became a great humanistic centre. Conrad Celtes left his *Germania illustrata* unfinished, but he had found the works of Hroswitha. Conrad Peutinger gathered all sorts of Chronicles in his room in Vienna, and published several,—among them Gregory of Tours. This national movement of the 15th century was not paralleled in France or England, where the classical humanities reigned. The Reformation meanwhile gave another turn to the work of German scholars.

The Reformation, with its heated controversies, seems a strange starting-point for science, yet it, even more than the Renaissance, brought out scientific methods of historical investigation. It not only sobered the humanist tendency to sacrifice truth for aesthetic effect, it called for the documents of the Church and subjected them to the most hostile criticism. Luther himself challenged them. Then in the *Magdeburg Centuries* (1559–1574) Protestantism tried to make good its attack on the medieval Church by a great collection of sources accompanied with much destructive criticism. This gigantic work is the first monument of modern historical research. The reply of Cardinal Baronius (*Annales ecclesiastici*, 1588–1697) was a still greater collection, drawn from archives which till then had not been used for scientific history. Baronius' criticism and texts are faulty, though far surpassing anything before his day, and his collection is the basis for most subsequent ones,—in spite of J. J. Scaliger's refutation, which was to contain an equal number of volumes of the errors in Baronius.

The movement back to the sources in Germany until the Thirty Years' War was a notable one. Collections were made by Simon Schard (1535–1573), Johannes Pistorius (1576–1608), Marquard Freher (1565–1614), Melchior Goldast (1576-1635) and others. After the war Leibnitz began a new epoch, both by his philosophy with its law of continuity in phenomena, and by his systematic attempt to collect sources through an association (1670). His plan to have documents printed as they were, instead of "correcting" them, was a notable advance. But from Leibnitz until the 19th century German national historiography made little progress,—although church historians like Mosheim and Neander stand out among the greatest historians of all time.

France had not paralleled the activity of Maximilian's Renaissance historians. The father of modern French history, or at least of historical research, was André Duchesne (1584–1640), whose splendid collections of sources are still in use. Jean Bodin wrote the first treatise on scientific history (*Methodus ad facilem historiarum cognitionem*, 1566), but he did not apply his own principles of criticism; and it was left for the Benedictine monks of the Congregation of St Maur to establish definitely the new science. The place of this school in the history of history is absolutely without a parallel. Few of those in the audiences of Molière, returning home under the grey walls of St Germain-des-Près, knew that within that monastery the men whose midnight they disturbed were laying the basis for all scientific history; and few of the later historians of that age have been any wiser. But when Luc d'Achery turned from exegetics to patristics and the lives of the saints, as a sort of Christian humanist, he led the way to that vast work of collection and comparison of texts which developed through Mabillon, Montfaucon, Ruinart, Martène, Bouquet and their associates, into the indispensable implements of modern historians. Here, as in the Reformation, controversy called out the richest product. Jean Mabillon's treatise, *De re diplomatica* (1681), was due to the criticisms of that group of Belgian Jesuits whose *Acta Sanctorum quotquot toto orbe coluntur* (1643, &c., see BOLLANDISTS) was destined to grow into the greatest repository of legend and biography the world has seen. In reply to D. Papebroch's criticisms of the chronicle of St Denis, Mabillon prepared this manual for the testing of medieval documents. Its canons are the basis, indeed, almost the whole, of the science of diplomatic (*q.v.*), the touchstone of truth for medieval research. Henceforth even the mediocre scholar had a body of technical rules by which to sort out the vast mass of apocrypha in medieval

SpinSmart Software http://www.spinsmart.com

documentary sources. Scientific history depends upon implements. Without manuals, dictionaries, and easy access to texts, we should go as far astray as any medieval chronicler. The France of the Maurists supplied the most essential of these instruments. The great "glossary" of Ducange is still in enlarged editions the indispensable encyclopaedia of the middle ages. Chronology and palaeography were placed on a new footing by Dom Bernard de Montfaucon's *Palaeographia graeca* (1708), the monumental *Art de vérifier les dates* (3rd ed., 1818–1831, in 38 vols.), and the *Nouveau Traité de diplomatique* (1750–1765) of Dom Tassin and Dom Toustain. The collections of texts which the Maurists published are too many and too vast to be enumerated here (see C. Langlois, *Manuel de bibliographie historique*, pp. 293 ff.). Dom Bouquet's *Historiens de la Gaule et de la France*—the national repertory for French historians—is but one of a dozen tasks of similar magnitude. During the 18th century this deep under-work of scientific history continued to advance, though for the most part unseen by the brilliant writers whose untrustworthy generalities passed for history in the salons of the old régime. Interrupted by the Revolution, it revived in the 19th century, and the roll of honour of the French École des Chartes has almost rivalled that of St-Germain-des-Prés.

The father of critical history in Italy was L. A. Muratori (1672–1750), the Italian counterpart of Leibnitz. His vast collection of sources (*Rerum Italicarum scriptores*), prepared amid every discouragement, remains to-day the national monument of Italian history; and it is but one of his collections. His output is perhaps the greatest of any isolated worker in the whole history of historiography. The same haste, but much less care, marked the work of J. D. Mansi (d. 1769), the compiler of the fullest collection of the Councils. Spain, stifled by the Inquisition, produced no national collection of sources during the 17th and 18th centuries, although Nicolas Antonio (d. 1684) produced a national literary history of the first rank.

England in the 16th century kept pace with Continental historiography. Henry VIII.'s chaplain, John Leland, is the father of English antiquaries. Three of the most precious collections of medieval manuscripts still in existence were then begun by Thomas Bodley (the Bodleian at Oxford), Archbishop Matthew Parker (Corpus Christi at Cambridge), and Robert Cotton (the Cottonian collection of the British Museum). In Elizabeth's reign a serious effort was made to arrange the national records, but until the end of the 18th century they were scattered in not less than fifteen repositories. In the 17th and 18th centuries English scholarship was enriched by such monuments of research as William Dugdale's *Monasticon*, Thomas Madox's *History of the Exchequer*, Wilkins's *Concilia*, and Thomas Rymer's *Foedera*. But these works, important as they were, gave but little idea of the wealth of historical sources which the 19th century was to reveal in England.

In the 19th century the science of history underwent a sort of industrial revolution. The machinery of research, invented by the genius of men like Mabillon, was perfected and set going in all the archives of Europe. Isolated workers or groups of workers grew into national or international associations, producing from archives vast collections of material to be worked up into the artistic form of history. The result of this movement has been to revolutionize the whole subject. These men of the factory—devoting their lives to the cataloguing of archives and libraries, to the publication of material, and then to the gigantic task of indexing what they have produced—have made it possible for the student in an American or Australian college to master in a few hours in his library sources of history which baffled the long years of research of a Martène or Rymer. The texts themselves have mostly become as correct as they can ever be, and manuals and bibliographies guide one to and through them, so that no one need go astray who takes the trouble to make use of the mechanism which is at his hand. For example, since the papal archives were opened, so many *regesta* have appeared that soon it will be possible to follow the letter-writing of the medieval popes day by day for century after century.

The apparatus for this research is too vast to be described here. Archives have been reformed, their contents catalogued or calendared; government commissions have rescued numberless documents from oblivion or destruction, and learned societies have supplemented and criticized this work and co-ordinated the results. Every state in Europe now has published the main sources for its history. The "Rolls" series, the *Monumenta Germaniae historica*, and the *Documents inédits* are but the more notable of such national products. A series of periodicals keeps watch over this enormous output. The files and indices of the *English Historical Review*, *Historische Zeitschrift*, *Revue historique*, or *American Historical Review* will alone reveal the strength and character of historical research in the later 19th century.

Every science which deals with human phenomena is in a way an implement in this great factory system, in which the past is welded together again. Psychology has been drawn upon to interpret the movements of revolutions or religions, anthropology and ethnology furnish a clue to problems to which the key of documents has been lost. Genealogy, heraldry and chronology run parallel with the wider subject. But the real auxiliary sciences to history are those which deal with those traces of the past that still exist, the science of language (philology), of writing (palaeography), of documents (diplomatic), of seals (sphragistics), of coins (numismatics), of weights and measures, and archaeology in the widest sense of the word. These sciences underlie the whole development of scientific history. Dictionaries and manuals are the instruments of this industrial revolution. Without them the literary remains of the race would still be as useless as Egyptian inscriptions to the fellaheen. Archaeology itself remained but a minor branch of art until the machinery was perfected which enabled it to classify and interpret the remains of the "pre-historic" age.

This is the most remarkable chapter in the whole history of history—the recovery of that past which had already been lost when our literary history began. The perspective stretches out as far the other side of Homer as we are this. The old "providential" scheme of history disintegrates before a new interest in the "gentile" nations to whose high culture Hebrew sources bore unwilling testimony. Biblical criticism is a part of the historic process. The Jewish texts, once the infallible basis of history, are now tested by the libraries of Babylon, from which they were partly drawn, and Hebrew history sinks into its proper place in the wide horizon of antiquity. The finding of the Rosetta stone left us no longer dependent upon Greek, Latin or Hebrew sources, and now fifty centuries of Egyptian history lie before us. The scientific historian of antiquity works on the hills of Crete, rather than in the quiet of a library with the classics spread out before him. There he can reconstruct the splendour of that Minoan age to which Homeric poems look back, as the Germanic epics looked back to Rome or Verona. His discoveries, co-ordinated and arranged in vast *corpora inscriptionum*, stand now alongside Herodotus or Livy, furnishing a basis for their criticism. Medieval archaeology has, since Quicherat, revealed how men were living while the monks wrote chronicles, and now cathedrals and castles are studied as genuine historic documents.

The immense increase in available sources, archaeological and literary, has remade historical criticism. Ranke's application of the principles of "higher criticism" to works written since the invention of printing (*Kritik neuerer Geschichtsschreiber*) was an epoch-making challenge of narrative sources. Now they are everywhere checked by contemporary evidence, and a clearer sense of what constitutes a primary source has discredited much of what had been currently accepted as true. This is true not only of ancient history, where last year's book may be a thousand years out of date, but of the whole field. Hardly an "old master" remains an authoritative book of reference. Gibbon, Grote, Giesebrecht, Guizot stand to-day by reason of other virtues than their truth. Old landmarks drop out of sight—*e.g.* the fall of the Western Empire in 476, the coming of the Greeks to Italy in 1450, dates which once enclosed the middle ages. The perspective changes—the Renaissance grows less and the middle

SpinSmart Software http://www.spinsmart.com

ages more; the Protestant Revolution becomes a complex of economics and politics and religion; the French Revolution a vast social reform in which the Terror was an incident, &c., &c. The result has been a complete transformation of history since the middle of the 19th century.

In the 17th century the Augustinian scheme of world history received its last classic statement in Bossuet's *Histoire universelle*. Voltaire's reply to it in the 18th (*Essai sur les mœurs*) attacked its limitations on the basis of deism, and its miraculous procedure on that of science. But while there are foreshadowings of the evolutionary theory in this work, neither the *philosophe* historians nor Hume nor Gibbon arrived at a constructive principle in history which could take the place of the Providence they rejected. Religion, though false, might be a real historic force. History became the tragic spectacle of a game of dupes—the real movers being priests, kings or warriors. The pawns slowly acquired reason, and then would be able to regulate the moves themselves. But all this failed to give a satisfactory explanation of the laws which determine the direction of this evolution. Giovanni Battista Vico (1668–1744) was the first to ask why there is no science of human history. But his lonely life and unrecognized labours leave him apart from the main movement, until his works were discovered again in the 19th century. It was A. L. H. Heeren who, at the opening of the 19th century, first laid that emphasis upon the economic factors in history which is to-day slowly replacing the Augustinian explanation of its evolution. Heeren's own influence, however, was slight. The first half of the century (apart from the scientific activity of Pertz, Guizot, &c.) was largely dominated by the romanticists, with their exaggeration of the individual. Carlyle's "great man theory of history" is logically connected with the age of Scott. It was a philosophy of history which lent itself to magnificent dramatic creations; but it explained nothing. It substituted the work of the genius for the miraculous intervention of Providence, but, apart from certain abstract formulae such as Truth and Right, knew nothing of why or how. It is but dealing in words to say that the meaning of it all is God's revelation of Himself. Granting that, what is the process? Why does it so slowly reveal the Right of the middle ages (as in slavery for instance) to be the Wrong to-day? Carlyle stands to Bossuet as the sage to the myth. Hegel got no closer to realities. His idealistic scheme of history, which makes religion the keynote of progress, and describes the function of each—Judaism to typify duty, Confucianism order, Mahommedanism justice, Buddhism patience, and Christianity love—does not account for the facts of the history enacted by the devotees. It characterizes, not the real process of evolution, but an ideal which history has not realized. Besides, it does not face the question how far religion itself is a product or a cause, or both combined.

In the middle of the century two men sought to incorporate in their philosophy the physical basis which Hegel had ignored in his spiritism—recognizing that life is conditioned by an environment and not an abstraction for metaphysics. H. T. Buckle, in his *History of Civilization in England* (1857), was the first to work out the influences of the material world upon history, developing through a wealth of illustration the importance of food, soil and the general aspect of nature upon the formation of society. Buckle did not, as is generally believed, make these three factors dominate all history. He distinctly stated that "the advance of European civilization is characterized by a diminishing influence of physical laws and an increasing influence of mental laws," and "the measure of civilization is the triumph of mind over external agents." Yet his challenge, not only to the theologian, but also to those "historians whose indolence of thought" or "natural incapacity" prevented them from attempting more than the annalistic record of events, called out a storm of protest from almost every side. Now that the controversy has cleared away, we see that in spite of Buckle's too confident formulation of his laws, his pioneer work in a great field marks him out as the Augustine of the scientific age. Among historians, however, Buckle's theory received but little favour for another generation. Meanwhile the economists had themselves taken up the problem, and it was from them that the historians of to-day have learned it. Ten years before Buckle published his history, Karl Marx had already formulated the "economic theory of history." Accepting with reservation Feuerbach's attack on the Hegelian "absolute idea," based on materialistic grounds (*Der Mensch ist, was er isst*), Marx was led to the conclusion that the causes of that process of growth which constitutes the history of society are to be found in the economic conditions of existence. From this he went on to socialism, which bases its militant philosophy upon this interpretation of history. But the truth or falseness of socialism does not affect the theory of history. In 1845 Marx wrote of the Young-Hegelians that to separate history from natural science and industry was like separating the soul from the body, and "finding the birthplace of history, not in the gross material production on earth, but in the misty cloud formation of heaven" (*Die heilige Familie*, p. 238). In his *Misère de la philosophie* (1847) he lays down the principle that social relationships largely depend upon modes of production, and therefore the principles, ideas and categories which are thus evolved are no more eternal than the relations they express, but are historical and transitory products. In the famous *Manifesto of the Communist Party* (1848) the theory was applied to show how the industrial revolution had replaced feudal with modern conditions. But it had little vogue, except among Socialists, until the third volume of *Das Kapital* was published in 1894, when its importance was borne in upon continental scholars. Since then the controversy has been almost as heated as in the days of the Reformation. It is an exaggeration of the theory which makes it an explanation of all human life, but the whole science of dynamic sociology rests upon the postulate of Marx.

The content of history always reflects the interests of the age in which it is written. It was so in Herodotus and in medieval chronicles. Modern historians began with politics. But as the complex nature of society became more evident in the age of democracy, the economic or sociological history gained ground. Histories of commerce and cities now rank beside those on war and kings, although there are readers still who prefer to follow the pennants of robber barons rather than to watch the slow evolution of modern conditions. The drum-and-trumpet history has its place like that of art, jurisprudence, science or philosophy. Only now we know that no one of these is more than a single glimpse at a vast complex of phenomena, most of which lie for ever beyond our ken.

This expansion of interest has intensified specialization. Historians no longer attempt to write world histories; they form associations of specialists for the purpose. Each historian chooses his own epoch or century and his own subject, and spends his life mastering such traces of it as he can find. His work there enables him to judge of the methods of his fellows, but his own remains restricted by the very wealth of material which has been accumulated on the single subject before him. Thus the great enterprises of to-day are co-operative—the *Cambridge Modern History*, Lavisse and Rambaud's *Histoire générale*, or Lavisse's *Histoire de France*, like Hunt and Poole's *Political History of England*, and Oncken's *Allgemeine Geschichte in Einzeldarstellungen*. But even these vast sets cover but the merest fraction of their subjects. The Cambridge history passes for the most part along the political crust of society, and seldom glances at the social forces within. This limitation of the professed historian is made up for by the growingly historical treatment of all the sciences and arts—a tendency noted before, to which this edition of the *Encyclopaedia Britannica* is itself a notable witness. Indeed, for a definition of that limitless subject which includes all the phenomena that stand the warp and stress of change, one might adapt a famous epitaph—*si historiam requiris, circumspice.*

BIBLIOGRAPHY.—See Ch. V. Langlois, *Manuel de bibliographie historique* (2 vols., 1904). This forms the logical bibliography of this article. It is a general survey of the whole apparatus of historical research, and is the indispensable guide to the subject. Similar bibliographies covering sections of history are noted with the articles where they properly belong, *e.g.* in English medieval history the manual of Chas. Gross, *Sources and Literature of English History;*

SpinSmart Software http://www.spinsmart.com

in German history the *Quellenkunde* of Dahlmann-Waitz (7th ed.); for France the *Bibliographie de l'histoire de France* of G. Monod (antiquated, 1888), or the *Sources de l'histoire de France* so ably begun by A. Molinier's volumes on the medieval period. Perhaps the sanest survey of the present scientific movement in history is the clear summary of Ch. V. Langlois and Ch. Seignobos, *Introduction to the Study of History* (trans. with preface by F. York Powell, London, 1898). Much more ambitious is E. Bernheim's *Lehrbuch der historischen Methode und der Geschichtsphilosophie mit Nachweis der wichtigsten Quellen und Hilfsmittel zum Studium der Geschichte* (3rd and 4th ed., Leipzig, 1903). (J. T. S.*)

HIT, a town of Asiatic Turkey, in the vilayet of Bagdad, on the west bank of the Euphrates, 70 m. W.N.W. of Bagdad, in 33° 38′ 8″ N., 42° 52′ 15″ E. It is picturesquely situated on a line of hills, partly natural, but in large part certainly artificial, the accumulation of centuries of former habitation, from 30 to 100 ft. in height, bordering the river. The houses are built of field stones and mud. A striking feature of the town is a lofty and well-proportioned minaret, which leans quite perceptibly. Behind and around Hit is an extensive but utterly barren plain, through which flow several streams of bitter water, coming from mineral springs. Directly behind the town are two bitumen springs, one cold and one hot, within 30 ft. of one another. The gypsum cliffs on the edge of the plain, and the rocks which crop out here and there in the plain, are full of seams of bitumen, and the whole place is redolent of sulphuretted hydrogen. Across the river there are naphtha springs. Indeed, the entire region is one possessing great potential wealth in mineral oils and the like. Hit, with its fringe of palms, is like an oasis in the desert occasioned by the outcrop of these deposits. From time immemorial it has been the chief source of supply of bitumen for Babylonia, the prosperity of the town depending always upon its bitumen fountains, which are still the property of the government, but are rented out to any one who wishes to use them. There is also a shipyard at Hit, where the characteristic Babylonian boats are still made, smeared within and without with bitumen. Hit is the head of navigation on the Euphrates. It is also the point from which the camel-post starts across the desert to Damascus. About 8 m. inland from Hit, on a bitter stream, lies the small town of Kubeitha. Hit is mentioned, under the name of Ist, in the Karnak inscription as paying tribute to Tethmosis (Thothmes) III. In the Bible (Ezra viii. 15) it is called Ahava; the original Babylonian name seems to have been *Ihi*, which becomes in the Talmud *Ihidakira*, in Ptolemy Ἰδικάρα, and in Zosimus and Ammianus Δακίρα and Diacira.

See Geo. Rawlinson's *Herodotus*, i. 179, and note by H. C. Rawlinson; J. P. Peters, *Nippur* (1897); H. V. Geere, *By Nile and Euphrates* (1904). (J. P. Pe.)

HITA, GINÉS PEREZ DE (1544?–1605?), Spanish novelist and poet, was born at Mula (Murcia) about the middle of the 16th century. He served in the campaign of 1569–1571 against the Moriscos, and in 1572 wrote a rhymed history of the city of Lorca which remained unpublished till 1889. He owes his wide celebrity to the *Historia de los bandos de Zegries y Abencerrajes* (1595–1604), better known as the *Guerras civiles de Granada*, which purports to be a chronicle based on an Arabic original ascribed to a certain Aben-Hamin. Aben-Hamin is a fictitious personage, and the *Guerras de Granada* is in reality a historical novel, perhaps the earliest example of its kind, and certainly the first historical novel that attained popularity. In the first part the events which led to the downfall of Granada are related with uncommon brilliancy, and Hita's sympathetic transcription of life at the Emir's court has clearly suggested the conventional presentation of the picturesque, chivalrous Moor in the pages of Mlle de Scudéry, Mme de Lafayette, Châteaubriand and Washington Irving. The second part is concerned with the author's personal experiences, and the treatment is effective; yet, though Calderón's play, *Amar después de la muerte*, is derived from it, the second part has never enjoyed the vogue or influence of the first. The exact date of Hita's death is unknown. His blank verse rendering of the *Crónica Troyana*, written in 1596, exists in manuscript.

HITCHCOCK, EDWARD (1793–1864), American geologist, was born of poor parents at Deerfield, Massachusetts, on the 24th of May 1793. He owed his education chiefly to his own exertions, and was preparing himself to enter Harvard College when he was compelled to interrupt his studies from a weakness in his eyesight. In 1815 he became principal of the academy of his native town; but he resigned this office in 1818 in order to study for the ministry. Having been ordained in 1821 pastor of the Congregational church of Conway, Mass., he employed his leisure in making a scientific survey of the western counties of the state. From 1825 to 1845 he was professor of chemistry and natural history, from 1845 to 1864 was professor of natural theology and geology at Amherst College, and from 1845 to 1854 was president; the college owed its early success largely to his energetic efforts, especially during the period of his presidency. In 1830 he was appointed state geologist of Massachusetts, and in 1836 was made geologist of the first district of the state of New York. In 1840 he received the degree of LL.D. from Harvard, and in 1846 that of D.D. from Middlebury College, Vermont. Besides his constant labours in geology, zoology and botany, Hitchcock took an active interest in agriculture, and in 1850 he was sent by the Massachusetts legislature to examine into the methods of the agricultural schools of Europe. In geology he made a detailed examination and exposition of the fossil footprints from the Triassic sandstones of the Connecticut valley. His collection is preserved in the Hitchcock Ichnological Museum of Amherst College, and a description of it was published in 1858 in his report to the Massachusetts legislature on the ichnology of New England. The footprints were regarded as those of reptiles, amphibia and birds (?). In 1857 he undertook, with the aid of his two sons, the geological survey of Vermont, which was completed in 1861. As a writer on geological science, Hitchcock was largely concerned in determining the connexion between it and religion, and employing its results to explain and support what he regarded as the truths of revelation. He died at Amherst, on the 27th of February 1864.

His son, CHARLES HENRY HITCHCOCK (1836–), did good service in geology, in Vermont, New Hampshire (1868–1878), and other parts of America, and became professor of geology at Dartmouth in 1868.

The following are Edward Hitchcock's principal works: *Geology of the Connecticut Valley* (1823); *Catalogue of Plants growing without cultivation in the vicinity of Amherst* (1829); *Reports on the Geology of Massachusetts* (1833–1841); *Elementary Geology* (1840; ed. 2, 1841; and later ed. with C. H. Hitchcock, 1862); *Fossil Footmarks in the United States* (1848); *Outline of the Geology of the Globe and of the United States in particular* (1853); *Illustrations of Surface Geology* (1856); *Ichnology of New England* (1858); *The Religion of Geology and its Connected Sciences* (1851; new ed., 1869); *Reminiscences of Amherst College* (1863); and various papers in the *American Journal of Science*, and other periodicals.

HITCHCOCK, GEORGE (1850–), American artist, was born at Providence, Rhode Island, in 1850. He graduated from Brown University in 1872 and from the law school of Harvard University in 1874; then turned his attention to art and became a pupil of Boulanger and Lefebvre in Paris. He attracted notice in the Salon of 1885 with his "Tulip Growing," a Dutch garden which he painted in Holland. He had for years a studio at Egmond, in the Netherlands. He became a Chevalier of the Legion of Honour, France; a member of the Vienna Academy of Arts, the Munich Secession Society, and other art bodies; and is represented in the Dresden gallery; the imperial collection, Vienna; the Chicago Art Institute, and the Detroit Museum of Fine Arts.

HITCHCOCK, ROSWELL DWIGHT (1817–1887), American divine, was born at East Machias, Maine, on the 15th of August 1817, graduated at Amherst College in 1836, and later studied at Andover Theological Seminary, Mass. After a visit to Germany he was a tutor at Amherst in 1839–1842, and was minister of the First (Congregational) Church, Exeter, New Hampshire, in 1845–1852. He became professor of natural and revealed religion in Bowdoin College, Brunswick, Maine, in 1852, and in 1855 professor of church history in the Union Theological Seminary in New York, of which he was president in 1880–1887. He died at Somerset, Mass., on the 16th of June 1887.

Among his works are: *Life of Edward Robinson* (1863); *Socialism* (1879); *Carmina Sanctorum* (with Z. Eddy and L. W. Mudge, 1885); and *Eternal Atonement* (1888).

SpinSmart Software http://www.spinsmart.com

HITCHIN, a market town in the Hitchin parliamentary division of Hertfordshire, England, on the small river Hiz, 32 m. N. from London by the Great Northern railway. Pop. of urban district (1901) 10,072. It is the junction of the main line with the Cambridge branch, and with a branch of the Midland railway to Bedford. The church of St Mary is Perpendicular, with a fine porch, a painting of the Adoration of the Magi, attributed to Rubens, a small crypt said to have been used by Cromwell as a prison for the Royalists, and many interesting monuments. Hitchin Priory is a mansion on the site of a Carmelite foundation of the early 14th century. A Gilbertine nunnery, founded later in the same century, stood adjacent to the church, and portions of the buildings appear in an existing block of almshouses. The grammar school (1632) was reconstituted in 1889 for boys and girls. Straw-plaiting, malting, brewing, and the cultivation and distillation of lavender and peppermint are carried on.

HITTITES, an ancient people, alluded to frequently in the earlier records of Israel, and also, under slightly variant names, in Egyptian records of the XVIIIth, XIXth and XXth Dynasties, and in Assyrian from about 1100 to 700 B.C. They appear also in the Vannic cuneiform texts, and are believed to be the authors of a class of monuments bearing inscriptions in a peculiar pictographic character, and widely distributed over Asia Minor and N. Syria, around which much controversy has raged during the past thirty years.

1. *The Bible.*—In the Old Testament the name of the race is written *Heth* (with initial aspirate), members of it being *Hitti, Hittim*, which the Septuagint renders χέτ, χεττα῀ος, χεττείν or χεττείμ, keeping, it will be noted, ε in the stem throughout. The race appears in two connexions. (*a*) In pre-Israelite Palestine, it is resident about Hebron (Gen. xxiii. 3), and in the central uplands (Num. xiii. 29). To Joshua (i. 4) is promised "from the wilderness and this Lebanon even unto the great river, the river Euphrates, all the land of the Hittites." The term "wilderness" here is of geographical ambiguity; but the promise is usually taken to mean that Palestine itself was part of the Hittite land before the coming of Israel; and an apostrophe of Ezekiel (xvi. 3) to Jerusalem, "thy mother (was) an Hittite," is quoted in confirmation. Under the monarchy we hear frequently of Hittites within the borders of Israel, but either as a small subject people, coupled with other petty tribes, or as individuals in the Jewish service (*e.g.* Uriah, in the time of David). It appears, therefore, that there survived in Palestine to late times a detached Hittite population, with which Hebrews sometimes intermarried (Judges iii. 5-6; Gen. xxvi. 34) and lived in relations now amicable, now tyrannical (*e.g.* Hittites were made tributary bondsmen by Solomon, 1 Kings ix. 20, 21; 2 Chron. viii. 7, 8). (*b*) An independent and powerful Hittite people was domiciled N. of Palestine proper, organized rather as a confederacy of tribes than a single monarchy (1 Kings x. 28; 2 Kings vii. 6). Presumably it was a daughter of these Hittites that Solomon took to wife. If the emendation of 2 Sam. xxiv. 64, "Tahtim-hodshi," based on the Septuagint version γῆν χεττείμ καδής be accepted, we hear of them at Kadesh on Orontes; and some minor Hittite cities are mentioned, *e.g.* Luz; but no one capital city of the race is clearly indicated. Carchemish, on the Euphrates, though mentioned three times (2 Chron. xxxv. 20; Isa. x. 9; Jer. xlvi. 2), is not connected explicitly with Hittites, a fact which is not surprising, since that city was no longer under a Hatti dynasty at the epoch of the Old Testament references. So far as the Old Testament goes, therefore, we gather that the Hittites were a considerable people, widely spread in Syria, in part subdued and to some extent assimilated by Israel, but in part out of reach. The latter portion was not much known to the Hebrews, but was vaguely feared as a power in the early days of the monarchy, though not in the later pre-Captivity period. The identification of the northern and southern Hittites, however, presents certain difficulties not yet fully explained; and it seems that we must assume Heth to have been the name both of a country in the north and of a tribal population not confined to that country.

2. *Egyptian Records.*—The decipherment of the inscriptions of the XVIIIth Theban Dynasty led, before the middle of the 19th century, to the discovery of the important part played in the Syrian campaigns of Tethmosis (Thothmes) III. by the H-t$_s$ (vulgarly transliterated *Kheta*, though the vocalization is uncertain). The coincidence of this name, beginning with an aspirate, led H. K. Brugsch to identify the Kheta with Heth. That identification stands, and no earlier Egyptian mention of the race has been found. Tethmosis III. found the Kheta ("Great" and "Little") in N. Syria, not apparently at Kadesh, but at Carchemish, though they had not been in possession of the latter place long (not in the epoch of Tethmosis I.'s Syrian campaign). They were a power strong enough to give the Pharaoh cause to vaunt his success (see also EGYPT: *Ancient History*, § "The New Empire"). Though he says he levied tribute upon them, his successors in the dynasty nearly all record fresh wars with the Kheta who appear as the northernmost of Pharaoh's enemies, and Amenophis or Amenhotep III. saw fit to take to wife Gilukhipa, a Syrian princess, who may or may not have been a Hittite. This queen is by some supposed to have introduced into Egypt certain exotic ideas which blossomed in the reign of Amenophis IV. The first Pharaoh of the succeeding dynasty, Rameses I., came to terms with a Kheta king called Saplel or Saparura; but Seti I. again attacked the Kheta (1366 B.C.), who had apparently pushed southwards. Forced back by Seti, the Kheta returned and were found holding Kadesh by Rameses II., who, in his fifth year, there fought against them and a large body of allies, drawn probably in part from beyond Taurus, the battle which occasioned the monumental poem of Pentaur. After long struggles, a treaty was concluded in Rameses's twenty-first year, between Pharaoh and "Kheta-sar" (*i.e.* Kheta-king), of which we possess an Egyptian copy. The discovery of a cuneiform tablet containing a copy of this same treaty, in the Babylonian language, was reported from Boghaz Keui in Cappadocia by H. Winckler in 1907. It argues the Kheta a people of considerable civilization. The Kheta king subsequently visited Pharaoh and gave him his daughter to wife. Rameses' successor, Mineptah, remained on terms with the Kheta folk; but in the reign of Rameses III. (Dyn. XX.) the latter seem to have joined in the great raid of northern tribes on Egypt which was checked by the battle of Pelusium. From this point (*c.* 1150 B.C.)—the point at which (roughly) the monarchic history of Israel in Palestine opens—Egyptian records cease to mention Kheta; and as we know from other sources that the latter continued powerful in Carchemish for some centuries to come, we must presume that the rise of the Israelite state interposed an effective political barrier.

3. *Assyrian Records.*—In an inscription of Tiglath Pileser I. (about 1100 B.C.), first deciphered in 1857, a people called *Khatti* is mentioned as powerful in Girgamish on Euphrates (*i.e.* Carchemish); and in other records of the same monarch, subsequently read, much mention is made of this and of other N. Syrian names. These Khatti appear again in the inscriptions of Assur-nazir-pal (early 9th century B.C.), in whose time Carchemish was very wealthy, and the Khatti power extended far over N. Syria and even into Mesopotamia. Shalmaneser II. (d. 825 B.C.) raided the Khatti and their allies year after year; and at last Sargon III., in 717 B.C., relates that he captured Carchemish and its king, Pisiris, and put an end to its independence. We hear no more of it thenceforward. These *Khatti*, there is no reasonable doubt, are identical with *Kheta*. (For the chronology see further under BABYLONIA AND ASSYRIA.)

4. *Other Cuneiform Records.*—The name of the race appears in certain of the Tel-el-Amarna letters, tablets written in Babylonian script to Amenophis (Amenhotep) IV. and found in 1892 on the site of his capital. Some of his governors in Syrian districts (*e.g.* one Aziru of Phoenicia) report movements of the Hittites, who were then pursuing an aggressive policy (about 1400 B.C.). There are also other letters from rulers of principalities in N. Syria (Mitanni) and E. Asia Minor (Arzawa), who write in non-Semitic tongues and are supposed to have been Hittites.

Certain *Khatē* or *Khati* are mentioned in the Vannic inscriptions (deciphered partially by A. H. Sayce and others) as attacked by

SpinSmart Software http://www.spinsmart.com

kings of Bianas (Van), and apparently domiciled on the middle Euphrates N. of Taurus in the 9th century B.C. This name again may safely be identified with *Khatti-Kheta*.

The Khatti also appear on a "prophecy-tablet," referring ostensibly to the time of Sargon of Agadé (middle of 4th millennium B.C.); but the document is probably of very much later date. Lastly, a fragmentary chronicle of the 1st Babylonian Dynasty mentions an invasion of Akkad by them about 1800 B.C.

From all these various sources we should gather that the Hittites were among the more important racial elements in N. Syria and S.E. Asia Minor for at least a thousand years. The limits at each end, however, are very ill defined, the superior falling not later than 2000 B.C. and the inferior not earlier than 600 B.C. This people was militant, aggressive and unsettled in the earlier part of that time; commercial, wealthy and enervated in the latter. A memorial of its trading long remained in Asia in the shape of the weight-measure called in cuneiform records the *maneh* "of Carchemish." These Hittites had close relations with other Asia Minor peoples, and at times headed a confederacy. During the later part of their history they were in continual contact with Assyria, and, as a Syrian power, and perhaps also as a Cappadocian one, they finally succumbed to Assyrian pressure.

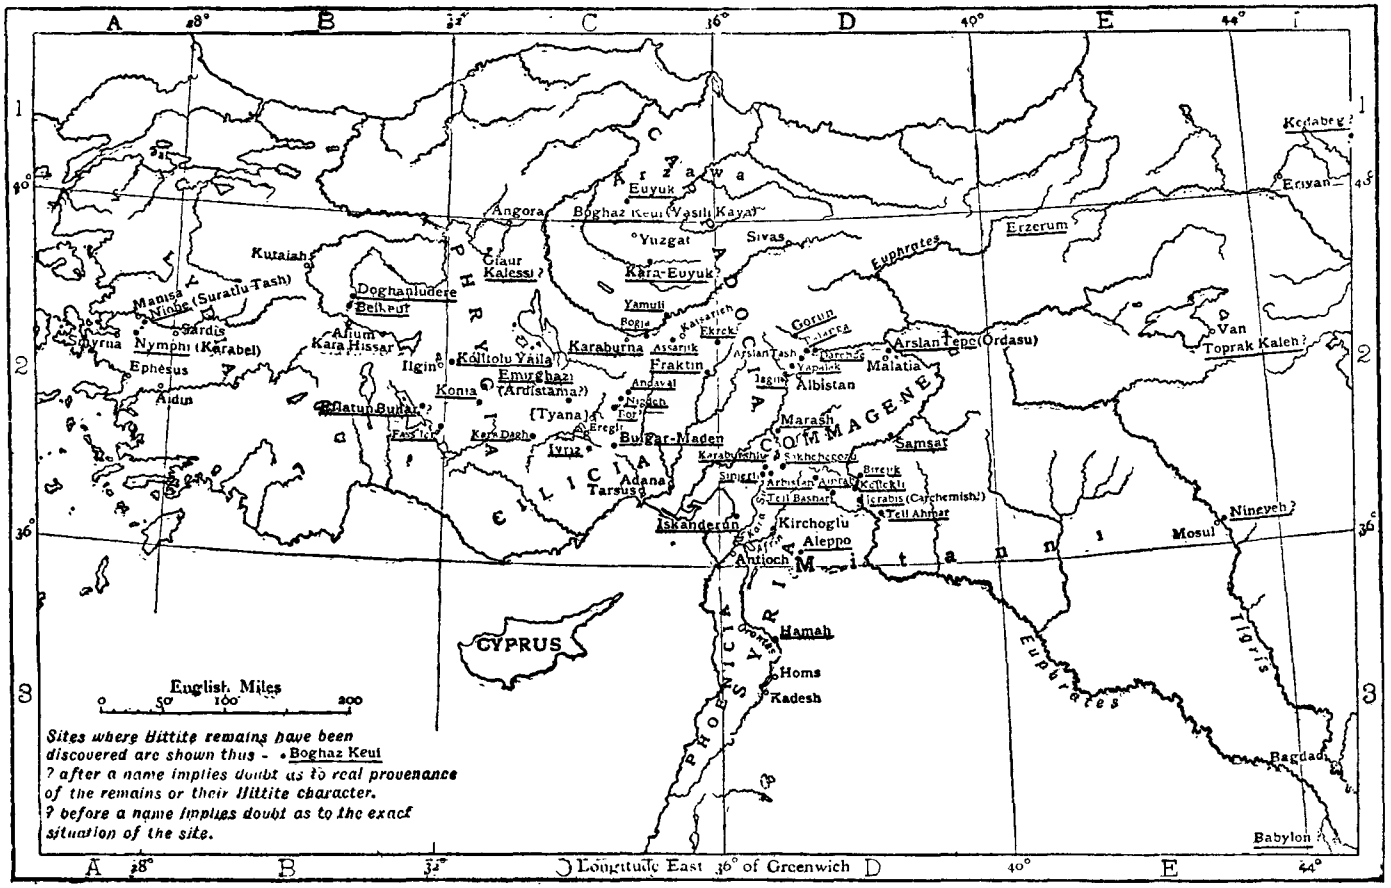
The "Hittite" Monuments.—It remains to consider in the light of the foregoing evidence a class of monuments to which attention began to be called about 1870. In that year two Americans, Consul J. A. Johnson and the Rev. S. Jessup, rediscovered, at Hamah (Hamath) on Orontes, five basaltic blocks bearing pictographic inscriptions in relief, one of which had been reported by J. L. Burckhardt in 1812. In spite of their efforts and subsequent attempts made by Tyrwhitt Drake and Richard Burton, when consul at Damascus, proper copies could not be obtained; and it was not till the end of 1872 that, thanks to W. Wright of Beirut, casts were taken and the stones themselves sent to Constantinople by Subhi Pasha of Damascus. As usually happens when a new class of antiquities is announced, it was soon found that the "Hamathite" inscriptions did not stand alone. A monument in the same script had been seen in Aleppo by Tyrwhitt Drake and George Smith in 1872. It still exists, built into a mosque on the western wall of the city. Certain clay sealings, eight of which bore pictographic signs, found by A. H. Layard in the palace of Assur-bani-pal at Kuyunjik (Nineveh), as long ago as 1851 and noticed then as in a "doubtful character," were compared by Hayes Ward and found to be of the Hamathite class. A new copy of the long known rock-sculpture at Ivriz[1] in S.W. Cappadocia was published by E. J. Davis in 1876, and clearly showed Hamathite characters accompanying the figures. Davis also reported, but did not see, a similar inscription at Bulgar Maden, not far away. Sculptures seen by W. Skene and George Smith at Jerablus, on the middle Euphrates, led to excavations being undertaken there, in 1878, by the British Museum, and to the discovery of certain Hamathite inscriptions accompanying sculptures, a few of which were brought to London. The conduct of these excavations, owing to the death of George Smith, devolved on Consul Henderson of Aleppo, and was not satisfactorily carried out. Meanwhile Wright, Ward and Sayce had all suggested "Hittite" as a substitute for "Hamathite," because no other N. Syrian people loomed so large in ancient records as did the Hittites, and the suggestion began to find acceptance. Jerablus was confidently identified with Carchemish (but without positive proof to this day), and the occurrence of Hamathite monuments there was held to confirm the Hittite theory.

In 1876 Sayce pointed out the resemblance between certain Hittite signs and characters in the lately deciphered Cypriote syllabary, and suggested that the comparison might lead to a beginning of decipherment; but the hope has proved vain. To this scholar, however, is owed the next great step ahead. In 1879 it first occurred to him to compare the rock-monuments at Boghaz Keui (see PTERIA) and Euyuk in N. Cappadocia, discovered by Texier and Hamilton in 1835 and subsequently explored by G. Perrot and E. Guillaume. These, he now saw, bore Hittite pictographs. Other rock-sculptures at Giaur Kalessi, in Galatia, and in the Karabel pass near Smyrna, he suspected of belonging to the same class[2]; and visiting the last-named locality in the autumn, he found Hittite pictographs accompanying one of the two figures.[3] He announced his discoveries in 1880, and proclaimed the fact that a great Hittite empire, extending from Kadesh to Smyrna, had risen from the dead. A month later he had the good fortune to recover copies of a silver boss, or hilt-top, offered to various museums about 1860, but rejected by them as a meaningless forgery and for a long time lost again to sight. Round the rim was a cuneiform legend, and in the field a Hittite figure with six Hittite symbols engraved twice over on either hand of it. Reading the cuneiform as *Tarqu-dimme sar mat Erme* (*i.e.* "T. king of the country E."), Sayce distributed phonetic values, corresponding to the syllables of the two proper names, among four of the Hittite characters, reserving two as "ideograms" of "king" and "country," and launched into the field of decipherment. But he subsequently recognized that this was a false start, and began afresh from another basis. Since then a number of other monuments have been found, some on new sites, others on sites already known to be Hittite, the distribution of which can be seen by reference to the accompanying map. It will be observed that, so far as at present known, they cluster most closely in Commagene, Cappadocia and S. Phrygia.

The following notes supplement the map:—

A. WEST ASIA MINOR.—"*Niobe*" (*Suratlu Tash*) and *Karabel* (two); rock-cut figures with much defaced hieroglyphs in relief. Remains of buildings, not yet explored, lie near the "Niobe" figure. Nothing purely Hittite has been found at Sardis or in any W. Asian excavation; but small Hittite objects have been sold in Smyrna and Aidin.

B. PHRYGIA.—*Giaur-Kalessi*; rock-cut figures and remains of a stronghold, but no inscriptions. *Doghanlüdere* and *Beikeui* in the Phrygian rock-monument country; at the first is a sculptured rock-panel with a few pictographs in relief; at the latter a fragment of an inscription in relief was disinterred from a mound. *Kolitolu Yaila*, near Ilghin; block inscribed in relief, disinterred from mounds apparently marking a camp or palace-enclosure. *Eflatun Bunar* (=Plato's Spring), W. of Konia; megalithic building with rude and greatly defaced reliefs, not certainly Hittite: no inscription. *Fassiler*, W. of Konia; gigantic *stela*, or composite statue (figure on animals), not certainly Hittite; no inscription. *Konia*; relief of warrior, drawn by Texier in 1835 and since lost; of very doubtful Hittite character. A gold inscribed Hittite ring, now at Oxford, was bought there in 1903. *Emirghazi* (anc. *Ardistama*?); three inscriptions in relief (two on altars) and large mounds. Evidently an important Hittite site. *Kara-Dagh*; hill-sanctuary with incised carving of seated figure and inscriptions, found by Miss G. L. Bell and Sir W. M. Ramsay in 1907 (see their *Thousand and One Churches*, 1909).



C. NORTH CAPPADOCIA.—*Boghaz Keui* (see PTERIA); large city with remains of palace, citadel, walls, &c. Long rock-cut inscription of ten lines in relief, two short relief inscriptions cut on blocks, and also cuneiform tablets in Babylonian and also in a native language, first found *in situ* in 1893, and showing the site to be the capital of Arzawa, whence came two of the Tell el-Amarna letters. Near the site are the rock reliefs of *Yasili Kaya* in two hypaethral galleries, showing, in the one, two processions composed of over sixty figures meeting at the head of the gallery; in the other, isolated groups of figures, fifteen in number (see for detailed description *Murray's Guide to Asia Minor*, 1895, pp. 23 ff.). Pictographs accompany many of the figures. The whole makes the most extensive group of Hittite remains yet known. Boghaz Keui was never thoroughly explored until 1907, the survey of Perrot and Guillaume having been superficial only and the excavations of E. Chantre (1894) very slight. In 1906 a German expedition under Professor H. Winckler undertook the work, and great numbers of cuneiform tablets were found. These refer to the reigns of at least four kings from Subbiluliuma (=Saplel, see above) to Hattusil II. or Khattusil (=Khetasar, see above). The latter was an ally of Katashmanturgu of Babylon,

[1] First described by the Turk, Hajji Khalifa, in the 17th century; first seen by the Swedish traveller Otter in 1736, and first published in 1840 in Ritter's *Erdkunde*, iii., after a drawing by Major Fischer, made in 1837.

[2] The "Niobe" statue near Manisa was not definitely known for "Hittite" till 1882, when G. Dennis detected pictographs near it.

[3] The "pseudo-Sesostres" of Herodotus, already demonstrated non-Egyptian by Rosellini. The second figure was unknown, till found by Dr Beddoe in 1856.

SpinSmart Software http://www.spinsmart.com

and powerful enough to write to the Babylonian court as a sovereign of equal standing. His letter shows that he considered the rise of Assyria a menace to himself. Winckler claims to read *Hatti* as the name of the possessors of Boghaz Keui, and to find in this name the proof of the Hittite character of Syro-Cappadocian power and of the imperial predominance of the city. But it remains to be proved whether these tablets were written there, and not rather, being in a foreign script, abroad, like most of the Tell el-Amarna archives. O. Puchstein has cleared and studied important architectural remains. *Euyuk*; large mound with remains of palace entered between sphinxes. Sculptured wall-dados, but no Hittite inscriptions. Cuneiform tablets; some Babylonian, others in a native language. Also inscriptions in early Phrygian character and language, found in 1894. The most famous of Hittite reliefs is here—a double-headed eagle "displayed" on the flank of one of the gateway sphinxes. This is supposed to have suggested to the Seljuks of Konia their heraldic device adopted in the 13th century, which, brought to Europe by the Crusaders, became the emblem of Teutonic empire in 1345. This derivation must be taken, however, *cum grano*, proof of its successive steps being wanting. *Kara-Euyuk*; a mound near Dedik, partially excavated by E. Chantre in 1894. Cuneiform tablets and small objects possibly, but not certainly, Hittite. A colossal eagle was found on a deserted site near *Yamuli* on the middle Halys, in 1907 by W. Attmore Robinson.

D. South Cappadocia.—*Karaburna*; long, incised rock-inscription. *Bogja*, eight hours west of Kaisariye; four-sided *stela* with incised inscription. *Assarjik*, on the side of Mt. Argaeus; incised rock-inscription. *Ekrek*; a fragmentary inscription in relief and an incised inscription on a *stela* of very late appearance. *Fraktin* or *Farakdin* (probably anc. *Das-tarkon*); sculptured rock-panel showing two groups of figures in act of cult, with hieroglyphs in relief. *Arslan Tash*, near Comana (Cappadocia), on the Soghan Dagh; two colossal lions, one with incised inscription. *Tashji* in the Zamanti valley; rock-relief with rudely incised inscription. *Andaval* and *Bor*; inscriptions incised on sculptured *stelae* of kings (?), probably from Tyana (*Ekuzli Hissar*). All are now in Constantinople. A silver seal with hieroglyphs, now at Oxford, came also from Bor. *Nigdeh*; basalt drum or altar with incised inscription. *Ivriz*; rock-sculpture of king adoring god, with three inscriptions in relief. A second sculpture, similar in subject but smaller and much defaced, was found hard by in 1906. *Bulgar Maden*; long incised rock inscription, near silver-mines. *Gorun* (Gurun); two rock-inscriptions in relief, much damaged. *Arslan-Tepe*, near Ordasu (two hours from Malatia); large mound whence two sculptured *stelae* or wall-blocks with inscriptions in relief have been unearthed (now in Constantinople and the Louvre). Four other reliefs, reported found near Malatia and published by J. Garstang in *Annals Arch. and Anthrop.*, 1908, probably came also from Arslan Tepe. *Palanga*; lower aniconic half of draped statue with incised inscription, now in Constantinople. Also a small basalt lion. *Arslan Tash*, near Palanga; two rude gateway lions, uninscribed. *Yapalak*; defaced inscription, reported by J. S. Sterrett but never copied. *Izgin*; obelisk with long inscription in relief on all four faces, now in Constantinople. These last four places seem to lie on a main road leading from Cappadocia to Marash and the Syrian sites. The expedition sent out by Cornell University in 1907 found several Hittite inscriptions on rocks near *Darende* in the valley of the Tokhma Su.

E. North Syria.—*Marash*; several monuments (*stelae*, wall-blocks and two lions) with inscriptions, both in relief and incised (part are now at Constantinople, part in Berlin and America); evidently one of the most important of Hittite sites. *Karaburshlu*, *Arbistan*, *Gerchin*, *Sinjerli*; mounds about the head-waters of the Kara Su. The last-named mound, brought to O. Puchstein's notice in 1882 by the chance discovery of sculptured wall-dados, now in Constantinople, was the scene of extensive German excavations in 1893–1894, directed by F. v. Luschan and K. Koldewey, and was found to cover a walled town with central fortified palace. Hittite, cuneiform and old Aramaean monuments were found with many small objects, most of which have been taken to Berlin; but no Hittite inscriptions came to light. *Sakchegeuzu* (Sakchegözu), a site with several mounds between Sinjerli and Aintab; series of reliefs, once wall-dados, now in Berlin and Constantinople. This site is in process of excavation by Professor J. Garstang of the University of Liverpool. A sculptured portico has come to light in the smallest of the five mounds, and much pottery, with incised and painted decoration, has been recovered. *Aintab*; fragment of relief inscription. *Samsat* (Samosata); sculptured *stela* with incised inscription much defaced. *Jerablus*; see above. Several Hittite objects sent from Birejik and Aintab to Europe probably came from Jerablus, others from *Tell Bashar* on the Sajur. *Kellekli*, near Jerablus; two *stelae*, one with relief inscription. *Iskanderun* (Alexandretta); source of a long inscription cut on both sides of a spheroidal object of unknown origin. *Kirchoglu*, a site on the Afrin, whence a fragmentary draped statue with incised inscription was sent to Berlin. *Aleppo*; inscription in relief (see above). *Tell Ahmar* (on left bank of Euphrates); large *stela* with sculpture and long relief inscription, found in 1908 with several sculptured slabs and two gateway lions, inscribed in cuneiform. Two hours south, a lion and a fragment of a relief inscription were found in 1909 by Miss G. L. Bell. *Tell Halaf* in Mid-Mesopotamia, near Ras el-Ain; sculptures on portico of a temple or palace; cuneiform inscriptions

SpinSmart Software http://www.spinsmart.com

and large mounds, explored in 1902 by Oppenheim. *Hamah*; five blocks inscribed in relief (see above).

F. OUTLYING SITES.—*Erzerum*; source of an incised inscription, perhaps not originally found there. *Kedabeg*; metal boss or hilt-top with pictographs, found in a tomb and stated by F. Hommel to be Hittite, but doubtful. *Toprak Kaleh*; bronze fragments with two pictographs; doubtful if Hittite. *Nineveh*; sealings, see above. *Babylon*; a bowl and a *stela* of storm-god, both with incised inscriptions; doubtless spoil of war or tribute brought from Syria. The bowl is inscribed round the outside, the *stela* on the back.

(For a detailed description of the subjects of the reliefs, &c., with the necessary illustrations, see the works indicated in the bibliography.)

Structures.—The structural remains found as yet on Hittite sites are few, scanty and far between. They consist of: (*a*) Ground plans of a palatial building and three temples and fortifications with sculptured gate at Boghaz Keui. The palace was built round a central court, flanked by passages and entered by a doorway of three *battants* hung on two columns. The whole plan bears more than a superficial resemblance to those of Cretan palaces in the later Minoan period. Only the rough core of the walls is standing to a height of about 3 ft. The fortifications of the citadel have an elaborate double gate with flanking towers. (*b*) Fortifications, palace, &c., at Sinjerli. The gates here are more elaborate than at Boghaz Keui, but planned with the same idea—that of entrapping in an enclosed space, barred by a second door, an enemy who may have forced the first door, while flanking towers would add to his discomfiture. The palace plan is again rectangular, with a central pillared hall, and very similar in plan to that of Boghaz Keui. The massive walls are also of similar construction. Dados of relief-sculpture run round the inner walls; this feature seems to have been common to Hittite buildings of a sumptuous kind, and accounts for most of the sculptured blocks that have been found, *e.g.* at Jerablus, Sakhchegeuzu, Euyuk, Arslan Tepe, &c. Columns, probably of wood, rested on bases carved as winged lions. (*c*) Gate with sculptured approach at Euyuk. The ground plan of the gate is practically the same in idea as that at Sinjerli. Structures were found at Jerablus, but never properly uncovered or planned. (*d*) Sculptured porticoes of temples or palaces uncovered at Sakchegeuzu and Tell Halaf (see above). On other sites, *e.g.* Arslan Tepe (Ordasu), Arbistan, Marash (above the modern town and near the springs), Beikeui, mounds, doubtless covering structures, may be seen, and sculptured slabs have been recovered. The mounds, probably Hittite, in N. Syria alone are to be counted by hundreds. No tombs certainly Hittite have been found,[1] though it is possible that some of the reliefs (*e.g.* at Fraktin) are of funerary character.

Sculptures and other Objects of Art.—The sculptures hitherto found consist of reliefs on rocks and on *stelae*, either honorific or funerary; reliefs on blocks forming parts of wall-dados; and a few figures more or less in the round, though most of these (*e.g.* the sphinxes of Euyuk and the lions of Arslan Tash and Marash) are not completely disengaged from the block. The most considerable sculptured rock-panels are at Boghaz Keui (see PTERIA); the others (Ivriz, Fraktin, Karabel, Giaur Kalessi, Doghanludere), it should be observed, all lie N. of Taurus—a fact of some bearing on the problem of the origin and local domicile of the art, since rock-reliefs, at any rate, cannot be otherwise than *in situ*. Sculptured *stelae*, honorific or funerary, all with pyramidal or slightly rounded upper ends, and showing a single regal or divine figure or two figures, have come to light at Bor, Marash, Sinjerli, Jerablus, Babylon, &c. These, like most of the rock-panels, are all marked as Hittite by accompanying pictographic inscriptions. The wall-blocks are seldom inscribed, the exceptions (*e.g.* the Arslan Tepe lion-hunt and certain blocks from Marash and Jerablus) being not more certainly wall-dados than *stelae*. The only fairly complete anthropoid statue known is the much-defaced "Niobe" at Suratlu Tash, engaged in the rock behind. The aniconic lower part of an inscribed statue wholly in the round was found at Palanga, and parts of others at Kirchoglu and Marash. Despite considerable differences in execution and details, all these sculptures show one general type of art, a type which recalls now Babylonian, now Assyrian, now Egyptian, now archaic Ionian, style, but is always individual and easily distinguishable from the actual products of those peoples. The figures, whether of men or beasts, are of a squat, heavy order, with internal features (*e.g.* bones, muscles, &c.) shown as if external, as in some Mesopotamian sculptures. The human type is always very brachycephalic, with brow receding sharply and long nose making almost one line with the sloping forehead. In the sculptures of the Commagene and the Tyana districts, the nose has a long curving tip, of very Jewish appearance, but not unlike the outline given to Kheta warriors in Egyptian scenes. The lips are full and the chin short and shaven. The whole physiognomy is fleshy and markedly distinct from that of other Syrians. At Boghaz Keui, Euyuk and Jerablus, the facial type is very markedly non-Semitic. But not much stress can be laid on these differences owing to (1) great variety of execution in different sculptures, which argues artists of very unequal capacity; (2) doubt whether individual portraits are intended in some cases and not in others. The hair of males is sometimes, but not always, worn in pigtail. The fashions of head-covering and clothes are very various, but several of them—*e.g.* the horned cap of the Ivriz god; the conical hat at Boghaz Keui, Fraktin, &c.; the "jockey-cap" on the Tarkudimme boss; the broad-bordered over-robe, and the upturned shoes—are not found on other Asiatic monuments, except where Hittites are portrayed. Animals in profile are represented more naturalistically than human beings, *e.g.* at Yasili Kaya, and especially in some pictographic symbols in relief (*e.g.* at Hamah). This, however, is a feature common to Mesopotamian and Egyptian, and perhaps to all primitive art.

The subjects depicted are processions of figures, human and divine (Yasili Kaya, Euyuk, Giaur Kalessi); scenes of sacrifice or adoration, or other cult-practice (Yasili Kaya, Euyuk, Fraktin, Ivriz, and perhaps the figures seated beside tables at Marash Sakchegeuzu, Sinjerli, &c.); of the chase (Arslan Tepe, Sakchegeuzu); but not, as known at present, of battle. Both at Euyuk and Yasili Kaya reliefs in one and the same series are widely separated in artistic conception and execution, some showing the utmost *naïveté*, others expressing both outline and motion with fair success. The fact warns us against drawing hasty inductions as to relative dates from style and execution.

Besides sculptures, well assured, Hittite art-products include a few small objects in metal (*e.g.* heavy, inscribed gold ring bought by Sir W. M. Ramsay at Konia; base silver seal, supported on three lions' claws, bought by D. G. Hogarth at Bor; inscribed silver boss of "Tarkudimme," mentioned above, &c., &c.); many intaglios in various stones (chiefly in steatite), mostly either spheroidal or gable-shaped, but a few scarabaeoid, conical or cylindrical, bearing sometimes pictographic symbols, sometimes divine, human or animal figures. The best collection is at Oxford. The majority are of very rude workmanship, bodies and limbs being represented by mere skeleton lines or unfilled outlines; a few vessels (*e.g.* inscribed basalt bowl found at Babylon) and fragments of ware painted with dark ornament on light body-clay, or in polychrome on a cream-white slip, or black burnished, found on N. Cappadocian sites, &c. The bronzes hitherto claimed as Hittite have been bought on the Syrian coast or come from not certainly Hittite sites in Cappadocia (see E. Chantre, *Mission en Cappadocie*). A great many small objects were found in the excavations at Sinjerli, including carved ivories, seals, toilet-instruments, implements, &c., but these have not been published. Nor, except provisionally, has the pottery, found at Sakchegeuzu.

Inscriptions.—These, now almost sixty in number (excluding seals), are all in a pictographic character which employed symbols somewhat elaborately depicted in relief, but reduced to conventional and "shorthand" representations in the incised texts. So far, the majority of our Hittite inscriptions, like those first found at Hamah, are in relief (cameo); but the incised characters, first observed in the Tyana district, have since been shown, by discoveries at Marash, Babylon, &c., to have had a

[1] Five intramural graves were explored at Sinjerli, but whether of the Hittite or of the Assyrian occupation is doubtful.

SpinSmart Software http://www.spinsmart.com

wider range. It has usually been assumed that the incised inscriptions, being the more conventionalized, are all of later date than those in relief; but comparison of Egyptian inscriptions, wherein both incised and cameo characters coexisted back to very early times, suggests that this assumption is not necessarily correct. The Hittite symbols at present known show about two hundred varieties; but new inscriptions continually add to the list, and great uncertainty remains as to the distinction of many symbols (*i.e.* whether mere variants or not), and as to many others which are defaced or broken in our texts. The objects represented by these symbols have been certainly identified in only a few instances. A certain number are heads (human and animal) detached from bodies, in a manner not known in the Egyptian hieroglyphic system, with which some of the other symbols show obvious analogies. Articles of dress, weapons, tools, &c., also appear. The longer inscriptions are disposed in horizontal zones or panels, divided by lines, and, it seems, they were to be read *boustrophedon*, not only as regards the lines (which begin right to left) but also the words, which are written in columnar fashion, syllable *below* syllable, and read downwards and upwards alternately. The direction of reading is towards any faces which may be shown among the pictographs. The words are perhaps distinguished in some texts by punctuation marks.

Long and patient efforts have been made to decipher this script, ever since it was first restored to our knowledge; and among the would-be decipherers honourable mention must be made, for persistence and courage, of Professor A. H. Sayce and of Professor P. Jensen. Other interpretations have been put forward by F. E. Peiser (based on conjectures as to the names on the Nineveh sealings), C. R. Conder (based largely on Cypriote comparisons and phonetic values transferred from these) and C. J. Ball (based on Hittite names recorded on Egyptian and Assyrian monuments, and applied to word-groups on the Hittite monuments). These, however, as having arbitrary and inadequate foundations, and for other reasons, have not been accepted. F. Hommel, J. Halévy and J. Menant have done useful work in distinguishing word-groups, and have essayed partial interpretations. No other decipherers call for mention. A. H. Sayce and P. Jensen alone have enlisted any large body of adherents; and the former, who has worked upon his system for thirty years and published in the *Proceedings of the Society for Biblical Archaeology* for 1907 a summary of his method and results, has proceeded on the more scientific plan. His system, however, like all others, is built in the main upon hypotheses incapable at present of quite satisfactory verification, such, for example, as the conjectural reading "Gargamish" for a group of symbols which recurs in inscriptions from Jerablus and elsewhere. In this case, to add to the other obvious elements of uncertainty, it must be borne in mind that the location of Carchemish at Jerablus is not proved, though it is very probable. Other conjectural identifications of groups of symbols with the place-names Hamath, Marash, Tyana are bases of Sayce's system. Jensen's system may be said to have been effectually demolished by L. Messerschmidt in his *Bemerkungen* (1898); but Sayce's system, which has been approved by Hommel and others, is probably in its main lines correct. Its frequent explanation, however, of incompatible symbols by the doctrines of phonetic variation and interchange, or by alternative values of the same symbol used as ideograph, determinative or phonetic complement, and the occasional use of circular argument in the process of "verification," do not inspire confidence in other than its broader results. Sayce's phonetic values and interpretations of determinatives are his best assured achievements. But the words thus arrived at represent a language on which other known tongues throw little or no light, and their meaning is usually to be guessed only. In some significant cases, however, the Boghaz Keui tablets appear to give striking confirmation of Sayce's conjectures.

Writing in 1903 L. Messerschmidt, editor of the best collection of Hittite texts up to date, made a *tabula rasa* of all systems of decipherment, asserting that only one sign out of two hundred – the bisected oval, determinative of divinity—had been interpreted with any certainty; and in view of this opinion, coupled with the steady refusal of historians to apply the results of any Hittite decipherment, and the obvious lack of satisfactory verification, without which the piling of hypothesis on hypothesis may only lead further from probability, there is no choice but to suspend judgment for some time longer as to the inscriptions and all deductions drawn from them.

Are the Monuments Hittite?—It is time to ask this question, although a perfectly satisfactory answer can only be expected when the inscriptions themselves have been deciphered. Almost all "Hittitologues" assume a connexion between the monuments and the Kheta-Khatti-Hittites, but in various degrees; *e.g.* while Sayce has said roundly that common sense demands the acceptance of all as the work of the Hittites, who were the dominant caste throughout a loosely-knit empire extending at one time from the Orontes to the Aegean, Messerschmidt has stated with equal dogmatism that the Hittites proper were only one people out of many[1] in N. Syria and Asia Minor who shared a common civilization, and that therefore they were authors of a part of the monuments only—presumably the N. Syrian, Commagenian and Cataonian groups. O. Puchstein[2] has denied to the Hittites some of the N. Syrian monuments, holding these of too late a date (judged by their Assyrian analogies) for the flourishing period of the Kheta-Khatti, as known from Egyptian and Assyrian records. He would ascribe them to the Kummukh (Commagenians), who seem to have succeeded the Khatti as the strongest opponents of Assyria in these parts. He was possibly right as regards the Sinjerli and Sakchegeuzu sculptures, which are of provincial appearance. The following considerations, however, may be stated in favour of the ascription of the monuments to the Hittites:—

(1) The monuments in question are found frequently whereever, from other records, we know the Hittites to have been domiciled at some period, *i.e.* throughout N. Syria and in Cataonia. (2) It was under the Khatti that Carchemish was a flourishing commercial city; and if Jerablus be really Carchemish, it is significant that apparently the most numerous and most artistic of the monuments occur there. (3) Among all the early peoples of N. Syria and Asia Minor known to us from Egyptian and Assyrian records, the Kheta-Khatti alone appear frequently as leading to war peoples from far beyond Taurus. (4) The Kheta certainly had a system of writing and a glyptic art in the time of Rameses II., or else the Egyptian account of their copy of the treaty would be baseless. (5) The physiognomy given to Kheta warriors by Egyptian artists is fairly representative of the prevailing type shown in the Hittite sculptures.

Furthermore, the Boghaz Keui tablets, though only partially deciphered as yet, go far to settle the question. They show that whether Boghaz Keui was actually the capital of the Hatti or not, it was a great city of the Hatti, and that the latter were an important element in Cappadocia from very early times. Before the middle of the 16th century B.C. the Cappadocian Hatti were already in relations, generally more or less hostile, with a rival power in Syria, that of Mitanni; and Subbiluliuma (=Saplel or Saparura), king of these Hatti, a contemporary of Amenophis IV. and Rameses I., seems to have obtained lasting dominion in Syria by subduing Dushratta of Mitanni. Carchemish thenceforward became a Hatti city and the southern capital of Cappadocian power. Since all the Syrian monuments of the Hittite class, so far known, seem comparatively late (most show such strong Assyrian influence that they must fall after 1100 B.C. and probably even considerably later), while the North Cappadocian monuments (as Sayce, Ramsay, Perrot and others saw long ago) are the earlier in style, we are bound to ascribe the origin of the civilization which they represent to the Cappadocian Hatti.

[1] The Assyrian records, as well as the Egyptian, distinguish many peoples in both areas from the Kheta-Khatti; and the most we can infer from these records is that there was an occasional league formed under the Hittites, not any imperial subjection or even a continuous federation.

[2] *Pseudo-Hethitische Kunst* (Berlin, 1890).

SpinSmart Software http://www.spinsmart.com

Whether the Mitanni had shared in that civilization while independent, and whether they were racially kin to the Hatti, cannot be determined at present. Winckler has adduced evidence from names of local gods to show that there was an Indo-European racial element in Mitanni; but none for a similar element in the Hatti, whose chief god was Teshub. The majority of scholars has always regarded the Hittites proper as, at any rate, non-Semitic, and some leading authorities have called them proto-Armenian, and believed that they have modern descendants in the Caucasus. This racial question can hardly be determined till those Hatti records, whether in cuneiform or pictographic script, which are couched in a native tongue, not in Babylonian, are read. In the meantime we have proper names to argue from; and these give us at least the significant indication that the Hittite nominative ended in *s* and the accusative in *m*. In any case the connexion of the Hatti with the peculiar class of monuments which we have been describing, can hardly be further questioned; and it has become more than probable that the Hatti of Cappadocia were responsible in the beginning for the art and script of those monuments and for the civilization of which they are memorials. Other peoples of north Syria and Asia Minor (*e.g.* the Kummukh or Commagenians and the Muski or Phrygians) came no doubt under the influence of this civilization and imitated its monuments, while subject to or federated with the Hatti. Through Phrygia and Lydia (*q.v.*) influences of this same Cappadocian civilization passed towards the west; and indeed, before the Greek colonization of Asia Minor, a loosely knit Hatti empire may have stretched even to the Aegean. The Nymphi (Kara Bel) and Niobe sculptures near Smyrna are probably memorials of that extension. Certainly some inland Anatolian power seems to have kept Aegean settlers and culture away from the Ionian coast during the Bronze Age, and that power was in all likelihood the Hatti kingdom of Cappadocia. Owing perhaps to Assyrian aggression, this power seems to have begun to suffer decay about 1000 B.C. and thereafter to have shrunk inwards, leaving the coasts open. The powers of Phrygia and Lydia rose successively out of its ruins, and continued to offer westward passage to influences of Mesopotamian culture till well into historic times. The Greeks came too late to Asia to have had any contact with Hatti power obscured from their view by the intermediate and secondary state of Phrygia. Their earliest writers regarded the latter as the seat of the oldest and most godlike of mankind. Only one Greek author, Herodotus, alludes to the prehistoric Cappadocian power and only at the latest moment of its long decline. At the same time, some of the Greek legends seem to show that peoples, with whom the Greeks came into early contact, had vivid memories of the Hatti. Such are the Amazon stories, whose local range was very extensive, and the myths of Memnon and Pelops. The real reference of these stories, however, was forgotten, and it has been reserved to our own generation to rediscover the records of a power and a civilization which once dominated Asia Minor and north Syria and occupied all the continental roads of communication between the East and the West of the ancient world. The credit of having been the first to divine this importance of the Hittites should always be ascribed to Sayce.

The history of the Hatti and their civilization, then, would appear to have been, very briefly, this. They belonged to an ethnic scattered widely over Eastern Asia Minor and Syria at an early period (Khatti invaded Akkad about 1800 B.C. in the reign of Samsuditana); but they first formed a strong state in Cappadocia late in the 16th century B.C. Subbiluliuma became their first great king, though he had at least one dynastic predecessor of the name of Hattusil. The Hatti now pushed southwards in force, overcame the kingdom of Mitanni and proceeded partly to occupy and partly to make tributary both north Syria and western Mesopotamia where some of their congeners were already settled. They came early into collision with Egypt, and at the height of their power under Hattusil II. fought the battle of Kadesh with Rameses II., on at least equal terms. Both now and previously the diplomatic correspondence of the Hatti monarchs shows that they treated on terms of practical equality with both the Babylonian and the Egyptian courts; and that they waged constant wars in Syria, mainly with the Amorite tribes. At this time the Hatti empire or confederacy probably included, on the west, both Phrygia and Lydia. The Boghaz Keui correspondence ceases to be important with the generation following Hattusil II., and in the Assyrian records, which begin about a couple of centuries later, we find Carchemish the chief Hatti city and N. Syria called the Hatti-land. It is possible therefore that a change of imperial centre took place after the Hatti had ceased to fear Egypt in north Syria. If so, the continuation of Hittite history will have to be sought among the remains at Jerablus and other middle Euphratean sites, rather than in those at Boghaz Keui. The establishment of the Hatti at Carchemish not only made them a commercial people and probably sapped their highland vigour, but also brought them into closer proximity to the rising North Semitic power of Assyria, whose advent had been regarded with apprehension by Hattusil II. (see above). One of his successors, Arnaunta (late 13th century?), was already feeling the effect of Assyrian pressure, and with the accession of Tiglath Pileser I., about a century later, a long but often interrupted series of Assyrian efforts to break up the Hatti power began. A succession of Ninevite armies raided north Syria and even south-east Asia Minor, and gradually reduced the Hatti. But the resistance of the latter was sturdy and prolonged. They remained the strongest power in Syria and eastern Asia Minor till well into the first millennium B.C., and their Syrian seat was not lost finally till after the great extension of Assyrian power which took place in the latter part of the 9th century. What had been happening to their Cappadocian province meanwhile we do not yet know; but the presence of Phrygian inscriptions at Euyuk and Tyana, ancient seats of their power, suggests that the client monarchy in the Sangarius valley shook itself free during the early part of the Hittite struggle with Assyria, and in the day of Hatti weakness extended its dominion over the home territory of its former suzerain. "White Syrians," however, were still in Cappadocia even after the Cimmerians had destroyed the Phrygian monarchy, allowing Lydia to become independent under the Mermnad dynasty. Croesus found them centred at Pteria in the 6th century and dealt them a final blow. But much of their secular or religious custom lived on to be recorded by Greek writers, and regarded by modern scholars as typically "Anatolian."

(D. G. H.)

HITTORFF, JACQUES IGNACE (1792–1867), French architect, was born at Cologne on the 20th of August 1792. After serving an apprenticeship to a mason in his native town, he went in 1810 to Paris, and studied for some years at the Academy of Fine Arts, where he was a favourite pupil of Bélanger, the government architect, who in 1814 appointed him his principal inspector. Succeeding Bélanger as government architect in 1818, he designed many important public and private buildings in Paris and also in the south of France. From 1819 to 1830 in collaboration with le Cointe he directed the royal fêtes and ceremonials. After making architectural tours in Germany, England, Italy and Sicily, he published the result of his observations in the latter country in the work *Architecture antique de la Sicile* (3 vols., 1826–1830; new edition, 1866–1867), and also in *Architecture moderne de la Sicile* (1826–1835). One of his important discoveries was that colour had been made use of in ancient Greek architecture, a subject which he especially discussed in *Architecture polychrome chez les Grecs* (1830) and in *Restitution du temple d'Empédocle à Sélinunte* (1851); and in accordance with the doctrines enunciated in these works he was in the habit of making colour an important feature in most of his architectural designs. His principal building is the church of St Vincent de Paul in the basilica style, which was constructed between 1830 and 1844. He also designed the two fountains in the Place de la Concorde, the Circus of the Empress, the Rotunda of the panoramas, many cafés and restaurants of the Champs Elysées, the houses forming the circle round the Arc de Triomphe de l'Étoile, besides many embellishments of the Bois de Boulogne and other places. In 1833 he was elected a member of the Academy of Fine Arts. He died in Paris on the 25th of March 1867.

HITZACKER, a town of Germany, in the Prussian province of Hanover at the influx of the Jeetze into the Elbe, 33 m. N.E. of Lüneburg by the railway to Wittenberge. Pop. (1905) 1106. It has an Evangelical church and an old castle and numerous medieval remains. There are chalybeate springs and a hydropathic establishment in the town. The famous library now in Wolfenbüttel was originally founded here by Augustus, duke of Brunswick (d. 1666) and was removed to its present habitation in 1643.

HITZIG, FERDINAND (1807–1875), German biblical critic, was born at Hauingen, Baden, where his father was a pastor, on the 23rd of June 1807. He studied theology at Heidelberg under H. E. G. Paulus, at Halle under Wilhelm Gesenius and at Göttingen under Ewald. Returning to Heidelberg he became *Privatdozent* in theology in 1829, and in 1831 published his *Begriff der Kritik am Alten Testamente praktisch erörtert*, a study of Old Testament criticism in which he explained the critical principles of the grammatico-historical school, and his *Des Propheten Jonas Orakel über Moab*, an exposition of the 15th and 16th chapters of the book of Isaiah attributed by him to the prophet Jonah mentioned in 2 Kings xiv. 25. In 1833 he was called to the university of Zürich as professor ordinarius of theology. His next work was a commentary on Isaiah with a translation (*Übersetzung u. Auslegung des Propheten Jesajas*), which he dedicated to Heinrich Ewald, and which Hermann Hupfeld (1796–1866), well known as a commentator on the Psalms (1855–1861), pronounced to be his best exegetical work. At Zürich he laboured for a period of twenty-eight years, during which, besides commentaries on *The Psalms* (1835–1836; 2nd ed., 1863–1865), *The Minor Prophets* (1838; 3rd ed., 1863), *Jeremiah* (1841; 2nd ed., 1866), *Ezekiel* (1847), *Daniel* (1850), *Ecclesiastes* (1847), *Canticles* (1855), and *Proverbs* (1858), he published a monograph, *Über Johannes Markus u. seine Schriften* (1843), in which he maintained the chronological priority of the second gospel, and sought to prove that the Apocalypse was written by the same author. He also published various treatises of archaeological interest, of which the most important are *Die Erfindung des Alphabets* (1840), *Urgeschichte u. Mythologie der Philistäer* (1845), and *Die Grabschrift des Eschmunezar* (1855). After the death of Friedrich Umbreit (1795–1860), one of the founders of the well-known *Studien und Kritiken*, he was called in 1861 to succeed him as professor of theology at Heidelberg. Here he wrote his *Geschichte des Volkes Israel* (1869–1870), in two parts, extending respectively to the end of the Persian domination and to the fall of Masada, A.D. 72, as well as a work on the Pauline epistles, *Zur Kritik Paulinischer Briefe* (1870), on the Moabite Stone, *Die Inschrift des Mescha* (1870), and on Assyrian, *Sprache u. Sprachen Assyriens* (1871), besides revising the commentary on Job by Ludwig Hirzel (1801–1841), which was first published in 1839. He was also a contributor to the *Monatsschrift des wissenschaftlichen Vereins in Zürich*, the *Zeitschrift der deutschen morgenländischen Gesellschaft*, the *Theologische Studien u. Kritiken*, Eduard Zeller's *Theologische Jahrbücher*, and Adolf Hilgenfeld's *Zeitschrift für wissenschaftliche Theologie*. Hitzig died at Heidelberg on the 22nd of January 1875. As a Hebrew philologist he holds high rank; and as a constructive critic he is remarkable for acuteness and sagacity. As a historian, however, some of his speculations have been considered fanciful. "He places the cradle of the Israelites in the south of Arabia, and, like many other critics, makes the historical times begin only with Moses" (F. Lichtenberger, *History of German Theology*, p. 569).

His lectures on biblical theology (*Vorlesungen über biblische Theologie u. messianische Weissagungen*) were published in 1880 after his death, along with a portrait and biographical sketch by his pupil, J. J. Kneucker (b. 1840), professor of theology at Heidelberg. See Heinrich Steiner, *Ferdinand Hitzig* (1882); and Adolf Kamphausen's article in Herzog-Hauck's *Realencyklopädie*.

HIUNG-NU, HIONG-NU, HEUNG-NU, a people who about the end of the 3rd century B.C. formed, according to Chinese records, a powerful empire from the Great Wall of China to the Caspian. Their ethnical affinities have been much discussed; but it is most probable that they were of the Turki stock, as were the Huns, their later western representatives. They are the first Turkish people mentioned by the Chinese. A theory which seems plausible is that which assumes them to have been a heterogenous collection of Mongol, Tungus, Turki and perhaps even Finnish hordes under a Mongol military caste, though the Mongolo-Tungus element probably predominated. Towards the close of the 1st century of the Christian era the Hiung-nu empire broke up. Their subsequent history is obscure. Some of them seem to have gone westward and settled on the Ural river. These, de Guiques suggests, were the ancestors of the Huns, and many ethnologists hold that the Hiung-nu were the ancestors of the modern Turks.

See *Journal Anthropological Institute* for 1874; Sir H. H. Howorth, *History of the Mongols* (1876–1880); 6th Congress of Orientalists, Leiden, 1883 (*Actes*, part iv. pp. 177-195); de Guiques, *Histoire générale des Huns, des Turcs, des Mongoles, et des autres Tartares occidentaux* (1756–1758).

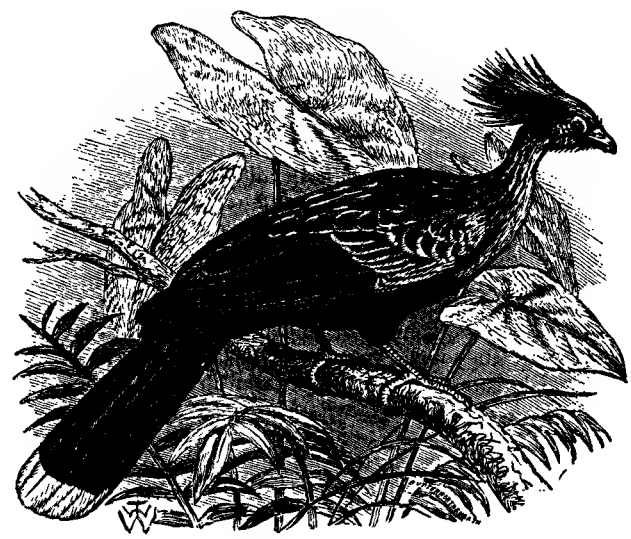
HIVITES, an ancient tribe of Palestine driven out by the invading Israelites. In Josh. ix. 7, xi. 19 they are connected with Gibeon. The meaning of the name is uncertain; Wellhausen derives it from חִוָּא "Eve," or "serpent," in which case the Hivites were originally the snake clan; others explain it from the Arabic *hayy*, "family," as meaning "dwellers in (Bedouin) encampments." (See PALESTINE; JEWS.)

HJÖRRING, an ancient town of Denmark, capital of the *amt* (county) of its name, in the northern insular part of the peninsula of Jutland. Pop. (1901) 7901. It lies 7 m. inland from the shore of Jammer Bay, a stretch of coast notoriously dangerous to shipping. On the coast is Lönstrup, a favoured seaside resort. In this neighbourhood as well as to the south-east of Hjörring, slight elevations are seen, deserving the name of hills in this low-lying district. Hjörring is on the northern railway of Jutland, which here turns eastward to the Cattegat part of Frederikshavn (23 m.), a harbour of refuge.

HKAMTI LÔNG (called Kantigyi by the Burmese, and Bor Hkampti by the peoples on the Assam side), a collection of seven

SpinSmart Software http://www.spinsmart.com

Shan states subordinate to Burma, but at present beyond the administrative border. Estimated area, 900 sq. m.; estimated pop. 11,000. It lies between 27° and 28° N. and 97° and 98° E., and is bordered by the Mishmi country on the N., by the Patkai range on the W., by the Hukawng valley on the S. and E., and indeed all round by various Chingpaw or Kachin communities. The country is little known. It was visited by T. T. Cooper, the Chinese traveller and political agent at Bhamo, where he was murdered; by General Woodthorpe and Colonel Macgregor in 1884, by Mr Errol Grey in the following year, and by Prince Henry of Orleans in 1895. All of these, however, limited their explorations to the valley of the Mali-hka, the western branch of the Irrawaddy river. Hkamti has shrunk very much from its old size. It was no doubt the northernmost province of the Shan kingdom, founded at Mogaung by Sam Lōng-hpa, the brother of the ruler of Kambawsa, when that empire had reached its greatest extension. The irruption of Kachins or Chingpaw from the north has now completely hemmed the state in. Prince Henry of Orleans described it as "a splendid territory, fertile in soil and abundant in water, where tropical and temperate culture flourish side by side, and the inhabitants are protected on three fronts by mountains." According to him the Kiutze, the people of the hills between the Irrawaddy and the Salween, call it the kingdom of Moam.



HLOTHHERE, king of Kent, succeeded his brother Ecgberht in 673, and appears for a time to have reigned jointly with his nephew Eadric, son of Ecgberht, as a code of laws still extant was issued under both names. Neither is mentioned in the account of the invasion of Æthelred in 676. In 685 Eadric, who seems to have quarrelled with Hlothhere, went into exile and led the South Saxons against him. Hlothhere was defeated and died of his wounds.

See Bede, *Hist. eccl.* (Plummer), iv. 5, 17, 26, v. 24; *Saxon Chronicle* (Earle and Plummer), s.a. 685; Schmid, *Gesetze*, pp. 10 sqq.; Thorpe, *Ancient Laws*, i. 26 sqq.

HOACTZIN, or HOATZIN, a bird of tropical South America, thought by Buffon to be that indicated by Hernandez or Fernandez under these names, the *Opisthocomus hoazin* or *O. cristatus* of modern ornithologists—a very curious and remarkable form, which has long exercised the ingenuity of classifiers. Placed by Buffon among his "*Hoccos*" (Curassows), and then by P. L. S. Müller and J. F. Gmelin in the Linnaean genus *Phasianus*, some of its many peculiarities were recognized by J. K. W. Illiger in 1811 as sufficient to establish it as a distinct genus, *Opisthocomus*; but various positions were assigned to it by subsequent systematic authors. L'Herminier was the first to give any account of its anatomy (*Comptes rendus*, 1837, v. 433), and from his time our knowledge of it has been successively increased by Johannes Müller (*Ber. Akad. Wissensch. Berlin*, 1841, p. 177), Deville (*Rev. et mag. de zoologie*, 1852, p. 217), Gervais (Castelnau, *Expéd. Amérique du Sud, zoologie, anatomie*, p. 66), Huxley (*Proc. Zool. Society*, 1868, p. 304), Perrin (*Trans. Zool. Society*, ix. p. 353), and A. H. Garrod (*Proc. Zool. Society*, 1879, p. 109). After a minute description of the skeleton of *Opisthocomus*, with the especial object of determining its affinities, Huxley declared that it "resembles the ordinary gallinaceous birds and pigeons more than it does any others, and that when it diverges from them it is either *sui generis* or approaches the *Musophagidae*." He accordingly regarded it as the type and sole member of a group, named by him *Heteromorphae*, which sprang from the great Carinate stem later than the *Tinamomorphae*, *Turnicomorphae*, or *Charadriomorphae*, but before the *Peristeromorphae*, *Pteroclomorphae* or *Alectoromorphae*. This conclusion is substantially the same as that at which A. H. Garrod subsequently arrived after closely examining and dissecting specimens preserved in spirit; but the latter has gone further and endeavoured to trace more particularly the descent of this peculiar form and some others, remarking that the ancestor of *Opisthocomus* must have left the parent stem very shortly before the true *Gallinae* first appeared, and at about the same time as the independent pedigree of the *Cuculidae* and *Musophagidae* commenced—these two groups being, he believed, very closely related, and *Opisthocomus* serving to fill the gap between them.

The first thing that strikes the observer of its skeleton is the extraordinary structure of the sternal apparatus, which is wholly unlike that of any other bird known. The keel is only developed on the posterior part of the sternum—the fore part being, as it were, cut away, while the short furcula at its symphysis meets the manubrium, with which it is firmly consolidated by means of a prolonged and straight hypocleidium, and anteriorly ossifies with the coracoids. This unique arrangement seems to be correlated with the enormously capacious crop, which rests upon the furcula and fore part of the sternum, and is also received in a cavity formed on the surface of each of the great pectoral muscles. Furthermore this crop is extremely muscular, so as more to resemble a gizzard, and consists of two portions divided by a partial constriction, after a fashion of which no other example is known among birds. The true gizzard is greatly reduced.

The hoactzin appears to be about the size of a small pheasant, but is really a much smaller bird. The beak is strong, curiously denticulated along the margin of the maxilla near the base, and is beset by diverging bristles. The eyes, placed in the middle of a patch of bare skin, are furnished with bristly lashes, resembling those of horn-bills and some few other birds. The head bears a long pendant crest of loose yellowish feathers. The body is olive-coloured, varied with white above, and beneath

Hoactzin.

is of a dull bay. The wings are short and rounded. The tail is long and tipped with yellow. The legs are rather short, the feet stout, the tarsi reticulated, and the toes scutellated; the claws long and slightly curved. According to all who have observed the habits of this bird, it lives in bands on the lower trees and bushes bordering the streams and lagoons, feeding on leaves and various wild fruits, especially, says H. W. Bates (*Naturalist on the River Amazons*, i. 120), those of a species of *Psidium*, and it is also credited with eating those of an arum (*Caladium arborescens*), which grows plentifully in its haunts. "Its voice is a harsh, grating hiss," continues the same traveller, and "it makes the noise when alarmed, all the individuals sibilating as they fly heavily away from tree to tree, when disturbed by passing canoes." It exhales a very strong odour—wherefore it is known in British Guiana as the "stink-bird"—compared by Bates to "musk combined with wet hides," and by Deville to that of a cow-house. The species is said to be polygamous; the nest is built on trees, of sticks placed above one another, and softer materials atop. Therein the hen lays her eggs to the number of three or four, of a dull-yellowish white, somewhat profusely marked with reddish blotches and spots, so as to resemble those of some of the *Rallidae* (*Proc. Zool. Society*, 1867, pl. xv. fig. 7. p. 164). The young are covered only with very scanty hair, like down, and have well-developed claws on the first and second fingers of the wing, which they use

SpinSmart Software http://www.spinsmart.com

in clambering about the twigs in a quadrupedal manner; if placed in the water they swim and dive well, although the adults seem to be not at all aquatic. (A. N.)

HOADLY, BENJAMIN (1676–1761), English divine, was born at Westerham, Kent, on the 14th of November 1676. In 1691 he entered Catharine Hall, Cambridge, where he graduated M.A. and was for two years tutor, after which he held from 1701 to 1711 the lectureship of St Mildred in the Poultry, and along with it from 1704 the rectory of St Peter-le-Poer, London. His first important appearance as a controversialist was against Edmund Calamy "the younger" in reference to conformity (1703–1707), and after this he came into conflict with Francis Atterbury, first on the interpretation of certain texts and then on the whole Anglican doctrine of non-resistance. His principal treatises on this subject were the *Measures of Submission to the Civil Magistrate* and *The Origin and Institution of Civil Government discussed*; and his part in the discussion was so much appreciated by the Commons that in 1709 they presented an address to the queen praying her to "bestow some dignity in the church on Mr Hoadly for his eminent services both to church and state." The queen returned a favourable answer, but the dignity was not conferred. In 1710 he was presented by a private patron to the rectory of Streatham in Surrey. In 1715 he was appointed chaplain to the king, and the same year he obtained the bishopric of Bangor. He held the see for six years, but never visited the diocese. In 1716, in reply to George Hickes (*q.v.*), he published a *Preservative against the Principles and Practices of Nonjurors in Church and State*, and in the following year preached before the king his famous sermon on the *Kingdom of Christ*, which was immediately published by royal command. These works were attacks on the divine authority of kings and of the clergy, but as the sermon dealt more specifically and distinctly with the power of the church, its publication caused an ecclesiastical ferment which in certain aspects has no parallel in religious history. It was at once resolved to proceed against him in convocation, but this was prevented by the king proroguing the assembly, a step which had consequences of vital bearing on the history of the Church of England, since from that period the great Anglican council ceased to transact business of a more than formal nature. The restrained sentiments of the council in regard to Hoadly found expression in a war of pamphlets known as the Bangorian Controversy, which, partly from a want of clearness in the statements of Hoadly, partly from the disingenuousness of his opponents and the confusion resulting from exasperated feelings, developed into an intricate and bewildering maze of side discussions in which the main issues of the dispute were concealed almost beyond the possibility of discovery. But however vague and uncertain might be the meaning of Hoadly in regard to several of the important bearings of the questions around which he aroused discussion, he was explicit in denying the power of the Church over the conscience, and its right to determine the condition of men in relation to the favour of God. The most able of his opponents was William Law; others were Andrew Snape, provost of Eton, and Thomas Sherlock, dean of Chichester. So exercised was the mind of the religious world over the dispute that in July 1717 as many as seventy-four pamphlets made their appearance; and at one period the crisis became so serious that the business of London was for some days virtually at a stand-still. Hoadly, being not unskilled in the art of flattery, was translated in 1721 to the see of Hereford, in 1723 to Salisbury and in 1734 to Winchester. He died at his palace at Chelsea on the 17th of April 1761. His controversial writings are vigorous if prolix and his theological essays have little merit. He must have been a much hated man, for his latitudinarianism offended the high church party and his rationalism the other sections. He was an intimate friend of Dr Samuel Clarke, of whom he wrote a life.

Hoadly's brother, JOHN HOADLY (1678–1746), was archbishop of Dublin from 1730 to 1742 and archbishop of Armagh from the latter date until his death on the 19th of July 1746. In early life the archbishop was very intimate with Gilbert Burnet, then bishop of Salisbury, and in later life he was a prominent figure in Irish politics.

The works of Benjamin Hoadly were collected and published by his son John in 3 vols. (1773). To the first volume was prefixed the article "Hoadly" from the supplement to the *Biographia Britannica*. See also L. Stephen, *English Thought in the 18th Century*.

HOAR, SAMUEL (1778–1856), American lawyer, was born in Lincoln, Massachusetts, on the 18th of May 1778. He was the son of Samuel Hoar, an officer in the American army during the War of Independence, for many years a member of the Massachusetts General Court, and a member in 1820–1821 of the state Constitutional Convention. The son graduated at Harvard in 1802, was admitted to the Massachusetts bar in 1805 and began practice at Concord. His success in his profession was immediate, and for a half-century he was one of the leading lawyers of Massachusetts. He was in early life a Federalist and was later an ardent Whig in politics. He was a member of the state senate in 1825, 1832 and 1833, and of the national house of representatives in 1835–1837, during which time he made a notable speech in favour of the constitutional right of congress to abolish slavery in the District of Columbia. In November 1844, having retired from active legal practice some years before, he went to Charleston, S.C., at the request of Governor George Nixon Briggs (1796–1861), to test in the courts of South Carolina the constitutionality of the state law which provided that "it shall not be lawful for any free negro, or person of color, to come into this state on board any vessel, as a cook, steward or mariner, or in any other employment," and that such free negroes should be seized and locked up until the vessels on which they had come were ready for sea, when they should be returned to such vessels. His visit aroused great excitment, he was threatened with personal injury, the state legislature passed resolutions calling for his expulsion, and he was compelled to leave early in December. In 1848 he was prominent in the Free Soil movement in Massachusetts, and subsequently assisted in the organization of the Republican Party. In 1850 he served in the Massachusetts house of representatives. He married a daughter of Roger Sherman of Connecticut. He died at Concord, Massachusetts, on the 2nd of November 1856.

See a memoir by his son G. F. Hoar in *Memorial Biographies of the New England Historic Genealogical Society*, vol. iii. (Boston, 1883); the estimate by R. W. Emerson in *Lectures and Biographical Sketches* (Boston, 1903); and "Samuel Hoar's Expulsion from Charleston," *Old South Leaflets*, vol. vi. No. 140.

His son, EBENEZER ROCKWOOD HOAR (1816–1895), was born at Concord, Massachusetts, on the 21st of February 1816. He graduated at Harvard in 1835 and at the Harvard Law School in 1839, and was admitted to the Massachusetts bar in 1840. From 1849 to 1855 he was a judge of the Massachusetts court of common pleas, from 1859 to 1869 a judge of the state supreme court, and in 1869–1870 attorney-general of the United States in the cabinet of President Grant, and in that position fought unmerited "machine" appointments to offices in the civil service until at the pressure of the "machine" Grant asked for his resignation from the cabinet. The Senate had already shown its disapproval of Hoar's policy of civil service reform by its failure in 1870 to confirm the President's nomination of Hoar as associate-justice of the supreme court. In 1871 he was a member of the Joint High Commission which drew up the Treaty of Washington. In 1872 he was a presidential elector on the Republican ticket, and in 1873–1875 was a representative in Congress. He was a member of the Board of Overseers of Harvard University from 1868 to 1880 and from 1881 to 1887, and was president of the Board in 1878–1880 and in 1881–1887. He was also prominent in the affairs of the Unitarian church. He was a man of high character and brilliant wit. He died at Concord on the 31st of January 1895.

Another son, GEORGE FRISBIE HOAR (1826–1904), was born in Concord, Massachusetts, on the 29th of August 1826. He graduated at Harvard in 1846 and at the Harvard Law School in 1849. He settled in the practice of law in Worcester, Massachusetts, where in 1852 he became a partner of Emory Washburn (1800–1877). In 1852 he was elected as a Free-Soiler to the

SpinSmart Software http://www.spinsmart.com

Massachusetts House of Representatives, and during his single term of service became the leader of his party in that body. He was active in the organization of the Republican party in Massachusetts, and in 1857 was elected to the State senate, but declined a re-election. During 1856–1857 he was active in behalf of the Free-State cause in Kansas. He was a member of the National House of Representatives from 1869 until 1877, and in this body took high rank as a ready debater and a conscientious committee worker. He was prominent as a defender and supporter of the Freedman's Bureau, took a leading part in the later reconstruction legislation and in the investigation of the Crédit Mobilier scandal, and in 1876 was one of the House managers of the impeachment of General W. W. Belknap, Grant's secretary of war. In 1877 he was a member of the Electoral Commission which settled the disputed Hayes-Tilden election. From 1877 until his death he was a member of the United States senate. In the senate almost from the start he took rank as one of the most influential leaders of the Republican party; he was a member from 1882 until his death of the important Judiciary Committee, of which he was chairman in 1891–1893 and in 1895–1904. His most important piece of legislation was the Presidential Succession Act of 1886. He was a delegate to every Republican National Convention from 1876 to 1904, and presided over that at Chicago in 1880. He was a conservative by birth and training, and although he did not leave his party he disagreed with its policy in regard to the Philippines, and spoke and voted against the ratification of the Spanish Treaty. He was regent of the Smithsonian Institution in 1880–1881, and long served as an overseer of Harvard University (1896–1904) and as president of its alumni association. He was also president of the American Historical Association (1894–1895) and of the American Antiquarian Society (1884–1887). Like his brother, he was a leading Unitarian, and was president of its National Conference from 1894 to 1902. He died at Worcester, Massachusetts, on the 30th of September 1904. A memorial statue has been erected there.

See his *Recollections of Seventy Years* (New York, 1903).

HOARE, SIR RICHARD COLT, BART. (1758–1838), English antiquary, was the eldest son of Richard Hoare, who was created a baronet in 1786, and was born on the 9th of December 1758. He was descended from Sir Richard Hoare (1648–1718), lord mayor of London, the founder of the family banking business. An ample allowance from his grandfather, Henry Hoare, enabled him to pursue the archaeological studies for which he had already shown an inclination. In 1783 he married Hester, daughter of William Henry, Lord Lyttelton, and after her death in 1785 he paid a prolonged visit to France, Italy and Switzerland. He succeeded to the baronetcy in 1787, and in 1788 made a second continental tour, the record of his travels appearing in 1819 under the title *A Classical Tour through Italy and Sicily*. A journey through Wales was followed by a translation of the *Itinerarium Cambriae* and of the *Descriptio Cambriae of* Giraldus Cambrensis, Hoare adding notes and a life of Giraldus to the translation. This was first published in 1804, and has been revised by T. Wright (London, 1863). Sir Richard died at Stourhead, Wiltshire, on the 19th of May 1838, being succeeded in the baronetcy by his half-brother, Henry Hugh Hoare. Hoare's most important work was his *Ancient History of North and South Wiltshire* (1812–1819); he also did some work on the large *History of Modern Wiltshire* (1822–1844).

For notices of him and a list of his works, many of which were printed privately, see the *Gentleman's Magazine* for July 1838, and the *Dict. Nat. Biog.* vol. xxvii. (1891). See also E. Hoare, *History of the Hoare Family* (1883).

HOBART, GARRET AUGUSTUS (1844–1899), Vice-President of the United States 1897–1899, was born at Long Branch, N.J., on the 3rd of June 1844. He graduated at Rutgers College in 1863, was admitted to the bar in 1869, practised law at Paterson, N.J., and rose to prominence in the State. He was long conspicuous in the State Republican organization, was chairman of the New Jersey State Republican Committee from 1880 to 1890, became a member in 1884 of the Republican National Committee, and was the delegate-at-large from New Jersey to five successive Republican national nominating conventions. He served in the New Jersey Assembly in 1873–1874, and in the New Jersey Senate in 1877–1882, and was speaker of the Assembly in 1874 and president of the Senate in 1881 and 1882. He was also prominent and successful in business and accumulated a large fortune. He accepted the nomination as Vice-President in 1896, on the ticket with President McKinley, and was elected; but while still in office he died at Paterson, N.J., on the 21st of November 1899.

See the *Life* (New York, 1910) by David Magie.

HOBART, JOHN HENRY (1775–1830), American Protestant Episcopal bishop, was born in Philadelphia, Pennsylvania, on the 14th of September 1775, being fifth in direct descent from Edmund Hobart, a founder of Hingham, Massachusetts. He was educated at the Philadelphia Latin School, the College of Philadelphia (now the University of Pennsylvania), and Princeton, where he graduated in 1793. After studying theology under Bishop William White at Philadelphia, he was ordained deacon in 1798, and priest two years later. He was elected assistant bishop of New York, with the right of succession, in 1811, and was acting diocesan from that date because of the ill-health of Bishop Benjamin Moore, whom he formally succeeded on the latter's death in February 1816. He was one of the founders of the General Theological Seminary, became its professor of pastoral theology in 1821, and as bishop was its governor. In his zeal for the historic episcopacy he published in 1807 *An Apology for Apostolic Order and its Advocates*, a series of letters to Rev. John M. Mason, who, in *The Christian's Magazine*, of which he was editor, had attacked the Episcopacy in general and in particular Hobart's *Collection of Essays on the Subject of Episcopacy* (1806). Hobart's zeal for the General Seminary and the General Convention led him to oppose the plan of Philander Chase, bishop of Ohio, for an Episcopal seminary in that diocese; but the Ohio seminary was made directly responsible to the House of Bishops, and Hobart approved the plan. His strong opposition to "dissenting churches" was nowhere so clearly shown as in a pamphlet published in 1816 to dissuade all Episcopalians from joining the American Bible Society, which he thought the Protestant Episcopal Church had not the numerical or the financial strength to control. In 1818, to counterbalance the influence of the Bible Society and especially of Scott's *Commentaries*, he began to edit with selected notes the *Family Bible* of the Society for Promoting Christian Knowledge. He delivered episcopal charges to the clergy of Connecticut and New York entitled *The Churchman* (1819) and *The High Churchman Vindicated* (1826), in which he accepted the name "high churchman," and stated and explained his principles "in distinction from the corruptions of the Church of Rome and from the Errors of Certain Protestant Sects." He exerted himself greatly in building up his diocese, attempting to make an annual visit to every parish. His failing health led him to visit Europe in 1823–1825. Upon his return he preached a characteristic sermon entitled *The United States of America compared with some European Countries, particularly England* (published 1826), in which, although there was some praise for the English church, he so boldly criticized the establishment, state patronage, cabinet appointment of bishops, lax discipline, and the low requirements of theological education, as to rouse much hostility in England, where he had been highly praised for two volumes of *Sermons on the Principal Events and Truths of Redemption* (1824). He died at Auburn, New York, on the 12th of September 1830. He was able, impetuous, frank, perfectly fearless in controversy, a speaker and preacher of much eloquence, a supporter of missions to the Oneida Indians in his diocese, and the compiler of the following devotional works: *A Companion for the Altar* (1804), *Festivals and Fasts* (1804), *A Companion to the Book of Common Prayer* (1805), and *A Clergyman's Companion* (1805).

See *Memorial of Bishop Hobart*, containing a *Memoir* (New York, 1831); John McVickar, *The Early Life and Professional Years of Bishop Hobart* (New York, 1834), and *The Closing Years of Bishop Hobart* (New York, 1836).

HOBART PASHA, AUGUSTUS CHARLES HOBART-HAMPDEN (1822–1886), English naval captain and Turkish admiral, **was**

SpinSmart Software http://www.spinsmart.com

born in Leicestershire on the 1st of April 1822, being the third son of the 6th Earl of Buckinghamshire. In 1835 he entered the Royal Navy and served as a midshipman on the coast of Brazil in the suppression of the slave trade, displaying much gallantry in the operations. In 1855 he took part, as captain of the "Driver," in the Baltic Expedition, and was actively engaged at Bomarsund and Abo. In 1862 he retired from the navy with the rank of post-captain; but his love of adventure led him, during the American Civil War, to take the command of a blockade-runner. He had the good fortune to run the blockade eighteen times, conveying war material to Charleston and returning with a cargo of cotton. In 1867 Hobart entered the Turkish service, and was immediately nominated to the command of that fleet, with the rank of "Bahrie Limassi" (rear-admiral). In this capacity he performed splendid service in helping to suppress the insurrection in Crete, and was rewarded by the Sultan with the title of Pasha (1869). In 1874 Hobart, whose name had, on representations made by Greece, been removed from the British Navy List, was reinstated; his restoration did not, however, last long, for on the outbreak of the Russo-Turkish war he again entered Turkish service. In command of the Turkish squadron he completely dominated the Black Sea, blockading the ports of South Russia and the mouths of the Danube, and paralysing the action of the Russian fleet. On the conclusion of peace Hobart still remained in the Turkish service, and in 1881 was appointed Mushir, or marshal, being the first Christian to hold that high office. His achievements as a blockade-runner, his blockade of Crete, and his handling of the Turkish fleet against the torpedo-lined coasts of Russia, showed him to be a daring, resourceful, and skilful commander, worthy to be ranked among the illustrious names of British naval heroes. He died at Milan on the 19th of June 1886.

See his *Sketches of My Life* (1886), which must, however, be used with caution, since it contains many proved inaccuracies.

HOBART, the capital of Tasmania, in the county of Buckingham, on the southern coast of the island. It occupies a site of great beauty, standing on a series of low hills at the foot of Mount Wellington, a lofty peak (4166 ft.) which is snow-clad for many months in the year. The town fronts Sullivan's Cove, a picturesque bay opening into the estuary of the river Derwent, and is nearly square in form, laid out with wide streets intersecting at right angles, the chief of which are served by electric tramways. It is the seat of the Anglican bishop of Tasmania, and of the Roman Catholic archbishop of Hobart. The Anglican cathedral of St David dates from 1873, though its foundations were laid as early as 1817. St Mary's Roman Catholic cathedral is a beautiful building; but perhaps the most notable ecclesiastical building in Hobart is the great Baptist tabernacle in Upper Elizabeth Street. The most prominent public buildings are the Houses of Parliament, to which an excellent library is attached; the town hall, a beautiful building of brown and white Tasmanian freestone in Italian style; the museum and national art gallery, and the general post office (1904) with its lofty clock-tower. Government House, the residence of the governor of Tasmania, a handsome castellated building, stands in its domain on the banks of the Derwent, to the north of the town. The botanical gardens adjoin. Of the parks and public gardens, the most extensive is the Queen's Domain, covering an area of about 700 acres, while the most central is Franklin Square, adorned with a statue of Sir John Franklin, the famous Arctic explorer, who was governor of Tasmania from 1837 to 1843. The university of Tasmania, established in 1890, and opened in 1893, has its headquarters at Hobart. The town is celebrated for its invigorating climate, and its annual regatta on the Derwent attracts numerous visitors. The harbour is easy of access, well sheltered and deep, with wharf accommodation for vessels of the largest tonnage. It is a regular port of call for several intercolonial lines from Sydney and Melbourne, and for lines from London to New Zealand. The exports, of an average value of £850,000 annually, consist mainly of fruit, hops, grain, timber and wool. The industries comprise brewing, saw-milling, iron-founding, flour-milling, tanning, and the manufacture of pottery and woollen goods. Hobart is the centre of a large fruit-growing district, the produce of which, for the most part, is exported to London and Sydney. The city was founded in 1804 and takes its name from Lord Hobart (see BUCKINGHAMSHIRE, EARLS OF), then secretary of state for the colonies. It was created a municipality in 1853, and a city in 1857; and in 1881 its name was changed from Hobart Town to the present form. The chief suburbs are Newton, Sandy Bay, Wellington, Risdon, Glenorchy, Bellerive and Beltana. The population of the city proper in 1901 was 24,652, or including suburbs, 34,182.

HOBBEMA, MEYNDERT (*c.* 1638–1709), the greatest landscape painter of the Dutch school after Ruysdael, lived at Amsterdam in the second half of the 17th century. The facts of his life are somewhat obscure. Nothing is more disappointing than to find that in Hobbema's case chronology and signed pictures substantially contradict each other. According to the latter his practice lasted from 1650 to 1689; according to the former his birth occurred in 1638, his death as late as 1709. If the masterpiece formerly in the Bredel collection, called "A Wooded Stream," honestly bears the date of 1650, or "The Cottages under Trees" of the Ford collection the date of 1652, the painter of these canvases cannot be Hobbema, whose birth took place in 1638, unless indeed we admit that Hobbema painted some of his finest works at the age of twelve or fourteen. For a considerable period it was profitable to pass Hobbemas as Ruysdaels, and the name of the lesser master was probably erased from several of his productions. When Hobbema's talent was recognized, the contrary process was followed, and in this way the name, and perhaps fictitious dates, reappeared by fraud. An experienced eye will note the differences which occur in Hobbema's signatures in such well-known examples as adorn the galleries of London and Rotterdam, or the Grosvenor and van der Hoop collections. Meanwhile, we must be content to know that, if the question of dates could be brought into accordance with records and chronology, the facts of Hobbema's life would be as follows.

Meyndert Hobbema was married at the age of thirty to Eeltije Vinck of Gorcum, in the Oudekerk or old church at Amsterdam, on the 2nd of November 1668. Witnesses to the marriage were the bride's brother Cornelius Vinck and Jacob Ruysdael. We might suppose from this that Hobbema and Ruysdael, the two great masters of landscape, were united at this time by ties of friendship, and accept the belief that the former was the pupil of the latter. Yet even this is denied to us, since records tell us that there were two Jacob Ruysdaels, cousins and contemporaries, at Amsterdam in the middle of the 17th century—one a framemaker, the son of Solomon, the other a painter, the son of Isaac Ruysdael. Of Hobbema's marriage there came between 1668 and 1673 four children. In 1704 Eeltije died, and was buried in the pauper section of the Leiden cemetery at Amsterdam. Hobbema himself survived till December 1709, receiving burial on the 14th of that month in the pauper section of the Westerkerk cemetery at Amsterdam. Husband and wife had lived during their lifetime in the Rozengracht, at no great distance from Rembrandt, who also dwelt there in his later and impoverished days. Rembrandt, Hals, Jacob Ruysdael, and Hobbema were in one respect alike. They all died in misery, insufficiently rewarded perhaps for their toil, imprudent perhaps in the use of the means derived from their labours. Posterity has recognized that Hobbema and Ruysdael together represent the final development of landscape art in Holland. Their style is so related that we cannot suppose the first to have been unconnected with the second. Still their works differ in certain ways, and their character is generally so marked that we shall find little difficulty in distinguishing them, nor indeed shall we hesitate in separating those of Hobbema from the feebler productions of his imitators and predecessors—Isaac Ruysdael, Rontbouts, de Vries, Dekker, Looten, Verboom, du Bois, van Kessel, van der Hagen, even Philip de Koningk. In the exercise of his craft Hobbema was patient beyond all conception. It is doubtful whether any one ever so completely

SpinSmart Software http://www.spinsmart.com

mastered as he did the still life of woods and hedges, or mills and pools. Nor can we believe that he obtained this mastery otherwise than by constantly dwelling in the same neighbourhood, say in Guelders or on the Dutch Westphalian border, where day after day he might study the branching and foliage of trees and underwood embowering cottages and mills, under every variety of light, in every shade of transparency, in all changes produced by the seasons. Though his landscapes are severely and moderately toned, generally in an olive key, and often attuned to a puritanical grey or russet, they surprise us, not only by the variety of their leafage, but by the finish of their detail as well as the boldness of their touch. With astonishing subtlety light is shown penetrating cloud, and illuminating, sometimes transiently, sometimes steadily, different portions of the ground, shining through leaves upon other leaves, and multiplying in an endless way the transparency of the picture. If the chance be given him he mirrors all these things in the still pool near a cottage, the reaches of a sluggish river, or the swirl of the stream that feeds a busy mill. The same spot will furnish him with several pictures. One mill gives him repeated opportunities of charming our eye; and this wonderful artist, who is only second to Ruysdael because he had not Ruysdael's versatility and did not extend his study equally to downs and rocky eminences, or torrents and estuaries—this is the man who lived penuriously, died poor, and left no trace in the artistic annals of his country! It has been said that Hobbema did not paint his own figures, but transferred that duty to Adrian van de Velde, Lingelbach, Barendt Gael, and Abraham Storck. As to this much is conjecture.

The best of Hobbema's dated pictures are those of the years 1663 to 1667. Of the former, several in the galleries of Brussels and St Petersburg, and one in the Holford collection, are celebrated. Of 1665 fine specimens are at Grosvenor House and the Wallace collection. Of seven pieces in the National Gallery, including the "Avenue at Middelharnis," which some assign to 1689, and the "Ruins of Breberode Castle," two are dated 1667. A sample of the last of these years is also in the Fitzwilliam Museum at Cambridge. Amongst the masterpieces in private hands in England may be noticed two landscapes in Buckingham Palace, two at Bridgewater House, and one belonging to Mr Walter of Bearwood. On the continent are a "Wooded Landscape" in the Berlin gallery, a "Forest" belonging to the duchess of Sagan in Paris, and a "Glade" in the Louvre. There are other fine Hobbemas in the Antwerp Museum, the Arenberg gallery at Brussels, and the Belvedere at Vienna. (J. A. C.)

HOBBES, THOMAS (1588–1679), English philosopher, second son of Thomas Hobbes, was born at Westport (now part of Malmesbury, Wiltshire) on the 5th of April 1588. His father, vicar of Charlton and Westport, an illiterate and choleric man, quarrelled, it is said, with a brother clergyman at the church door, and was forced to decamp, leaving his three children to the care of an elder brother Francis, a flourishing glover at Malmesbury. Thomas Hobbes was put to school at Westport church at the age of four, passed to the Malmesbury school at eight, and was taught again in Westport later at a private school kept by a young man named Robert Latimer, fresh from Oxford and "a good Grecian." He had begun Latin and Greek early, and under Latimer made such progress as to be able to translate the *Medea* of Euripides into Latin iambic verse before he was fourteen. About the age of fifteen he was sent to Oxford and entered at Magdalen Hall. During his residence, the first principal of Magdalen Hall, John Hussee, was succeeded by John Wilkinson, who ruled in the interest of the Calvinistic party in the university. Thus early was he brought into contact with the aggressive Puritan spirit. Apart from this, Hobbes owed little to his university training, which was based on the scholastic logic then prevalent. We have from himself a lively record of his student life (*Vit. carm. exp.* p. lxxxv.), which, though penned in extreme old age, may be taken as trustworthy. He tells how, when he had slowly taken in the doctrine of logical figures and moods, he put it aside and would prove things only in his own way; how he then heard about bodies as consisting of matter and form, as throwing off species of themselves for perception, and as moved by sympathies and antipathies, with much else of a like sort, all beyond his comprehension; and how he therefore turned to his old books again, fed his mind on maps and charts of earth and sky, traced the sun in his path, followed Drake and Cavendish girdling the main, and gazed with delight upon pictured haunts of men and wonders of unknown lands. Very characteristic is the interest in men and things, and the disposition to cut through questions in the schools after a trenchant fashion of his own. He was little attracted by the scholastic learning, though it would be wrong to take his words as evidence of a precocious insight into its weakness. The truth probably is that he took no interest in studies which there was no risk in neglecting, and thought as little of rejecting as of accepting the traditional doctrines. He adds that he took his degree at the proper time; but in fact, upon any computation and from whatever cause, he remained at Magdalen Hall five, instead of the required four, years, not being admitted as bachelor till the 5th of February 1608.

In the same year Hobbes was recommended by Wilkinson as tutor to the son of William Cavendish, baron of Hardwick (afterwards 2nd earl of Devonshire), and thus began a lifelong connexion with a great and powerful family. Twice it was loosened —once, for a short time, after twenty years, and again, for a longer period, during the Civil War—but it never was broken. Hobbes spoke of the first years of his tutorship as the happiest of his life. Young Cavendish was hardly younger than Hobbes, and had been married, a few months before, at the instance of the king, to Christiana, the only daughter of Edward, Lord Bruce of Kinloss, though by reason of the bride's age, which was only twelve years, the pair had no establishment for some time. Hobbes was his companion rather than tutor (before becoming secretary); and, growing greatly attached to each other, they were sent abroad together on the grand tour in 1610. During this journey, the duration of which cannot be precisely stated, Hobbes acquired some knowledge of French and Italian, and also made the important discovery that the scholastic philosophy which he had learned in Oxford was almost universally neglected in favour of the scientific and critical methods of Galileo, Kepler and Montaigne. Unable at first to cope with their unfamiliar ideas, he determined to become a scholar, and until 1628 was engaged in a careful study of Greek and Latin authors, the outcome of which was his great translation of Thucydides. But when he had finished his work he kept it lying by him for years, being no longer so sure of finding appreciative readers; and when he did send it forth, in 1628, he was fain to be content with "the few and better sort."[1] That he was finally determined to publication by the political troubles of the year 1628 may be regarded as certain, not only from his own express declaration at a later time (*Vit. carm. exp.*), but also from unmistakable hints in the account of the life and work of his author prefixed to the translation on its appearance. This was the year of the Petition of Right, extorted from the king in the third parliament he had tried within three years of his accession; and, in view of Hobbes's later activity, it is significant that he came forward just then, at the mature age of forty, with his version of the story of the Athenian democracy as the first production of his pen. Nothing else is known of his doings

Translation of Thucydides.

[1] The translation, under the title *Eight Books of the Peloponnesian War, written by Thucydides the son of Olorus, interpreted with faith and diligence immediately out of the Greek by Thomas Hobbes, secretary to the late Earl of Devonshire*, appeared in 1628 (or 1629), after the death of the earl, to whom touching reference is made in the dedication. It reappeared in 1634, with the date of the dedication altered, as if then newly written. Though Hobbes claims to have performed his work "with much more diligence than elegance," his version is remarkable as a piece of English writing, but is by no means accurate. It fills vols. viii. and ix. in Molesworth's collection (11 vols., including index vol.) of Hobbes's *English Works* (London, Bohn, 1839–1845). The volumes of this collection will here be cited as *E.W.* Molesworth's collection of the Latin *Opera philosophica* (5 vols., 1839–1845) will be cited as *L.W.* The five hundred and odd Latin hexameters under the title *De mirabilibus Pecci* (*L.W.* v. 323-340), giving an account of a short excursion from Chatsworth to view the seven wonders of the Derbyshire Peak, were written before 1628 (in 1626 or 1627), though not published till 1636. It was a New Year's present to his patron, who gave him £5 in return. A later edition, in 1678, included an English version by another hand.

before 1628, except that through his connexion with young Cavendish he had relations with literary men of note like Ben Jonson, and also with Bacon and Lord Herbert of Cherbury. If he never had any sympathy with Herbert's intuitionalist principles in philosophy, he was no less eager, as he afterwards showed, than Herbert to rationalize in matters of religious doctrine, so that he may be called the second of the English deists, as Herbert has been called the first. With Bacon he was so intimate (Aubrey's *Lives*, pp. 222, 602) that some writers have described him as a disciple. The facts that he used to walk with Bacon at Gorhambury, and would jot down with exceptional intelligence the eager thinker's sudden "notions," and that he was employed to make the Latin version of some of the *Essays*, prove nothing when weighed against his own disregard of all Bacon's principles, and the other evidence that the impulse to independent thinking came to him not from Bacon, and not till some time after Bacon's death in 1626.[1]

So far as we have any positive evidence, it was not before the year 1629 that Hobbes entered on philosophical inquiry. Meanwhile a great change had been wrought in his circumstances. His friend and master, after about two years' tenure of the earldom of Devonshire, died of the plague in June 1628, and the affairs of the family were so disordered financially that the widowed countess was left with the task of righting them in the boyhood of the third earl. Hobbes went on for a time living in the household; but his services were no longer in demand, and, remaining inconsolable under his personal bereavement, he sought distraction, in 1629, in another engagement which took him abroad as tutor to the son of Sir Gervase Clifton, of an old Nottinghamshire family. This, his second, sojourn abroad appears to have been spent chiefly in Paris, and the one important fact recorded of it is that he then first began to look into Euclid. The engagement came to an end in 1631, when he was recalled to train the young earl of Devonshire, now thirteen years old, son of his previous pupil. In the course of the next seven years in Derbyshire and abroad, Hobbes took his pupil over rhetoric,[2] logic, astronomy, and the principles of law, with other subjects. His mind was now full of the thought of motion in nature, and on the continent he sought out the philosophical speculators or scientific workers. In Florence in 1636 he saw Galileo, for whom he ever retained the warmest admiration, and spent eight months in daily converse with the members of a scientific circle in Paris, held together by Marin Mersenne (*q.v.*). From that time (the winter of 1636–1637) he too, as he tells us, was numbered among philosophers.

Philosophic inquiry.

His introduction to Euclid took place accidentally in 1629 (Aubrey's *Lives*, p. 604). Euclid's manner of proof became the model for his own way of thinking upon all subjects. It is less easy to determine when he awoke to an interest in the physical doctrine of motion. The story told by himself (*Vit.* p. xx.) is that, hearing the question asked "What is sense?" he fell to thinking often on the subject, till it suddenly occurred to him that if bodies and their internal parts were at rest, or were always in the same state of motion, there could be no distinction of anything, and consequently no sense; the cause of all things must therefore be sought in diversity of movements. Starting from this principle he was driven to geometry for insight into the ground and modes of motion. The biographies we possess do not tell us where or when this great change of interest occurred. Nothing is said, however, which contradicts a statement that on his third journey in Europe he began to study the doctrine of motion more seriously, being interested in it before; and as he claims more than once (*L.W.* v. 303; *E.W.* vii. 468) to have explained light and sound by a mechanical hypothesis as far back as 1630, the inspiration may be assigned to the time of the second journey. But it was not till the third journey that the new interest became an overpowering passion, and the "philosopher" was on his way home before he had advanced so far as to conceive the scheme of a system of thought to the elaboration of which his life should henceforth be devoted.

Hobbes was able to carry out his plan in some twenty years or more from the time of its conception, but the execution was so broken in upon by political events, and so complicated with other labours, that its stages can hardly be followed without some previous understanding of the relations of the parts of the scheme, as there is reason to believe they were sketched out from the beginning. His scheme was first to work out, in a separate treatise *De corpore*, a systematic doctrine of Body, showing how physical phenomena were universally explicable in terms of motion, as motion or mechanical action was then (through Galileo and others) understood—the theory of motion being applied in the light of mathematical science, after quantity, the subject-matter of mathematics, had been duly considered in its place among the fundamental conceptions of philosophy, and a clear indication had been given, at first starting, of the logical ground and method of all philosophical inquiry. He would then single out Man from the realm of nature, and, in a treatise *De homine*, show what specific bodily motions were involved in the production of the peculiar phenomena of sensation and knowledge, as also of the affections and passions thence resulting, whereby man came into relation with man. Finally he would consider, in a crowning treatise *De cive*, how men, being naturally rivals or foes, were moved to enter into the better relation of Society, and demonstrate how this grand product of human wit must be regulated if men were not to fall back into brutishness and misery. Thus he proposed to unite in one coherent whole the separate phenomena of Body, Man and the State.

Hobbes came home, in 1637, to a country seething with discontent. The reign of "Thorough" was collapsing, and the forces pent up since 1629 were soon to rend the fabric of the state. By these events Hobbes was distracted from the orderly execution of his philosophic plan. The Short Parliament, as he tells us at a later time (*E.W.* iv. 414), was not dissolved before he had ready "a little treatise in English," in which he sought to prove that the points of the royal prerogative which the members were determined to dispute before granting supplies "were inseparably annexed to the sovereignty which they did not then deny to be in the king." Now it can be proved that at this time he had written not only his *Human Nature* but also his *De corpore politico*, the two treatises (though published separately ten years later) having been composed as parts of one work;[3] and there cannot be the least question that together they make "the little treatise" just mentioned. We are therefore to understand, first, that he wrote the earliest draft of his political theory some years before the outbreak of the Civil War, and, secondly, that this earliest draft was not written till, in accordance with his philosophical conception, he had established the grounds of polity in human nature. The first point is to be noted, because it has often been supposed that Hobbes's political doctrine took its peculiar complexion from his revulsion against the state of anarchy before his eyes, as he wrote during the progress of the Civil War. The second point must be maintained against his own implied, if not express, statement some years later, when publishing his *De cive* (*L.W.* ii. 151), that he wrote this third part of his system before he had been able to set down any finished representation of the fundamental doctrines which it presupposed. In the beginning of 1640, therefore, he had written out his doctrine of Man at least, with almost as much elaboration as it ever received from him.

In November 1640 the Long Parliament succeeded to the Short, and sent Laud and Strafford to the Tower, and Hobbes, who had become, or thought he had become, a marked man by the circulation of his treatise (of which, "though not printed, many gentlemen had copies"), hastened to Paris, "the first of all that fled." He was now for the fourth and last time abroad, and did not return for eleven years. Apparently he remained the greater part of the time in or about

In Paris.

[1] Hobbes, in minor works dealing with physical questions (*L.W.* iv. 316; *E.W.* vii. 112), makes two incidental references to Bacon's writings, but never mentions Bacon as he mentions Galileo, Kepler, Harvey, and others (*De corpore*, ep. ded.), among the lights of the century. The word "Induction," which occurs in only three or four passages throughout all his works (and these again minor ones), is never used by him with the faintest reminiscence of the import assigned to it by Bacon; and, as will be seen, he had nothing but scorn for *experimental* work in physics.

[2] The free English abstract of Aristotle's *Rhetoric*, published in 1681, after Hobbes's death, as *The Whole Art of Rhetoric* (*E.W.* vi. 423-510), corresponds with a Latin version dictated to his young pupil. Among Hobbes's papers preserved at Hardwick, where he died, there remains the boy's dictation-book, interspersed with headings, examples, &c. in Hobbes's hand.

[3] Among the Hardwick papers there is preserved a MS. copy of the work, under the title *Elementes of Law Naturall and Politique*, with the dedication to the earl of Newcastle, written in Hobbes's own hand, and dated May 9, 1640. This dedication was prefixed to the first thirteen chapters of the work when printed by themselves, under the title *Human Nature* in 1650.

Paris. He was welcomed back into the scientific coterie about Mersenne, and forthwith had the task assigned him of criticizing the *Meditations* of Descartes, which had been sent from Holland, before publication, to Mersenne with the author's request for criticism from the most different points of view. Hobbes was soon ready with the remarks that were printed as "Third" among the six (later seven) sets of "Objections" appended, with "Replies" from Descartes, to the *Meditations*, when published shortly afterwards in 1641 (reprinted in *L.W.* v. 249-274). About the same time also Mersenne sent to Descartes, as if they came from a friend in England, another set of objections which Hobbes had to offer on various points in the scientific treatises, especially the *Dioptrics*, appended by Descartes to his *Discourse on Method* in 1637; to which Descartes replied without suspecting the common authorship of the two sets. The result was to keep the two thinkers apart rather than bring them together. Hobbes was more eager to bring forward his own philosophical and physical ideas than careful to enter into the full meaning of another's thought; and Descartes was too jealous, and too confident in his conclusions to bear with this kind of criticism. He was very curt in his replies to Hobbes's philosophical objections, and broke off all correspondence on the physical questions, writing privately to Mersenne that he had grave doubts of the Englishman's good faith in drawing him into controversy (*L.W.* v. 277-307).

Meanwhile Hobbes had his thoughts too full of the political theory which the events of the last years had ripened within him to settle, even in Paris, to the orderly composition of his works. Though connected in his own mind with his view of human nature and of nature generally, the political theory, as he always declared, could stand by itself. Also, while he may have hoped at this time to be able to add much (though he never did) to the sketch of his doctrine of Man contained in the unpublished "little treatise," he might extend, but could hardly otherwise modify, the sketch he had there given of his carefully articulated theory of Body Politic. Possibly, indeed, before that sketch was written early in 1640, he may, under pressure of the political excitement, have advanced no small way in the actual composition of the treatise *De Cive*, the third section of his projected system. In any case, it was upon this section, before the others, that he set to work in Paris; and before the end of 1641 the book, as we know from the date of the dedication (November 1), was finished. Though it was forthwith printed in the course of the year 1642, he was content to circulate a limited number of copies privately[1]; and when he found his work received with applause (it was praised even by Descartes), he seems to have taken this recognition of his philosophical achievement as an additional reason for deferring publication till the earlier works of the system were completed. Accordingly, for the next three or four years, he remained steadily at work, and nothing appeared from him in public except a short treatise on optics (*Tractatus opticus*, *L.W.* v. 217-248) included in the collection of scientific tracts published by Mersenne under the title *Cogitata physico-mathematica* in 1644, and a highly compressed statement of his psychological application of the doctrine of motion (*L.W.* v. 309-318), incorporated with Mersenne's *Ballistica*, published in the same year. Thus or otherwise he had become sufficiently known by 1645 to be chosen as a referee, with Descartes, Roberval and others, in the famous controversy between John Pell (*q.v.*) and the Dane Longomontanus (*q.v.*) over that problem of the squaring of the circle which was seen later on to have such a fatal charm for himself. But though about this time he had got ready all or most of the materials for his fundamental work on Body, not even now was he able to make way with its composition, and when he returned to it after a number of years, he returned a different man.

The Civil War had broken out in 1642, and the royalist cause began to decline from the time of the defeat at Marston Moor, in the middle of 1644. Then commenced an exodus of the king's friends. Newcastle himself, who was a cousin of Hobbes's late patron and to whom he dedicated the "little treatise" of 1640, found his way to Paris, and was followed by a stream of fugitives, many of whom were known to Hobbes. The sight of these exiles made the political interest once more predominant in Hobbes, and before long the revived feeling issued in the formation of a new and important design. It first showed itself in the publication of the *De cive*, of which the fame, but only the fame, had extended beyond the inner circle of friends and critics who had copies of the original impression. Hobbes now entrusted it, early in 1646, to his admirer, the Frenchman Samuel de Sorbière, by whom it was seen through the Elzevir press at Amsterdam in 1647—having previously inserted a number of notes in reply to objections, and also a striking preface, in the course of which he explained its relation to the other parts of the system not yet forthcoming, and the (political) occasion of its having been composed and being now published before them.[2] So hopeless, meanwhile, was he growing of being able to return home that, later on in the year, he was on the point of leaving Paris to take up his abode in the south with a French friend,[3] when he was engaged "by the month" as mathematical instructor to the young prince of Wales, who had come over from Jersey about the month of July. This engagement lasted nominally from 1646 to 1648 when Charles went to Holland. Thus thrown more than ever into the company of the exiled royalists, it was then, if not earlier, that he conceived his new design of bringing all his powers of thought and expression to bear upon the production of an English book that should set forth his whole theory of civil government in relation to the political crisis resulting from the war. The *De cive*, presently to be published, was written in Latin for the learned, and gave the political theory without its foundation in human nature. The unpublished treatise of 1640 contained all or nearly all that he had to tell concerning human nature, but was written before the terrible events of the last years had disclosed how men might still be urged by their anti-social passions back into the abyss of anarchy. There was need of an exposition at once comprehensive, incisive and popular. The State, it now seemed to Hobbes, might be regarded as a great artificial man or monster (*Leviathan*), composed of men, with a life that might be traced from its generation through human reason under pressure of human needs to its dissolution through civil strife proceeding from human passions. This, we may suppose, was the presiding conception from the first, but the design may have been variously modified in the three or four years of its execution. Before the end, in 1650–1651, it is plain that he wrote in direct reference to the greatly changed aspect of affairs in England. The king being dead, and the royalist cause appearing to be hopelessly lost, he did not scruple, in closing the work with a general "Review and Conclusion," to raise the question of the subject's right to change allegiance when a former sovereign's power to protect was irrecoverably gone. Also he took advantage of the rule of the Commonwealth to indulge much more freely than he might have otherwise dared in rationalistic criticism of religious doctrines; while, amid the turmoil of sects, he could the more forcibly urge that the preservation of social order, when again firmly restored, must depend on the assumption by the civil power of the right

Leviathan.

[1] The book, of which the copies are rare (one in Dr Williams's library in London and one in the Bodleian), was printed in quarto size (Paris, 1642), with a pictorial title-page (not afterwards reproduced) of scenes and figures illustrating its three divisions, "Libertas," "Imperium," "Religio." The title *Elementorum philosophiae sectio tertia, De cive*, expresses its relation to the unwritten sections, which also comes out in one or two back-references in the text.

[2] *L.W.* ii. 133-134. In this first public edition (12mo), the title was changed to *Elementa philosophica de cive*, the references in the text to the previous sections being omitted. The date of the dedication to the young earl of Devonshire was altered from 1641 to 1646.

[3] Described as "nobilis Languedocianus" in *Vit.*; doubtless the same with the "Dominus Verdusius, nobilis Aquitanus," to whom was dedicated the *Exam. et emend. math. hod.* (*L.W.* iv.) in 1660. Du Verdus was one of Hobbes's profoundest admirers and most frequent correspondents in later years; there are many of his letters among Hobbes's papers at Hardwick.

SpinSmart Software http://www.spinsmart.com

to wield all sanctions, supernatural as well as natural, against the pretensions of any clergy, Catholic, Anglican or Presbyterian, to the exercise of an *imperium in imperio*.

We know the *Leviathan* only as it finally emerged from Hobbes's pen. During the years of its composition he remained in or near Paris, at first in attendance on his royal pupil, with whom he became a great favourite. In 1647 Hobbes was overtaken by a serious illness which disabled him for six months. Mersenne begged him not to die outside the Roman Catholic Church, but Hobbes said that he had already considered the matter sufficiently and afterwards took the sacrament according to the rites of the Church of England. On recovering from this illness, which nearly proved fatal, he resumed his literary task, and carried it steadily forward to completion by the year 1650, having also within the same time translated into English, with characteristic force of expression, his Latin treatise. Otherwise the only thing known (from one or two letters) of his life in those years is that from the year 1648 he had begun to think of returning home; he was then sixty and might well be weary of exile. When 1650 came, as if to prepare the way for the reception of his *magnum opus*, he allowed the publication of his earliest treatise, divided into two separate small volumes (*Human Nature, or the Fundamental Elements of Policy*, *E.W.* iv. 1-76, and *De Corpore Politico, or the Elements of Law, Moral and Politic*, pp. 77-228).[1] In 1651[2] he published his translation of the *De Cive* under the title of *Philosophical Rudiments concerning Government and Society* (*E.W.* ii.). Meanwhile the printing of the greater work was proceeding, and finally it appeared about the middle of the same year, 1651, under the title of *Leviathan, or the Matter, Form and Power of a Commonwealth, Ecclesiastical and Civil* (*E.W.* iii.), with a quaint frontispiece in which, from behind hills overlooking a fair landscape of town and country, there towered the body (above the waist) of a crowned giant, made up of tiny figures of human beings and bearing sword and crozier in the two hands. It appeared, and soon its author was more lauded and decried than any other thinker of his time; but the first effect of its publication was to sever his connexion with the exiled royalist party, and to throw him for protection on the revolutionary Government. No sooner did copies of the book reach Paris than he found himself shunned by his former associates, and though he was himself so little conscious of disloyalty that he was forward to present a manuscript copy "engrossed in vellum in a marvellous fair hand"[3] to the young king of the Scots (who, after the defeat at Worcester, escaped to Paris about the end of October), he was denied the royal presence when he sought it shortly afterwards. Straightway, then, he saw himself exposed to a double peril. The exiles had among them desperadoes who could slay; and, besides exciting the enmity of the Anglican clergy about the king, who bitterly resented the secularist spirit of his book, he had compromised himself with the French authorities by his elaborate attack on the papal system. In the circumstances, no resource was left him but secret flight. Travelling with what speed he could in the depths of a severe winter and under the effects of a recent (second) illness, he managed to reach London, where, sending in his submission to the council of state, he was allowed to subside into private life.

Though Hobbes came back, after his eleven years' absence, without having as yet publicly proved his title to rank with the natural philosophers of the age, he was sufficiently conscious of what he had been able to achieve in *Leviathan*; and it was in no humble mood that he now, at the age of sixty-four, turned to complete the fundamental treatise of his philosophical system. Neither those whom his masterpiece soon roused to enthusiasm, nor those whom it moved to indignation, were likely to be indifferent to anything he should now write, whether it lay near to or far from the region of practice. Taking up his abode in Fetter Lane, London, on his return, and continuing to reside there for the sake of intellectual society, even after renewing his old ties with the earl of Devonshire, who lived in the country till the Restoration,[4] he worked so steadily as to be printing the *De corpore* in the year 1654. Circumstances (of which more presently), however, kept the book back till the following year, and meanwhile the readers of *Leviathan* had a different excitement. In 1654 a small treatise, "Of Liberty and Necessity" (*E.W.* iv. 229-278), issued from the press, claiming to be an answer to a discourse on the same subject by Bishop Bramhall of Londonderry (afterwards archbishop of Armagh, d. 1663), addressed by Hobbes to the marquis of Newcastle.[5] It had grown out of an oral discussion between Hobbes and Bramhall in the marquis's presence at Paris in 1646. Bramhall, a strong Arminian, had afterwards written down his views and sent them to Newcastle to be answered in this form by Hobbes. Hobbes duly replied, but not for publication, because he thought the subject a delicate one. But it happened that Hobbes had allowed a French acquaintance to have a private translation of his reply made by a young Englishman, who secretly took a copy of the original for himself; and now it was this unnamed purloiner who, in 1654, when Hobbes had become famous and feared, gave it to the world of his own motion, with an extravagantly laudatory epistle to the reader in its front. Upon Hobbes himself the publication came as a surprise, but, after his plain speaking in *Leviathan*, there was nothing in the piece that he need scruple to have made known, and he seems to have condoned the act. On the other hand, Bramhall, supposing Hobbes privy to the publication, resented the manner of it, especially as no mention was made of his rejoinder. Accordingly, in 1655, he printed everything that had passed between them (under the title of *A Defence of the True Liberty of Human Actions from Antecedent or Extrinsic Necessity*), with loud complaint against the treatment he had received, and the promise added that, in default of others, he himself would stand forward to expose the deadly principles of *Leviathan*. About this time Hobbes had begun to be hard pressed by other foes, and, being never more sure of himself than upon the question of the will, he appears to have welcomed the opportunity thus given him of showing his strength. By 1656 he was ready with his *Questions concerning Liberty, Necessity and Chance* (*E.W.* v.), in which he replied with astonishing force to the bishop's rejoinder point by point, besides explaining the occasion and circumstances of the whole debate, and reproducing (as Bramhall had done) all the pieces from the beginning. As perhaps the first clear exposition and defence of the *psychological* doctrine of determinism, Hobbes's own two pieces must ever retain a classical importance in the history of the free-will controversy; while Bramhall's are still worth study as specimens of scholastic fence. The bishop, it should be added, returned to the charge in 1658 with ponderous *Castigations of Mr Hobbes's Animadversions*, and also made good his previous threat in a bulky

Return to London.

Controversy with Bramhall.

[1] *The Human Nature* corresponds with cc. i.-xiii. of the first part of the original treatise. The remaining six chapters of the part stand now as Part I. of the *De corpore politico*. Part II. of the *D.C.P.* corresponds with the original second part of the whole work.

[2] At the beginning of this year he wrote and published in Paris a letter on the nature and conditions of poetry, chiefly epic, in answer to an appeal to his judgment made in the preface to Sir W. Davenant's heroic poem, *Gondibert* (*E.W.* iv. 441-458). The letter is dated Jan. 10, 1650 (1650/1).

[3] This presentation copy, so described by Clarendon (*Survey of the Leviathan*, 1676, p. 8), is doubtless the beautifully written and finely bound MS. now to be found in the British Museum (Egerton MSS. 1910).

[4] During all the time he was abroad he had continued to receive from his patron a yearly pension of £80, and they remained in steady correspondence. The earl, having sided with the king in 1642, was declared unfit to sit in the House of Peers, and though, by submission to Parliament, he recovered his estates when they were sequestered later on, he did not sit again till 1660. Among Hobbes's friends at this time are specially mentioned John Selden and William Harvey, who left him a legacy of £10. According to Aubrey, Selden left him an equal bequest, but this seems to be a mistake. Harvey (not Bacon) is the only Englishman he mentions in the dedicatory epistle prefixed to the *De corpore*, among the founders, before himself, of the new natural philosophy.

[5] The treatise bore the date, "Rouen, Aug. 20, 1652," but it should have been 1646, as afterwards explained by Hobbes himself (*E.W.* v. 25).

appendix entitled *The Catching of Leviathan the Great Whale*. Hobbes never took any notice of the *Castigations*, but ten years later replied to the charges of atheism, &c., made in the non-political part of the appendix, of which he says he then heard for the first time (*E.W.* iv. 279-384). This *Answer* was first published after Hobbes's death.[1]

Controversy with Wallis and Ward.

We may now follow out the more troublesome conflict, or rather series of conflicts, in which Hobbes became entangled from the time of publishing his *De corpore* in 1655, and which checkered all his remaining years. In *Leviathan* he had vehemently assailed the system of the universities, as originally founded for the support of the papal against the civil authority, and as still working social mischief by adherence to the old learning. The attack was duly noted at Oxford, where under the Commonwealth a new spirit of scientific activity had begun to stir. In 1654 Seth Ward (1617–1689), the Savilian professor of astronomy, replying in his *Vindiciae academiarum* to some other assaults (especially against John Webster's *Examen of Academies*) on the academic system, retorted upon Hobbes that, so far from the universities being now what he had known them in his youth, he would find his geometrical pieces, when they appeared, better understood there than he should like. This was said in reference to the boasts in which Hobbes seems to have been freely indulging of having squared the circle and accomplished other such feats; and, when a year later the *De corpore* (*L.W.* i.) finally appeared, it was seen how the thrust had gone home. In the chapter (xx.) of that work where Hobbes dealt with the famous problem whose solution he thought he had found, there were left expressions against Vindex (Ward) at a time when the solutions still seemed to him good; but the solutions themselves, as printed, were allowed to be all in different ways halting, as he naively confessed he had discovered only when he had been driven by the insults of malevolent men to examine them more closely with the help of his friends. A strange conclusion this, and reached by a path not less strange, as was now to be disclosed by a relentless hand. Ward's colleague, the more famous John Wallis (*q.v.*), Savilian professor of geometry from 1649, had been privy to the challenge thrown out in 1654, and it was arranged that they should critically dispose of the *De corpore* between them. Ward was to occupy himself with the philosophical and physical sections, which he did in leisurely fashion, bringing out his criticism in the course of next year (*In Th. Hobbii philosophiam exercitatio epistolica*). Wallis was to confine himself to the mathematical chapters, and set to work at once with characteristic energy. Obtaining an unbound copy of the *De corpore*, he saw by the mutilated appearance of the sheets that Hobbes had repeatedly altered his demonstrations before he issued them at last in their actual form, grotesque as it was, rather than delay the book longer. Obtaining also a copy of the work as it had been printed before Hobbes had any doubt of the validity of his solutions, Wallis was able to track his whole course from the time of Ward's provocation—his passage from exultation to doubt, from doubt to confessed impotence, yet still without abandoning the old assumption of confident strength; and all his turnings and windings were now laid bare in one of the most trenchant pieces of controversial writing ever penned. Wallis's *Elenchus geometriae Hobbianae*, published in 1655 about three months after the *De corpore*, contained also an elaborate criticism of Hobbes's whole attempt to relay the foundations of mathematical science in its place within the general body of reasoned knowledge—a criticism which, if it failed to allow for the merit of the conception, exposed only too effectually the utter inadequacy of the result. Taking up mathematics when not only his mind was already formed but his thoughts were crystallizing into a philosophical system, Hobbes had, in fact, never put himself to school and sought to work up gradually to the best knowledge of the time, but had been more anxious from the first to become himself an innovator with whatever insufficient means. The consequence was that, when not spending himself in vain attempts to solve the impossible problems that have always waylaid the fancy of self-sufficient beginners, he took an interest only in the elements of geometry, and never had any notion of the full scope of mathematical science, undergoing as it then was (and not least at the hands of Wallis) the extraordinary development which made it before the end of the century the potent instrument of physical discovery which it became in the hands of Newton. He was even unable, in dealing with the elementary conceptions of geometry, to work out with any consistency the few original thoughts he had, and thus became the easy sport of Wallis. At his advanced age, however, and with the sense he had of his powers, he was not likely to be brought to a better mind by so insulting an opponent. He did indeed, before allowing an English translation of the *De corpore* (*E.W.* i.) to appear in 1656, take care to remove some of the worst mistakes exposed by Wallis, and, while leaving out all the references to Vindex, now profess to make, in altered form, a series of mere "attempts" at quadrature; but he was far from yielding the ground to the enemy. With the translation,[2] in the spring of 1656, he had ready *Six Lessons to the Professors of Mathematics, one of Geometry, the other of Astronomy, in the University of Oxford* (*E.W.* vii. 181-356), in which, after reasserting his view of the principles of geometry in opposition to Euclid's, he proceeded to repel Wallis's objections with no lack of dialectical skill, and with an unreserve equal to Wallis's own. He did not scruple, in the ardour of conflict, even to maintain positions that he had resigned in the translation, and he was not afraid to assume the offensive by a counter criticism of three of Wallis's works then published. When he had thus disposed of the "Paralogisms" of his more formidable antagonist in the first five lessons, he ended with a lesson on "Manners" to the two professors together, and set himself gravely at the close to show that he too could be abusive. In this particular part of his task, it must be allowed, he succeeded very well; his criticism of Wallis's works, especially the great treatise *Arithmetica infinitorum* (1655), only showed how little able he was to enter into the meaning of the modern analysis. Wallis, on his side, was not less ready to keep up the game in English than he had been to begin it in Latin. Swift as before to strike, in three months' time he had deftly turned his own word against the would-be master by administering *Due Correction for Mr Hobbes, or School Discipline for not saying his Lessons right*, in a piece that differed from the *Elenchus* only in being more biting and unrestrained. Having an easy task in defending himself against Hobbes's trivial criticism, he seized the opportunity given him by the English translation of the *De corpore* to track Hobbes again step by step over the whole course, and now to confront him with his incredible inconsistencies multiplied by every new utterance. But it was no longer a fight over mathematical questions only. Wallis having been betrayed originally by his fatal cleverness into the pettiest carping at words, Hobbes had retorted in kind, and then it became a high duty in the other to defend his Latin with great parade of learning and give fresh provocation. One of Wallis's rough sallies in this kind suggested to Hobbes the title of the next rejoinder with which, in 1657, he sought to close the unseemly wrangle. Arguing in the *Lessons* that a mathematical point must have quantity, though this were not reckoned, he had explained the Greek word στιγμή, used for a point, to mean a visible mark made with a hot iron; whereupon he was charged by Wallis with gross ignorance for confounding στιγμή and στιγμα. Hence the title of his new piece: Στιγμαὶ ἀγεωμετρίας, ἀγροικίας, ἀντιπολιτείας, ἀμαθείας, *or Marks of the Absurd Geometry, Rural Language, Scottish Church Politics, and Barbarisms of John Wallis, Professor of Geometry and Doctor of Divinity* (*E.W.* vii. 357-400). He now attacked more in detail but not more happily than before Wallis's great work, while hardly attempting any further defence of his own positions; also he repelled with some force and dignity the insults that had been heaped upon him, and fought the verbal points, but could not leave the field without making political insinuations against his adversary, quite irrelevant in themselves and only noteworthy as evidence of his own resignation to Cromwell's rule. The thrusts were easily and nimbly parried by Wallis in a reply (*Hobbiani puncti dispunctio*, 1657) occupied mainly with the verbal questions. Irritating as it was, it did not avail to shake Hobbes's determination to remain silent; and thus at last there was peace for a time.

Before the strife flamed up again, Hobbes had published, in 1658, the outstanding section of his philosophical system, and thus completed, after a fashion, the scheme he had planned more than twenty years before. So far as the treatise *De homine* (*L.W.* ii. 11-32) was concerned, the completion was more in name than in fact. It consisted for the most part of an elaborate theory of vision which, though very creditable to Hobbes's scientific insight, was out of place, or at least out of proportion, in a philosophical consideration of human nature generally. The remainder of the treatise, dealing cursorily with some of the topics more fully treated in the *Human Nature* and the *Leviathan*, has all the appearance of having been tagged in haste to the optical chapters (composed years before)[3] as

[1] "The *Vit. auct.* refers to 1676, a 'Letter to William duke of Newcastle on the Controversy about Liberty and Necessity, held with Benjamin Laney, bishop of Ely.' In that year there did appear a (confused) little tract written by Laney against Hobbes's concluding statement of his own 'Opinion' in the 'Liberty and Necessity' of 1654 (1646), but I can find no trace of any further writing by Hobbes on the subject" (G. Croom Robertson, *Hobbes*, p. 202).

[2] This translation, *Concerning Body*, though not made by Hobbes, was revised by him; but it is far from accurate, and not seldom, at critical places (*e.g.* c. vi. § 2), quite misleading. Philosophical citations from the *De corpore* should always be made in the original Latin. Molesworth reprints the Latin, not from the first edition of 1655, but from the modified edition of 1668—modified, in the mathematical chapters, in general (not exact) keeping with the English edition of 1656. The Vindex episode, referred to in the *Six Lessons*, becomes intelligible only by going beyond Molesworth to the original Latin edition of 1655.

[3] They were composed originally, in a somewhat different and rather more extended form, as the second part of an English treatise on Optics, completed by the year 1646. Of this treatise, preserved in Harleian MSS. 3360, Molesworth otherwise prints the dedication to the marquis of Newcastle, and the concluding paragraphs (*E.W.* vii. 467-471)

SpinSmart Software http://www.spinsmart.com

a makeshift for the proper transition required in the system from questions of Body Natural to questions of Body Politic. Hobbes had in fact spent himself in his earlier constructive efforts, and at the age of seventy, having nothing to add to his doctrine of Man as it was already in one form or another before the world, was content with anything that might stand for the fulfilment of his philosophical purpose. But he had still in him more than twenty years of vigorous vitality, and, not conscious to himself of any shortcoming, looked forward, now his hands were free, to doing battle for his doctrines. Rather than remain quiet, on finding no notice taken of his latest production, he would himself force on a new conflict with the enemy. Wallis having meanwhile published other works and especially a comprehensive treatise on the general principles of calculus (*Mathesis universalis*, 1657), he might take this occasion of exposing afresh the new-fangled methods of mathematical analysis and reasserting his own earlier positions. Accordingly, by the spring of 1660, he had managed to put his criticism and assertions into five dialogues under the title *Examinatio et emendatio mathematicae hodiernae qualis explicatur in libris Johannis Wallisii*, with a sixth dialogue so called, consisting almost entirely of seventy or more propositions on the circle and cycloid.[1] Wallis, however, would not take the bait. Hobbes then tried another tack. Next year, having solved, as he thought, another ancient *crux*, the duplication of the cube, he had his solution brought out anonymously at Paris in French, so as to put Wallis and other critics off the scent and extort a judgment that might be withheld from a work of his. The artifice was successful, and no sooner had Wallis publicly refuted the solution than Hobbes claimed the credit of it, and went more wonderfully than ever astray in its defence. He presently republished it (in modified form), with his remarks, at the end of a new Latin dialogue which he had meanwhile written in defence of another part of his philosophical doctrine. This was the *Dialogus physicus, sive De natura aëris* (*L.W.* iv. 233-296), fulminated in 1661 against Boyle and other friends of Wallis who, as he fancied, under the influence of that malevolent spirit, were now in London, after the Restoration, forming themselves into a society (incorporated as the Royal Society in 1662) for experimental research, to the exclusion of himself personally, and in direct contravention of the method of physical inquiry enjoined in the *De corpore*.[2] All the laborious manipulation recorded in Boyle's *New Experiments touching the Spring of the Air* (1660), which Hobbes chose, without the least warrant, to take as the manifesto of the new "academicians," seemed to him only to confirm the conclusions he had reasoned out years before from speculative principles, and he warned them that if they were not content to begin where he had left off their work would come to nought. To as much of this diatribe as concerned himself Boyle quickly replied with force and dignity, but it was from Hobbes's old enemy that retribution came, in the scathing satire *Hobbius heauton-timorumenos* (1662). Wallis, who had deftly steered his course amid all the political changes of the previous years, managing ever to be on the side of the ruling power, was now apparently stung to fury by a wanton allusion in Hobbes's latest dialogue to a passage of his former life (his deciphering for the parliament the king's papers taken at Naseby), whereof he had once boasted but after the Restoration could not speak or hear too little. The revenge he took was crushing. Professing to be roused by the attack on his friend Boyle, when he had scorned to lift a finger in defence of himself against the earlier dialogues, he tore them all to shreds with an art of which no general description can give an idea. He got, however, upon more dangerous ground when, passing wholly by the political insinuation against himself, he roundly charged Hobbes with having written *Leviathan* in support of Oliver's title, and deserted his royal master in distress. Hobbes seems to have been fairly bewildered by the rush and whirl of sarcasm with which Wallis drove him anew from every mathematical position he had ever taken up, and did not venture forth into the field of scientific controversy again for some years, when he had once followed up the physical dialogue of 1661 by seven shorter ones, with the inevitable appendix, entitled *Problemata physica, una cum magnitudine circuli* (*L.W.* iv. 297-384), in 1662.[3] But all the more eagerly did he take advantage of Wallis's loose calumny to strike where he felt himself safe. His answer to the personal charges took the form of a letter about himself in the third person addressed to Wallis in 1662, under the title of *Considerations upon the Reputation, Loyalty, Manners and Religion of Thomas Hobbes* (*E.W.* iv. 409-440). In this piece, which is of great biographical value, he told his own and Wallis's "little stories during the time of the late rebellion" with such effect that Wallis, like a wise man, attempted no further reply. Thus ended the second bout.

After a time Hobbes took heart again and began a third period of controversial activity, which did not end, on his side, till his ninetieth year. Little need be added to the simple catalogue of the untiring old man's labours in this last stage of his life. The first piece, published in 1666, *De principiis et ratiocinatione geometrarum* (*L.W.* iv. 385-484), was designed, as the sub-title declared, to lower the pride of geometrical professors by showing that there was no less uncertainty and error in their works than in those of physical or ethical writers. Wallis replied shortly in the *Philosophical Transactions* (August 1666). Three years later he brought his three great achievements together in compendious form, *Quadratura circuli, Cubatio sphaerae, Duplicatio cubi*, and as soon as they were once more refuted by Wallis, reprinted them with an answer to the objections, in compliment to the grand-duke of Tuscany, who paid him attentions on a visit to England in 1669 (*L.W.* iv. 485-522). Wallis, who had promised to leave him alone henceforward, refuted him again before the year was out. In 1671 he worked up his propositions over again in *Rosetum geometricum* (*L.W.* v. 1-50), as a fragrant offering to the geometrical reader, appending a criticism (*Censura brevis*, pp. 50-88) on the first part of Wallis's treatise *De motu*, published in 1669; also he sent *Three Papers* to the Royal Society on selected points treated very briefly, and when Wallis, still not weary of confuting, shortly replied, published them separately with triumphant *Considerations on Dr Wallis's Answer to them* (*E.W.* vii. 429-448). Next year (1672), having now, as he believed, established himself with the Royal Society, he proceeded to complete the discomfiture of Wallis by a public address to the Society on all the points at issue between them from the beginning, *Lux Mathematica excussa collisionibus Johannis Wallisii et Thomae Hobbesii* (*L.W.* v. 89-150), the light, as the author R. R. (Roseti Repertor) added, being here "increased by many very brilliant rays." Wallis replied in the *Transactions*, and then finally held his hand. Hobbes's energy was not yet exhausted. In 1674, at the age of eighty-six, he published his *Principia et problemata aliquot geometrica, ante desperata nunc breviter explicata et demonstrata* (*L.W.* v. 150-214), containing in the chapters dealing with questions of principle not a few striking observations, which ought not to be overlooked in the study of his philosophy. His last piece of all, *Decameron physiologicum* (*E.W.* vii. 69-180), in 1678, was a new set of dialogues on physical questions, most of which he had treated in a similar fashion before; but now, in dealing with gravitation, he was able to fire a parting shot at Wallis; and one more demonstration of the equality of a straight line to the arc of a circle, thrown in at the end, appropriately closed the strangest warfare in which perverse thinker ever engaged.[4]

Later Years.

We must now turn back to trace the fortunes of Hobbes and his other doings in the last twenty years of his life. All these controversial writings on mathematics and physics represent but one half of his activity after the age of seventy; though, as regards the other half, it is not possible, for a reason that will be seen, to say as definitely in what order the works belonging to the period were produced. From the time of the Restoration he acquired a new prominence in the public eye. No year had passed since the appearance of *Leviathan* without some indignant protest against the influence which its trenchant doctrine was calculated to produce upon minds longing above everything for civil repose; but after the Restoration "Hobbism" became a fashionable creed, which it was the duty of every lover of true morality and religion to denounce. Two or three days after Charles's arrival in London, Hobbes drew in the street the notice of his former pupil, and was at once received into favour. The young king, if he had ever himself resented the apparent disloyalty of the "Conclusion" of *Leviathan*, had not retained the feeling long, and could appreciate the principles of the great book when the application of them happened, as now, to be turned in his own favour. He had, besides, a relish for Hobbes's wit (as he used to say, "Here comes the bear to be baited"), and did not like the old man the less because his presence at court scandalized the bishops or the prim virtue of Chancellor Hyde. He even went the length of bestowing on Hobbes (but not always paying) a pension of £100, and had his portrait hung up in the royal

[1] *L.W.* iv. 1-232. The propositions on the circle, forty-six in number (shattered by Wallis in 1662), were omitted by Hobbes when he republished the *Dialogues* in 1668, in the collected edition of his Latin works from which Molesworth reprints. In the part omitted, at p. 154 of the original edition, Hobbes refers to his first introduction to Euclid, in a way that confirms the story in Aubrey quoted in an earlier paragraph.

[2] Remaining at Oxford, Wallis, in fact, took no active part in the constitution of the new society, but he had been, from 1645, one of the originators of an earlier association in London, thus continued or revived. This earlier society had been continued also at Oxford after the year 1649, when Wallis and others of its members received appointments there.

[3] The *Problemata physica* was at the same time put into English (with some changes and omission of part of the mathematical appendix), and presented to the king, to whom the work was dedicated in a remarkable letter apologizing for *Leviathan*. In its English form, as *Seven Philosophical Problems and Two Propositions of Geometry* (*E.W.* vii. 1-68), the work was first published in 1682, after Hobbes's death.

[4] Wallis's pieces were excluded from the collected edition of his works (1693-1697), and have become extremely rare.

SpinSmart Software http://www.spinsmart.com

closet. These marks of favour, naturally, did not lessen Hobbes's self-esteem, and perhaps they explain, in his later writings, a certain slavishness toward the regal authority, which is wholly absent from his rational demonstration of absolutism in the earlier works. At all events Hobbes was satisfied with the rule of a king who had appreciated the author of *Leviathan*, and protected him when, after a time, protection in a very real sense became necessary. His eagerness to defend himself against Wallis's imputation of disloyalty, and his apologetic dedication of the *Problemata physica* to the king, are evidence of the hostility with which he was being pressed as early as 1662; but it was not till 1666 that he felt himself seriously in danger. In that year the Great Fire of London, following on the Great Plague, roused the superstitious fears of the people, and the House of Commons embodied the general feeling in a bill against atheism and profaneness. On the 17th of October it was ordered that the committee to which the bill was referred "should be empowered to receive information touching such books as tend to atheism, blasphemy and profaneness, or against the essence and attributes of God, and in particular the book published in the name of one White,[1] and the book of Mr Hobbes called the *Leviathan*, and to report the matter with their opinion to the House." Hobbes, then verging upon eighty, was terrified at the prospect of being treated as a heretic, and proceeded to burn such of his papers as he thought might compromise him. At the same time he set himself, with a very characteristic determination, to inquire into the actual state of the law of heresy. The results of his investigation were first announced in three short Dialogues added (in place of the old "Review and Conclusion," for which the day had passed) as an Appendix to his Latin translation of *Leviathan* (*L.W.* iii.), included with the general collection of his works published at Amsterdam in 1668. In this appendix, as also in the posthumous tract, published in 1680, *An Historical Narration concerning Heresy and the Punishment thereof* (*E.W.* iv. 385-408), he aimed at showing that, since the High Court of Commission had been put down, there remained no court of heresy at all to which he was amenable, and that even when it stood nothing was to be declared heresy but what was at variance with the Nicene Creed, as he maintained the doctrine of *Leviathan* was not.

The only consequence that came of the parliamentary scare was that Hobbes could never afterwards get permission to print anything on subjects relating to human conduct. The collected edition of his Latin works (in two quarto volumes) appeared at Amsterdam in 1668, because he could not obtain the censor's licence for its publication at London, Oxford or Cambridge. Other writings which he had finished, or on which he must have been engaged about this time, were not made public till after his death—the king apparently having made it the price of his protection that no fresh provocation should be offered to the popular sentiment. The most important of the works composed towards 1670, and thus kept back, is the extremely spirited dialogue to which he gave the title *Behemoth: the History of the Causes of the Civil Wars of England and of the Counsels and Artifices by which they were carried on from the year 1640 to the year 1660.*[2] To the same period probably belongs the unfinished *Dialogue between a Philosopher and a Student of the Common Laws of England* (*E.W.* vi. 1-160), a trenchant criticism of the constitutional theory of English government as upheld by Coke. Aubrey takes credit for having tried to induce Hobbes to write upon the subject in 1664 by presenting him with a copy of Bacon's *Elements of the Laws of England*, and though the attempt was then unsuccessful, Hobbes later on took to studying the statute-book, with *Coke upon Littleton*. One other posthumous production also (besides the tract on Heresy before mentioned) may be referred to this, if not, as Aubrey suggests, an earlier time—the two thousand and odd elagiac verses in which he gave his view of ecclesiastical encroachment on the civil power; the quaint verses, disposed in his now favourite dialogue-form, were first published, nine years after his death, under the title *Historia ecclesiastica* (*L.W.* v. 341-408), with a preface by Thomas Rymer.

For some time Hobbes was not even allowed to utter a word of protest, whatever might be the occasion that his enemies took to triumph over him. In 1669 an unworthy follower—Daniel Scargil by name, a fellow of Corpus Christi College, Cambridge—had to recant publicly and confess that his evil life had been the result of Hobbist doctrines. In 1674 John Fell, the dean of Christ Church, who bore the charges of the Latin translation of Anthony Wood's *History and Antiquities of the University of Oxford* (1670), struck out all the complimentary epithets in the account of his life, and substituted very different ones; but this time the king did suffer him to defend himself by publishing a dignified letter (*Vit. Auct.* pp. xlvii.-l.), to which Fell replied by adding to the translation when it appeared a note full of the grossest insults. And, amid all his troubles, Hobbes was not without his consolations. No Englishman of that day stood in the same repute abroad, and foreigners, noble or learned, who came to England, never forgot to pay their respects to the old man, whose vigour and freshness of intellect no progress of the years seemed able to quench. Among these was the grand-duke of Tuscany (Ferdinand II.), who took away some works and a portrait to adorn the Medicean library.

His pastimes in the latest years were as singular as his labours. The autobiography in Latin verse, with its playful humour, occasional pathos and sublime self-complacency, was thrown off at the age of eighty-four. At eighty-five, in the year 1673, he sent forth a translation of four books of the *Odyssey* (ix.-xii.) in rugged but not seldom happily turned English rhymes; and, when he found this *Voyage of Ulysses* eagerly received, he had ready by 1675 a complete translation of both *Iliad* and *Odyssey* (*E.W.* x.), prefaced by a lively dissertation "Concerning the Virtues of an Heroic Poem," showing his unabated interest in questions of literary style. After 1675, he passed his time at his patron's seats in Derbyshire, occupied to the last with intellectual work in the early morning and in the afternoon hours, which it had long been his habit to devote to thinking and to writing. Even as late as August 1679 he was promising his publisher "somewhat to print in English." The end came very soon afterwards. A suppression of urine in October, in spite of which he insisted upon being conveyed with the family from Chatsworth to Hardwick Hall towards the end of November, was followed by a paralytic stroke, under which he sank on the 4th of December, in his ninety-second year. He lies buried in the neighbouring church of Ault Hucknall.

He was tall and erect in figure, and lived on the whole a temperate life, though he used to say that he had been drunk about a hundred times. His favourite exercise was tennis, which he played regularly even after the age of seventy. Socially he was genial and courteous, though in argument he occasionally lost his temper. As a friend he was generous and loyal. Intellectually bold in the extreme, he was curiously timid in ordinary life, and is said to have had a horror of ghosts. He read little, and often boasted that he would have known as little as other men if he had read as much. He appears to have had an illegitimate daughter for whom he made generous provision. In the National Portrait Gallery there is a portrait of him by J. M. Wright, and two others are in the possession of the Royal Society.

Personal characteristics.

As already suggested, it cannot be allowed that Hobbes falls into any regular succession from Bacon; neither can it be said that he handed on the torch to Locke. He was the one English thinker of the first rank in the long period of two generations separating Locke from Bacon, but, save in the chronological sense, there is no true relation of succession among the three. It would be difficult even to prove any ground of affinity among them beyond a desposition to take sense as a prime factor in the account of subjective experience: their common interest in physical science was shared

Place in English thought.

[1] The *De medio animarum statu* of Thomas White, a heterodox Catholic priest, who contested the natural immortality of the soul. White (who died 1676) and Hobbes were friends.

[2] *E.W.* vi. 161-418. Though *Behemoth* was kept back at the king's express desire, it saw the light, without Hobbes's leave, in 1679, before his death.

SpinSmart Software http://www.spinsmart.com

equally by rationalist thinkers of the Cartesian school, and was indeed begotten of the time. Backwards, Hobbes's relations are rather with Galileo and the other inquirers who, from the beginning of the 17th century, occupied themselves with the physical world in the manner that has come later to be distinguished by the name of science in opposition to philosophy. But even more than in external nature, Hobbes was interested in the phenomena of social life, presenting themselves so impressively in an age of political revolution. So it came to pass that, while he was unable, by reason of imperfect training and too tardy development, with all his pains, to make any contribution to physical science or to mathematics as instrumental in physical research, he attempted a task which no other adherent of the new "mechanical philosophy" conceived—nothing less than such a universal construction of human knowledge as would bring Society and Man (at once the matter and maker of Society) within the same principles of scientific explanation as were found applicable to the world of Nature. The construction was, of course, utterly premature, even supposing it were inherently possible; but it is Hobbes's distinction, in his century, to have conceived it, and he is thereby lifted from among the scientific workers with whom he associated to the rank of those philosophical thinkers who have sought to order the whole domain of human knowledge. The effects of his philosophical endeavour may be traced on a variety of lines. Upon every subject that came within the sweep of his system, except mathematics and physics, his thoughts have been productive of thought. When the first storm of opposition from smaller men had begun to die down, thinkers of real weight, beginning with Cumberland and Cudworth, were moved by their aversion to his analysis of the moral nature of man to probe anew the question of the natural springs and the rational grounds of human action; and thus it may be said that Hobbes gave the first impulse to the whole of that movement of ethical speculation that, in modern times, has been carried on with such remarkable continuity in England. In politics the revulsion from his particuar conclusions did not prevent the more clear-sighted of his opponents from recognizing the force of his supreme demonstration of the practical irresponsibility of the sovereign power, wherever seated, in the state; and, when in a later age the foundations of a positive theory of legislation were laid in England, the school of Bentham—James Mill, Grote, Molesworth—brought again into general notice the writings of the great publicist of the 17th century, who, however he might, by the force of temperament, himself prefer the rule of one, based his whole political system upon a rational regard to the common weal. Finally, the psychology of Hobbes, though too undeveloped to guide the thoughts or even perhaps arrest the attention of Locke, when essaying the scientific analysis of knowledge, came in course of time (chiefly through James Mill) to be connected with the theory of associationism developed from within the school of Locke, in different ways, by Hartley and Hume; nor is it surprising that the later associationists, finding their principle more distinctly formulated in the earlier thinker, should sometimes have been betrayed into affiliating themselves to Hobbes rather than to Locke. For his ethical theories see ETHICS.

Sufficient information is given in the *Vitae Hobbianae auctarium* (*L.W.* i. p. lxv. ff.) concerning the frequent early editions of Hobbes's separate works, and also concerning the works of those who wrote against him, to the end of the 17th century. In the 18th century, after Clarke's *Boyle Lectures* of 1704–1705, the opposition was less express. In 1750 *The Moral and Political Works* were collected, with life, &c., by Dr Campbell, in a folio edition, including in order, *Human Nature, De corpore politico, Leviathan, Answer to Bramhall's Catching of the Leviathan, Narration concerning Heresy, Of Liberty and Necessity, Behemoth, Dialogue of the Common Laws*, the Introduction to the *Thucydides, Letter to Davenant and two others*, the Preface to the *Homer, De mirabilibus Pecci* (with English translation), *Considerations on the Reputation, &c., of T. H.* In 1812 the *Human Nature* and the *Liberty and Necessity* (with supplementary extracts from the *Questions* of 1656) were reprinted in a small edition of 250 copies, with a meritorious memoir (based on Campbell) and dedication to Horne Tooke, by Philip Mallet. Molesworth's edition (1839–1845), dedicated to Grote, has been referred to in a former note. Of translations may be mentioned *Les Élémens philosophiques du citoyen* (1649) and *Le Corps politique* (1652), both by S. de Sorbière, conjoined with *Le Traité de la nature humaine*, by d'Holbach, in 1787, under the general title *Les Œuvres philosophiques et politiques de Thomas Hobbes*; a translation of the first section, "Computatio sive logica," of the *De corpore*, included by Destutt de Tracy with his *Élémens d'idéologie* (1804); a translation of *Leviathan* into Dutch in 1678, and another (anonymous) into German—*Des Engländers Thomas Hobbes Leviathan oder der kirchliche und bürgerliche Staat* (Halle, 1794, 2 vols.); a translation of the *De cive* by J. H. v. Kirchmann—*T. Hobbes: Abhandlung über den Bürger, &c.* (Leipzig, 1873). Important later editions are those of Ferdinand Tönnies, *Behemoth* (1889), on which see Croom Robertson's *Philosophical Remains* (1894), p. 451; *Elements of Law* (1889).

Biographical and Critical Works.—There are three accounts of Hobbes's life, first published together in 1681, two years after his death, by R. B. (Richard Blackbourne, a friend of Hobbes's admirer, John Aubrey), and reprinted, with complimentary verses by Cowley and others, at the beginning of Sir W. Molesworth's collection of the *Latin Works*: (1) *T. H. Malmesb. vita* (pp. xiii.-xxi.), written by Hobbes himself, or (as also reported) by T. Rymer, at his dictation; (2) *Vitae Hobbianae auctarium* (pp. xxii.-lxxx.), turned into Latin from Aubrey's English; (3) *T. H. Malmesb. vita carmine expressa* (pp. lxxxi.-xcix.), written by Hobbes at the age of eighty-four (first published by itself in 1680). The *Life of Mr T. H. of Malmesburie*, printed among the *Lives of Eminent Men*, in 1813, from Aubrey's papers in the Bodleian, &c. (vol. ii. pt. ii. pp. 593-637), contains some interesting particulars not found in the *Auctarium*. All that is of any importance for Hobbes's life is contained in G. Croom Robertson's *Hobbes* (1886) in Blackwood's Philosophical Classics, and Sir Leslie Stephen's *Hobbes* (1904) in the "English Men of Letters" series, both of which deal fully with his philosophy also. See also F. Tönnies, *Hobbes Leben und Lehre* (1896), *Hobbes-Analekten* (1904 foll.); G. Zart, *Einfluss der englischen Philosophie seit Bacon auf die deutsche Philosophie des 18ten Jahrh.* (Berlin, 1881); G. Brandt, *Thomas Hobbes: Grundlinien seiner Philosophie* (1895); G. Lyon, *La Philos. de Hobbes* (1893); J. M. Robertson, *Pioneer Humanists* (1907); J. Rickaby, *Free Will and Four English Philosophers* (1906), pp. 1-72; J. Watson, *Hedonistic Theories* (1895); W. Graham, *English Political Philosophy from Hobbes to Maine* (1899); W. J. H. Campion, *Outlines of Lectures on Political Science* (1895). (G. C. R.; X.)

HOBBY, a small horse, probably from early quotations, of Irish breed, trained to an easy gait so that riding was not fatiguing. The common use of the word is for a favourite pursuit or occupation, with the idea either of excessive devotion or of absence of ulterior motive or of profit, &c., outside the occupation itself. This use is probably not derived from the easy ambling gait of the Irish "hobby," but from the "hobby-horse," the mock horse of the old morris-dances, made of a painted wooden horse's head and tail, with a framework casing for an actor's body, his legs being covered by a cloth made to represent the "housings" of the medieval tilting-horse. A hobby or hobby-horse is thus a toy, a diversion. The O. Fr. *hobin*, or *hobi*, Mod. *aubin*, and Ital. *ubina* are probably adaptations of the English, according to the *New English Dictionary*. The O. Fr. *hober*, to move, which is often taken to be the origin of all these words, is the source of a use of "hobby" for a small kind of falcon, *falco subbuteo*, used in hawking.

HOBHOUSE, ARTHUR HOBHOUSE, 1ST BARON (1819–1904), English judge, fourth son of Henry Hobhouse, permanent under-secretary of state in the Home Office, was born at Hadspen, Somerset, on the 10th of November 1819. Educated at Eton and Balliol, he was called to the bar at Lincoln's Inn in 1845, and rapidly acquired a large practice as a conveyancer and equity draftsman; he became Q.C. in 1862, and practised in the Rolls Court, retiring in 1866. He was an active member of the charity commission and urged the appropriation of pious bequests to educational and other purposes. In 1872 he began a five years' term of service as legal member of the council of the governor-general of India, his services being acknowledged by a K.C.S.I.; and in 1881 he was appointed a member of the judicial committee of the privy council, on which he served for twenty years. He was made a peer in 1885, and consistently supported the Liberal party in the House of Lords. He died on the 6th of December 1904, leaving no heir to the barony.

His papers read before the Social Science Association on the subject of property were collected in 1880 under the title of *The Dead Hand*.

HOBOKEN, a small town of Belgium on the right bank of the Scheldt about 4 m. above Antwerp. It is only important on account of the ship-building yard which the Cockerill firm of Seraing has established at Hoboken. Many wealthy Antwerp

SpinSmart Software http://www.spinsmart.com

merchants have villas here, and it is the headquarters of several of the leading rowing clubs on the Scheldt. Pop. (1904) 12,816.

HOBOKEN, a city of Hudson county, New Jersey, U.S.A., on the Hudson river, adjoining Jersey City on the S. and W. and opposite New York city, with which it is connected by ferries and by two subway lines through tunnels under the river. Pop. (1890) 43,648; (1900) 59,364, of whom 21,380 were foreign-born, 10,843 being natives of Germany; (1910 census) 70,324. Of the total population in 1900, 48,349 had either one or both parents foreign-born, German being the principal racial element. The city is served by the West Shore, and the Delaware, Lackawanna & Western railways, being the eastern terminus of the latter, and is connected by electric railway with the neighbouring cities of north-eastern New Jersey. In Hoboken are the piers of the North German Lloyd, the Hamburg American, the Netherlands American, the Scandinavian and the Phoenix steamship lines. Hoboken occupies a little more than 1 sq. m. and lies near the foot of the New Jersey Palisades, which rise both on the W. and N. to a height of nearly 200 ft. Much of its surface has had to be filled in to raise it above high tide, but Castle Point, in the N.E., rises from the generally low level about 100 ft. On this Point are the residence and private estate of the founder of the city, John Stevens (1749–1838), Hudson Park, and facing it the Stevens Institute of Technology, an excellent school of mechanical engineering endowed by Edwin A. Stevens (1795–1868), son of John Stevens, opened in 1871, and having in 1909–1910 34 instructors and 390 students. The institute owes much to its first president, Henry Morton (1836–1902), a distinguished scientist, whose aim was "to offer a course of instruction in which theory and practice were carefully balanced and thoroughly combined," and who gave to the institute sums aggregating $175,000 (see *Morton Memorial, History of Stevens Institute*, ed. by Furman, 1905). In connexion with the institute there is a preparatory department, the Stevens School (1870). The city maintains a teachers' training school. Among the city's prominent buildings are the Delaware, Lackawanna & Western station, the Hoboken Academy (1860), founded by German Americans, and the public library. The city has an extensive coal trade and numerous manufactures, among which are lead pencils, leather goods, silk goods, wall-paper and caskets. The value of the manufactured product increased from $7,151,391 in 1890 to $12,092,872 in 1900, or 69·1%. The factory product in 1905 was valued at $14,077,305, an increase of 34·3% over that for 1900. The site of Hoboken (originally "Hobocanhackingh," the place of the tobacco pipe) was occupied about 1640 as a Dutch farm, but in 1643 the stock and all the buildings except a brew-house were destroyed by the Indians. In 1711 title to the place was acquired by Samuel Bayard, a New York merchant, who built on Castle Point his summer residence. During the War of Independence his descendant, William Bayard, was a loyalist, and his home was burned and his estate confiscated. In 1784 the property was purchased by John Stevens, the inventor, who in 1804 laid it out as a town. For the next thirty-five years its "Elysian Fields" were a famous pleasure resort of New York City. Hoboken was incorporated as a town in 1849 and as a city in 1855. On the 30th of June 1900 the wharves of the North German Lloyd Steamship Company and three of its ocean liners were almost completely destroyed by a fire, which caused a loss of more than 200 lives and over $5,000,000.

HOBSON'S CHOICE, *i.e.* "this or nothing," an expression that arose from the fact that the Cambridge-London carrier, Thomas Hobson (1544–1630), refused, when letting his horses on hire, to allow any animal to leave the stable out of its turn. Among other bequests made by Hobson, and commemorated by Milton, was a conduit for the Cambridge market-place, for which he provided the perpetual maintenance. See *Spectator*, No. 509 (14th of October 1712).

HOBY, SIR THOMAS (1530–1566), English diplomatist and translator, son of William Hoby of Leominster, was born in 1530. He entered St John's College, Cambridge, in 1545, but in 1547 he went to Strassburg, where he was the guest of Martin Bucer, whose *Gratulation . . . unto the Church of Englande for the restitution of Christes Religion* he translated into English. He then proceeded to Italy, visiting Padua and Venice, Florence and Siena, and in May 1550 he had settled at Rome, when he was summoned by his half-brother, Sir Philip Hoby (1505–1558), then ambassador at the emperor's court, to Augsburg. The brothers returned to England at the end of the year, and Thomas attached himself to the service of the marquis of Northampton, whom he accompanied to France on an embassy to arrange a marriage between Edward VI. and the princess Elizabeth. Shortly after he returned to England he started once more for Paris, and in 1552 he was engaged on his translation of *The Courtyer of Count Baldessar Castilio*. His work was probably completed in 1554, and the freedom of the allusions to the Roman church probably accounts for the fact that it was withheld from publication until 1561. The *Cortegiano* of Baldassare Castiglione, which Dr Johnson called "the best book that ever was written upon good breeding," is a book as entirely typical of the Italian Renaissance as Machiavelli's *Prince* in another direction. It exercised an immense influence on the standards of chivalry throughout Europe, and was long the recognized authority for the education of a nobleman. The accession of Mary made it desirable for the Hobys to remain abroad, and they were in Italy until the end of 1555. Thomas Hoby married in 1558 Elizabeth, the learned daughter of Sir Anthony Cook, who wrote a Latin epitaph on her husband. He was knighted in 1566 by Elizabeth, and was sent to France as English ambassador. He died on the 13th of July in the same year in Paris, and was buried in Bisham Church.

His son, SIR EDWARD HOBY (1560–1617), enjoyed Elizabeth's favour, and he was employed on various confidential missions. He was constable of Queenborough Castle, Kent, where he died on the 1st of March 1617. He took part in the religious controversies of the time, publishing many pamphlets against Theophilus Higgons and John Fludd or Floyd. He translated, from the French of Mathieu Coignet, *Politique Discourses on Trueth and Lying* (1586).

The authority for Thomas Hoby's biography is a MS. "Booke of the Travaile and lief of me Thomas Hoby, with diverse things worth the noting." This was edited for the Royal Historical Society by Edgar Powell in 1902. Hoby's translation of *The Courtyer* was edited (1900) by Professor Walter Raleigh for the "Tudor Translations" series.

HOCHE, LAZARE (1768–1797), French general, was born of poor parents near Versailles on the 24th of June 1768. At sixteen years of age he enlisted as a private soldier in the *Gardes françaises*. He spent his entire leisure in earning extra pay by civil work, his object being to provide himself with books, and this love of study, which was combined with a strong sense of duty and personal courage, soon led to his promotion. When the *Gardes françaises* were broken up in 1789 he was a corporal, and thereafter he served in various line regiments up to the time of his receiving a commission in 1792. In the defence of Thionville in that year Hoche earned further promotion, and he served with credit in the operations of 1792–1793 on the northern frontier of France. At the battle of Neerwinden he was aide-de-camp to General le Veneur, and when Dumouriez deserted to the Austrians, Hoche, along with le Veneur and others, fell under suspicion of treason; but after being kept under arrest and unemployed for some months he took part in the defence of Dunkirk, and in the same year (1793) he was promoted successively *chef de brigade*, general of brigade, and general of division. In October 1793 he was provisionally appointed to command the Army of the Moselle, and within a few weeks he was in the field at the head of his army in Lorraine. His first battle was that of Kaiserslautern (28th–30th of November) against Prussians. The French were defeated, but even in the midst of the Terror the Committee of Public Safety continued Hoche in his command. Pertinacity and fiery energy in their eyes outweighed everything else, and Hoche soon showed that he possessed these qualities. On the 22nd of December he stormed the lines of Fröschweiler, and the representatives of the Convention with his army at once added the Army of the Rhine to his sphere of command. On the 26th of December the French

SpinSmart Software http://www.spinsmart.com

carried by assault the famous lines of Weissenburg, and Hoche pursued his success, sweeping the enemy before him to the middle Rhine in four days. He then put his troops into winter quarters. Before the following campaign opened, he married Anne Adelaïde Dechaux at Thionville (March 11th, 1794). But ten days later he was suddenly arrested, charges of treason having been preferred by Pichegru, the displaced commander of the Army of the Rhine, and by his friends. Hoche escaped execution, however, though imprisoned in Paris until the fall of Robespierre. Shortly after his release he was appointed to command against the Vendéans (21st of August 1794). He completed the work of his predecessors in a few months by the peace of Jaunaye (15th of February 1795), but soon afterwards the war was renewed by the Royalists. Hoche showed himself equal to the crisis and inflicted a crushing blow on the Royalist cause by defeating and capturing de Sombreuil's expedition at Quiberon and Penthièvre (16th–21st of July 1795). Thereafter, by means of mobile columns (which he kept under good discipline) he succeeded before the summer of 1796 in pacifying the whole of the west, which had for more than three years been the scene of a pitiless civil war. After this he was appointed to organize and command the troops destined for the invasion of Ireland, and he started on this enterprise in December 1796. A tempest, however, separated Hoche from the expedition, and after various adventures the whole fleet returned to Brest without having effected its purpose. Hoche was at once transferred to the Rhine frontier, where he defeated the Austrians at Neuwied (April), though operations were soon afterwards brought to an end by the Preliminaries of Leoben. Later in 1797 he was minister of war for a short period, but in this position he was surrounded by obscure political intrigues, and, finding himself the dupe of Barras and technically guilty of violating the constitution, he quickly laid down his office, returning to his command on the Rhine frontier. But his health grew rapidly worse, and he died at Wetzlar on the 19th of September 1797 of consumption. The belief was widely spread that he had been poisoned, but the suspicion seems to have been without foundation. He was buried by the side of his friend Marceau in a fort on the Rhine, amidst the mourning not only of his army but of all France.

See Privat, *Notions historiques sur la vie morale, politique et militaire du général Hoche* (Strassburg, 1798); Daunou, *Éloge du général Hoche* (1798), delivered on behalf of the Institut at Hoche's funeral; Rousselin, *Vie de Lazare Hoche, général des armées de la république française* (Paris, 1798; this work was printed at the public expense and distributed to the schools); Dubroca, *Éloge funèbre du général Hoche* (Paris, 1800); *Vie et pensées du général Hoche* (Bern); Champrobert, *Notice historique sur Lazare Hoche, le pacificateur de la Vendée* (Paris, 1840); Dourille, *Histoire de Lazare Hoche* (Paris, 1844); Desprez, *Lazare Hoche d'après sa correspondance* (Paris, 1858; new ed., 1880); Bergounioux, *Essai sur la vie de Lazare Hoche* (1852); É. de Bonnechose, *Lazare Hoche* (1867); H. Martin, *Hoche et Bonaparte* (1875); Dutemple, *Vie politique et militaire du général Hoche* (1879); Escaude, *Hoche en Irlande* (1888); Cunéo d'Ornano, *Hoche* (1892); A. Chuquet, *Hoche et la lutte pour l'Alsace* (a volume of this author's series on the campaigns of the Revolution, 1893); E. Charavaray, *Le Général Hoche* (1893); A. Duruy, *Hoche et Marceau* (1885).

HOCHHEIM, a town of Germany, in the Prussian province of Hesse-Nassau, situated on an elevation not far from the right bank of the Main, 3 m. above its influx into the Rhine and 3 m. E. of Mainz by the railway from Cassel to Frankfort-on-Main. Pop. (1905) 3779. It has an Evangelical and a Roman Catholic church, and carries on an extensive trade in wine, the English word "Hock," the generic term for Rhine wine, being derived from its name. Hochheim is mentioned in the chronicles as early as the 7th century. It is also memorable as the scene of a victory gained here, on the 7th of November 1813 by the Austrians over the French.

See Schüler, *Geschichte der Stadt Hochheim am Main* (Hochheim, 1888).

HÖCHST, a town of Germany, in the Prussian province of Hesse-Nassau on the Main, 6 m. by rail W. of Frankfort-on-Main. Pop. (1905) 14,121. It is a busy industrial town with large dye-works and manufactures of machinery, snuff, tobacco, waxcloth, gelatine, furniture and biscuits. Brewing is carried on and there is a considerable river trade. The Roman Catholic church of St Justinus is a fine basilica originally built in the 9th century; it has been restored several times, and a Gothic choir was added in the 15th century. The town has also an Evangelical church and a synagogue, and a statue of Bismarck by Alois Mayer. Höchst belonged formerly to the electors of Mainz who had a palace here; this was destroyed in 1634 with the exception of one fine tower which still remains. In 1622 Christian, duke of Brunswick, was defeated here by Count Tilly, and in 1795 the Austrians gained a victory here over the French.

Höchst is also the name of a small town in Hesse. This has some manufactures, and was formerly the seat of a Benedictine monastery.

HÖCHSTÄDT, a town of Bavaria, Germany, in the district of Swabia, on the left bank of the Danube, 34 m. N.E. of Ulm by rail. Pop. (1905) 2305. It has three Roman Catholic churches, a castle flanked by walls and towers and some small industries, including malting and brewing. Höchstädt, which came into the possession of Bavaria in 1266, has been a place of battles. Here Frederick of Hohenstaufen, vicegerent of the Empire for Henry IV., was defeated by Henry's rival, Hermann of Luxemburg, in 1081; in 1703 the Imperialists were routed here by Marshal Villars in command of the French; in August 1704 Marlborough and Prince Eugene defeated the French and Bavarians commanded by Max Emanuel, the elector of Bavaria and Marshal Tallard, this battle being usually known as that of Blenheim; and in June 1800 an engagement took place here between the Austrians and the French.

There is another small town in Bavaria named Höchstadt. Pop. 2000. This is on the river Aisch, not far from Bamberg, to which bishopric it belonged from 1157 to 1802, when it was ceded to Bavaria.

HOCHSTETTER, FERDINAND CHRISTIAN VON, Baron (1829–1884), Austrian geologist, was born at Esslingen, Württemberg, on the 30th of April 1829. He was the son of Christian Ferdinand Hochstetter (1787–1860), a clergyman and professor at Brünn, who was also a botanist and mineralogist. Having received his early education at the evangelical seminary at Maulbronn, he proceeded to the university of Tübingen; there under F. A. Quenstedt the interest he already felt in geology became permanently fixed, and there he obtained his doctor's degree and a travelling scholarship. In 1852 he joined the staff of the Imperial Geological Survey of Austria and was engaged until 1856 in parts of Bohemia, especially in the Böhmerwald, and in the Fichtel and Karlsbad mountains. His excellent reports established his reputation. Thus he came to be chosen as geologist to the Novara expedition (1857–1859), and made numerous valuable observations in the voyage round the world. In 1859 he was engaged by the government of New Zealand to make a rapid geological survey of the islands. On his return he was appointed in 1860 professor of mineralogy and geology at the Imperial Polytechnic Institute in Vienna, and in 1876 he was made superintendent of the Imperial Natural History Museum. In these later years he explored portions of Turkey and eastern Russia, and he published papers on a variety of geological, palaeontological and mineralogical subjects. He died at Vienna on the 18th of July 1884.

Publications.—*Karlsbad, seine geognostischen Verhältnisse und seine Quellen* (1858); *Neu-Seeland* (1863); *Geological and Topographical Atlas of New Zealand* (1864); *Leitfaden der Mineralogie und Geologie* (with A. Bisching) (1876, ed. 8, 1890).

HOCKEY (possibly derived from the "hooked" stick with which it is played; cf. O. Fr. *hoquet*, shepherd's crook), a game played with a ball or some similar object by two opposing sides, using hooked or bent sticks, with which each side attempts to drive it into the other's goal. In one or more of its variations Hockey was known to most northern peoples in both Europe and Asia, and the Romans possessed a game of similar nature. It was played indiscriminately on the frozen ground or the ice in winter. In Scotland it was called "shinty," and in Ireland "hurley," and was usually played on the hard, sandy sea-shore

SpinSmart Software http://www.spinsmart.com

with numerous players on each side. The rules were simple and the play very rough.

Modern Hockey, properly so called, is played during the cold season on the hard turf, and owes its recent vogue to the formation of "The Men's Hockey Association" in England in 1875. The rules drawn up by the Wimbledon Club in 1883 still obtain in all essentials. Since 1895 "international" matches at hockey have been played annually between England, Scotland, Ireland and Wales; and in 1907 a match was played between England and France, won by England by 14 goals to nil. In 1890 Divisional Association matches (North, South, West, Midlands) and inter-university matches (Oxford and Cambridge) were inaugurated, and have since been played annually. County matches are also now regularly played in England, twenty-six counties competing in 1907. Of other hockey clubs playing regular matches in 1907, there were eighty-one in the London district, and fifty-nine in the provinces.

The game is played by teams of eleven players on a ground 100 yds. long and 50 to 60 yds. wide. The goals are in the centre of each end-line, and consist of two uprights 7 ft. high surmounted by a horizontal bar, enclosing a space 12 ft. wide. In front of each goal is a space enclosed by a curved line, its greatest diameter from the goal-line being 15 ft., called the *striking-circle*. The positions of the players on each side may be seen on the accompanying diagram. Two umpires, one on each side of the centre-line, officiate.

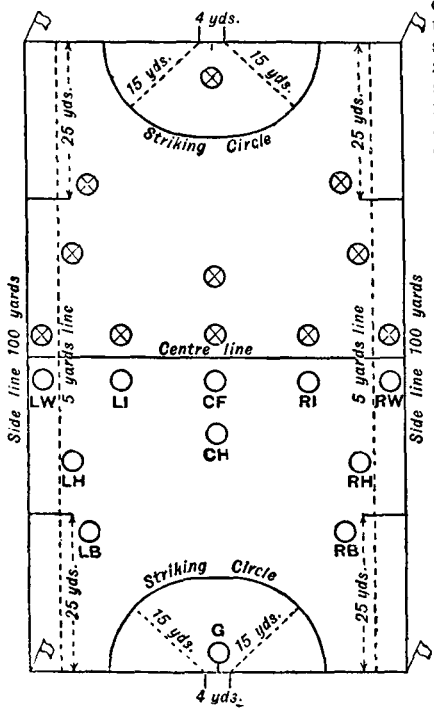

Diagram of Hockey Field.

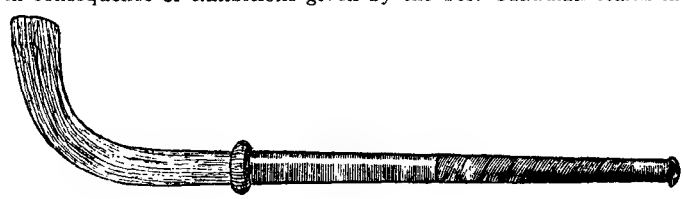


G, Goal. RW, Right Wing.
RB, Right Back. RI, Inside Right.
LB, Left Back. CF, Centre Forward.
RH, Right Half. LI, Inside Left.
CH, Centre Half. LW, Left Wing.
LH, Left Half.

The ball is an ordinary cricket-ball painted white. The stick has a hard-wood curved head, and a handle of cork or wrapped cane. It must not exceed 2 in. in diameter nor 28 oz. in weight. At the start of the game, which consists of two thirty or thirty-five minute periods, the two centre-forwards "bully off" the ball in the middle of the field. In "bullying off" each centre must strike the ground on his own side of the ball three times with his stick and strike his opponent's stick three times alternately; after which either may strike the ball. Each side then endeavours, by means of striking, passing and dribbling, to drive the ball into its opponents' goal. A player is "off side" if he is nearer the enemy's goal than one of his own side who strikes the ball, and he may not strike the ball himself until it has been touched by one of the opposing side. The ball may be caught (but not held) or stopped by any part of the body, but may not be picked up, carried, kicked, thrown or knocked except with the stick. An opponent's stick may be hooked, but not an opponent's person, which may not be obstructed in any way. No left-handed play is allowed. Penalties for infringing rules are of two classes; "free hits" and "penalty bullies," to be taken where the foul occurred. For flagrant fouls penalty goals may also be awarded. A "corner" occurs when the ball goes behind the goal-line, but not into goal. If it is hit by the attacking side, or unintentionally by the defenders, it must be brought out 25 yds., in a direction at right angles to the goal-line from the point where it crossed the line, and there "bullied." But if the ball is driven from within the 25-yd. line unintentionally behind the goal-line by the defenders, a member of the attacking side is given a free hit from a point within 3 yds. of a corner flag, the members of the defending side remaining behind their goal-line. If the ball is hit intentionally behind the goal-line by the attacking side, the free hit is taken from the point where the ball went over. No goal can be scored from a free hit directly.

Ice Hockey (or *Bandy*, to give it its original name) is far more popular than ordinary Hockey in countries where there is much ice; in fact in America "Hockey" means Ice Hockey, while the land game is called Field Hockey. Ice Hockey in its simplest form of driving a ball across a given limit with a stick or club has been played for centuries in northern Europe, attaining its greatest popularity in the Low Countries, and there are many 16th- and 17th-century paintings extant which represent games of Bandy, the players using an implement formed much like a golf club.

In England Bandy is controlled by the "National Bandy Association." A team consists of eleven players, wearing skates, and the proper space for play is 200 yds. by 100 yds. in extent. The ball is of solid india-rubber, between $2\frac{1}{4}$ and $2\frac{3}{4}$ in. in diameter. The bandies are 2 in. in diameter and about 4 ft. long. The goals, placed in the centre of each goal-line, consist of two upright posts 7 ft. high and 12 ft. apart, connected by a lath. A match is begun by the referee throwing up the ball in the centre of the field, after which it must not be touched other than with the bandy until a goal is scored or the ball passes the boundaries of the course, in which case it is hit into the field in any direction excepting forward from the point where it went out by the player who touched it last. If the ball is hit across the goal-line but not into a goal, it is hit out by one of the defenders from the point where it went over, the opponents not being allowed to approach nearer than 25 yds. from the goal-line while the hit is made.

In America the development of the modern game is due to the Victoria Hockey Club and McGill University (Montreal). About 1881 the secretary of the former club made the first efforts towards drawing up a recognized code of laws, and for some time afterwards playing rules were agreed upon from time to time whenever an important match was played, the chief teams being, besides those already mentioned, the Ottawa, Quebec, Crystal and Montreal Hockey Clubs, the first general tournament taking place in 1884. Three years later the "Amateur Hockey Association of Canada" was formed, and a definite code of rules drawn up. Soon afterwards, in consequence of exhibitions given by the best Canadian teams in some of the larger cities of the United States, the new game was taken up by American schools, colleges and athletic clubs, and became nearly as popular in the northern states as in the Dominion. The rules differ widely from those of English Bandy. The rink must be at least 112 ft. long by 58 ft. wide, and seven players form a side. The goals are 6 ft. wide and 4 ft. high and are provided with goal-nets. Instead of the English painted cricket-ball a puck is used, made of vulcanized rubber in the form of a draught-stone, 1 in. thick, and 3 in. in diameter. The sticks are made of one piece of hard wood, and may not be more than 3 in. wide at any part. The game is played for two half-hour or twenty-minute periods with an intermission of ten minutes. At the beginning of a match, and also when a goal has been made, the puck is *faced*, *i.e.* it is placed in the middle of the rink between the sticks of the two left-centres, and the referee calls "play." Whichever side then secures the ball endeavours by means of passing and dribbling to get the puck into a position from which a goal may be *shot*. The puck may be stopped by any part of the person but not carried or knocked except with the stick. No stick may be raised above the shoulder except when actually striking the puck. When the puck is driven off the rink or behind the goal, or a foul has been made behind the goal, it is faced 5 yds. inside the rink. The goal-keeper must maintain a standing position.

Hockey Stick.

There are a number of Hockey organizations in America, all under the jurisdiction of the "American Amateur Hockey League" in the United States and the "Canadian Amateur Athletic League" in Canada.

Ice Polo, a winter sport similar to Ice Hockey, is almost exclusively played in the New England states. A rubber-covered ball is used and the stick is heavier than that used in Ice Hockey. The radical difference between the two games is that, in Ice Polo, there is no strict off-side rule, so that passes and shots at goal may come from any and often the most unexpected direction. Five men constitute a team: a goal-tend, a half-back, a centre and two rushers. The rushers must be rapid skaters, adepts in dribbling and passing and good goal shots. The centre supports the rushers, passing the ball to them or trying for goal himself. The half-back is the first defence and the goal-tend the last. The rink is 150 ft. long.

Ring Hockey may be played on the floor of any gymnasium or large room by teams of six, comprising a goal-keeper, a quarter, three

SpinSmart Software http://www.spinsmart.com

forwards and a centre. The goals consist of two uprights 3 ft. high and 4 ft. apart. The ring, which takes the place of the ball or puck, is made of flexible rubber, and is 5 in. in diameter with a 3-in. opening through the centre. It weighs between 12 and 16 oz. The stick is a wand of light but tough wood, between 36 and 40 in. long, about ¾ in. in diameter, provided with a 5-in. guard 20 in. from the lower end. The method of shooting is to insert the end of the stick in the hole of the ring and drive it towards the goal. A goal shot from the field counts one point, a goal from a foul ½ point. When a foul is called by the referee a player of the opposing side is allowed a free shot for goal from any point on the quarter line.

Roller Polo, played extensively during the winter months in the United States, is practically Ice Polo adapted to the floors of gymnasiums and halls, the players, five on a side, wearing roller-skates. The first professional league was organized in 1883.

HOCK-TIDE, an ancient general holiday in England, celebrated on the second Monday and Tuesday after Easter Sunday. Hock-Tuesday was an important term day, rents being then payable, for with Michaelmas it divided the rural year into its winter and summer halves. The derivation of the word is disputed: any analogy with Ger. *hoch*, "high," being generally denied. No trace of the word is found in Old English, and "hock-day," its earliest use in composition, appears first in the 12th century. The characteristic pastime of hock-tide was called binding. On Monday the women, on Tuesday the men, stopped all passers of the opposite sex and bound them with ropes till they bought their release with a small payment, or a rope was stretched across the highroads, and the passers were obliged to pay toll. The money thus collected seems to have gone towards parish expenses. Many entries are found in parish registers under "Hocktyde money." The hocktide celebration became obsolete in the beginning of the 18th century. At Coventry there was a play called "The Old Coventry Play of Hock Tuesday." This, suppressed at the Reformation owing to the incidental disorder, and revived as part of the festivities on Queen Elizabeth's visit to Kenilworth in July 1575, depicted the struggle between Saxons and Danes, and has given colour to the suggestion that hock-tide was originally a commemoration of the massacre of the Danes on St Brice's Day, the 13th of November A.D. 1002, or of the rejoicings at the death of Hardicanute on the 8th of June 1042 and the expulsion of the Danes. But the dates of these anniversaries do not bear this out.

HOCUS, a shortened form of "hocus pocus," used in the 17th century in the sense of "to play a trick on any one," to "hoax," which is generally taken to be a derivative. "Hocus pocus" appears to have been a mock Latin expression first used as the name of a juggler or conjurer. Thus in Ady's *Candle in the Dark* (1655), quoted in the *New English Dictionary*, "I will speak of one man . . . that went about in King James his time . . . who called himself, The Kings Majesties most excellent Hocus Pocus, and so was called, because that at the playing of every Trick, he used to say, *Hocus pocus, tontus talontus, vade celeriter jubeo*, a dark composure of words, to blinde the eyes of the beholders, to make his Trick pass the more currantly without discovery." Tillotson's guess (*Sermons*, xxvi.) that the phrase was a corruption of *hoc est corpus* and alluded to the words of the Eucharist, "in ridiculous imitation of the priests of the Church of Rome in their trick of Transubstantiation," has frequently been accepted as a serious derivation, but has no foundation. A connexion with a supposed demon of Scandinavian mythology, called "Ochus Bochus," is equally unwarranted. "Hocus" is used as a verb, meaning to drug, stupefy with opium, &c., for a criminal purpose. This use dates from the beginning of the 19th century.

HODDEN (a word of unknown origin), a coarse kind of cloth made of undyed wool, formerly much worn by the peasantry of Scotland. It was usually made on small hand-looms by the peasants themselves. Grey hodden was made by mixing black and white fleeces together in the proportion of one to twelve when weaving.

HODDESDON, an urban district in the Hertford parliamentary division of Hertfordshire, England, near the river Lea. 17 m. N. from London by the Great Eastern railway (Broxbourne and Hoddesdon station on the Cambridge line). Pop. (1901), 4711. This is the northernmost of a series of populous townships extending from the suburbs of London along the Lea valley as far as its junction with the Stort, which is close to Hoddesdon. They are in the main residential. Hoddesdon was a famous coaching station on the Old North Road; and the Bull posting-house is mentioned in Matthew Prior's "Down Hall." The Lea has been a favourite resort of anglers (mainly for coarse fish in this part) from the time of Izaak Walton, in whose book Hoddesdon is specifically named. The church of St Augustine, Broxbourne, is a fine example of Perpendicular work, and contains interesting monuments, including an altar tomb with enamelled brasses of 1473. Hoddesdon probably covers the site of a Romano-British village.

HODEDA (*Hodeida*, *Hadeda*), a town in Arabia situated on the Red Sea coast 14° 48′ N. and 42° 57′ E. It lies on a beach of muddy sand exposed to the southerly and westerly winds. Steamers anchor more than a mile from shore, and merchandize has to be transhipped by means of *sambuks* or native boats. But Hodeda has become the chief centre of the maritime trade of Turkish Yemen, and has superseded Mokha as the great port of export of South Arabian coffee. The town is composed of stone-built houses of several storeys, and is surrounded, except on the sea face, by a fortified enceinte. The population is estimated at 33,000, and contains, besides the Arab inhabitants and the Turkish officials and garrison, a considerable foreign element, Greeks, Indians and African traders from the opposite coast. There are consulates of Great Britain, United States, France, Germany, Italy and Greece. The steam tonnage entering and clearing the port in 1904 amounted to 78,700 tons, the highest hitherto recorded. Regular services are maintained with Aden, and with Suez, Massowa and the other Red Sea ports. Large *dhows* bring dates from the Persian Gulf, and occasional steamers from Bombay call on their way to Jidda with cargoes of grain. The imports for 1904 amounted in value to £467,000, the chief items being piece goods, food grains and sugar; the exports amounted to £451,000, including coffee valued at £229,000.

HODENING, an ancient Christmas custom still surviving in Wales, Kent, Lancashire and elsewhere. A horse's skull or a wooden imitation on a pole is carried round by a party of youths, one of whom conceals himself under a white cloth to simulate the horse's body, holding a lighted candle in the skull. They make a house-to-house visitation, begging gratuities. The "Penitential" of Archbishop Theodore (d. 690) speaks of "any who, on the kalands of January, clothe themselves with the skins of cattle and carry heads of animals." This, coupled with the fact that among the primitive Scandinavians the horse was often the sacrifice made at the winter solstice to Odin for success in battle, has been thought to justify the theory that hodening is a corruption of Odining.

HODGE, CHARLES (1797–1878), American theologian, was born in Philadelphia, Pennsylvania, on the 28th of December 1797. He graduated at the College of New Jersey (now Princeton) in 1815, and in 1819 at the Princeton Theological seminary, where he became an instructor in 1820, and the first professor of Oriental and Biblical literature in 1822. Meanwhile, in 1821, he had been ordained as a Presbyterian minister. From 1826 to 1828 he studied under de Sacy in Paris, under Gesenius and Tholuck in Halle, and under Hengstenberg, Neander and Humboldt in Berlin. In 1840 he was transferred to the chair of exegetical and didactic theology, to which subjects that of polemic theology was added in 1854, and this office he held until his death. In 1825 he established the quarterly *Biblical Repertory*, the title of which was changed to *Biblical Repertory and Theological Review* in 1830 and to *Biblical Repertory and Princeton Review* in 1837. With it, in 1840, was merged the *Literary and Theological Review* of New York, and in 1872 the *American Presbyterian Review* of New York, the title becoming *Presbyterian Quarterly and Princeton Review* in 1872 and *Princeton Review* in 1877. He secured for it the position of theological organ of the Old School division of the Presbyterian church, and continued its principal editor and contributor until 1868, when the Rev. Lyman H. Atwater became his colleague. His more important essays were republished under the titles *Essays and Reviews*

SpinSmart Software http://www.spinsmart.com

(1857), *Princeton Theological Essays*, and *Discussions in Church Polity* (1878). He was moderator of the General Assembly (O.S.) in 1846, a member of the committee to revise the *Book of Discipline* of the Presbyterian church in 1858, and president of the Presbyterian Board of Foreign Missions in 1868–1870. The 24th of April 1872, the fiftieth anniversary of his election to his professorship, was observed in Princeton as his jubilee by between 400 and 500 representatives of his 2700 pupils, and $50,000 was raised for the endowment of his chair. He died at Princeton on the 19th of June 1878. Hodge was one of the greatest of American theologians.

Besides his articles in the *Princeton Review*, he published a *Commentary on the Epistle to the Romans* (1835, abridged 1836, rewritten and enlarged 1864, new ed. 1886), *Constitutional History of the Presbyterian Church in the United States* (2 vols., 1839–1840); *The Way of Life* (1841); *Commentaries on Ephesians* (1856); 1 *Corinthians* (1857); 2 *Corinthians* (1859); *Systematic Theology* (3 vols., 2200 pp., 1871–1873), probably the best of all modern expositions of Calvinistic dogmatic; and *What is Darwinism?* (1874), in which he opposed "Atheistic Evolutionism." After his death a volume of *Conference Papers* (1879) was published. His life, by his son, was published in 1880.

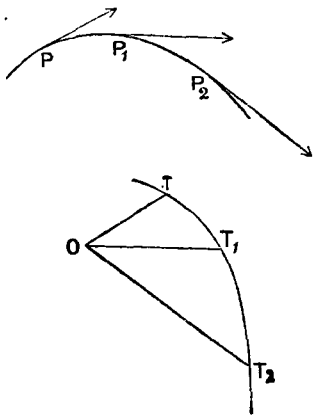
His son, ARCHIBALD ALEXANDER HODGE (1823–1886), also famous as a Presbyterian theologian, was born at Princeton on the 18th of July 1823. He graduated at the College of New Jersey in 1841, and at the Princeton Theological seminary in 1846, and was ordained in 1847. From 1847 to 1850 he was a missionary at Allahabad, India, and was then pastor of churches successively at Lower West Nottingham, Maryland (1851–1855); at Fredericksburg, Virginia (1855–1861), and at Wilkes-Barré, Pennsylvania (1861–1864). From 1864 to 1877 he was professor of didactic and polemical theology in the Allegheny Theological seminary at Allegheny, Pennsylvania, where he was also from 1866 to 1877 pastor of the North Church (Presbyterian). In 1878 he succeeded his father as professor of didactic theology at the Princeton seminary. He died on the 11th of November 1886. Besides writing the biography of his father, he was the author of *Outlines of Theology* (1860, new ed. 1875; enlarged, 1879); *The Atonement* (1867); *Exposition of the Confession of Faith* (1869); and *Popular Lectures on Theological Themes* (1887).

See C. A. Salmond's *Charles and A. A. Hodge* (New York, 1888).

HODGKIN, THOMAS (1831–), British historian, son of John Hodgkin (1800–1875), barrister, was born in London on the 29th of July 1831. Having been educated as a member of the Society of Friends and taken the degree of B.A. at London University, he became a partner in the banking house of Hodgkin, Barnett & Co., Newcastle-on-Tyne, a firm afterwards amalgamated with Lloyds' Bank. While continuing in business as a banker, Hodgkin devoted a good deal of time to historical study, and soon became a leading authority on the history of the early middle ages, his books being indispensable to all students of this period. His chief works are, *Italy and her Invaders* (8 vols., Oxford, 1880–1899); *The Dynasty of Theodosius* (Oxford, 1889); *Theodoric the Goth* (London, 1891); and an introduction to the *Letters* of Cassiodorus (London, 1886). He also wrote a *Life of Charles the Great* (London, 1897); *Life of George Fox* (Boston, 1896); and the opening volume of Longman's *Political History of England* (London, 1906).

HODGKINSON, EATON (1789–1861), English engineer, the son of a farmer, was born at Anderton near Northwich, Cheshire, on the 26th of February 1789. After attending school at Northwich, he began to help his widowed mother on the farm, but to escape from that uncongenial occupation he persuaded her in 1811 to remove to Manchester and start a pawnbroking business. There he made the acquaintance of John Dalton, and began those inquiries into the strength of materials which formed the work of his life. He was associated with Sir William Fairbairn in an important series of experiments on cast iron, and his help was sought by Robert Stephenson in regard to the forms and dimensions of the tubes for the Britannia bridge. A paper which he communicated to the Royal Society on "Experimental Researches on the Strength of Pillars of Cast Iron and other Materials," in 1840 gained him a Royal medal in 1841, and he was also elected a fellow. In 1847 he was appointed professor of the mechanical principles of engineering in University College, London, and at the same time he was employed as a member of the Royal Commission appointed to inquire into the application of iron to railway structures. In 1848 he was chosen president of the Manchester Philosophical Society, of which he had been a member since 1826, and to which, both previously and subsequently, he contributed many of the more important results of his discoveries. For several years he took an active part in the discussions of the Institution of Civil Engineers, of which he was elected an honorary member in 1851. He died at Eaglesfield House, near Manchester, on the 18th of June 1861.

HODGSON, BRIAN HOUGHTON (1800–1894), English administrator, ethnologist and naturalist, was born at Lower Beech, Prestbury, Cheshire, on the 1st of February 1800. His father, Brian Hodgson, came of a family of country gentlemen, and his mother was a daughter of William Houghton of Manchester. In 1816 he obtained an East Indian writership. After passing through the usual course at Haileybury, he went out to India in 1818, and after a brief service at Kumaon as assistant-commissioner was in 1820 appointed assistant to the Resident at Katmandu, the capital of Nepal. In 1823 he obtained an under-secretaryship in the foreign department at Calcutta, but his health failed, and in 1824 he returned to Nepal, to which the whole of his life, whether in or out of India, may be said to have been thenceforth given. He devoted himself particularly to the collection of Sanskrit MSS. relating to Buddhism, and hardly less so to the natural history and antiquities of the country, and by 1839 had contributed eighty-nine papers to the *Transactions* of the Asiatic Society of Bengal. His investigations of the ethnology of the aboriginal tribes were especially important. In 1833 he became Resident in Nepal, and passed many stormy years in conflict with the cruel and faithless court to which he was accredited. He succeeded, nevertheless, in concluding a satisfactory treaty in 1839; but in 1842 his policy, which involved an imperious attitude towards the native government, was upset by the interference of Lord Ellenborough, but just arrived in India and not unnaturally anxious to avoid trouble in Nepal during the conflict in Afghanistan. Hodgson took upon himself to disobey his instructions, a breach of discipline justified to his own mind by his superior knowledge of the situation, but which the governor-general could hardly be expected to overlook. He was, nevertheless, continued in office for a time, but was recalled in 1843, and resigned the service. In 1845 he returned to India and settled at Darjeeling, where he devoted himself entirely to his favourite pursuits, becoming the greatest authority on the Buddhist religion and on the flora of the Himalayas. It was he who early suggested the recruiting of Gurkhas for the Indian army, and who influenced Sir Jung Bahadur to lend his assistance to the British during the mutiny in 1857. In 1858 he returned to England, and lived successively in Cheshire and Gloucestershire, occupied with his studies to the last. He died at his seat at Alderley Grange in the Cotswold Hills on the 23rd of May 1894. No man has done so much to throw light on Buddhism as it exists in Nepal, and his collections of Sanskrit manuscripts, presented to the East India Office, and of natural history, presented to the British Museum, are unique as gatherings from a single country. He wrote altogether 184 philological and ethnological and 127 scientific papers, as well as some valuable pamphlets on native education, in which he took great interest. His principal work, *Illustrations of the Literature and Religion of Buddhists* (1841), was republished with the most important of his other writings in 1872–1880.



His life was written by Sir W. W. Hunter in 1896.

HÓDMEZÖ-VÁSÁRHELY, a town of Hungary, in the county of Csongrád, 135 m. S.E. of Budapest by rail. Pop. (1900) 60,824, of which about two-thirds are Protestants. The town, situated on Lake Hód, not far from the right bank of the Tisza, has a modern aspect. The soil of the surrounding country, of which 383 sq. m. belong to the municipality, is exceedingly fertile, the chief products being wheat, mangcorn, barley, oats, millet, maize and various descriptions of fruit, especially melons. Extensive vineyards, yielding large quantities of both white and

SpinSmart Software http://www.spinsmart.com

red grapes, skirt the town, and the horned cattle and horses of Hódmezö-Vásárhely have a good reputation; sheep and pigs are also extensively reared. The commune is protected from inundations of the Tisza by an enormous dike, but the town, nevertheless, sometimes suffers considerable damage during the spring floods.

HODOGRAPH (Gr. ὁδός, a way, and γράφειν, to write), a curve of which the radius vector is proportional to the velocity of a moving particle. It appears to have been used by James Bradley, but for its practical development we are mainly indebted to Sir William Rowan Hamilton, who published an account of it in the *Proceedings of the Royal Irish Academy*, 1846. If a point be in motion in any orbit and with any velocity, and if, at each instant, a line be drawn from a fixed point parallel and equal to the velocity of the moving point at that instant, the extremities of these lines will lie on a curve called the hodograph. Let PP_1P_2 be the path of the moving point, and let OT, OT_1, OT_2, be drawn from the fixed point O parallel and equal to the velocities at P, P_1, P_2 respectively, then the locus of T is the hodograph of the orbits described by P (see figure). From this definition we have the following important fundamental property which belongs to all hodographs, viz. that at any point the tangent to the hodograph is parallel to the direction, and the velocity in the hodograph equal to the magnitude of the resultant acceleration at the corresponding point of the orbit. This will be evident if we consider that, since radii vectors of the hodograph represent velocities in the orbit, the elementary arc between two consecutive radii vectors of the hodograph represents the velocity which must be compounded with the velocity of the moving point at the beginning of any short interval of time to get the velocity at the end of that interval, that is to say, represents the change of velocity for that interval. Hence the elementary arc divided by the element of time is the rate of change of velocity of the moving-point, or in other words, the velocity in the hodograph is the acceleration in the orbit.

Analytically thus (Thomson and Tait, *Nat. Phil.*):—Let x, y, z be the coordinates of P in the orbit, ξ, η, ζ those of the corresponding point T in the hodograph, then

$$\xi=\frac{dx}{dt},\ \eta=\frac{dy}{dt},\ \zeta=\frac{dz}{dt};$$

therefore

$$\frac{d\xi}{\frac{d^2x}{dt^2}}=\frac{d\eta}{\frac{d^2y}{dt^2}}=\frac{d\zeta}{\frac{d^2z}{dt^2}} \quad \ldots\ldots\ldots \quad (1).$$

Also, if s be the arc of the hodograph,

$$\frac{ds}{dt}=v=\sqrt{\left(\frac{d\xi}{dt}\right)^2+\left(\frac{d\eta}{dt}\right)^2+\left(\frac{d\zeta}{dt}\right)^2},$$

$$=\sqrt{\left(\frac{d^2x}{dt^2}\right)^2+\left(\frac{d^2y}{dt^2}\right)^2+\left(\frac{d^2z}{dt^2}\right)^2} \quad \ldots\ldots \quad (2).$$

Equation (1) shows that the tangent to the hodograph is parallel to the line of resultant acceleration, and (2) that the velocity in the hodograph is equal to the acceleration.

Every orbit must clearly have a hodograph, and, conversely, every hodograph a corresponding orbit; and, theoretically speaking, it is possible to deduce the one from the other, having given the other circumstances of the motion.

For applications of the hodograph to the solution of kinematical problems see MECHANICS.

HODSON, WILLIAM STEPHEN RAIKES (1821–1858), known as "Hodson of Hodson's Horse," British leader of light cavalry during the Indian Mutiny, third son of the Rev. George Hodson, afterwards archdeacon of Stafford and canon of Lichfield, was born on the 19th of March 1821 at Maisemore Court, near Gloucester. He was educated at Rugby and Cambridge, and accepted a cadetship in the Indian army at the advanced age for those days of twenty-three. Joining the 2nd Bengal Grenadiers he went through the first Sikh War, and was present at the battles of Moodkee, Ferozeshah and Sobraon. In one of his letters home at this period he calls the campaign a "tissue of mismanagement, blunders, errors, ignorance and arrogance", and outspoken criticism such as this brought him many bitter enemies throughout his career, who made the most of undeniable faults of character. In 1847, through the influence of Sir Henry Lawrence, he was appointed adjutant of the corps of Guides, and in 1852 was promoted to the command of the Guides with the civil charge of Yusafzai. But his brusque and haughty demeanour to his equals made him many enemies. In 1855 two separate charges were brought against him. The first was that he had arbitrarily imprisoned a Pathan chief named Khadar Khan, on suspicion of being concerned in the murder of Colonel Mackeson. The man was acquitted, and Lord Dalhousie removed Hodson from his civil functions and remanded him to his regiment on account of his lack of judgment. The second charge was more serious, amounting to an accusation of malversation in the funds of his regiment. He was tried by a court of inquiry, who found that his conduct to natives had been "unjustifiable and oppressive," that he had used abusive language to his native officers and personal violence to his men, and that his system of accounts was "calculated to screen peculation and fraud." Subsequently another inquiry was carried out by Major Reynell Taylor, which dealt simply with Hodson's accounts and found them to be "an honest and correct record . . . irregularly kept." At this time the Guides were split up into numerous detachments, and there was a system of advances which made the accounts very complicated. The verdicts of the two inquiries may be set against each other, and this particular charge declared "not proven." It is possible that Hodson was careless and extravagant in money matters rather than actually dishonest; but there were several similar charges against him. During a tour through Kashmir with Sir Henry Lawrence he kept the purse and Sir Henry could never obtain an account from him; subsequently Sir George Lawrence accused him of embezzling the funds of the Lawrence Asylum at Kasauli; while Sir Neville Chamberlain in a published letter says of the third brother, Lord Lawrence, "I am bound to say that Lord Lawrence had no opinion of Hodson's integrity in money matters. He has often discussed Hodson's character in talking to me, and it was to him a regret that a man possessing so many fine gifts should have been wanting in a moral quality which made him untrustworthy." Finally, on one occasion Hodson spent £500 of the pay due to Lieutenant Godby, and under threat of exposure was obliged to borrow the money from a native banker through one of his officers named Bisharat Ali.

It was just at the time when Hodson's career seemed ruined that the Indian Mutiny broke out, and he obtained the opportunity of rehabilitating himself. At the very outset of the campaign he made his name by riding with despatches from General Anson at Karnal to Meerut and back again, a distance of 152 m. in all, in seventy-two hours, through a country swarming with the rebel cavalry. This feat so pleased the commander-in-chief that he empowered him to raise a regiment of 2000 irregular horse, which became known to fame as Hodson's Horse, and placed him at the head of the Intelligence Department. In his double rôle of cavalry leader and intelligence officer, Hodson played a large part in the reduction of Delhi and consequently in saving India for the British empire. He was the finest swordsman in the army, and possessed that daring recklessness which is the most useful quality of leadership against Asiatics. In explanation of the fact that he never received the Victoria Cross it was said of him that it was because he earned it every day of his life. But he also had the defects of his qualities, and could display on occasion a certain cruelty and callousness of disposition. Reference has already been made to Bisharat Ali, who had lent Hodson money. During the siege of Delhi another native, said to be an enemy of Bisharat Ali's, informed Hodson that he had turned rebel

SpinSmart Software http://www.spinsmart.com

and had just reached Khurkhouda, a village near Delhi. Hodson thereupon took out a body of his sowars, attacked the village, and shot Bisharat Ali and several of his relatives. General Crawford Chamberlain states that this was Hodson's way of wiping out the debt. Again, after the fall of Delhi, Hodson obtained from General Wilson permission to ride out with fifty horsemen to Humayun's tomb, 6 m. out of Delhi, and bring in Bahadur Shah, the last of the Moguls. This he did with safety in the face of a large and threatening crowd, and thus dealt the mutineers a heavy blow. On the following day with 100 horsemen he went out to the same tomb and obtained the unconditional surrender of the three princes, who had been left behind on the previous occasion. A crowd of 6000 persons gathered, and Hodson with marvellous coolness ordered them to disarm, which they proceeded to do. He sent the princes on with an escort of ten men, while with the remaining ninety he collected the arms of the crowd. On galloping after the princes he found the crowd once more pressing on the escort and threatening an attack; and fearing that he would be unable to bring his prisoners into Delhi he shot them with his own hand. This is the most bitterly criticized action in his career, but no one but the man on the spot can judge how it is necessary to handle a crowd; and in addition one of the princes, Abu Bukt, heir-apparent to the throne, had made himself notorious for cutting off the arms and legs of English children and pouring the blood into their mothers' mouths. Considering the circumstances of the moment, Hodson's act at the worst was one of irregular justice. A more unpleasant side to the question is that he gave the king a safe conduct, which was afterwards seen by Sir Donald Stewart, before he left the palace, and presumably for a bribe; and he took an armlet and rings from the bodies of the princes. He was freely accused of looting at the time, and though this charge, like that of peculation, is matter for controversy, it is very strongly supported. General Pelham Burn said that he saw loot in Hodson's boxes when he accompanied him from Fatehgarh to take part in the siege of Lucknow, and Sir Henry Daly said that he found "loads of loot" in Hodson's boxes after his death, and also a file of documents relating to the Guides case, which had been stolen from him and of which Hodson denied all knowledge. On the other hand the Rev. G. Hodson states in his book that he obtained the inventory of his brother's possessions made by the Committee of Adjustment and it contained no articles of loot, and Sir Charles Gough, president of the committee, confirmed this evidence. This statement is totally incompatible with Sir Henry Daly's and is only one of many contradictions in the case. Sir Henry Norman stated that to his personal knowledge Hodson remitted several thousand pounds to Calcutta which could only have been obtained by looting. On the other hand, again, Hodson died a poor man, his effects were sold for £170, his widow was dependent on charity for her passage home, was given apartments by the queen at Hampton Court, and left only £400 at her death.

Hodson was killed on the 11th of March 1858 in the attack on the Begum Kotee at Lucknow. He had just arrived on the spot and met a man going to fetch powder to blow in a door; instead Hodson, with his usual recklessness, rushed into the doorway and was shot. On the whole, it can hardly be doubted that he was somewhat unscrupulous in his private character, but he was a splendid soldier, and rendered inestimable services to the empire.

The controversy relating to Hodson's moral character is very complicated and unpleasant. Upon Hodson's side see Rev. G. Hodson, *Hodson of Hodson's Horse* (1883), and L. J. Trotter, *A Leader of Light Horse* (1901); against him, R. Bosworth Smith, *Life of Lord Lawrence*, appendix to the 6th edition of 1885; T. R. E. Holmes, *History of the Indian Mutiny*, appendix N to the 5th edition of 1898, and *Four Famous Soldiers* by the same author, 1889; and General Sir Crawford Chamberlain, *Remarks on Captain Trotter's Biography of Major W. S. R. Hodson* (1901).

HODY, HUMPHREY (1659–1707), English divine, was born at Odcombe in Somersetshire in 1659. In 1676 he entered Wadham College, Oxford, of which he became fellow in 1685. In 1684 he published *Contra historiam Aristeae de LXX. interpretibus dissertatio*, in which he showed that the so-called letter of Aristeas, containing an account of the production of the Septuagint, was the late forgery of a Hellenist Jew originally circulated to lend authority to that version. The dissertation was generally regarded as conclusive, although Isaac Vossius published an angry and scurrilous reply to it in the appendix to his edition of Pomponius Mela. In 1689 Hody wrote the *Prolegomena* to the Greek chronicle of John Malalas, published at Oxford in 1691. The following year he became chaplain to Edward Stillingfleet, bishop of Worcester, and for his support of the ruling party in a controversy with Henry Dodwell regarding the non-juring bishops he was appointed chaplain to Archbishop Tillotson, an office which he continued to hold under Tenison. In 1698 he was appointed regius professor of Greek at Oxford, and in 1704 was made archdeacon of Oxford. In 1701 he published *A History of English Councils and Convocations*, and in 1703 in four volumes *De Bibliorum textis originalibus*, in which he included a revision of his work on the Septuagint, and published a reply to Vossius. He died on the 20th of January 1707.

A work, *De Graecis Illustribus*, which he left in manuscript, was published in 1742 by Samuel Jebb, who prefixed to it a Latin life of the author.

HOE, RICHARD MARCH (1812–1886), American inventor, was born in New York City on the 12th of September 1812. He was the son of Robert Hoe (1784–1833), an English-born American mechanic, who with his brothers-in-law, Peter and Matthew Smith, established in New York City a manufactory of printing presses, and used steam to run his machinery. Richard entered his father's manufactory at the age of fifteen and became head of the firm (Robert Hoe & Company) on his father's death. He had considerable inventive genius and set himself to secure greater speed for printing presses. He discarded the old flat-bed model and placed the type on a revolving cylinder, a model later developed into the well-known Hoe rotary or "lightning" press, patented in 1846, and further improved under the name of the Hoe web perfecting press (see PRINTING). He died in Florence, Italy, on the 7th of June 1886.

See *A Short History of the Printing Press* (New York, 1902) by his nephew Robert Hoe (1839–1909), who was responsible for further improvements in printing, and was an indefatigable worker in support of the New York Metropolitan Museum.

HOE (through Fr. *houe* from O.H.G. *houwâ*, mod. Ger. *Haue*; the root is seen in "hew," to cut, cleave; the word must be distinguished from "hoe," promontory, tongue of land, seen in place names, *e.g.* Morthoe, Luton Hoo, the Hoe at Plymouth, &c.; this is the same as Northern English "heugh" and is connected with "hang"), an agricultural and gardening implement used for extirpating weeds, for stirring the surface-soil in order to break the capillary channels and so prevent the evaporation of moisture, for singling out turnips and other root-crops and similar purposes. Among common forms of hoe are the ordinary

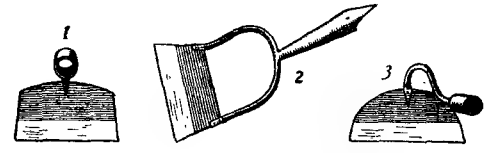


FIG. 1.—Three Forms of Manual Hoe.

garden-hoe (numbered *1* in fig. 1), which consists of a flat blade set transversely in a long wooden handle; the Dutch or thrust-hoe (*2*), which has the blade set into the handle after the fashion of a spade; and the swan-neck hoe (*3*), the best manual hoe for agricultural purposes, which has a long curved neck to attach the blade to the handle; the soil falls back over this, blocking is thus avoided and a longer stroke obtained. Several types of horse-drawn hoe capable of working one or more rows at a time are used among root and grain crops. The illustrations show two forms of the implement, the blades of which differ in shape from those of the garden-hoe. Fig. 2 is in ordinary use for hoeing between two lines of beans or turnips or other "roots." Fig. 3

SpinSmart Software http //www spinsmart com

is adapted for the narrow rows of grain crops and is also convertible into a root-hoe. In the lever-hoe, which is largely used in grain crops, the blades may be raised and lowered by means

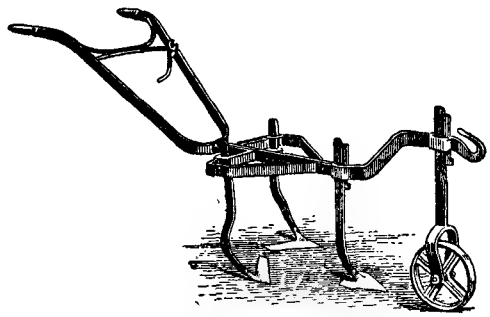

FIG. 2.—Martin's One-Row Horse Hoe.

of a lever. The horse-drawn hoe is steered by means of handles in the rear, but its successful working depends on accurate drilling of the seed, because unless the rows are parallel the roots of the plants are liable to be cut and the foliage injured. Thus Jethro Tull (17th century), with whose name the beginning of

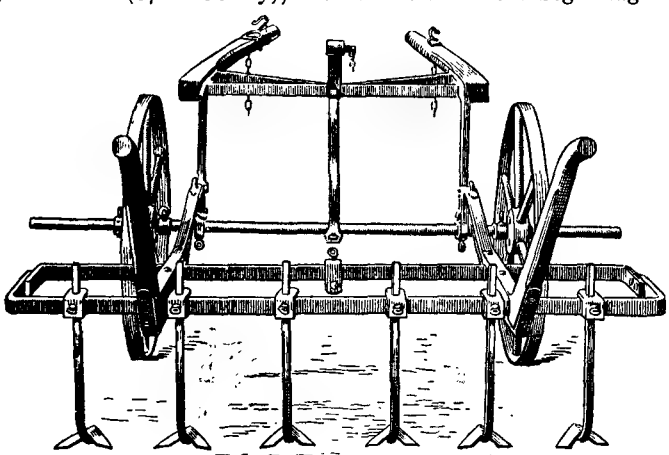

FIG. 3.—Martin's General Purpose Steerage Horse Hoe.

the practice of horse-hoeing is principally connected, used the drill which he invented as an essential adjunct in the so-called "Horse-hoeing Husbandry" (see AGRICULTURE).

HOEFNAGEL, JORIS (1545–1601), Dutch painter and engraver, the son of a diamond merchant, was born at Antwerp. He travelled abroad, making drawings from archaeological subjects, and was a pupil of Jan Bol at Mechlin. He was afterwards patronized by the elector of Bavaria at Munich, where he stayed eight years, and by the Emperor Rudolph at Prague. He died at Vienna in 1601. He is famous for his miniature work, especially on a missal in the imperial library at Vienna; he painted animals and plants to illustrate works on natural history; and his engravings (especially for Braun's *Civitates orbis terrarum*, 1572, and Ortelius's *Theatrum orbis terrarum*, 1570) give him an interesting place among early topographical draughtsmen.

HOF, a town of Germany, in the Bavarian province of Upper Franconia, beautifully situated on the Saale, on the north-eastern spurs of the Fichtelgebirge, 103 m. S.W. of Leipzig on the main line of railway to Regensburg and Munich. Pop. (1885) 22,257; (1905) 36,348. It has one Roman Catholic and three Protestant churches (among the latter that of St Michael, which was restored in 1884), a town hall of 1563, a gymnasium with an extensive library, a commercial school and a hospital founded in 1262. It is the seat of various flourishing industries, notably woollen, cotton and jute spinning, jute weaving, and the manufacture of cotton and half-woollen fabrics. It has also dye-works, flour-mills, saw-mills, breweries, iron-works, and manufactures of machinery, iron and tin wares, chemicals and sugar. In the neighbourhood there are large marble quarries and extensive iron mines. Hof, originally called Regnitzhof, was built about 1080. It was held for some time by the dukes of Meran, and was sold in 1373 to the burgraves of Nuremberg. The cloth manufacture introduced into it in the 15th century, and the manufacture of veils begun in the 16th century, greatly promoted its prosperity, but it suffered severely in the Albertine and Hussite wars as well as in the Thirty Years' War. In 1792 it came into the possession of Prussia; in 1806 it fell to France; and in 1810 it was incorporated with Bavaria. In 1823 the greater part of the town was destroyed by fire.

See Ernst, *Geschichte und Beschreibung des Bezirks und der Stadt Hof* (1866); Tillmann, *Die Stadt Hof und ihre Umgebung* (Hof, 1899), and C. Meyer, *Quellen zur Geschichte der Stadt Hof* (1894–1896).

HOFER, ANDREAS (1767–1810), Tirolese patriot, was born on the 22nd of November 1767 at St Leonhard, in the Passeier valley. There his father kept an inn known as "am Sand," which Hofer inherited, and on that account he was popularly known as the "Sandwirth." In addition to this he carried on a trade in wine and horses with the north of Italy, acquiring a high reputation for intelligence and honesty. In the wars against the French from 1796 to 1805 he took part, first as a sharp-shooter and afterwards as a captain of militia. By the treaty of Pressburg (1805) Tirol was transferred from Austria to Bavaria, and Hofer, who was almost fanatically devoted to the Austrian house, became conspicuous as a leader of the agitation against Bavarian rule. In 1808 he formed one of a deputation who went to Vienna, at the invitation of the archduke John, to concert a rising; and when in April 1809 the Tirolese rose in arms, Hofer was chosen commander of the contingent from his native valley, and inflicted an overwhelming defeat on the Bavarians at Sterzing (April 11). This victory, which resulted in the temporary reoccupation of Innsbruck by the Austrians, made Hofer the most conspicuous of the insurgent leaders. The rapid advance of Napoleon, indeed, and the defeat of the main Austrian army under the archduke Charles, once more exposed Tirol to the French and Bavarians, who reoccupied Innsbruck. The withdrawal of the bulk of the troops, however, gave the Tirolese their chance again; after two battles fought on the Iselberg (May 25 and 29) the Bavarians were again forced to evacuate the country, and Hofer entered Innsbruck in triumph. An autograph letter of the emperor Francis (May 29) assured him that no peace would be concluded by which Tirol would again be separated from the Austrian monarchy, and Hofer, believing his work accomplished, returned to his home. Then came the news of the armistice of Znaim (July 12), by which Tirol and Vorarlberg were surrendered by Austria unconditionally and given up to the vengeance of the French. The country was now again invaded by 40,000 French and Bavarian troops, and Innsbruck fell; but the Tirolese once more organized resistance to the French "atheists and freemasons," and, after a temporary hesitation, Hofer—on whose head a price had been placed—threw himself into the movement. On the 13th of August, in another battle on the Iselberg, the French under Marshal Lefebvre were routed by the Tirolese peasants, and Hofer once more entered Innsbruck, which he had some difficulty in saving from sack. Hofer was now elected *Oberkommandant* of Tirol, took up his quarters in the Hofburg at Innsbruck, and for two months ruled the country in the emperor's name. He preserved the habits of a simple peasant, and his administration was characterized in part by the peasant's shrewd common sense, but yet more by a pious solicitude for the minutest details of faith and morals. On the 29th of September Hofer received from the emperor a chain and medal of honour, which encouraged him in the belief that Austria did not intend again to desert him; the news of the conclusion of the treaty of Schönbrunn (October 14), by which Tirol was again ceded to Bavaria, came upon him as an overwhelming surprise. The French in overpowering force at once pushed into the country, and, an amnesty having been stipulated in the treaty, Hofer and his companions, after some hesitation, gave in their submission. On the 12th of November, however,

SpinSmart Software http://www.spinsmart.com

urged on by the hotter heads among the peasant leaders and deceived by false reports of Austrian victories, Hofer again issued a proclamation calling the mountaineers to arms. The summons met with little response; the enemy advanced in irresistible force, and Hofer, a price once more set on his head, had to take refuge in the mountains. His hiding-place was betrayed by one of his neighbours, named Josef Raffl, and on the 27th of January 1810 he was captured by Italian troops and sent in chains to Mantua. There he was tried by court-martial, and on the 20th of February was shot, twenty-four hours after his condemnation. This crime, which was believed to be due to Napoleon's direct orders, caused an immense sensation throughout Germany and did much to inflame popular sentiment against the French. At the court of Austria, too, which was accused of having cynically sacrificed the hero, it produced a painful impression, and Metternich, when he visited Paris on the occasion of the marriage of the archduchess Marie Louise to Napoleon, was charged to remonstrate with the emperor. Napoleon expressed his regret, stating that the execution had been carried out against his wishes, having been hurried on by the zeal of his generals. In 1823 Hofer's remains were removed from Mantua to Innsbruck, where they were interred in the Franciscan church, and in 1834 a marble statue was erected over his tomb. In 1893 a bronze statue of him was also set up on the Iselberg. At Meran his patriotic deeds of heroism are the subject of a festival play celebrated annually in the open air. In 1818 the patent of nobility bestowed upon him by the Austrian emperor in 1809 was conferred upon his family.

Hofer's Sandwirths auf Passeyr* (Leipzig, 1845); B. Weber, *Das Thal Passeyr und seine Bewohner mit besonderer Rücksicht auf Andreas Hofer und das Jahr 1809* (Innsbruck, 1851); Rapp, *Tirol im Jahr 1809* (Innsbruck, 1852); Weidinger, *Andreas Hofer und seine Kampfgenossen* (3rd ed., Leipzig, 1861); Heigel, *Andreas Hofer* (Munich, 1874); Stampfer, *Sandwirt Andreas Hofer* (Freiburg, 1874); Schmölze, *Andreas Hofer und seine Kampfgenossen* (Innsbruck, 1900). His history has supplied the materials for tragedies to B. Auerbach and Immermann, and for numerous ballads, of which some remain very popular in Germany (see Franke, *Andreas Hofer im Liede*, Innsbruck, 1884).

HÖFFDING, HARALD (1843–), Danish philosopher, was born and educated in Copenhagen. He became a schoolmaster, and ultimately in 1883 professor in the university of Copenhagen. He was much influenced by Sören Kierkegaard in the early development of his thought, but later became a positivist, retaining, however, and combining with it the spirit and method of practical psychology and the critical school. His best-known work is perhaps his *Den nyere Filosofis Historie* (1894), translated into English from the German edition (1895) by B. E. Meyer as *History of Modern Philosophy* (2 vols., 1900), a work intended by him to supplement and correct that of Hans Bröchner, to whom it is dedicated. His *Psychology, the Problems of Philosophy* (1905) and *Philosophy of Religion* (1906) also have appeared in English.

Among Höffding's other writings, practically all of which have been translated into German, are: *Den engelske Filosofi i vor Tid* (1874); *Etik* (1876; ed. 1879); *Psychologi i Omrids paa Grundlag of Erfaring* (ed. 1892); *Psykologiske Undersogelser* (1889); *Charles Darwin* (1889); *Kontinuiteten i Kants filosofiske Udviklingsgang* (1893); *Det psykologiske Grundlag for logiske Domme* (1899); *Rousseau und seine Philosophie* (1901); *Mindre Arbejder* (1899).

HOFFMANN, AUGUST HEINRICH (1798–1874), known as HOFFMANN VON FALLERSLEBEN, German poet, philologist and historian of literature, was born at Fallersleben in the duchy of Lüneburg, Hanover, on the 2nd of April 1798, the son of the mayor of the town. He was educated at the classical schools of Helmstedt and Brunswick, and afterwards at the universities of Göttingen and Bonn. His original intention was to study theology, but he soon devoted himself entirely to literature. In 1823 he was appointed custodian of the university library at Breslau, a post which he held till 1838. He was also made extraordinary professor of the German language and literature at that university in 1830, and ordinary professor in 1835; but he was deprived of his chair in 1842 in consequence of his *Unpolitische Lieder* (1840–1841), which gave much offence to the authorities in Prussia. He then travelled in Germany, Switzerland and Italy, and lived for two or three years in Mecklenburg, of which he became a naturalized citizen. After the revolution of 1848 he was enabled to return to Prussia, where he was restored to his rights, and received the *Wartegeld*—the salary attached to a promised office not yet vacant. He married in 1849, and during the next ten years lived first in Bingerbrück, afterwards in Neuwied, and then in Weimar, where together with Oskar Schade (1826–1906) he edited the *Weimarische Jahrbuch* (1854–1857). In 1860 he was appointed librarian to the Duke of Ratibor at the monasterial castle of Corvey near Höxter on the Weser, where he died on the 19th of January 1874. Fallersleben was one of the best popular poets of modern Germany. In politics he ardently sympathized with the progressive tendencies of his time, and he was among the earliest and most effective of the political poets who prepared the way for the outbreak of 1848. As a poet, however, he acquired distinction chiefly by the ease, simplicity and grace with which he gave expression to the passions and aspirations of daily life. Although he had not been scientifically trained in music, he composed melodies for many of his songs, and a considerable number of them are sung by all classes in every part of Germany. Among the best known is the patriotic *Deutschland, Deutschland über Alles*, composed in 1841 on the island of Heligoland, where a monument was erected in 1891 to his memory (subsequently destroyed).

The best of his poetical writings is his *Gedichte* (1827; 9th ed., Berlin, 1887); but there is great merit also in his *Alemannische Lieder* (1826; 5th ed., 1843), *Soldatenlieder* (1851), *Soldatenleben* (1852), *Rheinleben* (1865), and in his *Fünfzig Kinderlieder*, *Fünfzig neue Kinderlieder*, and *Alte und neue Kinderlieder*. His *Unpolitische Lieder*, *Deutsche Lieder aus der Schweiz* and *Streiflichter* are not without poetical value, but they are mainly interesting in relation to the movements of the age in which they were written. As a student of ancient Teutonic literature Hoffmann von Fallersleben ranks among the most persevering and cultivated of German scholars, some of the chief results of his labours being embodied in his *Horae Belgicae*, *Fundgruben für Geschichte deutscher Sprache und Literatur*, *Altdeutsche Blätter*, *Spenden zur deutschen Literaturgeschichte* and *Findlinge*. Among his editions of particular works may be named *Reineke Vos*, *Monumenta Elnonensia* and *Theophilus*. *Die deutsche Philologie im Grundriss* (1836) was at the time of its publication a valuable contribution to philological research, and historians of German literature still attach importance to his *Geschichte des deutschen Kirchenliedes bis auf Luther* (1832; 3rd ed., 1861), *Unsere volkstümlichen Lieder* (3rd ed., 1869) and *Die deutschen Gesellschaftslieder des 16. und 17. Jahrh.* (2nd ed., 1860). In 1868–1870 Hoffmann published in 6 vols. an autobiography, *Mein Leben: Aufzeichnungen und Erinnerungen* (an abbreviated ed. in 2 vols., 1894). His *Gesammelte Werke* were edited by H. Gerstenberg in 8 vols. (1891–1894); his *Ausgewählte Werke* by H. Benzmann (1905, 4 vols.). See also *Briefe von Hoffmann von Fallersleben und Moritz Haupt an Ferdinand Wolf* (1874); J. M. Wagner, *Hoffmann von Fallersleben, 1818–1868* (1869–1870), and R. von Gottschall, *Porträts und Studien* (vol. v., 1876).

HOFFMANN, ERNST THEODOR WILHELM (1776–1822), German romance-writer, was born at Königsberg on the 24th of January 1776. For the name Wilhelm he himself substituted Amadeus in homage to Mozart. His parents lived unhappily together, and when the child was only three they separated. His bringing up was left to an uncle who had neither understanding nor sympathy for his dreamy and wayward temperament. Hoffmann showed more talent for music and drawing than for books. In 1792, when little over sixteen years old, he entered the university of Königsberg, with a view to preparing himself for a legal career. The chief features of interest in his student years were an intimate friendship for Theodor Gottlieb von Hippel (1775–1843), a nephew of the novelist Hippel, and an unhappy passion for a lady to whom he gave music lessons; the latter found its outlet, not merely in music, but also in two novels, neither of which he was able to have published. In the summer of 1795 he began his practical career as a jurist in Königsberg, but his mother's death and the complications in which his love-affair threatened to involve him made him decide to leave his native town and continue his legal apprenticeship

SpinSmart Software http://www.spinsmart.com

in Glogau. In the autumn of 1798 he was transferred to Berlin, where the beginnings of the new Romantic movement were in the air. Music, however, had still the first place in his heart, and the Berlin opera house was the chief centre of his interests.

In 1800 further promotion brought him to Posen, where he gave himself up entirely to the pleasures of the hour. Unfortunately, however, his brilliant powers of caricature brought him into ill odour, and instead of receiving the hoped-for preferment in Posen itself, he found himself virtually banished to the little town of Plozk on the Vistula. Before leaving Posen he married, and his domestic happiness alleviated to some extent the monotony of the two years' exile. His leisure was spent in literary studies and musical composition. In 1804 he was transferred to Warsaw, where, through J. E. Hitzig (1780–1849), he was introduced to Zacharias Werner, and began to take an interest in the later Romantic literature; now, for the first time, he discovered how writers like Novalis, Tieck, and especially Wackenroder, had spoken out of his own heart. But in spite of this literary stimulus, his leisure in Warsaw was mainly occupied by composition; he wrote music to Brentano's *Lustige Musikanten* and Werner's *Kreuz an der Ostsee*, and also an opera *Liebe und Eifersucht*, based on Calderon's drama *La Banda y la Flor*.

The arrival of the French in Warsaw and the consequent political changes put an end to Hoffmann's congenial life there, and a time of tribulation followed. A position which he obtained in 1808 as musical director of a new theatre in Bamberg availed him little, as within a very short time the theatre was bankrupt and Hoffmann again reduced to destitution. But these misfortunes induced him to turn to literature in order to eke out the miserable livelihood he earned by composing and giving music lessons. The editor of the *Allgemeine musikalische Zeitung* expressed his willingness to accept contributions from Hoffmann, and here appeared for the first time some of the musical sketches which ultimately passed over into the *Phantasiestücke in Callots Manier*. This work appeared in four volumes in 1814 and laid the foundation of his fame as a writer. Meanwhile, Hoffmann had again been for some time attached, in the capacity of musical director, to a theatrical company, whose headquarters were at Dresden. In 1814 he gladly embraced the opportunity that was offered him of resuming his legal profession in Berlin, and two years later he was appointed councillor of the Court of Appeal (*Kammergericht*). Hoffmann had the reputation of being an excellent jurist and a conscientious official; he had leisure for literary pursuits and was on the best of terms with the circle of Romantic poets and novelists who gathered round Fouqué, Chamisso and his old friend Hitzig. Unfortunately, however, the habits of intemperance which, in earlier years, had thrown a shadow over his life, grew upon him, and his health was speedily undermined by the nights he spent in the wine-house, in company unworthy of him. He was struck down by locomotor ataxy, and died on the 24th of July 1822.

The *Phantasiestücke*, which had been published with a commendatory preface by Jean Paul, were followed in 1816 by the gruesome novel—to some extent inspired by Lewis's *Monk*—*Die Elixiere des Teufels*, and the even more gruesome and grotesque stories which make up the *Nachtstücke* (1817, 2 vols.). The full range of Hoffmann's powers is first clearly displayed in the collection of stories (4 vols., 1819–1821) *Die Serapionsbrüder*, this being the name of a small club of Hoffmann's more intimate literary friends. *Die Serapionsbrüder* includes not merely stories in which Hoffmann's love for the mysterious and the supernatural is to be seen, but novels in which he draws on his own early reminiscences (*Rat Krespel*, *Fermate*), finely outlined pictures of old German life (*Der Artushof*, *Meister Martin der Küfner und seine Gesellen*), and vivid and picturesque incidents from Italian and French history (*Doge und Dogaressa*, the story of Marino Faliero, and *Das Fräulein von Scuderi*). The last-mentioned story is usually regarded as Hoffmann's masterpiece. Two longer works also belong to Hoffmann's later years and display to advantage his powers as a humorist; these are *Klein Zaches, genannt Zinnober* (1819), and *Lebensansichten des Katers Murr, nebst fragmentarischer Biographie des Kapellmeisters Johannes Kreisler* (1821–1822).

Hoffmann is one of the master novelists of the Romantic movement in Germany. He combined with a humour that reminds us of Jean Paul the warm sympathy for the artist's standpoint towards life, which was enunciated by early Romantic leaders like Tieck and Wackenroder; but he was superior to all in the almost clairvoyant powers of his imagination. His works abound in grotesque and gruesome scenes—in this respect they mark a descent from the high ideals of the Romantic school; but the gruesome was only one outlet for Hoffmann's genius, and even here the secret of his power lay not in his choice of subjects, but in the wonderfully vivid and realistic presentation of them. Every line he wrote leaves the impression behind it that it expresses something felt or experienced; every scene, vision or character he described seems to have been real and living to him. It is this realism, in the best sense of the word, that made him the great artist he was, and gave him so extraordinary a power over his contemporaries.

The first collected edition of Hoffmann's works appeared in ten volumes (*Ausgewählte Schriften*, 1827–1828); to these his widow added five volumes in 1839 (including the 3rd edition of J. E. Hitzig's *Aus Hoffmanns Leben und Nachlass*, 1823). Other editions of his works appeared in 1844–1845, 1871–1873, 1879–1883, and, most complete of all, *Sämtliche Werke*, edited by E. Grisebach, in 15 vols. (1900). There are many editions of selections, as well as cheap reprints of the more popular stories. All Hoffmann's important works—except *Klein Zaches* and *Kater Murr*—have been translated into English: *The Devil's Elixir* (1824), *The Golden Pot* by Carlyle (in *German Romance*, 1827), *The Serapion Brethren* by A. Ewing (1886–1892), &c. In France Hoffmann was even more popular than in England. Cp. G. Thurau, *Hoffmanns Erzählungen in Frankreich* (1896). An edition of his *Œuvres complètes* appeared in 12 vols. in Paris in 1830. The best monograph on Hoffmann is by G. Ellinger, *E. T. A. Hoffmann* (1894); see also O. Klinke, *Hoffmanns Leben und Werke vom Standpunkte eines Irrenarztes* (1903); and the exhaustive bibliography in Goedeke's *Grundriss zur Geschichte der deutschen Dichtung*, 2nd ed., vol. viii. pp. 468 ff. (1905). (J. G. R.)

HOFFMANN, FRANÇOIS BENOÎT (1760–1828), French dramatist and critic, was born at Nancy on the 11th of July 1760. He studied law at the university of Strassburg, but a slight hesitation in his speech precluded success at the bar, and he entered a regiment on service in Corsica. He served, however, for a very short time, and, returning to Nancy, he wrote some poems which brought him into notice at the little court of Lunéville over which the marquise de Boufflers then presided. In 1784 he went to Paris, and two years later produced the opera *Phèdre*. His opera *Adrien* (1792) was objected to by the government on political grounds, and Hoffmann, who refused to make the changes proposed to him, ran considerable risk under the revolutionary government. His later operas, which were numerous, were produced at the Opéra Comique. In 1807 he was invited by Étienne to contribute to the *Journal de l'Empire* (afterwards the *Journal des débats*). Hoffmann's wide reading qualified him to write on all sorts of subjects, and he turned, apparently with no difficulty, from reviewing books on medicine to violent attacks on the Jesuits. His severe criticism of Chateaubriand's *Martyrs* led the author to make some changes in a later edition. He had the reputation of being an absolutely conscientious and incorruptible critic and thus exercised wide influence. Hoffmann died in Paris on the 25th of April 1828. Among his numerous plays should be mentioned an excellent one-act comedy, *Le Roman d'une heure* (1803), and an amusing one-act opera *Les Rendez-vous bourgeois*.

See Sainte-Beuve, "M. de Feletz et la critique littéraire sous l'Empire" in *Causeries du lundi*, vol. i.

HOFFMANN, FRIEDRICH (1660–1742), German physician, a member of a family that had been connected with medicine for 200 years before him, was born at Halle on the 19th of February 1660. At the gymnasium of his native town he acquired that taste for and skill in mathematics to which he attributed much of his after success. At the age of eighteen he went to study medicine at Jena, whence in 1680 he passed to Erfurt, in order to attend Kasper Cramer's lectures on chemistry. Next year, returning to Jena, he received his doctor's diploma, and, after publishing a thesis, was permitted to

SpinSmart Software http://www.spinsmart.com

teach. Constant study then began to tell on his health, and in 1682, leaving his already numerous pupils, he proceeded to Minden in Westphalia to recruit himself, at the request of a relative who held a high position in that town. After practising at Minden for two years, Hoffmann made a journey to Holland and England, where he formed the acquaintance of many illustrious chemists and physicians. Towards the end of 1684 he returned to Minden, and during the next three years he received many flattering appointments. In 1688 he removed to the more promising sphere of Halberstadt, with the title of physician to the principality of Halberstadt; and on the founding of Halle university in 1693, his reputation, which had been steadily increasing, procured for him the primarius chair of medicine, while at the same time he was charged with the responsible duty of framing the statutes for the new medical faculty. He filled also the chair of natural philosophy. With the exception of four years (1708–1712), which he passed at Berlin in the capacity of royal physician, Hoffmann spent the rest of his life at Halle in instruction, practice and study, interrupted now and again by visits to different courts of Germany, where his services procured him honours and rewards. His fame became European. He was enrolled a member of many learned societies in different foreign countries, while in his own he became privy councillor. He died at Halle on the 12th of November 1742.

Of his numerous writings a catalogue is to be found in Haller's *Bibliotheca medicinae practicae*. The chief is *Medicina rationalis systematica*, undertaken at the age of sixty, and published in 1730. It was translated into French in 1739, under the title of *Médecine raisonnée d'Hoffmann*. A complete edition of Hoffmann's works, with a life of the author, was published at Geneva in 1740, to which supplements were added in 1753 and 1760. Editions appeared also at Venice in 1745 and at Naples in 1753 and 1793. (See also MEDICINE.)

HOFFMANN, JOHANN JOSEPH (1805–1878), German scholar, was born at Würzburg on the 16th of February 1805. After studying at Würzburg he went on the stage in 1825; but owing to an accidental meeting with the German traveller, Dr Philipp Franz von Siebold (1796–1866), in July 1830, his interest was diverted to Oriental philology. From Siebold he acquired the rudiments of Japanese, and in order to take advantage of the instructions of Ko-ching-chang, a Chinese teacher whom Siebold had brought home with him, he made himself acquainted with Malay, the only language except Chinese which the Chinaman could understand. In a few years he was able to supply the translations for Siebold's *Nippon*; and the high character of his work soon attracted the attention of older scholars. Stanislas Julien invited him to Paris; and he would probably have accepted the invitation, as a disagreement had broken out between him and Siebold, had not M. Baud, the Dutch colonial minister, appointed him Japanese translator with a salary of 1800 florins (£150). The Dutch authorities were slow in giving him further recognition; and he was too modest a man successfully to urge his claims. It was not till after he had received the offer of the professorship of Chinese in King's College, London, that the authorities made him professor at Leiden and the king allowed him a yearly pension. In 1875 he was decorated with the order of the Netherlands Lion, and in 1877 he was elected corresponding member of the Berlin Academy. He died at the Hague on the 23rd of January 1878.

Hoffmann's chief work was his unfinished Japanese Dictionary, begun in 1839 and afterwards continued by L. Serrurier. Unable at first to procure the necessary type, he set himself to the cutting of punches, and even when the proper founts were obtained he had to act as his own compositor as far as Chinese and Japanese were concerned. His Japanese grammar (*Japanische Sprechlehre*) was published in Dutch and English in 1867, and in English and German in 1876. Of his miscellaneous productions it is enough to mention "Japans Bezüge mit der koraischen Halbinsel und mit Schina" in *Nippon*, vii.; *Yo-San-fi-Rok, L'Art d'élever les vers à soie au Japon, par Ouckaki Mourikouni* (Paris, 1848); "Die Heilkunde in Japan" in *Mittheil. d. deutsch. Gesellsch. für Natur- und Völkerk. Ost-Asiens* (1873–1874); and *Japanische Studien* (1878).

HOFMANN, AUGUST WILHELM VON (1818–1892), German chemist, was born at Giessen on the 8th of April 1818. Not intending originally to devote himself to physical science, he first took up the study of law and philology at Göttingen, and the general culture he thus gained stood him in good stead when he turned to chemistry, the study of which he began under Liebig. When, in 1845, a school of practical chemistry was started in London, under the style of the Royal College of Chemistry, Hofmann, largely through the influence of the Prince Consort, was appointed its first director. It was with some natural hesitation that he, then a *Privatdozent* at Bonn, accepted the position, which may well have seemed rather a precarious one; but the difficulty was removed by his appointment as extraordinary professor at Bonn, with leave of absence for two years, so that he could resume his career in Germany if his English one proved unsatisfactory. Fortunately the college was more or less successful, owing largely to his enthusiasm and energy, and many of the men who were trained there subsequently made their mark in chemical history. But in 1864 he returned to Bonn, and in the succeeding year he was selected to succeed E. Mitscherlich as professor of chemistry and director of the laboratory in Berlin University. In leaving England, of which he used to speak as his adopted country, Hofmann was probably influenced by a combination of causes. The public support extended to the college of chemistry had been dwindling for some years, and before he left it had ceased to have an independent existence and had been absorbed into the School of Mines. This event he must have looked upon as a curtailment of its possibilities of usefulness. But, in addition, there is only too much reason to suppose that he was disappointed at the general apathy with which his science was regarded in England. No man ever realized more fully than he how entirely dependent on the advance of scientific knowledge is the continuation of a country's material prosperity, and no single chemist ever exercised a greater or more direct influence upon industrial development. In England, however, people cared for none of these things, and were blind to the commercial potentialities of scientific research. The college to which Hofmann devoted nearly twenty of the best years of his life was starved; the coal-tar industry, which was really brought into existence by his work and that of his pupils under his direction at that college, and which with a little intelligent forethought might have been retained in England, was allowed to slip into the hands of Germany, where it is now worth millions of pounds annually; and Hofmann himself was compelled to return to his native land to find due appreciation as one of the foremost chemists of his time. The rest of his life was spent in Berlin, and there he died on the 5th of May 1892. That city possesses a permanent memorial to his name in Hofmann House, the home of the German Chemical Society (of which he was the founder), which was formally opened in 1900, appropriately enough with an account of that great triumph of German chemical enterprise, the industrial manufacture of synthetical indigo.

Hofmann's work covered a wide range of organic chemistry, though with inorganic bodies he did but little. His first research, carried out in Liebig's laboratory at Giessen, was on coal-tar, and his investigation of the organic bases in coal-gas naphtha established the nature of aniline. This substance he used to refer to as his first love, and it was a love to which he remained faithful throughout his life. His perception of the analogy between it and ammonia led to his famous work on the amines and ammonium bases and the allied organic phosphorus compounds, while his researches on rosaniline, which he first prepared in 1858, formed the first of a series of investigations on colouring matters which only ended with quinoline red in 1887. But in addition to these and numberless other investigations for which he was responsible the influence he exercised through his pupils must also be taken into account. As a teacher, besides the power of accurately gauging the character and capabilities of those who studied under him, he had the faculty of infecting them with his own enthusiasm, and thus of stimulating them to put forward their best efforts. In the lecture-room he laid great stress on the importance of experimental demonstrations, paying particular attention to their selection and arrangement, though, since he

SpinSmart Software http://www.spinsmart.com

himself was a somewhat clumsy manipulator, their actual exhibition was generally entrusted to his assistants. He was the possessor of a clear and graceful, if somewhat florid, style, which showed to special advantage in his numerous obituary notices or encomiums (collected and published in three volumes *Zur Erinnerung an vorangegangene Freunde*, 1888). He also excelled as a speaker, particularly at gatherings of an international character, for in addition to his native German he could speak English, French and Italian with fluency.

See *Memorial Lectures delivered before the Chemical Society, 1893–1900* (London, 1901).

HOFMANN, JOHANN CHRISTIAN KONRAD VON (1810–1877), Lutheran theologian and historian, was born on the 21st of December 1810 at Nuremberg, and studied theology and history at the university of Erlangen. In 1829 he went to Berlin, where Schleiermacher, Hengstenberg, Neander, Ranke and Raumer were among his teachers. In 1833 he received an appointment to teach Hebrew and history in the gymnasium of Erlangen. In 1835 he became *Repetent*, in 1838 *Privatdozent* and in 1841 *professor extraordinarius* in the theological faculty at Erlangen. In 1842 he became *professor ordinarius* at Rostock, but in 1845 returned once more to Erlangen as the successor of Gottlieb Christoph Adolf von Harless (1806–1879), founder of the *Zeitschrift für Protestantismus und Kirche*, of which Hofmann became one of the editors in 1846, J. F. Höfling (1802–1853) and Gottfried Thomasius (1802–1875) being his collaborators. He was a conservative in theology, but an enthusiastic adherent of the progressive party in politics, and sat as member for Erlangen and Fürth in the Bavarian second chamber from 1863 to 1868. He died on the 20th of December 1877.

He wrote *Die siebzig Jahre des Jeremias u. die siebzig Jahrwochen des Daniel* (1836); *Geschichte des Aufruhrs in den Cevennen* (1837); *Lehrbuch der Weltgeschichte für Gymnasien* (1839), which became a text-book in the Protestant gymnasia of Bavaria; *Weissagung u. Erfüllung im alten u. neuen Testamente* (1841–1844; 2nd ed., 1857–1860); *DerSchriftbeweis* (1852–1856; 2nd ed., 1857–1860); *Die heilige Schrift des neuen Testaments zusammenhängend untersucht* (1862–1875); *Schutzschriften* (1856–1859), in which he defends himself against the charge of denying the Atonement; and *Theologische Ethik* (1878). His most important works are the five last named. In theology, as in ecclesiastical polity, Hofmann was a Lutheran of an extreme type, although the strongly marked individuality of some of his opinions laid him open to repeated accusations of heterodoxy. He was the head of what has been called the Erlangen School, and "in his day he was unquestionably the chief glory of the University of Erlangen" (Lichtenberger).

See the articles in Herzog-Hauck's *Realencyklopädie* and the *Allgemeine deutsche Biographie*; and cf. F. Lichtenberger, *History of German Theology in the Nineteenth Century* (1889) pp. 446-458.

HOFMANN, MELCHIOR (*c.* 1498–1543-4), anabaptist, was born at Hall, in Swabia, before 1500 (Zur Linden suggests 1498). His biographers usually give his surname as above; in his printed works it is Hoffman, in his manuscripts Hoffmann. He was without scholarly training, and first appears as a furrier at Livland. Attracted by Luther's doctrine, he came forward as a lay preacher, combining business travels with a religious mission. Accompanied by Melchior Rinck, also a skinner or furrier, and a religious enthusiast, he made his way to Sweden. Joined by Bernard Knipperdolling, the party reached Stockholm in the autumn of 1524. Their fervid attacks on image worship led to their expulsion. By way of Livonia, Hofmann arrived at Dorpat in November 1524, but was driven thence in the following January. Making his way to Riga, and thence to Wittenberg, he found favour with Luther; his letter of the 22nd of June 1525 appears in a tract by Luther of that year. He was again at Dorpat in May 1526; later at Magdeburg. Returning to Wittenberg, he was coldly received; he wrote there his exposition of Daniel xii. (1527). Repairing to Holstein, he got into the good graces of Frederick I. of Denmark, and was appointed by royal ordinance to preach the Gospel at Kiel. He was extravagant in denunciation, and developed a Zwinglian view of the Eucharist. Luther was alarmed. At a colloquy of preachers in Flensburg (8th April 1529) Hofmann, John Campanus and others were put on their defence. Hofmann maintained (against the "magic" of the Lutherans) that the function of the Eucharist, like that of preaching, is an appeal for spiritual union with Christ. Refusing to retract, he was banished. At Strassburg to which he now turned, he was well received (1529) till his anabaptist development became apparent. He was in relations with Schwenkfeld and with Carlstadt, but assumed a prophetic rôle of his own. Journeying to East Friesland, (1530) he founded a community at Emden (1532), securing a large following of artisans. Despite the warning of John Trypmaker, who prophesied for him "six months" in prison, he returned in the spring of 1533 to Strassburg, where we hear of his wife and child. He gathered from the Apocalypse a vision of "resurrections" of apostolic Christianity, first under John Hus, and now under himself. The year 1533 was to inaugurate the new era; Strassburg was to be the seat of the New Jerusalem. In May 1533 he and others were arrested. Under examination, he denied that he had made common cause with the anabaptists and claimed to be no prophet, a mere witness of the Most High, but refused the articles of faith proposed to him by the provincial synod. Hofmann and Claus Frey, an anabaptist, were detained in prison, a measure due to the terror excited by the Münster episode of 1533–1534. The synod, in 1539, made further effort to reclaim him. The last notice of his imprisonment is on the 19th of November 1543; he probably died soon after.

Two of his publications, with similar titles, in 1530, are noteworthy as having influenced Menno Simons and David Joris (*Weissagung vsz heiliger göttlicher geschrifft*, and *Prophecey oder Weissagung vsz warer heiliger göttlicher schrifft*). Bock treats him as an antitrinitarian, on grounds which Wallace rightly deems inconclusive. With better reason Trechsel includes him among pioneers of some of the positions of Servetus. His Christology was Valentinian. While all are elected to salvation, only the regenerate may receive baptism, and those who sin after regeneration sin against the Holy Ghost, and cannot be saved. His followers were known as Hofmannites or Melchiorites.

See G. Herrmann, *Essai sur la vie et les écrits de M. Hofmann* (1852); F. O. zur Linden, *M. Hofmann, ein Prophet der Wiedertäufer* (1885); H. Holtzmann, in *Allgemeine deutsche Biographie* (1880); Hegler in Hauck's *Realencyklopädie* (1900); Bock, *Hist. Antitrin.* (1776), ii.; Wallace, *Antitrin. Biography* (1850) iii., app. iii.; Trechsel, *Prot. Antitrin. vor F. Socin* (1839) i.; Barclay, *Inner Life of Rel. Societies* (1876). An alleged portrait, from an engraving of 1608, is reproduced in the appendix to A. Ross, *Pansebeia* (1655). (A. Go.*)

HOFMEISTER, WILHELM FRIEDRICH BENEDICT (1824–1877), German botanist, was born at Leipzig on the 18th of May 1824. He came of a family engaged in trade, and after being educated at the *Realschule* of Leipzig he entered business as a music-dealer. Much of his botanical work was done while he was so employed, till in 1863 he was nominated, without intermediate academic steps, to the chair in Heidelberg; thence he was transferred in 1872 to Tübingen, in succession to H. von Mohl. His first work was on the distribution of the Coniferae in the Himalaya, but his attention was very soon devoted to studying the sexuality and origin of the embryo of Phanerogams. His contributions on this subject extended from 1847 till 1860, and they finally settled the question of the origin of the embryo from an ovum, as against the prevalent pollen-tube theory of M. J. Schleiden, for he showed that the pollen-tube does not itself produce the embryo, but only stimulates the ovum already present in the ovule. He soon turned his attention to the embryology of Bryophytes and Pteridophytes, and gave continuous accounts of the germination of the spores and fertilization in *Pilularia*, *Salvinia*, *Selaginella*. Some of the main facts of the life of ferns and mosses were already known; these, together with his own wider observations, were worked into that great general pronouncement published in 1851 under the title, *Vergleichende Untersuchungen der Keimung, Entfaltung und Fruchtbildung höherer Kryptogamen und der Samenbildung der Coniferen.*

SpinSmart Software http://www.spinsmart.com

This work will always stand in the first rank of botanical books. It antedated the *Origin of Species* by eight years, but contained facts and comparisons which could only become intelligible on some theory of descent. The plan of life-story common to them all, involving two alternating generations, was demonstrated for Liverworts, Mosses, Ferns, Equiseta, Rhizocarps, Lycopodiaceae, and even Gymnosperms, with a completeness and certainty which must still surprise those who know the botanical literature of the author's time. The conclusions of Hofmeister remain in their broad outlines unshaken, but rather strengthened by later-acquired details. In the light of the theory of descent the common plan of life-history in plants apparently so diverse as those named acquires a special significance; but it is one of the remarkable features of this great work that the writer himself does not theorize—with an unerring insight he points out his comparisons and states his homologies, but does not indulge in explanatory surmises. It is the typical work of an heroic age of plant-morphology. From 1857 till 1862 Hofmeister wrote occasionally on physiological subjects, such as the ascent of sap, and curvatures of growing parts, but it was in morphology that he found his natural sphere. In 1861, in conjunction with other botanists, a plan was drawn up of a handbook of physiological botany, of which Hofmeister was to be editor. Though the original scheme was never completed, the editor himself contributed two notable parts, *Die Lehre von der Pflanzenzelle* (1867) and *Allgemeine Morphologie der Gewächse* (1868). The former gives an excellent summary of the structure and relations of the vegetable cell as then known, but it did not greatly modify current views. The latter was notable for its refutation of the spiral theory of leaf arrangement in plants, founded by C. F. Schimper and A. Braun. Hofmeister transferred the discussion from the mere study of mature form to the observation of the development of the parts, and substituted for the "spiral tendency" a mechanical theory based upon the observed fact that new branchings appear over the widest gaps which exist between next older branchings of like nature. With this important work Hofmeister's period of active production closed; he fell into ill-health, and retired from his academic duties some time before his death at Lindenau, near Leipzig, on the 12th of January 1877. (F. O. B.)

HOFMEYR, JAN HENDRIK (1845–1909), South African politician, was born at Cape Town on the 4th of July 1845. He was educated at the South African College, and at an early age turned his attention to politics, first as a journalist. He was editor of the *Zuid Afrikaan* till its incorporation with *Ons Land*, and of the *Zuid Afrikaansche Tidjschrift*. By birth, education and sympathies a typical Dutch Afrikander, he set himself to organize the political power of his fellow-countrymen. This he did very effectively, and when in 1879 he entered the Cape parliament as member for Stellenbosch, he became the real leader of the Dutch party. Yet he only held office for six months—as minister without portfolio in the Scanlen ministry from May to November 1881. He held no subsequent official post in the colony, though he shared with Sir Thomas Upington and Sir Charles Mills the honour of representing the Cape at the intercolonial conference of 1887. Here he supported the proposal for entrusting the defence of Simon's Town to Cape Colony, leaving only the armament to be provided by the imperial government, opposed trans-oceanic penny postage, and moved a resolution in favour of an imperial customs union. At the colonial conference of 1894 at Ottawa he was again one of the Cape representatives. In 1888 and in 1889 he was a member of the South African customs conference.

His chief importance as a public man was, however, derived from his power over the Dutch in Cape Colony, and his control of the Afrikander Bond. In 1878 he had himself founded the "Farmers' Association," and as the Cape farmers were almost entirely Dutch the Association became a centre of Dutch influence. When the Bond was formed in 1882, with purely political aims, Hofmeyr made haste to obtain control of it, and in 1883 amalgamated the Farmers' Association with it. Under his direction the constitution of the Bond was modified by the elimination of the provisions inconsistent with loyalty to the British crown. But it remained an organization for obtaining the political supremacy of the Cape Dutch. (See CAPE COLONY: *History*.) His control over the Bond enabled him for many years, while free from the responsibilities of office, to make and unmake ministers at his will, and earned for him the name of "Cabinet-maker of South Africa." Although officially the term "Afrikander" was explained by Hofmeyr to include white men of whatever race, yet in practice the influence of the Bond was always exerted in favour of the Dutch, and its power was drawn from the Dutch districts of Cape Colony. The sympathies of the Bond were thus always strongly with the Transvaal, as the chief centre of Dutch influence in South Africa; and Hofmeyr's position might in many respects be compared with that of Parnell at the head of the Irish Nationalist party in Great Britain. In the Bechuanaland difficulty of 1884 Hofmeyr threw all the influence of the Bond into the scale in favour of the Transvaal. But in the course of the next few years he began to drift away from President Kruger. He resented the reckless disregard of Cape interests involved in Kruger's fiscal policy; he feared that the Transvaal, after its sudden leap into prosperity upon the gold discoveries of 1886, might overshadow all other Dutch influences in South Africa; above all he was convinced, as he showed by his action at the London conference, that the protection of the British navy was indispensable to South Africa, and he set his face against Kruger's intrigues with Germany, and his avowed intention of acquiring an outlet to the sea in order to get into touch with foreign powers.

In 1890 Hofmeyr joined forces with Cecil Rhodes, who became premier of Cape Colony with the support of the Bond. Hofmeyr's influence was a powerful factor in the conclusion of the Swaziland convention of 1890, as well as in stopping the "trek" to Banyailand (Rhodesia) in 1891—a notable reversal of the policy he had pursued seven years before. But the reactionary elements in the Bond grew alarmed at Rhodes's imperialism, and in 1895 Hofmeyr resigned his seat in parliament and the presidency of the Bond. Then came the Jameson Raid, and in its wake there rolled over South Africa a wave of Dutch and anti-British feeling such as had not been known since the days of Majuba. (The proclamation issued by Sir Hercules Robinson disavowing Jameson was suggested by Hofmeyr, who helped to draw up its terms.) Once more Hofmeyr became president of the Bond. By an alteration of the provincial constitution, all power in the Cape branch of the Bond was vested in the hands of a vigilance committee of three, of whom Hofmeyr and his brother were two. As the recognized leader of the Cape Dutch, he protested against such abuses as the dynamite monopoly in the Transvaal, and urged Kruger even at the eleventh hour to grant reasonable concessions rather than plunge into a war that might involve Cape Afrikanderdom and the Transvaal in a common ruin. In July 1899 he journeyed to Pretoria, and vainly supported the proposal of a satisfactory franchise law, combined with a limited representation of the Uitlanders in the Volksraad, and in September urged the Transvaal to accede to the proposed joint inquiry. During the negotiations of 1899, and after the outbreak of war, the official organ of the Bond, *Ons Land*, was conspicuous for its anti-British attitude, and its violence forced Lord Roberts to suppress it in the Cape Colony district under martial law. Hofmeyr never associated himself publicly with the opinions expressed by *Ons Land*, but neither did he repudiate them. The tide of race sympathy among his Dutch supporters made his position one of great difficulty, and shortly after the outbreak of war he withdrew to Europe, and refused to act as a member of the "Conciliation Committee" which came to England in 1901 in the interests of the Boer republics.

Towards the close of the war Hofmeyr returned to South Africa and organized the Bond forces for the general election held in Cape Colony at the beginning of 1904, which resulted in the defeat of the Bond party. Hofmeyr retained his ascendancy over the Cape Dutch, but now began to find himself somewhat out of sympathy with the larger outlook on South African

SpinSmart Software http://www.spinsmart.com

affairs taken by the younger leaders of the Boers in the Transvaal. During 1906 he gave offence to the extreme section of the Bond by some criticisms of the *taal* and his use of English in public speeches. At the general election in 1908 the Bond, still largely under his direction, gained a victory at the polls, but Hofmeyr himself was not a candidate. In the renewed movement for the closer union of the South African colonies he advocated federation as opposed to unification. When, however, the unification proposals were ratified by the Cape parliament, Hofmeyr procured his nomination as one of the Cape delegates to England in the summer of 1909 to submit the draft act of union to the imperial government. He attended the conferences with the officials of the Colonial Office for the preparation of the draft act, and after the bill had become law went to Germany for a "cure." He returned to London in October 1909, where he died on the 16th of that month. His body was taken to Cape Town for burial.

HOFSTEDE DE GROOT, PETRUS (1802–1886), Dutch theologian, was born at Leer in East Friesland, Prussia, on the 8th of October 1802, and was educated at the Gymnasium and university of Gröningen. For three years (1826–1829) he was pastor of the Reformed Church at Ulrum, and then entered upon his lifelong duties as professor of theology at Gröningen. With his colleagues L.G. Pareau, J. F. van Vordt, and W. Muurling he edited from 1837 to 1872 the *Waarheid in Liefde*. In this review and in his numerous books he vigorously upheld the orthodox faith against the Dutch "modern theology" movement. Many of his works were written in Latin, including *Disputatio, qua ep. ad Hebraeos cum Paulin. epistolis comparatur* (1826), *Institutiones historiae ecclesiae* (1835), *Institutio theologiae naturalis* (1842), *Encyclopaedia theologi christiani* (1844). Others, in Dutch, were: *The Divine Education of Humanity up to the Coming of Jesus Christ* (3 vols., 1846), *The Nature of the Gospel Ministry* (1858), *The "Modern Theology" of the Netherlands* (1869), *The Old Catholic Movement* (1877). He became professor emeritus in 1872, and died at Gröningen on the 5th of December 1886.

HOGARTH, WILLIAM (1697–1764), the great English painter and pictorial satirist, was born at Bartholomew Close in London on the 10th of November 1697, and baptized on the 28th in the church of St Bartholomew the Great. He had two younger sisters, Mary, born in 1699, and Ann, born in 1701. His father, Richard Hogarth, who died in 1718, was a schoolmaster and literary hack, who had come to the metropolis to seek that fortune which had been denied to him in his native Westmorland. The son seems to have been early distinguished by a talent for drawing and an active perceptive faculty rather than by any close attention to the learning which he was soon shrewd enough to see had not made his parent prosper. "Shows of all sorts gave me uncommon pleasure when an infant," he says, "and mimicry, common to all children, was remarkable in me. . . . My exercises when at school were more remarkable for the ornaments which adorned them than for the exercise itself." This being the case, it is no wonder that, by his own desire, he was apprenticed to a silver-plate engraver, Mr Ellis Gamble, at the sign of the "Golden Angel" in Cranbourne Street or Alley, Leicester Fields. For this master he engraved a shop-card which is still extant. When his apprenticeship began is not recorded; but it must have been concluded before the beginning of 1720, for in April of that year he appears to have set up as engraver on his own account. His desires, however, were not limited to silver-plate engraving. "Engraving on copper was, at twenty years of age, my utmost ambition." For this he lacked the needful skill as a draughtsman; and his account of the means which he took to supply this want, without too much interfering with his pleasure, is thoroughly characteristic, though it can scarcely be recommended as an example. "Laying it down," he says, "first as an axiom, that he who could by any means acquire and retain in his memory, perfect ideas of the subjects he meant to draw, would have as clear a knowledge of the figure as a man who can write freely hath of the twenty-four letters of the alphabet and their infinite combinations (each of these being composed of lines), and would consequently be an accurate designer, . . . I therefore endeavoured to habituate myself to the exercise of a sort of technical memory, and by repeating in my own mind, the parts of which objects were composed, I could by degrees combine and put them down with my pencil." This account, it is possible, has something of the complacency of the old age in which it was written; but there is little doubt that his marvellous power of seizing expression owed less to patient academical study than to his unexampled eye-memory and tenacity of minor detail. But he was not entirely without technical training, since, by his own showing, he occasionally "took the life" to correct his memories, and is known to have studied at Sir James Thornhill's then recently opened art school.

"His first employment" (*i.e.* after he set up for himself) "seems," says John Nichols, in his *Anecdotes*, "to have been the engraving of arms and shop bills." After this he was employed in designing "plates for booksellers." Of these early and mostly insignificant works we may pass over "The Lottery, an Emblematic Print on the South Sea Scheme," and some book illustrations, to pause at "Masquerades and Operas" (1724), the first plate he published on his own account. This is a clever little satire on contemporary follies, such as the masquerades of the Swiss adventurer Heidegger, the popular Italian opera-singers, Rich's pantomimes at Lincoln's Inn Fields, and last, but by no means least, the exaggerated popularity of Lord Burlington's protégé, the architect painter William Kent, who is here represented on the summit of Burlington Gate, with Raphael and Michelangelo for supporters. This worthy, Hogarth had doubtless not learned to despise less in the school of his rival Sir James Thornhill. Indeed almost the next of Hogarth's important prints was aimed at Kent alone, being that memorable burlesque of the unfortunate altarpiece designed by the latter for St Clement Danes, which, in deference to the ridicule of the parishioners, Bishop Gibson took down in 1725. Hogarth's squib, which appeared subsequently, exhibits it as a very masterpiece of confusion and bad drawing. In 1726 he prepared twelve large engravings for Butler's *Hudibras*. These he himself valued highly, and they are the best of his book illustrations. But he was far too individual to be the patient interpreter of other men's thoughts, and it is not in this direction that his successes are to be sought.

To 1727–1728 belongs one of those rare occurrences which have survived as contributions to his biography. He was engaged by Joshua Morris, a tapestry worker, to prepare a design for the "Element of Earth." Morris, however, having heard that he was "an engraver, and no painter," declined the work when completed, and Hogarth accordingly sued him for the money in the Westminster Court, where, on the 28th of May 1728, the case was decided in his (Hogarth's) favour. It may have been the aspersion thus early cast on his skill as a painter (coupled perhaps with the unsatisfactory state of print-selling, owing to the uncontrolled circulation of piratical copies) that induced him about this time to turn his attention to the production of "small conversation pieces" (*i.e.* groups in oil of full-length portraits from 12 to 15 in. high), many of which are still preserved in different collections. "This," he says, "having novelty, succeeded for a few years." Among his other efforts in oil between 1728 and 1732 were "The Wanstead Conversation," "The House of Commons examining Bambridge," an infamous warden of the Fleet, and several pictures of the chief actors in Gay's popular *Beggar's Opera*.

On the 23rd of March 1729 he was married at old Paddington church to Jane Thornhill, the only daughter of Kent's rival above mentioned. The match was a clandestine one, although Lady Thornhill appears to have favoured it. We next hear of him in "lodgings at South Lambeth," where he rendered some assistance to the then well-known Jonathan Tyers, who opened Vauxhall in 1732 with an entertainment styled a *ridotto al fresco*. For these gardens Hogarth painted a poor picture of Henry VIII. and Anne Boleyn, and he also permitted Hayman to make copies of the later series of the "Four Times of the Day."

SpinSmart Software http://www.spinsmart.com

In return, the grateful Tyers presented him with a gold pass ticket "*In perpetuam Beneficii Memoriam.*" It was long thought that Hogarth designed this himself. Mr Warwick Wroth (*Numismatic Chronicle*, vol. xviii.) doubts this, although he thinks it probable that Hogarth designed some of the silver Vauxhall passes which are figured in Wilkinson's *Londina illustrata*. The only engravings between 1726 and 1732 which need be referred to are the "Large Masquerade Ticket" (1727), another satire on masquerades, and the print of "Burlington Gate" (1731), evoked by Pope's *Epistle to Lord Burlington*, and defending Lord Chandos, who is therein satirized. This print gave great offence, and was, it is said, suppressed.

By 1731 Hogarth must have completed the earliest of the series of moral works which first gave him his position as a great and original genius. This was "A Harlot's Progress," the paintings for which, if we may trust the date in the last of the pictures, were finished in that year. Almost immediately afterwards he must have begun to engrave them—a task he had at first intended to leave to others. From an advertisement in the *Country Journal; or, the Craftsman*, 29th of January 1732, the pictures were then being engraved, and from later announcements it seems clear that they were delivered to the subscribers early in the following April, on the 21st of which month an unauthorized prose description of them was published. We have no record of the particular train of thought which prompted these story-pictures; but it may perhaps be fairly assumed that the necessity for creating some link of interest between the personages of the little "conversation pieces" above referred to, led to the further idea of connecting several groups or scenes so as to form a sequent narrative. "I wished," says Hogarth, "to compose pictures on canvas, similar to representations on the stage." "I have endeavoured," he says again, "to treat my subject as a dramatic writer; my picture is my stage, and men and women my players, who by means of certain actions and gestures are to exhibit *a dumb show*." There was never a more eloquent dumb show than this of the "Harlot's Progress." In six scenes the miserable career of a woman of the town is traced out remorselessly from its first facile beginning to its shameful and degraded end. Nothing of the detail is softened or abated; the whole is acted out *coram populo*, with the hard, uncompassionate morality of the age the painter lived in, while the introduction here and there of one or two well-known characters such as Colonel Charteris and Justice Gonson give a vivid reality to the satire. It had an immediate success. To say nothing of the fact that the talent of the paintings completely reconciled Sir James Thornhill to the son-in-law he had hitherto refused to acknowledge, more than twelve hundred names of subscribers to the engravings were entered in the artist's book. On the appearance of plate iii. the lords of the treasury trooped to the print shop for Sir John Gonson's portrait which it contained. The story was made into a pantomime by Theophilus Cibber, and by some one else into a ballad opera; and it gave rise to numerous pamphlets and poems. It was painted on fan-mounts and transferred to cups and saucers. Lastly, it was freely pirated. There could be no surer testimony to its popularity.

From the MSS. of George Vertue in the British Museum (Add. MSS. 23069-98) it seems that during the progress of the plates, Hogarth was domiciled with his father-in-law, Sir James Thornhill, in the Middle Piazza, Covent Garden (the "second house eastward from James Street"), and it must have been thence that set out the historical expedition from London to Sheerness of which the original record still exists at the British Museum. This is an oblong MS. volume entitled *An Account of what seem'd most Remarkable in the Five Days' Peregrination of the Five Following Persons, vizt., Messieurs Tothall, Scott, Hogarth, Thornhill and Forrest. Begun on Saturday May 27th 1732 and Finish'd On the 31st of the Same Month. Abi tu et fac similiter. Inscription on Dulwich College Porch.* The journal, which is written by Ebenezer, the father of Garrick's friend Theodosius Forrest, gives a good idea of what a "frisk"—as Johnson called it—was in those days, while the illustrations were by Hogarth and Samuel Scott the landscape painter. John Thornhill, Sir James's son, made the map. This version (in prose) was subsequently run into rhyme by one of Hogarth's friends, the Rev. Wm. Gostling of Canterbury, and after the artist's death both versions were published. In the absence of other biographical detail, they are of considerable interest to the student of Hogarth. In 1733 Hogarth moved into the "Golden Head" in Leicester Fields, which, with occasional absences at Chiswick, he continued to occupy until his death. By December of this year he was already engaged upon the engravings of a second Progress, that of a Rake. It was not as successful as its predecessor. It was in eight plates in lieu of six. The story is unequal; but there is nothing finer than the figure of the desperate hero in the Covent Garden gaming-house, or the admirable scenes in the Fleet prison and Bedlam, where at last his headlong career comes to its tragic termination. The plates abound with allusive suggestion and covert humour; but it is impossible to attempt any detailed description of them here.

"A Rake's Progress" was dated June 25, 1735, and the engravings bear the words "according to Act of Parliament." This was an act (8 Geo. II. cap. 13) which Hogarth had been instrumental in obtaining from the legislature, being stirred thereto by the shameless piracies of rival printsellers. Although loosely drawn, it served its purpose; and the painter commemorated his success by a long inscription on the plate entitled "Crowns, Mitres, &c.," afterwards used as a subscription ticket to the Election series. These subscription tickets to his engravings, let us add, are among the brightest and most vivacious of the artist's productions. That to the "Harlot's Progress" was entitled "Boys peeping at Nature," while the Rake's Progress was heralded by the delightful etching known as "A Pleased Audience at a Play, or The Laughing Audience."

We must pass more briefly over the prints which followed the two Progresses, noting first "A Modern Midnight Conversation," an admirable drinking scene which comes between them in 1733, and the bright little plate of "Southwark Fair," which, although dated 1733, was published with "A Rake's Progress" in 1735. Between these and "Marriage *à la mode*," upon the pictures of which the painter must have been not long after at work, come the small prints of the "Consultation of Physicians" and "Sleeping Congregation" (1736), the "Scholars at a Lecture" (1737); the "Four Times of the Day" (1738), a series of pictures of 18th century life, the earlier designs for which have been already referred to; the "Strolling Actresses dressing in a Barn" (1738), which Walpole held to be, "for wit and imagination, without any other end, the best of all the painter's works"; and finally the admirable plates of the Distrest Poet painfully composing a poem on "Riches" in a garret, and the Enraged Musician fulminating from his parlour window upon a discordant orchestra of knife-grinders, milk-girls, ballad-singers and the rest upon the pavement outside. These are dated respectively 1736 and 1741. To this period also (*i.e.* the period preceding the production of the plates of "Marriage *à la mode*") belong two of those history pictures to which, in emulation of the Haymans and Thornhills, the artist was continually attracted. "The Pool of Bethesda" and the "Good Samaritan," "with figures seven feet high," were painted *circa* 1736, and presented by the artist to St Bartholomew's Hospital, where they remain. They were not masterpieces; and it is pleasanter to think of his connexion with Captain Coram's recently established Foundling Hospital (1739), which he aided with his money, his graver and his brush, and for which he painted that admirable portrait of the good old philanthropist which is still, and deservedly, one of its chief ornaments.

In "A Harlot's Progress" Hogarth had not strayed much beyond the lower walks of society, and although, in "A Rake's Progress," his hero was taken from the middle classes, he can scarcely be said to have quitted those fields of observation which are common to every spectator. It is therefore more remarkable, looking to his education and antecedents, that his masterpiece, "Marriage *à la mode*," should successfully depict, as the advertisement has it, "a variety of modern occurrences in high life."

SpinSmart Software http //www spinsmart com

Yet, as an accurate delineation of upper class 18th century society, his "Marriage *à la mode*" has never, we believe, been seriously assailed. The countess's bedroom, the earl's apartment with its lavish coronets and old masters, the grand saloon with its marble pillars and grotesque ornaments, are fully as true to nature as the frowsy chamber in the "Turk's Head Bagnio," the quack-doctor's museum in St Martin's Lane, or the mean opulence of the merchant's house in the city. And what story could be more vividly, more perspicuously, more powerfully told than this godless alliance of *sacs et parchemins*—this miserable tragedy of an ill-assorted marriage? There is no defect of invention, no superfluity of detail, no purposeless stroke. It has the merit of a work by a great master of fiction, with the additional advantages which result from the pictorial fashion of the narrative; and it is matter for congratulation that it is still to be seen by all the world in the National Gallery in London, where it can tell its own tale better than pages of commentary. The engravings of "Marriage *à la mode*" were dated April 1745. Although by this time the painter found a ready market for his engravings, he does not appear to have been equally successful in selling his pictures. The people bought his prints; but the richer and not numerous connoisseurs who purchased pictures were wholly in the hands of the importers and manufacturers of "old masters." In February 1745 the original oil paintings of the two Progresses, the "Four Times of the Day" and the "Strolling Actresses" were still unsold. On the last day of that month Hogarth disposed of them by an ill-devised kind of auction, the details of which may be read in Nichols's *Anecdotes*, for the paltry sum of £427,7s. No better fate attended "Marriage *à la mode*," which six years later became the property of Mr Lane of Hillingdon for 120 guineas, being then in Carlo Maratti frames which had cost the artist four guineas a piece. Something of this was no doubt due to Hogarth's impracticable arrangements, but the fact shows conclusively how completely blind his contemporaries were to his merits as a painter, and how hopelessly in bondage to the all-powerful picture-dealers. Of these latter the painter himself gave a graphic picture in a letter addressed by him under the pseudonym of "Britophil" to the *St James's Evening Post*, in June 1737.

But if Hogarth was not successful with his dramas on canvas, he occasionally shared with his contemporaries in the popularity of portrait painting. For a picture, executed in 1746, of Garrick as Richard III. he was paid £200, "which was more," says he, "than any English artist ever received for a single portrait." In the same year a sketch of Simon Fraser, Lord Lovat, afterwards beheaded on Tower Hill, had an exceptional success.

We must content ourselves with a brief enumeration of the most important of his remaining works. These are "The Stage Coach or Country Inn Yard" (1747); the series of twelve plates entitled "Industry and Idleness" (1747), depicting the career of two London apprentices; the "Gate of Calais" (1749), which had its origin in a rather unfortunate visit paid to France by the painter after the peace of Aix-la-Chapelle; the "March to Finchley" (1750); "Beer Street," "Gin Lane" and the "Four Stages of Cruelty" (1751); the admirable representations of election humours in the days of Sir Robert Walpole, entitled "Four Prints of an Election" (1755–1758); and the plate of "Credulity, Superstition and Fanaticism, a Medley" (1762), adapted from an earlier unpublished design called "Enthusiasm Delineated." Besides these must be chronicled three more essays in the "great style of history painting," viz. "Paul before Felix," "Moses brought to Pharaoh's Daughter" and the Altarpiece for St Mary Redcliffe at Bristol. The first two were engraved in 1751–1752, the last in 1794. A subscription ticket to the earlier pictures, entitled "Paul before Felix Burlesqued," had a popularity far greater than that of the prints themselves.

In 1745 Hogarth painted that admirable portrait of himself with his dog Trump, which is now in the National Gallery. In a corner of this he had drawn on a palette a serpentine curve with the words "The Line of Beauty." Much inquiry ensued as to the meaning of this hieroglyphic; and in an unpropitious hour the painter resolved to explain himself in writing. The result was the well-known *Analysis of Beauty* (1753), a treatise to fix "the fluctuating ideas of Taste," otherwise a desultory essay having for pretext the precept attributed to Michelangelo that a figure should be always "Pyramidall, Serpent like and multiplied by one two and three." The fate of the book was what might have been expected. By the painter's adherents it was praised as a final deliverance upon aesthetics; by his enemies and professional rivals, its obscurities, and the minor errors which, notwithstanding the benevolent efforts of literary friends, the work had not escaped, were made the subject of endless ridicule and caricature. It added little to its author's fame, and it is perhaps to be regretted that he ever undertook it. Moreover, there were further humiliations in store for him. In 1759 the success of a little picture called "The Lady's Last Stake," painted for Lord Charlemont, procured him a commission from Sir Richard Grosvenor to paint another picture "upon the same terms." Unhappily on this occasion he deserted his own field of genre and social satire, to select the story from Boccaccio (or rather Dryden) of Sigismunda weeping over the heart of her murdered lover Guiscardo, being the subject of a picture in Sir Luke Schaub's collection by Furini which had recently been sold for £400. The picture, over which he spent much time and patience, was not regarded as a success; and Sir Richard rather meanly shuffled out of his bargain upon the plea that "the constantly having it before one's eyes, would be too often occasioning melancholy ideas to arise in one's mind." Sigismunda, therefore, much to the artist's mortification, and the delight of the malicious, remained upon his hands. As, by her husband's desire, his widow valued it at £500, it found no purchaser until after her death, when the Boydells bought it for 56 guineas. It was exhibited, with others of Hogarth's pictures, at the Spring Gardens exhibition of 1761, for the catalogue of which Hogarth engraved a Head-piece and a Tail-piece which are still the delight of collectors; and finally, by the bequest of Mr J. H. Anderdon, it passed in 1879 to the National Gallery, where, in spite of theatrical treatment and a repulsive theme, it still commands admiration for its colour, drawing and expression.

In 1761 Hogarth was sixty-five years of age, and he had but three years more to live. These three years were embittered by an unhappy quarrel with his quondam friends, John Wilkes and Churchill the poet, over which most of his biographers are contented to pass rapidly. Having succeeded John Thornhill in 1757 as serjeant painter (to which post he was reappointed at the accession of George III.), an evil genius prompted him in 1762 to do some "timed" thing in the ministerial interest, and he accordingly published the indifferent satire of "The Times, plate i." This at once brought him into collision with Wilkes and Churchill, and the immediate result was a violent attack upon him, both as a man and an artist, in the opposition *North Briton*, No. 17. The alleged decay of his powers, the miscarriage of Sigismunda, the cobbled composition of the *Analysis*, were all discussed with scurrilous malignity by those who had known his domestic life and learned his weaknesses. The old artist was deeply wounded, and his health was failing. Early in the next year, however, he replied by that portrait of Wilkes which will for ever carry his squinting features to posterity. Churchill retaliated in July by a savage *Epistle to William Hogarth*, to which the artist rejoined by a print of Churchill as a bear, in torn bands and ruffles, not the most successful of his works. "The pleasure, and pecuniary advantage," writes Hogarth manfully, "which I derived from these two engravings" (of Wilkes and Churchill), "together with occasionally riding on horseback, restored me to as much health as can be expected at my time of life." He produced but one more print, that of "Finis, or The Bathos," March 1764, a strange jumble of "fag ends," intended as a tail-piece to his collected prints; and on the 26th October of the same year he died of an aneurism at his house in Leicester Square. His wife, to whom he left his plates as a chief source of income, survived him until 1789. He was buried in Chiswick churchyard, where a tomb was erected to him by his friends in 1771, with an epitaph by Garrick. Not far off, on the road

SpinSmart Software http://www.spinsmart.com

to Chiswick Gardens, still stands the little red-brick Georgian villa in which from September 1749 until his death he spent the summer seasons. After many vicissitudes and changes of ownership it was purchased in 1902 by Lieut.-Colonel Shipway of Chiswick, who turned it into a Hogarth museum and preserved it to the nation.

From such records of him as survive, Hogarth appears to have been much what from his portrait one might suppose him to have been—a blue-eyed, honest, combative little man, thoroughly insular in his prejudices and antipathies, fond of flattery, sensitive like most satirists, a good friend, an intractable enemy, ambitious, as he somewhere says, in all things to be singular, and not always accurately estimating the extent of his powers. With the art connoisseurship of his day he was wholly at war, because, as he believed, it favoured foreign mediocrity at the expense of native talent; and in the heat of argument he would probably, as he admits, often come "to utter blasphemous expressions against the divinity even of Raphael Urbino, Correggio and Michelangelo." But it was rather against the third-rate copies of third-rate artists—the "ship-loads of dead Christs, Holy Families and Madonnas"—that his indignation was directed; and in speaking of his attitude with regard to the great masters of art, it is well to remember his words to Mrs Piozzi:—"The connoisseurs and I are at war, you know; and because I hate *them*, they think I hate *Titian*—and let them!"

But no doubt it was in a measure owing to this hostile attitude of his towards the all-powerful picture-brokers that his contemporaries failed to recognize adequately his merits as a painter, and persisted in regarding him as an ingenious humorist alone. Time has reversed that unjust sentence. He is now held to have been a splendid painter, pure and harmonious in his colouring, wonderfully dexterous and direct in his handling, and in his composition leaving little or nothing to be desired. As an engraver his work is more conspicuous for its vigour, spirit and intelligibility than for finish and beauty of line. He desired that it should tell its own tale plainly, and bear the distinct impress of his individuality, and in this he thoroughly succeeded. As a draughtsman his skill has sometimes been debated, and his work at times undoubtedly bears marks of haste, and even carelessness. If, however, he is judged by his best instead of his worst, he will not be found wanting in this respect. But it is not after all as a draughtsman, an engraver or a painter that he claims his unique position among English artists—it is as a humorist and a satirist upon canvas. Regarded in this light he has never been equalled, whether for his vigour of realism and dramatic power, his fancy and invention in the decoration of his story, or his merciless anatomy and exposure of folly and wickedness. If we regard him—as he loved to regard himself—as "author" rather than "artist," his place is with the great masters of literature,—with the Thackerays and Fieldings, the Cervantes and Molières.

AUTHORITIES.—The main body of Hogarth literature is to be found in the autobiographical *Memoranda*, published by John Ireland in 1798, and in the successive *Anecdotes* of the antiquary John Nichols. Much minute information has also been collected in F. G. Stephens's *Catalogue of the Satirical Prints and Drawings in the British Museum*. But a copious bibliography of books, pamphlets, &c., relating to Hogarth, together with detailed catalogues of his paintings and prints, will be found in the *Memoir* of Hogarth by Austin Dobson. First issued in 1879, this was reprinted and expanded in 1891, 1897, 1902 and finally in 1907. Pictures by Hogarth from private collections are constantly to be found at the annual exhibitions of the Old Masters at Burlington House; but most of the best-known works have permanent homes in public galleries. "Marriage *à la mode*," "Sigismunda," "Lavinia Fenton," the "Shrimp Girl," the "Gate of Calais," the portraits of himself, his sister and his servants, are all in the National Gallery; the "Rake's Progress" and the Election Series, in the Soane Museum; and the "March to Finchley" and "Captain Coram" in the Foundling. There are also notable pictures in the Fitzwilliam Museum at Cambridge and the National Portrait Gallery. At the Print Room in the British Museum there is also a very interesting set of sixteen designs for the series called "Industry and Idleness," the majority of which formerly belonged to Horace Walpole. (A. D.)

HOGG, JAMES (1770–1835), Scottish poet, known as the "Ettrick Shepherd," was baptized at Ettrick in Selkirkshire on the 9th of December 1770. His ancestors had been shepherds for centuries. He received hardly any school training, and seems to have had difficulty in getting books to read. After spending his early years herding sheep for different masters, he was engaged as shepherd by Mr Laidlaw, tenant of Blackhouse, in the parish of Yarrow, from 1790 till 1799. He was treated with great kindness, and had access to a large collection of books. When this was exhausted he subscribed to a circulating library in Peebles. While attending to his flock, he spent a great deal of time in reading. He profited by the company of his master's sons, of whom William Laidlaw is known as the friend of Scott and the author of *Lucy's Flittin'*. Hogg's first printed piece was "The Mistakes of a Night" in the *Scots Magazine* for October 1794, and in 1801 he published his *Scottish Pastorals*. In 1802 Hogg became acquainted with Sir Walter Scott, who was then collecting materials for his *Border Minstrelsy*. On Scott's recommendation Constable published Hogg's miscellaneous poems (*The Mountain Bard*) in 1807. By this work, and by *The Shepherd's Guide, being a Practical Treatise on the Diseases of Sheep*, Hogg realized about £300. With this money he unfortunately embarked in farming in Dumfriesshire, and in three years was utterly ruined, having to abandon all his effects to his creditors. He returned to Ettrick, only to find that he could not even obtain employment as a shepherd; so he set off in February 1810 to push his fortune in Edinburgh as a literary adventurer. In the same year he published a collection of songs, *The Forest Minstrel*, to which he was the largest contributor. This book, being dedicated to the countess of Dalkeith (afterwards duchess of Buccleuch), and recommended to her notice by Scott, was rewarded with a present of 100 guineas. He then began a weekly periodical, *The Spy*, which he continued from September 1810 till August 1811. The appearance of *The Queen's Wake* in 1813 established Hogg's reputation as a poet; Byron recommended it to John Murray, who brought out an English edition. The scene of the poem is laid in 1561; the queen is Mary Stuart; and the "wake" provides a simple framework for seventeen poems sung by rival bards. It was followed by the *Pilgrims of the Sun* (1815), and *Mador of the Moor* (1816). The duchess of Buccleuch, on her death-bed (1814), had asked her husband to do something for the Ettrick bard; and the duke gave him a lease for life of the farm of Altrive in Yarrow, consisting of about 70 acres of moorland, on which the poet built a house and spent the last years of his life. In order to obtain money to stock his farm Hogg asked various poets to contribute to a volume of verse which should be a kind of poetic "benefit" for himself. Failing in his applications he wrote a volume of parodies, published in 1816, as *The Poetic Mirror, or the Living Bards of Great Britain*. He took possession of his farm in 1817; but his literary exertions were never relaxed. Before 1820 he had written the prose tales of *The Brownie of Bodsbeck* (1818) and two volumes of *Winter Evening Tales* (1820), besides collecting, editing and writing part of two volumes of *The Jacobite Relics of Scotland* (1819–1821), and contributing largely to *Blackwood's Magazine*. "The Chaldee MS.," which appeared in *Blackwood's Magazine* (October 1817), and gave such offence that it was immediately withdrawn, was largely Hogg's work.

In 1820 he married Margaret Phillips, a lady of a good Annandale family, and found himself possessed of about £1000, a good house and a well-stocked farm. Hogg's connexion with *Blackwood's Magazine* kept him continually before the public; his contributions, which include the best of his prose works, were collected in the *Shepherd's Calendar* (1829). The wit and mischief of some of his literary friends made free with his name as the "Shepherd" of the *Noctes Ambrosianae*, and represented him in ludicrous and grotesque aspects; but the effect of the whole was favourable to his popularity. "Whatever may be the merits of the picture of the Shepherd [in the *Noctes Ambrosianae*]—and no one will deny its power and genius," writes Professor Veitch—"it is true, all the same, that this Shepherd was not the Shepherd of Ettrick or the man James Hogg. He was neither a Socrates nor a Falstaff, neither to be credited

SpinSmart Software http://www.spinsmart.com

with the wisdom and lofty idealizings of the one, nor with the characteristic humour and coarseness of the other." *The Three Perils of Woman* (1820), and *The Three Perils of Man* (1822), were followed in 1825 by an epic poem, *Queen Hynde*, which was unfavourably received. He visited London in 1832, and was much lionized. On his return a public dinner was given to him in Peebles,—Professor Wilson in the chair,—and he acknowledged that he had at last "found fame." His health, however, was seriously impaired. With his pen in his hand to the last, Hogg in 1834 published a volume of *Lay Sermons*, and *The Domestic Manners and Private Life of Sir Walter Scott*, a book which Lockhart regarded as an infringement on his rights. In 1835 appeared three volumes of *Tales of the Wars of Montrose*. Hogg died on the 21st of November 1835, and was buried in the churchyard of his native parish Ettrick. His fame had seemed to fill the whole district, and was brightest at its close; his presence was associated with all the border sports and festivities; and as a man James Hogg was ever frank, joyous and charitable. It is mainly as a great peasant poet that he lives in literature. Some of his lyrics and minor poems—his "Skylark," "When the Kye comes Hame," his verses on the "Comet" and "Evening Star," and his "Address to Lady Ann Scott"—are exquisite. *The Queen's Wake* unites his characteristic excellences—his command of the old romantic ballad style, his graceful fairy mythology and his aerial flights of imagination. In the fairy story of Kilmeny in this work Hogg seems completely transformed; he is absorbed in the ideal and supernatural, and writes under direct and immediate inspiration.

See Hogg's "Memoir of the Author's Life, written by himself," prefixed to the 3rd edition (1821) of *The Mountain Bard*, also *Memorials of James Hogg, the Ettrick Shepherd*, edited by his daughter, Mrs M. G. Garden (enlarged edition with preface by Professor Veitch, 1903), and Sir G. B. S. Douglas, *James Hogg* (1899) in the "Famous Scots" series; also *The Poems of James Hogg*, selected by William Wallace (1903). John Wilson ("Christopher North") had a real affection for Hogg, but for some reason or other made no use of the materials placed in his hands for a biography of the poet. The memoir mentioned on the title-page of the *Works* (1838–1840) never appeared, and the memoir prefixed to the edition of Hogg's works published by Blackie & Co. (1865) was written by the Rev. Thomas Thompson. See also Wilson's *Noctes Ambrosianae*; Mrs Oliphant's *Annals of a Publishing House*, vol. i. chap. vii.; Gilfillan's *First Gallery of Literary Portraits*; Cunningham's *Biog. and Crit. Hist. of Lit.*; and the general index to *Blackwood's Magazine*. A collected edition of Hogg's *Tales* appeared in 1837 in 6 vols., and a second in 1851; his *Poetical Works* were published in 1822, 1838–1840 and 1865–1866. For an admirable account of the social entertainments Hogg used to give in Edinburgh, see *Memoir of Robert Chambers* (1874), by Dr William Chambers, pp. 263-270.

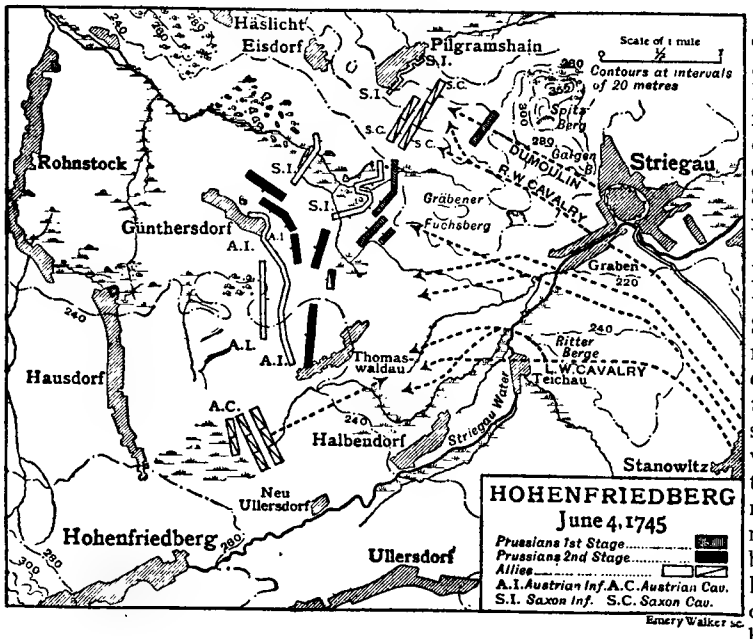
HOGG, THOMAS JEFFERSON (1792–1862), English man of letters, was born at Norton, Durham, on the 24th of May 1792. He was educated at Durham grammar school and at University College, Oxford. Here he became the intimate friend of the poet Shelley, with whom in 1811 he was expelled from the university for refusing to disclaim connexion with the authorship of the pamphlet *The Necessity for Atheism*. He was then sent to study law at York, where he remained for six months. Hogg's behaviour to Harriet Shelley interrupted his relations with her husband for some time, but in 1813 the friendship was renewed in London. In 1817 Hogg was called to the bar, and became later a revising barrister. In 1844 he inherited £2000 under Shelley's will, and in 1855, in accordance with the wishes of the poet's family, began to write Shelley's biography. The first two volumes of it were published in 1858, but they proved to be far more an autobiography than a biography, and Shelley's representatives refused Hogg further access to the materials necessary for its completion. Hogg died on the 27th of August 1862.

HOGMANAY, the name in Scotland and some parts of the north of England for New Year's Eve, as also for the cake then given to the children. On the morning of the 31st of December the children in small bands go from door to door singing:

"Hogmanay
Trollolay
Gie's o' your white bread and nane o' your grey";

and begging for small gifts or alms. These usually take the form of an oaten cake. The derivation of the term has been much disputed. Cotgrave (1611) says: "It is the voice of the country folks begging small presents or New Year's gifts . . . an ancient term of rejoicing derived from the Druids, who were wont the first of each January to go into the woods, where, having sacrificed and banquetted together, they gathered mistletoe, esteeming it excellent to make beasts fruitful and most soverayne against all poyson." And he connects the word, through such Norman French forms as *hoguinané*, with the old French *aguilanneuf*, which he explains as *au gui-l'an-neuf*, "to the mistletoe! the New Year!"—this being (on his interpretation) the Druidical salutation to the coming year as the revellers issued from the woods armed with boughs of mistletoe. But though this explanation may be accepted as containing the truth in referring the word to a French original, Cotgrave's detailed etymology is now repudiated by scientific philologists, and the identical French *aguilanneuf* remains, like it, in obscurity.

HOGSHEAD, a cask for holding liquor or other commodities, such as tobacco, sugar, molasses, &c.; also a liquid measure of capacity, varying with the contents. As a measure for beer, cider, &c., it equals 54 gallons. A statute of Richard III. (1483) fixed the hogshead of wine at 63 wine-gallons, *i.e.* 52½ imperial gallons. The etymology of the word has been much discussed. According to Skeat, the origin is to be found in the name for a cask or liquid measure appearing in various forms in several Teutonic languages, in Dutch *oxhooft* (modern *okshoofd*), Dan. *oxehoved*, O. Swed. *oxhufvod*, &c. The word should therefore be "oxhead," and "hogshead" is a mere corruption. It has been suggested that the name arose from the branding of such a measure with the head of an ox (see *Notes and Queries*, series iv. 2, 46, note by H. Tiedeman). The *New English Dictionary* does not attempt any explanation of the term, and takes "hogshead" as the original form, from which the forms in other languages have been corrupted. The earlier Dutch forms *hukeshovet* and *hoekshoot* are nearer to the English form, and, further, the Dutch for "ox" is *os*.



HOHENASPERG, an ancient fortress of Germany, in the kingdom of Württemberg, 10 m. N. of Stuttgart, is situated on a conical hill, 1100 ft. high, overlooking the town of Asperg. It was formerly strongly fortified and was long the state prison of the kingdom of Württemberg. Among the many who have been interned here may be mentioned the notorious Jew financier, Joseph Süss-Oppenheimer (1692–1738) and the poet C. F. D. Schubart (1739–1791). It is now a reformatory. Hohenasperg originally belonged to the counts of Calw; it next passed to the counts palatine of Tübingen and from them was acquired in 1308 by Württemberg. In 1535 the fortifications were extended and strengthened, and in 1635 the town was taken by the Imperialists, who occupied it until 1649.

See Schön, *Die Staatsgefangenen von Hohenasperg* (Stuttgart, 1899); and Biffart, *Geschichte der Württembergischen Feste Hohenasperg* (Stuttgart, 1858).

HOHENFRIEDBERG, or HOHENFRIEDEBERG, a village of Silesia, about 6 m. from the small town of Striegau. It gives its name to a battle (also called the battle of Striegau) in the War of the Austrian Succession, fought on the 3rd of June 1745 between the Prussians under Frederick the Great and the Austrians and Saxons commanded by Prince Charles of Lorraine. In May the king, whose army had occupied extended winter quarters in Silesia, had drawn it together into a position about Neisse whence he could manœuvre against the Austrians, whether they invaded Silesia by Troppau or Glatz, or joined their allies (who, under the duke of Weissenfels, were on the upper Elbe), and made their advance on Schweidnitz, Breslau or Liegnitz. On the Austrians concentrating towards the Elbe, Frederick gradually drew his army north-westward along the edge of the mountain country until on the 1st of June it was near Schweidnitz. At that date the Austro-Saxons were advancing (very slowly owing to the poorness of the roads and the dilatoriness of the Saxon artillery train) from Waldenburg

SpinSmart Software http://www.spinsmart.com

and Landshut through the mountains, heading for Striegau. After a few minor skirmishes at the end of May, Frederick had made up his mind to offer no opposition to the passage of the Allies, but to fall upon them as they emerged, and the Prussian army was therefore kept concentrated out of sight, while only selected officers and patrols watched the debouches of the mountains. On the other hand the Allies had no intention of delivering battle, but meant only, on emerging from the mountains, to take up a suitable camping position and thence to interpose between Breslau and the king, believing that "the king was at his wits' end, and, once the army really began its retreat on Breslau, there would be frightful consternation in its ranks." But in fact, as even the coolest observers noticed, the Prussian army was in excellent spirits and eager for the "decisive affair" promised by the king. On the 3rd of June, watched by the invisible patrols, the Austrians and Saxons emerged from the hills at Hohenfriedberg with bands playing and colours flying. Their advanced guard of infantry and cavalry spread out into the plain, making for a line of hills spreading north-west from Striegau, where the army was to encamp. But the main body moved slowly, and at last Prince Charles and Weissenfels decided to put off the occupation of the line of hills till the morrow. The army bivouacked therefore in two separate wings, the Saxons (with a few Austrian regiments) between Günthersdorf and Pilgramshain, the Austrians near Hausdorf. They were about 70,000 strong, Frederick 65,000.

The king had made his arrangements in good time, aided by the enemy's slowness, and in the evening he issued simple orders to move. About 9 P.M. the Prussians marched off from Alt-Jauernigk towards Striegau, the guns on the road, the infantry and cavalry, in long open columns of companies and squadrons, over the fields on either side—a night march well remembered by contrast with others as having been executed in perfect order. Meanwhile General Dumoulin, who commanded an advanced detachment between Striegau and Stanowitz, broke camp silently and moved into position below the hill north-west of Striegau, which was found to be occupied by Saxon light infantry outposts. The king's orders were for Dumoulin and the right wing of the main army to deploy and advance towards Häslicht against the Saxons, and for the left wing infantry to prolong the line from the marsh to Günthersdorf, covered by the left-wing cavalry on the plain near Thomaswaldau. On the side of the Austrians, the outlying hussars are said to have noticed and reported the king's movement, for the night was clear and starlit, but their report, if made, was ignored.

At 4 A.M. Dumoulin advanced on Pilgramshain, neglecting the fire of the Saxon outpost on the Spitzberg, whereupon this promptly retired in order to avoid being surrounded. Dumoulin then posted artillery on the slope of the hill and deployed his six grenadier battalions facing the village. The leading cavalry of the main army came up and deployed on Dumoulin's left front in open rolling ground. Meantime the duke of Weissenfels had improvised a line of defence, posting his infantry in the marshy ground and about Pilgramshain, and his cavalry, partly in front of Pilgramshain and partly on the intervening space, opposite that of the Prussians. But before the marshy ground was effectively occupied by the duke's infantry, his cavalry had been first shaken by the fire of Dumoulin's guns on the Spitzberg and a heavy battery that was brought up on to the Gräbener Fuchsberg, and then charged by the Prussian right-wing cavalry, and in the mêlée the Allies were gradually driven in confusion off the battlefield. The cavalry battle was ended by 6.30 A.M., by which time Dumoulin's grenadiers, stiffened by the line regiment Anhalt (the "Old Dessauer's" own), were vigorously attacking the garden hedges and walls of Pilgramshain, and the Saxon and Austrian infantry in the marsh was being attacked by Prince Dietrich of Dessau with the right wing of the king's infantry. The line infantry of those days, however, did not work easily in bad ground, and the Saxons were steady and well drilled. After an hour's fight, well supported by the guns and continually reinforced as the rest of the army closed up, the prince expelled the enemy from the marsh, while Dumoulin drove the light troops out of Pilgramshain. By 7 A.M. the Saxons, forming the left wing of the allied army, were in full retreat.

While his allies were being defeated, Prince Charles of Lorraine had done nothing, believing that the cannonade was merely an outpost affair for the possession of the Spitzberg. His generals indeed had drawn out their respective commands in order of battle, the infantry south of Günthersdorf, the cavalry near Thomaswaldau, but they had no authority to advance without orders, and stood inactive, while, 1 m. away, the Prussian columns were defiling over the Striegau Water. This phase of the king's advance was the most delicate of all, and the moment that he heard from Prince Dietrich that the marsh was captured he stopped the northward flow of his battalions and swung them westward, the left wing cavalry having to cover their deployment. But when one-third of this cavalry only had crossed at Teichau the bridge broke. For a time the advanced squadrons were in great danger. But they charged boldly, and a disjointed cavalry battle began, during which (Ziethen's hussars having discovered a ford) the rest of the left-wing cavalry was able to cross. At last 25 intact squadrons under Lieut.-General von Nassau charged and drove the Austrians in disorder towards Hohenfriedberg. This action was the more creditable to the victors in that 45 squadrons in 3 separate fractions defeated a mass of 60 squadrons that stood already deployed to meet them.

Meanwhile the Prussian infantry columns of the centre and left had crossed Striegau Water and deployed to their left, and by 8.30 they were advancing on Günthersdorf and the Austrian infantry south of that place. Frederick's purpose was to roll up the enemy from their inner flank, and while Prince Dietrich, with most of the troops that had forced the Saxons out of the marsh, pursued Weissenfels, two regiments of his and one of Dumoulin's were brought over to the left wing and sent against the north side of Günthersdorf. In the course of the general forward movement, which was made in what was for those days a very irregular line, a wide gap opened up between the centre and left, behind which 10 squadrons of the Bayreuth dragoon regiment, with Lieut.-General von Gessler, took up their position. Thus the line advanced. The grenadiers on the extreme left cleared Thomaswaldau, and their fire galled the Austrian squadrons engaged in the cavalry battle to the south. Then Günthersdorf, attacked on three sides, was also evacuated by the enemy. But although Frederick rode back from the front saying "the battle is won," the Prussian infantry, in spite

SpinSmart Software http://www.spinsmart.com

of its superior fire discipline, failed for some time to master the defence, and suffered heavily from the eight close-range volleys they received, one or two regiments losing 40 and 50 % of their strength. The Austrians, however, suffered still more; feeling themselves isolated in the midst of the victorious enemy, they began to waver, and at the psychological moment Gessler and the Bayreuth dragoons charged into their ranks and "broke the equilibrium." These 1500 sabres scattered twenty battalions of the enemy and brought in 2500 prisoners and 66 Austrian colours, and in this astounding charge they themselves lost no more than 94 men. By nine o'clock the battle was over, and the wrecks of the Austro-Saxon army were retreating to the mountains. The Prussians, who had been marching all night, were too far spent to pursue.

The loss of the allies was in all 15,224, 7985 killed and wounded, and 7239 prisoners, as well as 72 guns and 83 standards and colours. The Prussians lost 4666 killed and wounded, 71 missing.

HOHENHEIM, a village of Germany, in the kingdom of Württemberg, 7 m. S. of Stuttgart by rail. Pop. 300. It came in 1768 from the counts of Hohenheim to the dukes of Württemberg, and in 1785 Duke Karl Eugen built a country house here. This house with grounds is now the seat of the most important agricultural college in Germany; it was founded in 1817, was raised to the position of a high school in 1865, and now ranks as a technical high school with university status.

See Fröhlich, *Das Schloss und die Akademie Hohenheim* (Stuttgart, 1870).

HOHENLIMBURG, a town of Germany, on the Lenne, in the Prussian prov. of Westphalia, 30 m. by rail S.E. of Dortmund. Pop. (1905) 12,790. It has two Evangelical churches, a Roman Catholic church and a synagogue. The town is the seat of various iron and metal industries, while dyeing, cloth-making and linen-weaving are also carried on here. It is the chief town of the county of Limburg, and formerly belonged to the counts of Limburg, a family which became extinct in 1508. Later it passed to the counts of Bentheim-Tecklenburg. The castle of Hohenlimburg, which overlooks the town, is now the residence of Prince Adolf of Bentheim-Tecklenburg.

HOHENLOHE, a German princely family which took its name from the district of Hohenlohe in Franconia. At first a countship, its two branches were raised to the rank of principalities of the Empire in 1744 and 1764 respectively; in 1806 they lost their independence and their lands now form part of the kingdoms of Bavaria and of Württemberg. At the time of the mediatization the area of Hohenlohe was 680 sq. m. and its estimated population was 108,000. The family is first mentioned in the 12th century as possessing the castle of Hohenloch, or Hohenlohe, near Uffenheim, and its influence was soon perceptible in several of the Franconian valleys, including those of the Kocher, the Jagst and the Tauber. Henry I. (d. 1183) was the first to take the title of count of Hohenlohe, and in 1230 his grandsons, Gottfried and Conrad, supporters of the emperor Frederick II., founded the lines of Hohenlohe—Hohenlohe and Hohenlohe-Brauneck, names taken from their respective castles. The latter became extinct in 1390, its lands passing later to Brandenburg, while the former was divided into several branches, only two of which, however, Hohenlohe-Weikersheim and Hohenlohe-Uffenheim-Speckfeld, need be mentioned here. Hohenlohe-Weikersheim, descended from Count Kraft I. (d. 1313), also underwent several divisions, that which took place after the deaths of Counts Albert and George in 1551 being specially important. At this time the lines of Hohenlohe-Neuenstein and Hohenlohe-Waldenburg were founded by the sons of Count George. Meanwhile, in 1412, the family of Hohenlohe-Uffenheim-Speckfeld had become extinct, and its lands had passed through the marriages of its heiresses into other families.

The existing branches of the Hohenlohe family are descended from the lines of Hohenlohe-Neuenstein and Hohenlohe-Waldenburg, established in 1551. The former of these became Protestant, while the latter remained Catholic. Of the family of Hohenlohe-Neuenstein, which underwent several partitions and inherited Gleichen in 1631, the senior line became extinct in 1805, while in 1701 the junior line divided itself into three branches, those of Langenburg, Ingelfingen and Kirchberg. Kirchberg died out in 1861, but members of the families of Hohenlohe-Langenburg and Hohenlohe-Ingelfingen are still alive, the latter being represented by the branches of Hohenlohe-Ingelfingen and Hohenlohe-Öhringen. The Roman Catholic family of Hohenlohe-Waldenburg was soon divided into three branches, but two of these had died out by 1729. The surviving branch, that of Schillingsfürst, was divided into the lines of Hohenlohe-Schillingsfürst and Hohenlohe-Bartenstein; other divisions followed, and the four existing lines of this branch of the family are those of Waldenburg, Schillingsfürst, Jagstberg and Bartenstein. The family of Hohenlohe-Schillingsfürst possesses the duchies of Ratibor and of Corbie inherited in 1824.

The principal members of the family are dealt with below.

I. Friedrich Ludwig, prince of Hohenlohe-Ingelfingen (1746–1818), Prussian general, was the eldest son of Prince Johann Friedrich (d. 1796) of Hohenlohe-Ingelfingen, and began his military career as a boy, serving against the Prussians in the last years of the Seven Years' War. Entering the Prussian army after the peace (1768), he was on account of his rank at once made major, and in 1775 he became lieutenant-colonel; in 1778 he took part in the War of the Bavarian Succession and about the same time was made a colonel. Shortly before the death of Frederick the Great he was promoted to the rank of major-general and appointed chief of a regiment. For some years the prince did garrison duty at Breslau, until in 1791 he was made governor of Berlin. In 1794 he commanded a corps in the Prussian army on the Rhine and distinguished himself greatly in many engagements, particularly in the battle of Kaiserslautern on the 20th of September. He was at this time the most popular soldier in the Prussian army. Blücher wrote of him that "he was a leader of whom the Prussian army might well be proud." He succeeded his father in the principality, and acquired additional lands by his marriage with a daughter of Count von Hoym. In 1806 Hohenlohe, now a general of infantry, was appointed to command the left-wing army of the Prussian forces opposing Napoleon, having under him Prince Louis Ferdinand of Prussia; but, feeling that his career had been that of a prince and not that of a scientific soldier, he allowed his quartermaster-general Massenbach to influence him unduly. Disputes soon broke out between Hohenlohe and the commander-in-chief, the duke of Brunswick, the armies marched hither and thither without effective results, and finally Hohenlohe's army was almost destroyed by Napoleon at Jena (see Napoleonic Campaigns). The prince displayed his usual personal bravery in the battle, and managed to rally a portion of his corps near Erfurt, whence he retired into Prussia. But the pursuers followed him up closely, and, still acting under Massenbach's advice, he surrendered the remnant of his army at Prenzlau on the 28th of October, a fortnight after Jena and three weeks after the beginning of hostilities. Hohenlohe's former popularity and influence in the army had now the worst possible effect, for the commandants of garrisons everywhere lost heart and followed his example. After two years spent as a prisoner of war in France Hohenlohe retired to his estates, living in self-imposed obscurity until his death on the 15th of February 1818. He had, in August 1806, just before the outbreak of the French War, resigned the principality to his eldest son, not being willing to become a "mediatized" ruler under Württemberg suzerainty.

II. Ludwig Aloysius, prince of Hohenlohe-Waldenburg-Bartenstein (1765–1829), marshal and peer of France, was born on the 18th of August 1765. In 1784 he entered the service of the Palatinate, which he quitted in 1792 in order to take the command of a regiment raised by his father for the service of the emigrant princes of France. He greatly distinguished himself under Condé in the campaigns of 1792–1793, especially at the storming of the lines of Weissenburg. Subsequently he entered the service of Holland, and, when almost surrounded by the army of General Pichegru, conducted a masterly retreat from the island of Bommel. From 1794 to 1799 he served as

SpinSmart Software http://www.spinsmart.com

colonel in the Austrian campaigns; in 1799 he was named major-general by the archduke Charles; and after obtaining the rank of lieutenant-general he was appointed by the emperor governor of the two Galicias. Napoleon offered to restore to him his principality on condition that he adhered to the confederation of the Rhine, but as he refused, it was united to Württemberg. After Napoleon's fall in 1814 he entered the French service, and in 1815 he held the command of a regiment raised by himself, with which he took part in the Spanish campaign of 1823. In 1827 he was created marshal and peer of France. He died at Lunéville on the 30th of May 1829.

III. ALEXANDER LEOPOLD FRANZ EMMERICH, prince of Hohenlohe-Waldenburg-Schillingsfürst (1794–1849), priest and reputed miracle-worker, was born at Kupferzell, near Waldenburg, on the 17th of August 1794. By his mother, the daughter of an Hungarian nobleman, he was from infancy destined for the church; and she entrusted his early education to the ex-Jesuit Riel. In 1804 he entered the "Theresianum" at Vienna, in 1808 the academy at Bern, in 1810 the archiepiscopal seminary at Vienna, and afterwards he studied at Tyrnau and Ellwangen. He was ordained priest in 1815, and in the following year he went to Rome, where he entered the society of the "Fathers of the Sacred Heart." Subsequently, at Munich and Bamberg, he was blamed for Jesuit and obscurantist tendencies, but obtained considerable reputation as a preacher. His first co-called miraculous cure was effected, in conjunction with a peasant, Martin Michel, on a princess of Schwarzenberg who had been for some years paralytic. Immediately he acquired such fame as a performer of miraculous cures that multitudes from various countries flocked to partake of the beneficial influence of his supposed supernatural gifts. Ultimately, on account of the interference of the authorities with his operations, he went in 1821 to Vienna and then to Hungary, where he became canon at Grosswardein and in 1844 titular bishop of Sardica. He died at Vöslau near Vienna on the 17th of November 1849. He was the author of a number of ascetic and controversial writings, which were collected and published in one edition by S. Brunner in 1851.

IV. KRAFT, prince of Hohenlohe-Ingelfingen (1827–1892), soldier and military writer, son of Prince Adolf of Hohenlohe-Ingelfingen (1797–1873), was born at Koschentin in Upper Silesia. He was a nephew of the Prince Hohenlohe noticed above, who commanded the Prussians at Jena. Educated with great rigour, owing to the impoverishment of the family estates during the Napoleonic wars, he was sent into the Prussian army, and commissioned to the artillery at the least expensive arm of the service. He joined the Prussian Guard artillery in 1845, and it was soon discovered that he had unusual aptitudes as an artillery officer. For a time his brother officers resented the presence of a prince, until it was found that he made no attempt to use his social position to secure advancement. After serving as a military attaché in Vienna and on the Transylvanian frontier during the Crimean War, he was made a captain on the general staff, and in 1856 personal aide-de-camp to the king, remaining, however, in close touch with the artillery. In 1864, having become in the meanwhile successively major and lieut.-colonel, he resigned the staff appointments to become commander of the new Guard Field Artillery regiment and in the following year he became colonel. In 1866 he saw his first real active service. In the bold advance of the Guard corps on the Austrian right wing at Königgrätz (see SEVEN WEEKS' WAR), he led the Guard reserve artillery with the greatest dash and success, and after the short war ended he turned his energies, now fortified by experience, to the better tactical training of the Prussian artillery. In 1868 he was made a major-general and assigned to command the Guard artillery brigade. In this capacity he gained great distinction during the Franco-German war and especially at Gravelotte and Sedan; he was in control of the artillery attack on the fortifications of Paris. In 1873 he was placed in command of an infantry division, and three years later was promoted lieutenant-general. He retired in 1879, was made general of infantry in 1883 and general of artillery in 1889. His military writings were numerous, and amongst them several have become classics. These are *Briefe über Artillerie* (Eng. trans. *Letters on Artillery*, 1887); *Briefe über Strategie* (1877; Eng. trans. *Letters on Strategy*, 1898); and *Gespräche über Reiterei* (1887; Eng. trans. *Conversations on Cavalry*). The *Briefe über Infanterie* and *Briefe über Kavallerie* (translated into English, *Letters on Infantry*, *Letters on Cavalry*, 1889) are of less importance, though interesting as a reflection of prevailing German ideas. His memoirs (*Aus meinem Leben*) were prepared in retirement near Dresden, and the first volume (1897) created such a sensation that eight years were allowed to elapse before the publication was continued. Prince Kraft died near Dresden on the 16th of January 1892. (C. F. A.)

V. CHLODWIG KARL VICTOR, prince of Hohenlohe-Schillingsfürst (1819–1901), statesman, was born on the 31st of March 1819 at Schillingsfürst in Bavaria. His father, Prince Franz Joseph (1787–1841), was a Catholic, his mother, Princess Konstanze of Hohenlohe-Langenburg, a Protestant. In accordance with the compromise customary at the time, Prince Chlodwig and his brothers were brought up in the religion of their father, while his sisters followed that of their mother. In spite of the difference of creed the family was very united, and it was to the spirit that rendered this possible that the prince owed his liberal and tolerant point of view, which was to exercise an important influence on his politcal activity. As the younger son of a cadet line of his house it was necessary for Prince Chlodwig to follow a profession. For a while he thought of obtaining a commission in the British army through the influence of his aunt, Princess Feodora of Hohenlohe-Langenburg (*née* princess of Leiningen), Queen Victoria's half-sister. He decided, however, to enter the Prussian diplomatic service. His application to be excused the preliminary steps, which involved several years' work in subordinate positions in the Prussian civil service, was refused by Frederick William IV., and the prince, with great good sense, decided to sacrifice his pride of rank and to accept the king's conditions. As auscultator in the courts at Coblenz he acquired a taste for jurisprudence, became a *Referendar* in September 1843, and after some months of travel in France, Switzerland and Italy went to Potsdam as a civil servant (May 13, 1844). These early years were invaluable, not only as giving him experience of practical affairs but as affording him an insight into the strength and weakness of the Prussian system. The immediate result was to confirm his Liberalism. The Prussian principle of "propagating enlightenment with a stick" did not appeal to him; he "recognized the confusion and want of clear ideas in the highest circles," the tendency to make agreement with the views of the government the test of loyalty to the state; and he noted in his journal (June 25, 1844) four years before the revolution of '48, "a slight cause and we shall have a rising." "The free press," he notes on another occasion, "is a necessity, progress the condition of the existence of a state." If he was an ardent advocate of German unity, and saw in Prussia the instrument for its attainment, he was throughout opposed to the "Prussification" of Germany, and ultimately it was he who made the unification of Germany possible by insisting at once on the principle of union with the North German states and at the same time on the preservation of the individuality of the states of the South.

On the 12th of November 1834 the landgrave Viktor Amadeus of Hesse-Rotenburg died, leaving to his nephews, the princes Viktor and Chlodwig Hohenlohe, his allodial estates: the duchy of Ratibor in Silesia, the principality of Corvey in Westphalia, and the lordship of Treffurt in the Prussian governmental district of Erfurt. On the death of Prince Franz Joseph on the 14th of January 1841 it was decided that the principality of Schillingsfürst should pass to the third brother, Philipp Ernst, as the two elder sons, Viktor and Chlodwig, were provided for already under their uncle's will, the one with the duchy of Ratibor, the other with Corvey and Treffurt. The youngest son, Gustav (b. February 28, 1823), the future cardinal, was destined for the Church. On the death of Prince Philipp Ernst

SpinSmart Software http://www.spinsmart.com

(May 3, 1845) a new arrangement was made: Prince Chlodwig became prince of Schillingsfürst, while Corvey was assigned to the duke of Ratibor; Treffurt was subsequently sold by Prince Chlodwig, who purchased with the price large estates in Posen. This involved a complete change in Prince Chlodwig's career. His new position as a "reigning" prince and hereditary member of the Bavarian Upper House was incompatible with that of a Prussian official. On the 18th of April 1846 he took his seat as a member of the Bavarian *Reichsrath*, and on the 26th of June received his formal discharge from the Prussian service.

Save for the interlude of 1848 the political life of Prince Hohenlohe was for the next eighteen years not eventful. During the revolutionary years his sympathies were with the Liberal idea of a united Germany, and he compromised his chances of favour from the king of Bavaria by accepting the task (November 1, 1848) of announcing to the courts of Rome, Florence and Athens the accession to office of the Archduke John of Austria as regent of Germany. But he was too shrewd an observer to hope much from a national parliament which "wasted time in idle babble," or from a democratic victory which had stunned but not destroyed the German military powers. On the 16th of February 1847 he had married the Princess Marie of Sayn-Wittgenstein-Berleburg, the heiress to vast estates in Russia.[1] This led to a prolonged visit to Werki in Lithuania (1851–1853) in connexion with the management of the property, a visit repeated in 1860. In general this period of Hohenlohe's life was occupied in the management of his estates, in the sessions of the Bavarian *Reichsrath* and in travels. In 1856 he visited Rome, during which he noted the baneful influence of the Jesuits. In 1859 he was studying the political situation at Berlin, and in the same year he paid a visit to England. The marriage of his brother Konstantin in 1859 to another princess of Sayn-Wittgenstein-Berleburg led also to frequent visits to Vienna. Thus Prince Hohenlohe was brought into close touch with all the most notable people in Europe. At the same time, during this period (1850–1866) he was endeavouring to get into relations with the Bavarian government, with a view to taking a more active part in affairs. Towards the German question his attitude at this time was tentative. He had little hope of a practical realization of a united Germany, and inclined towards the tripartite divisions under Austria, Prussia and Bavaria—the so-called "Trias." He attended the *Fürstentag* at Frankfort in 1863, and in the Schleswig-Holstein question was a supporter of the prince of Augustenburg. It was at this time that, at the request of Queen Victoria, he began to send her regular reports on the political condition of Germany.

Prince Hohenlohe's importance in history, however, begins with the year 1866. In his opinion the war was a blessing. It had demonstrated the insignificance of the small and middle states, "a misfortune for the dynasties"—with whose feelings a mediatized prince could scarcely be expected to be over-sympathetic—but the best possible good fortune for the German nation. In the Bavarian *Reichsrath* Hohenlohe now began to make his voice heard in favour of a closer union with Prussia; clearly, if such a union were desirable, he was the man in every way best fitted to prepare the way for it. One of the main obstacles in the way was the temperament of Louis II. of Bavaria, whose ideas of kingship were very remote from those of the Hohenzollerns, whose pride revolted from any concession to Prussian superiority, and who—even during the crisis of 1866—was more absorbed in operas than in affairs of state. Fortunately Richard Wagner was a politician as well as a composer, and equally fortunately Hohenlohe was a man of culture capable of appreciating "the master's" genius. It was Wagner, apparently, who persuaded the king to place Hohenlohe at the head of his government (*Denkwürdigkeiten*, i. 178, 211), and on the 31st of December 1866 the prince was duly appointed minister of the royal house and of foreign affairs and president of the council of ministers.

As head of the Bavarian government Hohenlohe's principal task was to discover some basis for an effective union of the South German states with the North German Confederation, and during the three critical years of his tenure of office he was, next to Bismarck, the most important statesman in Germany. He carried out the reorganization of the Bavarian army on the Prussian model, brought about the military union of the southern states, and took a leading share in the creation of the customs parliament (*Zollparlament*), of which on the 28th of April 1868 he was elected a vice-president. During the agitation that arose in connexion with the summoning of the Vatican council Hohenlohe took up an attitude of strong opposition to the ultramontane position. In common with his brothers, the duke of Ratibor and the cardinal, he believed that the policy of Pius IX.—inspired by the Jesuits (that "devil's society," as he once called it)—of setting the Church in opposition to the modern State would prove ruinous to both, and that the definition of the dogma of papal infallibility, by raising the pronouncements of the Syllabus of 1864 into articles of faith, would commit the Church to this policy irrevocably. This view he embodied into a circular note to the Catholic powers (April 9, 1869), drawn up by Döllinger, inviting them to exercise the right of sending ambassadors to the council and to combine to prevent the definition of the dogma. The greater powers, however, were for one reason or another unwilling to intervene, and the only practical outcome of Hohenlohe's action was that in Bavaria the powerful ultramontane party combined against him with the Bavarian "patriots" who accused him of bartering away Bavarian independence to Prussia. The combination was too strong for him; a bill which he brought in for curbing the influence of the Church over education was defeated, the elections of 1869 went against him, and in spite of the continued support of the king he was forced to resign (March 7, 1870).

Though out of office, his personal influence continued very great both at Munich and Berlin and had not a little to do with favourable terms of the treaty of the North German Confederation with Bavaria, which embodied his views, and with its acceptance by the Bavarian parliament.[2] Elected a member of the German Reichstag, he was on the 23rd of March 1871 chosen one of its vice-presidents, and was instrumental in founding the new groups which took the name of the Liberal Imperial party (*Liberale Reichspartei*), the objects of which were to support the new empire, to secure its internal development on Liberal lines, and to oppose clerical aggression as represented by the Catholic Centre. Like the duke of Ratibor, Hohenlohe was from the first a strenuous supporter of Bismarck's anti-papal policy, the main lines of which (prohibition of the Society of Jesus, &c.) he himself suggested. Though sympathizing with the motives of the Old Catholics, however, he realized that they were doomed to sink into a powerless sect, and did not join them, believing that the only hope for a reform of the Church lay in those who desired it remaining in her communion.[3] In 1872 Bismarck proposed to appoint Cardinal Hohenlohe Prussian envoy at the Vatican, but his views were too much in harmony with those of his family, and the pope refused to receive him in this capacity.[4]

In 1873 Bismarck chose Prince Hohenlohe to succeed Count Harry Arnim as ambassador in Paris, where he remained for seven years. In 1878 he attended the congress of Berlin as third German representative, and in 1880, on the death of Bernhardt Ernst von Bülow (October 20), secretary of state for foreign affairs, he was called to Berlin as temporary head of the Foreign Office and representative of Bismarck during his

[1] Through her mother, *née* Princess Stephanie Radziwill (d. 1832). Before Prince Wittgenstein's death (1887) a new law had forbidden foreigners to hold land in Russia. Prince Hohenlohe appears, however, to have sold one of his wife's estates and to have secured certain privileges from the Russian court for the rest.

[3] "If I wished to leave the Church because of all the scandalous occurrences in the Catholic Church, I should have had to secede while studying Church history," *op. cit.* ii. 92.

[4] Dr Johann Friedrich (*q.v.*), afterwards one of the Old Catholic leaders, was his secretary at the time of the Vatican council, and supplied historical and theological material to the opposition bishops.

SpinSmart Software http://www.spinsmart.com

absence through illness. In 1885 he was chosen to succeed Manteuffel as governor of Alsace-Lorraine. In this capacity he had to carry out the coercive measures introduced by the chancellor in 1887-1888, though he largely disapproved of them;[1] his conciliatory disposition, however, did much to reconcile the Alsace-Lorrainers to German rule. He remained at Strassburg till October 1894, when, at the urgent request of the emperor, he consented, in spite of his advanced years, to accept the chancellorship in succession to Caprivi. The events of his chancellorship belong to the general history of Germany (*q.v.*); as regards the inner history of this time the editor of his memoirs has very properly suppressed the greater part of the detailed comments which the prince left behind him. In general, during his term of office, the personality of the chancellor was less conspicuous in public affairs than in the case of either of his predecessors. His appearances in the Prussian and German parliaments were rare, and great independence was left to the secretaries of state. What influence the tact and experience of Hohenlohe exercised behind the scenes on the masterful will and impulsive character of the emperor cannot as yet be generally known.

Prince Hohenlohe resigned the chancellorship on the 17th of October 1900, and died at Ragaz on the 6th of July 1901. On the 16th of February 1897 he had celebrated his golden wedding; on the 21st of December of the same year the princess died. There were six children of the marriage: Elizabeth (b. 1847); Stephanie (b. 1851); Philipp Ernst, reigning prince of Hohenlohe-Schillingsfürst (b. 1853), who married Princess Charielée Ypsilanti; Albert (1857–1866); Moritz and Alexander, twins (b. 1862).

All other authorities for the life of Prince Hohenlohe have been superseded by the *Denkwürdigkeiten* (2 vols., Stuttgart and Leipzig, 1906). With the exception noted above these are singularly full and outspoken, the latter quality causing no little scandal in Germany and bringing down on Prince Alexander, who was responsible for their publication, the disfavour of the emperor. They form not only the record of a singularly full and varied life, but are invaluable to the historian for the wealth of material they contain and for appreciations of men and events by an observer who had the best opportunities for forming a judgment. The prince himself they reveal not only as a capable man of affairs, though falling short of greatness, but as a personality of singular charm, tenacious of his principles, tolerant, broad-minded, and possessed of a large measure of the saving grace of humour.

HOHENSTAUFEN, the name of a village and ruined castle near Lorsch in Swabia, now in the kingdom of Württemberg, which gave its name to a celebrated Swabian family, members of which were emperors or German kings from 1138 to 1208, and again from 1214 to 1254. The earliest known ancestor was Frederick, count of Büren (d. 1094), whose son Frederick built a castle at Staufen, or Hohenstaufen, and called himself by this name. He was a firm supporter of the emperor Henry IV., who rewarded his fidelity by granting him the dukedom of Swabia in 1079, and giving him his daughter Agnes in marriage. In 1081 he remained in Germany as Henry's representative, but only secured possession of Swabia after a struggle lasting twenty years. In 1105 Frederick was succeeded by his son Frederick II., called the One-eyed, who, together with his brother Conrad, afterwards the German king Conrad III., held south-west Germany for their uncle the emperor Henry V. Frederick inherited the estates of Henry V. in 1125, but failed to secure the throne, and took up an attitude of hostility towards the new emperor, Lothair the Saxon, who claimed some of the estates of the late emperor as crown property. A war broke out and ended in the complete submission of Frederick at Bamberg. He retained, however, his dukedom and estates. In 1138 Conrad of Hohenstaufen was elected German king, and was succeeded in 1152, not by his son but by his nephew Frederick Barbarossa, son of his brother Frederick (d. 1147). Conrad's son Frederick inherited the duchy of Franconia which his father had received in 1115, and this was retained by the Hohenstaufen until the death of Duke Conrad II. in 1196. In 1152 Frederick received the duchy of Swabia from his cousin the German king Frederick I., and on his death in 1167 it passed successively to Frederick's three sons Frederick, Conrad and Philip. The second Hohenstaufen emperor was Frederick Barbarossa's son, Henry VI., after whose death a struggle for the throne took place between Henry's brother Philip, duke of Swabia, and Otto of Brunswick, afterwards the emperor Otto IV. Regained for the Hohenstaufen by Henry's son, Frederick II., in 1214, the German kingdom passed to his son, Conrad IV., and when Conrad's son Conradin was beheaded in Italy in 1268, the male line of the Hohenstaufen became extinct. Daughters of Philip of Swabia married Ferdinand III., king of Castile and Leon, and Henry II., duke of Brabant, and a daughter of Conrad, brother of the emperor Frederick I., married into the family of Guelph. The castle of Hohenstaufen was destroyed in the 16th century during the Peasants' War, and only a few fragments now remain.

See F. von Raumer, *Geschichte der Hohenstaufen und ihrer Zeit* (Leipzig, 1878); B. F. W. Zimmermann, *Geschichte der Hohenstaufen* (Stuttgart, 1st ed., 1838; 2nd ed., 1865); F. W. Schirrmacher, *Die letzten Hohenstaufen* (Göttingen, 1871).

HOHENSTEIN (Hohenstein-Ernstthal), a town of Germany, in the kingdom of Saxony, on the slopes of the Erzgebirge, and on the railway Reichenbach-Chemnitz, 12 m. N.E. of Zwickau. Pop. (1905) 13,903. Hohenstein possesses two fine Evangelical churches, a town hall, restored in 1876, and several monuments to famous men. The principal industries are the spinning and weaving of cotton, the manufacture of machines, stockings, gloves and woollen and silk fabrics, cotton printing and dyeing. Many of the inhabitants are also employed in the neighbouring copper and arsenic mines. Not far from Hohenstein there is a mineral spring, connected with which there are various kinds of baths. Hohenstein is the birthplace of the physicist G. H. von Schubert and of C. G. Schröter (1699–1782), one of the inventors of the pianoforte. Hohenstein consists of two towns, Hohenstein and Ernstthal, which were united in 1898.

Another place of the same name is a town in East Prussia. Pop. (1900) 2467. This Hohenstein, which was founded by the Teutonic Order in 1359, has a Roman Catholic and an Evangelical church, a synagogue and several educational establishments.

HOHENZOLLERN, the name of a castle which stood on the hill of Zollern about 1½ m. south of Hechingen, and gave its name to the family to which the present German emperor belongs. A vague tradition connects the house with the Colonna family of Rome, or the Colalto family of Lombardy; but one more definite unites the Hohenzollerns with the Burkhardingers, who were counts in Raetia during the early part of the 10th century, and two of whom became dukes of Swabia. Tassilo, a member of this family, is said to have built a castle at Zollern early in the 9th century; but the first historical mention of the name is in the *Chronicon* of a certain Berthold (d. 1088), who refers to Burkhard and Wezil, or Werner, of Zollern, or Zolorin. These men appear to have been counts of Zollern, and to have met their death in 1061. The family of Wezil died out in 1194, and the existing branches of the Hohenzollerns are descended from Burkhard and his son Frederick, whose eldest son, Frederick II., was in great favour with the German kings, Lothair the Saxon and Conrad III. Frederick II. died about 1145, and his son and successor, Frederick III., was a constant supporter of the Hohenstaufen. This count married Sophia, daughter and heiress of Conrad, burgrave of Nuremberg, and about 1192 he succeeded his father-in-law as burgrave, obtaining also some lands in Austria and Franconia. He died about 1200, and his sons, Conrad and Frederick, ruled their lands in common until 1227, when an important division took place. Conrad became burgrave of Nuremberg, and, receiving the lands which

[1] He protested against the passport system as likely to lead to a war with France, for which he preferred not to be responsible (Letter to Wilmowski, *Denkw.* ii. 433), but on the chancellor taking full responsibility consented to retain office.

SpinSmart Software http://www.spinsmart.com

had come into the family through his mother, founded the Franconian branch of the family, which became the more important of the two; while Frederick, receiving the county of Zollern and the older possessions of the family, was the ancestor of the Swabian branch.

Early in the 12th century Burkhard, a younger son of Frederick I., secured the county of Hohenberg, and this district remained in the possession of the Hohenzollerns until the death of Count Sigismund in 1486. Its rulers, however, with the exception of Count Albert II. (d. 1298), played an unimportant part in German history. Albert, who was a Minnesinger, was loyal to the declining fortunes of the Hohenstaufen, and afterwards supported his brother-in-law, Rudolph of Habsburg, in his efforts to obtain the German throne. He shared in the campaigns of Rudolph and fell in battle in 1298, during the struggle between Adolph of Nassau and Albert of Habsburg (afterwards King Albert I.). When this family became extinct in 1486 Hohenberg passed to the Habsburgs.

The Franconian branch of the Hohenzollerns was represented in 1227 by Conrad, burgrave of Nuremberg, whom the emperor Frederick II. appointed guardian of his son Henry, and administrator of Austria. After a short apostasy, during which he supported Henry Raspe, landgrave of Thuringia, Conrad returned to the side of the Hohenstaufen and aided Conrad IV. He died in 1261, when his son and successor, the burgrave Frederick III., had already obtained Bayreuth through his marriage with Elizabeth, daughter of Otto of Meran (d. 1234). Frederick took a leading part in German affairs, and it is interesting to note that he had a considerable share in securing the election of his uncle, Rudolph of Habsburg, as German king in 1273. He died in 1297 and was succeeded by his son, Frederick IV. This burgrave fought for King Albert I. in Thuringia, and supported Henry VII. in his efforts to secure Bohemia for his son John; but in 1314, forsaking his father's policy, he favoured Louis, afterwards the emperor Louis IV., in his struggle with Frederick, duke of Austria, and by his conduct at the battle of Mühldorf in 1322 and elsewhere earned the designation of "saviour of the empire." Frederick, however, did not neglect his hereditary lands. He did something for the maintenance of peace and the security of traders, gave corporate privileges to villages, and took the Jews under his protection. His services to Louis were rewarded in various ways, and, using part of his wealth to increase the area of his possessions, he bought the town and district of Ansbach in 1331. Dying in 1332, Frederick was succeeded by his son, John II., who, after one of his brothers had died and two others had entered the church, ruled his lands in common with his brother Albert. About 1338 John bought Culmbach and Plassenburg, and on the strength of a privilege granted to him in 1347 he seized many robber-fortresses and held the surrounding lands as imperial fiefs. In general he continued his father's policy, and when he died in 1357 was succeeded by his son, Frederick V., who, after the death of his uncle Albert in 1361, became sole ruler of Nuremberg, Ansbach and Bayreuth. Frederick lived in close friendship with the emperor Charles IV., who formally invested him with Ansbach and Bayreuth and made him a prince of the empire in 1363. In spite of the troubled times in which he lived, Frederick was a successful ruler, and introduced a regular system of public finance into his lands. In 1397 he divided his territories between his sons John and Frederick, and died in the following year. His elder son, John III., who had married Margaret, a daughter of the emperor Charles IV., was frequently in the company of his brothers-in-law, the German kings Wenceslaus and Sigismund. He died without sons in 1420.

Since 1307 the office of burgrave of Nuremberg had been held by John's brother, Frederick, who in 1415 received Brandenburg from King Sigismund, and became margrave of Brandenburg as Frederick I. (*q.v.*). On his brother's death in 1420 he reunited the lands of his branch of the family, but in 1427 he sold his rights as burgrave to the town of Nuremberg. The subsequent history of this branch of the Hohenzollerns is identified with that of Brandenburg from 1415 to 1701, and with that of Prussia since the latter date, as in this year the elector Frederick III. became king of Prussia. In 1871 William, the seventh king, took the title of German emperor. While the electorate of Brandenburg passed according to the rule of primogeniture, the Franconian possessions of the Hohenzollerns, Ansbach and Bayreuth, were given as appanages to younger sons, an arrangement which was confirmed by the *dispositio Achillea* of 1473. These principalities were ruled by the sons and descendants of the elector Albert Achilles from 1486 to 1603; and, after reverting to the elector of Brandenburg, by the descendants of the elector John George from 1603 to 1791. In 1791 Prince Charles Alexander (d. 1806), who had inherited both districts, sold his lands to Prussia.

The influence of the Swabian branch of the Hohenzollerns was weakened by several partitions of its lands; but early in the 16th century it rose to some eminence through Count Eitel Frederick II. (d. 1512), a friend and adviser of the emperor Maximilian I. Eitel received from this emperor the district of Haigerloch, and in 1534 his grandson Charles (d. 1576) was granted the counties of Sigmaringen and Vöhringen by the emperor Charles V. In 1576 the sons of Charles divided their lands, and founded three branches of the family, one of which is still flourishing. Eitel Frederick IV. took Hohenzollern with the title of Hohenzollern-Hechingen; Charles II. Sigmaringen and Vöhringen and the title of Hohenzollern-Sigmaringen; and Christopher took Haigerloch. Christopher's family died out in 1634, but the remaining lines are of some importance. Count John George of Hohenzollern-Hechingen was made a prince in 1623, and John of Hohenzollern-Sigmaringen soon received the same honour. In 1695 these two branches of the family entered conjointly into an agreement with Brandenburg, which provided that, in case of the extinction of either of the Swabian branches, the remaining branch should inherit its lands; and if both branches became extinct the principalities should revert to Brandenburg. During the 17th and 18th centuries and during the period of the Napoleonic wars the history of these lands was very similar to that of the other small estates of Germany. In consequence of the political troubles of 1848 Princes Frederick William of Hohenzollern-Hechingen and Charles Anton of Hohenzollern-Sigmaringen resigned their principalities, and accordingly these fell to the king of Prussia, who took possession on the 12th of March 1850. By a royal decree of the 20th of May following the title of "highness," with the prerogatives of younger sons of the royal house, was conferred on the two princes. The proposal to raise Prince Leopold of Hohenzollern-Sigmaringen (1835–1905) to the Spanish throne in 1870 was the immediate cause of the war between France and Germany. In 1908 the head of this branch of the Hohenzollerns, the only one existing besides the imperial house, was Leopold's son William (b. 1864), who, owing to the extinction of the family of Hohenzollern-Hechingen in 1869, was called simply prince of Hohenzollern. In 1866 Prince Charles of Hohenzollern-Sigmaringen was chosen prince of Rumania, becoming king in 1881.

The modern Prussian province of Hohenzollern is a long, narrow strip of territory bounded on the S.W. by Baden and in other directions by Württemberg. It was divided into two principalities, Hohenzollern-Sigmaringen and Hohenzollern-Hechingen, until 1850, when these were united. They now form the government of Sigmaringen (*q.v.*).

The castle of Hohenzollern was destroyed in 1423, but it has been restored several times. Some remains of the old building may still be seen adjoining the present castle, which was built by King Frederick William IV.

HOKKAIDO, the Japanese name for the northern division of the empire (*Hoku* = north, *kai* = sea, and *do* = road), including Yezo, the Kuriles and their adjacent islets.

HOKUSAI (1760–1849), the greatest of all the Japanese painters of the Popular School (*Ukiyo-ye*), was born at Yedo (Tōkyō) in the 9th month of the 10th year of the period Horeki, *i.e.* October-November 1760. He came of an artisan family, his father having been a mirror-maker, Nakajima Issai. After some practice as a wood-engraver he, at the age of eighteen, entered the studio of Katsugawa Shunshō, a painter and designer of colour-prints of considerable importance. His disregard for the artistic principles of his master caused his expulsion in 1785; and thereafter—although from time to time Hokusai studied various styles, including especially that of Shiba Gokan, from whom he gained some fragmentary knowledge of European methods—he kept his personal independence. For a time he lived in extreme poverty, and, although he must have gained sums for his work which might have secured him comfort, he remained poor, and to the end of his life proudly described himself as a peasant. He illustrated large numbers of books, of which the world-famous *Mangwa*, a pictorial encyclopaedia of Japanese life, appeared in fifteen volumes from 1812 to 1875. Of his colour-prints the "Thirty-six Views of Mount Fuji" (the whole set consisting of forty-six prints) were made between 1823 and 1829; "Views of Famous Bridges" (11), "Waterfalls" (8), and "Views of the Lu-chu Islands" (8), are the best known of those issued in series; but Hokusai also designed some superb broadsheets published separately, and his *surimono* (small prints made for special occasions and ceremonies) are unequalled for delicacy and beauty. The "Hundred Views of Mount Fuji" (1834–1835), 3 vols., in monochrome, are of extraordinary originality and variety. As a painter and draughtsman Hokusai is not held by Japanese critics to be of the first rank, but this verdict has never been accepted by Europeans, who place him among the greatest artists of the world. He possessed great powers of observation and characterization, a singular technical skill, an unfailing gift of good humour, and untiring industry. He was an eager student to the end of his long life, and on his death-bed said, "If Heaven had lent me but five years more, I should have become a great painter." He died on the 10th of May 1849.

HOLBACH, PAUL HEINRICH DIETRICH, BARON D' (1723–1789), French philosopher and man of letters, of German origin, was born at Heidelsheim in the palatinate in 1723. Of his family little is known; according to J. J. Rousseau his father was a rich parvenu, who brought his son at an early age to Paris, where the latter spent most of his life. Much of Holbach's fame is due to his intimate connexion with the brilliant coterie of bold thinkers and polished wits whose creed, the new philosophy, is concentrated in the famous *Encyclopédie*. Possessed of easy means and being of hospitable disposition, he kept open house for Helvétius, D'Alembert, Diderot, Condillac, Turgot, Buffon, Grimm, Hume, Garrick, Wilkes, Sterne, and for a time J. J. Rousseau, guests who, while enjoying the intellectual pleasure of their host's conversation, were not insensible to his excellent cuisine and costly wines. For the *Encyclopédie* he compiled and translated a large number of articles on chemistry and mineralogy, chiefly from German sources. He attracted more attention, however, in the department of philosophy. In 1767 *Christianisme dévoilé* appeared, in which he attacked Christianity and religion as the source of all human evils. This was followed up by other works, and in 1770 by a still more open attack in his most famous book, *Le Système de la nature*, in which it is probable he was assisted by Diderot. Denying the existence of a deity, and refusing to admit as evidence all a priori arguments, Holbach saw in the universe nothing save matter in spontaneous movement. What men call their souls become extinct when the body dies. Happiness is the end of mankind. "It would be useless and almost unjust to insist upon a man's being virtuous if he cannot be so without being unhappy. So long as vice renders him happy, he should love vice." The restraints of religion were to be replaced by an education developing an enlightened self-interest. The study of science was to bring human desires into line with their natural surroundings. Not less direct and trenchant are his attacks on political government, which, interpreted by the light of after events, sound like the first distant mutterings of revolution. Holbach exposed the logical consequences of the theories of the Encyclopaedists. Voltaire hastily seized his pen to refute the philosophy of the *Système* in the article "Dieu" in his *Dictionnaire philosophique*, while Frederick the Great also drew up an answer to it. Though vigorous in thought and in some passages clear and eloquent, the style of the *Système* is diffuse and declamatory, and asserts rather than proves its statements. Its principles are summed up in a more popular form in *Bon Sens, ou idées naturelles opposées aux idées surnaturelles* (Amsterdam, 1772). In the *Système social* (1773), the *Politique naturelle* (1773–1774) and the *Morale universelle* (1776) Holbach attempts to rear a system of morality in place of the one he had so fiercely attacked, but these later writings had not a tithe of the popularity and influence of his earlier work. He published his books either anonymously or under borrowed names, and was forced to have them printed out of France. The uprightness and sincerity of his character won the friendship of many to whom his philosophy was repugnant. J. J. Rousseau is supposed to have drawn his portrait in the virtuous atheist Wolmar of the *Nouvelle Héloïse*. He died on the 21st of January 1789.

Holbach is also the author of the following and other works: *Esprit du clergé* (1767); *De l'imposture sacerdotale* (1767); *Prêtres démasqués* (1768); *Examen critique de la vie et des ouvrages de St Paul* (1770); *Histoire critique de Jésus-Christ* (1770), and *Ethocratie* (1776). For further particulars as to his life and doctrines see Grimm's *Correspondance littéraire*, &c. (1813); Rousseau's *Confessions*; Morellet's *Mémoires* (1821); Madame de Genlis, *Les Dîners du Baron Holbach*; Madame d'Épinay's *Mémoires*; Avezac-Lavigne, *Diderot et la société du Baron d'Holbach* (1875), and Morley's *Diderot* (1878).

HOLBEACH, a market town in the Holland or Spalding parliamentary division of Lincolnshire, England, on the Midland and Great Northern joint railway, 23½ m. N.E. of Peterborough. Pop. of urban district (1901), 4755. All Saints' Church, with a lofty spire, is a fine specimen of late Decorated work. The grammar school, founded in 1669, occupies a building erected in 1877. Other public buildings are the assembly rooms and a market house. Roman and Saxon remains have been found, and the market dates from the 13th century.

HOLBEIN, HANS, the elder (*c.* 1460–1524), belonged to a celebrated family of painters in practice at Augsburg and Basel from the close of the 15th to the middle of the 16th century. Though closely connected with Venice by her commercial relations, and geographically nearer to Italy than to Flanders, Augsburg at the time of Maximilian cultivated art after the fashion of the Flemings, and felt the influence of the schools of Bruges and Brussels, which had branches at Cologne and in many cities about the headwaters of the Rhine. It was not till after the opening of the 16th century, and between that and the era of the Reformation, that Italian example mitigated to some extent the asperity of South German painting. Flemish and German art was first tempered with Italian elements at Augsburg by Hans Holbein the elder. Hans first appears at Augsburg as partner to his brother Sigismund, who survived him and died in 1540 at Berne. Sigismund is described as a painter, but his works have not come down to us. Hans had the lead of the partnership at Augsburg, and signed all the pictures which it produced. In common with Herlen, Schöngauer, and other masters of South Germany, he first cultivated a style

SpinSmart Software http://www.spinsmart.com

akin to that of Memlinc and other followers of the schools of Brussels and Bruges, but he probably modified the systems of those schools by studying the works of the masters of Cologne. As these early impressions waned, they were replaced by others less favourable to the expansion of the master's fame; and as his custom increased between 1499 and 1506, we find him relying less upon the teaching of the schools than upon a mere observation and reproduction of the quaintnesses of local passion plays. Most of his early works indeed are taken from the Passion, and in these he obviously marshalled his figures with the shallow stage effect of the plays, copying their artificial system of grouping, careless to some extent of proportion in the human shape, heedless of any but the coarser forms of expression, and technically satisfied with the simplest methods of execution. If in any branch of his art he can be said to have had a conscience at this period, we should say that he showed it in his portrait drawings. It is seldom that we find a painted likeness worthy of the name. The drawings of which numbers are still preserved in the galleries of Basel. Berlin and Copenhagen show extraordinary quickness and delicacy of hand, and a wonderful facility for seizing character; and this happily is one of the features which Holbein bequeathed to his more famous son, Hans the younger. It is between 1512 and 1522 that Holbein tempered the German quality of his style with some North Italian elements. A purer taste and more pleasing realism mark his work, which in drapery, dress and tone is as much more agreeable to the eye as in respect of modelling and finish it is smoother and more carefully rounded. Costume, architecture, ornament and colour are applied with some knowledge of the higher canons of art. Here, too, advantage accrued to Hans the younger, whose independent career about this time began.

The date of the elder Holbein's birth is unknown. But his name appears in the books of the tax-gatherers of Augsburg in 1494, superseding that of Michael Holbein, who is supposed to have been his father. Previous to that date, and as early as 1493, he was a painter of name, and he executed in that year, it is said, for the abbey at Weingarten, the wings of an altarpiece representing Joachim's Offering, the Nativity of the Virgin, Mary's Presentation in the Temple, and the Presentation of Christ, which now hang in separate panels in the cathedral of Augsburg. In these pieces and others of the same period, for instance in two Madonnas in the Moritz chapel and castle of Nuremberg, we mark the clear impress of the schools of Van der Weyden and Memlinc; whilst in later works, such as the Basilica of St Paul (1504) in the gallery of Augsburg, the wane of Flemish influence is apparent. But this altarpiece, with its quaint illustrations of St Paul's life and martyrdom, is not alone of interest because its execution is characteristic of old Holbein. It is equally so because it contains portraits of the master himself, accompanied by his two sons, the painters Ambrose (*c.* 1494–*c.* 1519) and Hans the younger. Later pictures, such as the Passion series in the Fürstenberg gallery at Donaueschingen, or the Martyrdom of St Sebastian in the Munich Pinakothek, contain similar portraits, the original drawings of which are found in old Holbein's sketch-book at Berlin, or in stray leaves like those possessed by the duke of Aumale in Paris. Not one of these fails to give us an insight into the character, or a reflex of the features, of the members of this celebrated family. Old Holbein seems to ape Leonardo, allowing his hair and beard to grow wildly, except on the upper lip. Hans the younger is a plain-looking boy. But his father points to him with his finger, and hints that though but a child he is clearly a prodigy.

After 1516 Hans Holbein the elder appears as a defaulter in the registers of the tax-gatherers at Augsburg; but he willingly accepts commissions abroad. At Issenheim in Alsace, where Grünewald was employed in 1516, old Holbein also finds patrons, and contracts to complete an altarpiece. But misfortune or a bailiff pursues him, and he leaves Issenheim, abandoning his work and tools. According to Sandrart, he wanders to Basel and takes the freedom of its gild. His brother Sigismund and others are found suing him for debt before the courts of Augsburg. Where he lived when he executed the altarpiece, of which two wings with the date of 1522 are in the gallery of Carlsruhe, is uncertain; where he died two years later is unknown. He slinks from ken at the close of a long life, and disappears at last heeded by none but his own son, who claims his brushes and paints from the monks of Issenheim without much chance of obtaining them. His name is struck off the books of the Augsburg gild in 1524.

The elder Holbein was a prolific artist, who left many pictures behind him. Earlier than the Basilica of St Paul, already mentioned, is the Basilica of St Mary Maggiore, and a Passion in eleven pieces, in the Augsburg gallery, both executed in 1499. Another Passion, with the root of Jesse and a tree of the Dominicans, is that preserved in the Staedel, Saalhof, and church of St Leonard at Frankfort. It was executed in 1501. The Passion of Donaueschingen was finished after 1502, in which year was completed the Passion of Kaisheim, a conglomerate of twenty-seven panels, now divided amongst the galleries of Munich, Nuremberg, Augsburg and Schleissheim. An altarpiece of the same class, commissioned for the monastery of St Moritz at Augsburg in 1504–1508, has been dispersed and lost. 1512 is the date of a Conception in the Augsburg gallery, long assigned, in consequence of a forged inscription, to Hans Holbein the younger. A diptych, with a Virgin and Child, and a portrait of an old man, dated 1513, came in separate parts into the collections of Mr Posonyi and Count Lanckoronski at Vienna. The sketch-books of Berlin, Copenhagen and Augsburg give a lively picture of the forms and dress of Augsburg residents at the beginning of the 16th century. They comprise portraits of the emperor Maximilian, the future Charles V., Kunz von der Rosen, the fool of Maximilian, the Fuggers, friars, merchants, and at rare intervals ladies.

See also the biography by Stödtner (Berlin, 1896).

HOLBEIN, HANS, the younger (1497–1543), German painter, favourite son of Hans Holbein the elder, was probably born at Augsburg about the year 1497. Though Sandrart and Van Mander declare that they do not know who gave him the first lessons, he doubtless received an artist's education from his father. About 1515 he left Augsburg with Ambrose, his elder brother, to seek employment as an illustrator of books at Basel. His first patron is said to have been Erasmus, for whom, shortly after his arrival, he illustrated with pen-and-ink sketches an edition of the *Encomium Moriae*, now in the museum of Basel. But his chief occupation was that of drawing titlepage-blocks and initials for new editions of the Bible and classics issued from the presses of Froben and other publishers. His leisure hours, it is supposed, were devoted to the production of rough painter's work, a schoolmaster's sign in the Basel collection, a table with pictures of St Nobody in the library of the university at Zurich. In contrast with these coarse productions, the portraits of Jacob Meyer and his wife in the Basel museum, one of which purports to have been finished in 1516, are miracles of workmanship. It has always seemed difficult indeed to ascribe such excellent creations to Holbein's nineteenth year; and it is hardly credible that he should have been asked to do things of this kind so early, especially when it is remembered that neither he nor his brother Ambrose were then allowed to matriculate in the guild of Basel. Not till 1517 did Ambrose, whose life otherwise remains obscure, join that corporation; Hans, not overburdened with practice, wandered into Switzerland, where (1517) he was employed to paint in the house of Jacob Hertenstein at Lucerne. In 1519 Holbein reappeared at Basel, where he matriculated and, there is every reason to think, married. Whether, previous to this time, he took advantage of his vicinity to the Italian border to cross the Alps is uncertain. Van Mander says that he never was in Italy; yet the large wall-paintings which he executed after 1519 at Basel, and the series of his sketches and pictures which is still extant, might lead to the belief that Van Mander was misinformed. The spirit of Holbein's compositions for the Basel town hall, the scenery and architecture of his numerous drawings, and the cast of form in some of his imaginative portraits, make it more likely that he should have felt the direct influence of North Italian painting than that he should have taken Italian elements from imported works or prints. The Swiss at this period wandered in thousands to swell the ranks of the French or imperial armies fighting on Italian soil, and the road they took may have been followed by Hans on a more peaceful mission. He shows himself at all events familiar with Italian examples

SpinSmart Software http://www.spinsmart.com

at various periods of his career; and if we accept as early works the "Flagellation," and the "Last Supper" at Basel, coarse as they are, they show some acquaintance with Lombard methods of painting, whilst in other pieces, such as the series of the Passion in oil in the same collection, the modes of Hans Holbein the elder are agreeably commingled with a more modern, it may be said Italian, polish. Again, looking at the "Virgin" and "Man of Sorrows" in the Basel museum, we shall be struck by a searching metallic style akin to that of the Ferrarese; and the "Lais" or the "Venus and Amor" of the same collection reminds us of the Leonardesques of the school of Milan. When Holbein settled down to an extensive practice at Basel in 1519, he decorated the walls of the house "Zum Tanz" with simulated architectural features of a florid character after the fashion of the Veronese; and his wall paintings in the town-hall, if we can truly judge of them by copies, reveal an artist not unfamiliar with North Italian composition, distribution, action, gesture and expression. In his drawings too, particularly in a set representing the Passion at Basel, the arrangement, and also the perspective, form and decorative ornament, are in the spirit of the school of Mantegna. Contemporary with these, however, and almost inexplicably in contrast with them as regards handling, are portrait-drawings such as the likenesses of Jacob Meyer, and his wife, which are finished with German delicacy, and with a power and subtlety of hand seldom rivalled in any school. Curiously enough, the same contrast may be observed between painted compositions and painted portraits. The "Bonifacius Amerbach" of 1519 at Basel is acknowledged to be one of the most complete examples of smooth and transparent handling that Holbein ever executed. His versatility at this period is shown by a dead Christ (1521), a corpse in profile on a dissecting table, and a set of figures in couples; the "Madonna and St Pantalus," and "Kaiser Henry with the Empress Kunigunde" (1522), originally composed for the organ loft of the Basel cathedral, now in the Basel museum. Equally remarkable, but more attractive, though injured, is the "Virgin and Child between St Ursus and St Nicholas" (not St Martin) giving alms to a beggar, in the gallery of Solothurn. This remarkable picture is dated 1522, and seems to have been ordered for an altar in the minster of St Ursus of Solothurn by Nicholas Conrad, a captain and statesman of the 16th century, whose family allowed the precious heirloom to fall into decay in a chapel of the neighbouring village of Grenchen. Numerous drawings in the spirit of this picture, and probably of the same period in his career, might have led Holbein's contemporaries to believe that he would make his mark in the annals of Basel as a model for painters of altarpieces as well as a model for pictorial composition and portrait. The promise which he gave at this time was immense. He was gaining a freedom in draughtsmanship that gave him facility to deal with any subject. Though a realist, he was sensible of the dignity and severity of religious painting. His colour had almost all the richness and sweetness of the Venetians. But he had fallen on evil times, as the next few years undoubtedly showed. Amongst the portraits which he executed in these years are those of Froben, the publisher, known only by copies at Basel and Hampton Court, and Erasmus, who sat in 1523, as he likewise did in 1530, in various positions, showing his face threequarters as at Longford, Basel, Turin, Parma, the Hague and Vienna, and in profile as in the Louvre or at Hampton Court. Besides these, Holbein made designs for glass windows, and for woodcuts, including subjects of every sort, from the Virgin and Child with saints of the old time to the Dance of Death, from gospel incidents extracted from Luther's Bible to satirical pieces illustrating the sale of indulgences and other abuses denounced by Reformers. Holbein, in this way, was carried irresistibly with the stream of the Reformation, in which, it must now be admitted, the old traditions of religious painting were wrecked, leaving nothing behind but unpictorial elements which Cranach and his school vainly used for pictorial purposes.

Once only, after 1526, and after he had produced the "Lais" and "Venus and Amor," did Holbein with impartial spirit give his services and pencil to the Roman Catholic cause. The burgomaster Meyer, whose patronage he had already enjoyed, now asked him to represent himself and his wives and children in prayer before the Virgin; and Holbein produced the celebrated altarpiece now in the palace of Prince William of Hesse at Darmstadt, the shape and composition of which are known to all the world by its copy in the Dresden museum. The drawings for this masterpiece are amongst the most precious relics in the museum of Basel. The time now came when art began to suffer from unavoidable depression in all countries north of the Alps. Holbein, at Basel, was reduced to accept the smallest commissions —even for scutcheons. Then he saw that his chances were dwindling to nothing, and taking a bold resolution, armed with letters of introduction from Erasmus to More, he crossed the Channel to England, where in the one-sided branch of portrait painting he found an endless circle of clients. Eighty-seven drawings by Holbein in Windsor Castle, containing an equal number of portraits, of persons chiefly of high quality, testify to his industry in the years which divide 1528 from 1543. They are all originals of pictures that are still extant, or sketches for pictures that were lost or never carried out. Sir Thomas More, with whom he seems to have had a very friendly connexion, sat to him for likenesses of various kinds. The drawing of his head is at Windsor. A pen-and-ink sketch, in which we see More surrounded by all the members of his family, is now in the gallery of Basel, and numerous copies of a picture from it prove how popular the lost original must once have been. At the same period were executed the portraits of Warham (Lambeth and Louvre), Wyatt (Louvre), Sir Henry Guildford and his wife (Windsor), all finished in 1527, the astronomer Nicholas Kratzer (Louvre), Thomas Godsalve (Dresden), and Sir Bryan Tuke (Munich) in 1528. In this year, 1528, Holbein returned to Basel, taking to Erasmus the sketch of More's family. With money which he brought from London he purchased a house at Basel wherein to lodge his wife and children, whose portraits he now painted with all the care of a husband and father (1528). He then witnessed the flight of Erasmus and the fury of the iconoclasts, who destroyed in one day almost all the religious pictures at Basel. The municipality, unwilling that he should suffer again from the depression caused by evil times, asked him to finish the frescoes of the town-hall, and the sketches from these lost pictures are still before us to show that he had not lost the spirit of his earlier days, and was still capable as a composer. His "Rehoboam receiving the Israelite Envoys," and "Saul at the Head of his Array meeting Samuel," testify to Holbein's power and his will, also proved at a later period by the "Triumphs of Riches and Poverty," executed for the Steelyard in London (but now lost), to prefer the fame of a painter of history to that of a painter of portraits. But the reforming times still remained unfavourable to art. With the exception of a portrait of Melanchthon (Hanover) which he now completed, Holbein found little to do at Basel. The year 1530, therefore, saw him again on the move, and he landed in England for the second time with the prospect of bettering his fortunes. Here indeed political changes had robbed him of his earlier patrons. The circle of More and Warham was gone. But that of the merchants of the Steelyard took its place, for whom Holbein executed the long and important series of portraits that lie scattered throughout the galleries and collections of England and the Continent, and bear date after 1532. Then came again the chance of practice in more fashionable circles. In 1533 the "Ambassadors" (National Gallery), and the "Triumphs of Wealth and Poverty" were executed, then the portraits of Leland and Wyatt (Longford), and (1534) the portrait of Thomas Cromwell. Through Cromwell Holbein probably became attached to the court, in the pay of which he appears permanently after 1537. From that time onwards he was connected with all that was highest in the society of London. Henry VIII. invited him to make a family picture of himself, his father and family, which obtained a post of honour at Whitehall. The beautiful cartoon of a part of this fine piece at Hardwicke Hall enables us to gauge its beauty before the fire which destroyed it in the 17th century. Then Holbein painted Jane Seymour in state (Vienna), employing

SpinSmart Software http://www.spinsmart.com

some English hand perhaps to make the replicas at the Hague, Sion House and Woburn; he finished the Southwell of the Uffizi (copy at the Louvre), the jeweller Morett at Dresden, and last, not least, Christine of Denmark, who gave sittings at Brussels in 1538. During the journey which this work involved Holbein took the opportunity of revisiting Basel, where he made his appearance in silk and satin, and *pro forma* only accepted the office of town painter. He had been living long and continuously away from home, not indeed observing due fidelity to his wife, who still resided at Basel, but fairly performing the duties of keeping her in comfort. His return to London in autumn enabled him to do homage to the king in the way familiar to artists. He presented to Henry at Christmas a portrait of Prince Edward. Again abroad in the summer of 1539, he painted with great fidelity the princess Anne of Cleves, at Düren near Cologne, whose form we still see depicted in the great picture of the Louvre. That he could render the features of his sitter without flattery is plain from this one example. Indeed, habitual flattery was contrary to his habits. His portraits up to this time all display that uncommon facility for seizing character which his father enjoyed before him, and which he had inherited in an expanded form. No amount of labour, no laboriousness of finish—and of both he was ever prodigal—betrayed him into loss of resemblance or expression. No painter was ever quicker at noting peculiarities of physiognomy, and it may be observed that in none of his faces, as indeed in none of the faces one sees in nature, are the two sides alike. Yet he was not a child of the 16th century, as the Venetians were, in substituting touch for line. We must not look in his works for modulations of surface or subtle contrasts of colour in juxtaposition. His method was to the very last delicate, finished and smooth, as became a painter of the old school.

Amongst the more important creations of Holbein's later time we should note his "Duke of Norfolk" at Windsor, the hands of which are so perfectly preserved as to compensate for the shrivel that now disfigures the head. Two other portraits of 1541 (Berlin and Vienna), the Falconer at the Hague, and John Chambers at Vienna (1542), are noble specimens of portrait art; most interesting and of the same year are the likenesses of Holbein himself, of which several examples are extant—one particularly good at Fähna, the seat of the Stackelberg family near Riga, and another at the Uffizi in Florence. Here Holbein appears to us as a man of regular features, with hair just turning grey, but healthy in colour and shape, and evidently well to do in the world. Yet a few months only separated him then from his death-bed. He was busy painting a picture of Henry the VIII. confirming the Privileges of the Barber Surgeons (Lincoln's Inn Fields), when he sickened of the plague and died after making a will about November 1543. His loss must have been seriously felt in England. Had he lived his last years in Germany, he would not have changed the current which decided the fate of painting in that country; he would but have shared the fate of Dürer and others who merely prolonged the agony of art amidst the troubles of the Reformation. (J. A. C.)

The early authorities are Karel Van Mander's *Het Schilder Boek* (1604), and J. von Sandrart, *Accademia Todesca* (1675). See also R. N. Wornum, *Life and Work of Holbein* (1867); H. Knackfuss, *Holbein* (1899); G. S. Davies, *Holbein* (1903); A. F. G. A. Woltmann, *Holbein und seine Zeit* (1876).

HOLBERG, LUDVIG HOLBERG, BARON (1684–1754), the great Scandinavian writer, was born at Bergen, in Norway, on the 3rd of December 1684. Both Holberg's parents died in his childhood, his father first, leaving a considerable property; and in his eleventh year he lost his mother also. Before the latter event, however, the family had been seriously impoverished by a great fire, which destroyed several valuable buildings, but notwithstanding this, the mother left to each of her six children some little fortune. In 1695 the boy Holberg was taken into the house of his uncle, Peder Lem, who sent him to the Latin school, and prepared him for the profession of a soldier; but soon after this he was adopted by his cousin Otto Munthe, and went to him up in the mountains. His great desire for instruction, however, at last induced his family to send him back to Bergen, to his uncle, and there he remained, eagerly studying, until the destruction of that city by fire in 1702, when he was sent to the university of Copenhagen. But he soon exhausted his resources, and, having nothing to live upon, was glad to hurry back to Norway, where he accepted the position of tutor in the house of a rural dean at Voss. He soon returned to Copenhagen, where in 1704 he took his degree, and worked hard at French, English and Italian. But he had to gain his living, and accordingly he accepted the post of tutor once more, this time in the house of Dr Smith, vice-bishop of Bergen. The good doctor had travelled much, and the reading of his itineraries and note-books awakened such a longing for travel in the young Holberg that at last, at the close of 1704, having scraped together 60 dollars, he went on board a ship bound for Holland. He proceeded as far as Aix-la-Chapelle, where he fell sick of a fever, and suffered so much from weakness and poverty, that he made his way on foot to Amsterdam, and came back to Norway. Ashamed to be seen so soon in Bergen, he stopped at Christianssand, where he lived through the winter, supporting himself by giving lessons in French. In the spring of 1706 he travelled, in company with a student named Brix, through London to Oxford, where he studied for two years, gaining his livelihood by giving lessons on the violin and the flute. He mentions, with gratitude, the valuable libraries of Oxford, and it is pleasant to record that it was while he was there that it first occurred to him, as he says, "how splendid and glorious a thing it would be to take a place among the authors." Through London and Elsinore he reached Copenhagen a third time, and began to lecture at the university; his lectures were attended, but he got no money. He was asked in 1709 to conduct a rich young gentleman to Dresden, and on his return journey he lectured at Leipzig, Halle and Hamburg. Once more in Copenhagen, he undertook to teach the children of Admiral Gedde. Weary with this work, he took a post at Borch College in 1710, where he wrote, and printed in 1711, his first work, *An Introduction to the History of the Nations of Europe*, and was permitted to present to King Frederick IV. two manuscript essays on Christian IV. and Frederick III. The king soon after presented him with the title of Professor, and with the Rosenkrantz grant of 100 dollars for four years, the holder of which was expected to travel. Holberg accordingly started in 1714, and visited, chiefly on foot, a great portion of Europe. From Amsterdam he walked through Rotterdam to Antwerp, took a boat to Brussels, and on foot again reached Paris. Walking and skating, he proceeded in the depth of winter to Marseilles, and on by sea to Genoa. On the last-mentioned voyage he caught a fever, and nearly died in that city. On his recovery he pushed on to Civita Vecchia and Rome. When the spring had come, being still very poor and in feeble health, he started homewards on foot by Florence, across the Apennines, through Bologna, Parma, Piacenza, Turin, over the Alps, through Savoy and Dauphiné to Lyons, and finally to Paris, where he arrived in excellent health. After spending a month in Paris, he walked on to Amsterdam, took sail to Hamburg, and so went back to Denmark in 1716. He spent the next two years in extreme poverty, and published his *Introduction to Natural and Popular Law*. But at last, in 1718, his talents were recognized by his appointment as professor of metaphysics at the university of Copenhagen; and in 1720 he was promoted to the lucrative chair of public eloquence, which gave him a seat in the consistory. His pecuniary troubles were now at an end. Hitherto he had written only on law, history and philology, although in a Latin controversy with the jurist Andreas Hojer of Flensborg his satirical genius had flashed out. But now, and until 1728, he created an entirely new class of humorous literature under the pseudonym of Hans Mikkelsen. The serio-comic epic of *Peder Paars*, the earliest of the great classics of the Danish language, appeared in 1719. This poem was a brilliant satire on contemporary manners, and enjoyed an extraordinary success. But the author had offended in it several powerful persons who threatened his life, and if Count Danneskjold had not personally interested the king in

SpinSmart Software http://www.spinsmart.com

him, Holberg's career might have had an untimely close. During the next two years he published five shorter satires, all of which were well received by the public. The great event of 1721 was the erection of the first Danish theatre in Grönnegade, Copenhagen; Holberg took the direction of this house, in which was played, in September 1722, a Danish translation of *L'Avare*. Until this time no plays had been acted in Denmark except in French and German, but Holberg now determined to use his talent in the construction of Danish comedy. The first of his original pieces performed was *Den politiske Kandestöber* (The Pewterer turned Politician); he wrote other comedies with miraculous rapidity, and before 1722 was closed, there had been performed in succession, and with immense success, *Den Vaegelsindede* (The Waverer), *Jean de France*, *Jeppe paa Bjerget*, and *Gert the Westphalian*. Of these five plays, four at least are masterpieces; and they were almost immediately followed by others. Holberg took no rest, and before the end of 1723 the comedies of *Barselstuen* (The Lying-in Room), *The Eleventh of July*, *Jakob von Thyboe*, *Den Bundeslöse* (The Fidget), *Erasmus Montanus*, *Don Ranudo*, *Ulysses of Ithaca*, *Without Head or Tail*, *Witchcraft* and *Melampe* had all been written, and some of them acted. In 1724 the most famous comedy that Holberg produced was *Henrik and Pernille*. But in spite of this unprecedented blaze of dramatic genius the theatre fell into pecuniary difficulties, and had to be closed, Holberg composing for the last night's performance, in February 1727, a *Funeral of Danish Comedy*. All this excessive labour for the stage had undermined the great poet's health, and in 1725 he had determined to take the baths at Aix-la-Chapelle; but instead of going thither he wandered through Belgium to Paris, and spent the winter there. In the spring he returned to Copenhagen with recovered health and spirits, and worked quietly at his protean literary labours until the great fire of 1728. In the period of national poverty and depression that followed this event, a puritanical spirit came into vogue which was little in sympathy with Holberg's dramatic or satiric genius. He therefore closed his career as a dramatic poet by publishing in 1731 his acted comedies, with the addition of five which he had no opportunity of putting on the stage. With characteristic versatility, he adopted the serious tone of the new age, and busied himself for the next twenty years with historical, philosophical and statistical writings. During this period he published his poetical satire called *Metamorphosis* (1726), his *Epistolae ad virum perillustrem* (1727), his *Description of Denmark and Norway* (1729), *History of Denmark*, *Universal Church History*, *Biographies of Famous Men*, *Moral Reflections*, *Description of Bergen* (1737), *A History of the Jews*, and other learned and laborious compilations. The only poem he published at this time was the famous *Nicolai Klimii iter subterraneum* (1741), afterwards translated into Danish by Baggesen. When Christian VI. died in 1747, pietism lost its sway; the theatre was reopened and Holberg was appointed director, but he soon resigned this arduous post. The six comedies he wrote in his old age did not add to his reputation. His last published work was his *Epistles*, in 5 vols. the last of them posthumous (1754). In 1747 he was created by the new king Baron of Holberg. In August 1753 he took to his bed, and he died at Copenhagen on the 28th of January 1754, in the seventieth year of his age. He was buried at Sorö, in Zealand. He had never married, and he bequeathed all his property, which was considerable, to Sorö College.

Holberg was not only the founder of Danish literature and the greatest of Danish authors, but he was, with the exception of Voltaire, the first writer in Europe during his own generation. Neither Pope nor Swift, who perhaps excelled him in particular branches of literary production, approached him in range of genius, or in encyclopaedic versatility. Holberg found Denmark provided with no books, and he wrote a library for her. When he arrived in the country, the Danish language was never heard in a gentleman's house. Polite Danes were wont to say that a man wrote Latin to his friends, talked French to the ladies, called his dogs in German, and only used Danish to swear at his servants. The single genius of Holberg revolutionized this system. He wrote poems of all kinds in a language hitherto employed only for ballads and hymns; he instituted a theatre, and composed a rich collection of comedies for it; he filled the shelves of the citizens with works in their own tongue on history, law, politics, science, philology and philosophy, all written in a true and manly style, and representing the extreme attainment of European culture at the moment. Perhaps no author who ever lived has had so vast an influence over his countrymen, an influence that is still at work after 200 years.

The editions of Holberg's works are legion. Complete editions of the *Comedies* are too numerous to be quoted; the best is that brought out in 3 vols. by F. L. Lichtenberg, in 1870. Of *Peder Paars* there exist at least twenty-three editions, besides translations in Dutch, German and Swedish. The *Iter subterraneum* has been three several times translated into Danish, ten times into German, thrice into Swedish, thrice into Dutch, thrice into English, twice into French, twice into Russian and once into Hungarian. The life of Holberg was written by Welhaven in 1858 and by Georg Brandes in 1884. Among works on his genius by foreigners may be mentioned an exhaustive study by Robert Prutz (1857), and *Holberg considéré comme imitateur de Molière*, by A. Legrelle (Paris, 1864). (E. G.)

HOLBORN, a central metropolitan borough of London, England, bounded N.W. by St Pancras, N.E. by Finsbury, S.E. by the City of London, S. and W. by the City of Westminster and St Marylebone. Pop. (1901), 59,405. Area 405·1 acres. Its main thoroughfare is that running E. and W. under the names of Holborn Viaduct, High Holborn and New Oxford Street.

The name of Holborn was formerly derived from Old Bourne, a tributary of the Fleet, the valley of which is clearly seen where Holborn Viaduct crosses Farringdon Street. Of the existence of this tributary, however, there is no evidence, and the origin of the name is found in *Hole-bourne*, the stream in the hollow, in allusion to the Fleet itself. The fall and rise of the road across the valley before the construction of the viaduct (1869) was abrupt and inconvenient. In earlier times a bridge here crossed the Fleet, leading from Newgate, while a quarter of a mile west of the viaduct is the site of Holborn Bars, at the entrance to the City, where tolls were levied. The better residential district of Holborn, which extends northward to Euston Road in the borough of St Pancras, is mainly within the parish of St George, Bloomsbury. The name of Bloomsbury is commonly derived from William Blemund, a lord of the manor in the 15th century. A dyke called Blemund's Ditch, of unknown origin, bounded it on the south, where the land was marshy. During the 18th century Bloomsbury was a fashionable and wealthy residential quarter. The reputation of the district immediately to the south, embraced in the parish of St Giles in the Fields, was far different. From the 17th century until modern times this was notorious as a home of crime and poverty. Here occurred some of the earliest cases of the plague which spread over London in 1664–1665. The opening of the thoroughfares of New Oxford Street (1840) and Shaftesbury Avenue (1855) by no means wholly destroyed the character of the district. The circus of Seven Dials, east of Shaftesbury Avenue, affords a typical name in connexion with the lowest aspect of life in London. A similar notoriety attached to Saffron Hill on the eastern confines of the borough. By a singular contrast, the neighbouring thoroughfare of Hatton Garden, leading north from Holborn Circus, is a centre of the diamond trade.

Of the ecclesiastical buildings of Holborn that of first interest is the chapel of St Etheldreda in Ely Place, opening from Holborn Circus. Ely Place takes its name from a palace of the bishops of Ely, who held land here as early as the 13th century. Here died John of Gaunt in 1399. The property was acquired by Sir Christopher Hatton, Lord Chancellor under Queen Elizabeth, after whom Hatton Garden is named; though the bishopric kept some hold upon it until the 18th century. The chapel, the only remnant of the palace, is a beautiful Decorated structure with a vaulted crypt, itself above ground-level. Both are used for worship by Roman Catholics, by whom the chapel was acquired in 1874 and opened five years later after careful restoration. The present parish church of St Giles in the Fields, between Shaftesbury Avenue and New

SpinSmart Software http://www.spinsmart.com

Oxford Street, dates from 1734, but here was situated a leper's hospital founded by Matilda, wife of Henry I., in 1101. Its chapel became the parish church on the suppression of the monasteries. The church of St Andrew, the parish of which extends into the City, stands near Holborn Viaduct. It is by Wren, but there are traces of the previous Gothic edifice in the tower. Sacheverell was among its rectors (1713–1724), and Thomas Chatterton (1770) was interred in the adjacent burial ground, no longer extant, of Shoe Lane Workhouse; the register recording his Christian name as William. Close to this church is the City Temple (Congregational).

Two of the four Inns of Court, Lincoln's Inn and Gray's Inn, lie within the borough. Of the first the Tudor gateway opens upon Chancery Lane. The chapel, hall and residential buildings surrounding the squares within, are picturesque, but of later date. To the west lie the fine square, with public gardens, still called, from its original character, Lincoln's Inn Fields. Gray's Inn, between High Holborn and Theobald's Road, and west of Gray's Inn Road, is of similar arrangement. The fabric of the small chapel is apparently of the 14th century, and may have been attached to the manor house of Portpool, held at that period by the Lords Grey of Wilton. Of the former Inns of Chancery attached to these Inns of Court the most noteworthy buildings remaining are those of Staple Inn, of which the timbered and gabled Elizabethan front upon High Holborn is a unique survival of its character in a London thoroughfare; and of Barnard's Inn, occupied by the Mercer's School. Both these were attached to Gray's Inn. Of Furnival's and Thavies Inns, attached to Lincoln's Inn, only the names remain. The site of the first is covered by the fine red brick buildings of the Prudential Assurance Company, Holborn Viaduct. Among other institutions in Holborn, the British Museum, north of New Oxford Street, is pre-eminent. The varied collections of Sir John Soane, accumulated at his house in Lincoln's Inn Fields, are open to view as the Soane Museum. There may also be mentioned the Royal College of Surgeons, Lincoln's Inn Fields, with museum; the Royal Colleges of Organists, and of Veterinary Surgeons, the College of Preceptors, the Jews' College, and the Metropolitan School of Shorthand. Among hospitals are the Italian, the Homoeopathic, the National for the paralysed and epileptic, the Alexandra for children with hip disease, and the Hospital for sick children. The Foundling Hospital, Guilford Street, was founded by Thomas Coram in 1739.

HOLCROFT, THOMAS (1745–1809), English dramatist and miscellaneous writer, was born on the 10th of December 1745 (old style) in Orange Court, Leicester Fields, London. His father, besides having a shoemaker's shop, kept riding horses for hire; but having fallen into difficulties was reduced ultimately to the necessity of hawking pedlary. The son accompanied his parents in their tramps, and succeeded in procuring the situation of stable boy at Newmarket, where he spent his evenings chiefly in miscellaneous reading and the study of music. Gradually he obtained a knowledge of French, German and Italian. At the end of his term of engagement as stable boy he returned to assist his father, who had again resumed his trade of shoemaker in London; but after marrying in 1765, he became a teacher in a small school in Liverpool. He failed in an attempt to set up a private school, and became prompter in a Dublin theatre. He acted in various strolling companies until 1778, when he produced *The Crisis; or, Love and Famine*, at Drury Lane. *Duplicity* followed in 1781. Two years later he went to Paris as correspondent of the *Morning Herald*. Here he attended the performances of Beaumarchais's *Mariage de Figaro* until he had memorized the whole. The translation of it, with the title *The Follies of the Day*, was produced at Drury Lane in 1784. *The Road to Ruin*, his most successful melodrama, was produced in 1792. A revival in 1873 ran for 118 nights. Holcroft died on the 23rd of March 1809. He was a member of the Society for Constitutional Information, and on that account was, in 1794, indicted of high treason, but was discharged without a trial. Among his novels may be mentioned *Alwyn* (1780), an account, largely autobiographical, of a strolling comedian, and *Hugh Trevor* (1794–1797). He also was the author of *Travels from Hamburg through Westphalia, Holland and the Netherlands to Paris*, of some volumes of verse and of translations from the French and German.

His *Memoirs written by Himself and continued down to the Time of his Death, from his Diary, Notes and other Papers*, by William Hazlitt, appeared in 1816, and was reprinted, in a slightly abridged form, in 1852.

HOLDEN, HUBERT ASHTON (1822–1896), English classical scholar, came of an old Staffordshire family. He was educated at King Edward's school, Birmingham, and Trinity College, Cambridge (senior classic, 1845; fellow, 1847). He was vice-principal of Cheltenham College (1853–1858), and headmaster of Queen Elizabeth's school, Ipswich (1858–1883). He died in London on the 1st of December 1896. In addition to several school editions of portions of Cicero, Thucydides, Xenophon and Plutarch, he published an expurgated text of Aristophanes with a useful onomasticon (re-issued separately, 1902) and larger editions of Cicero's *De officiis* (revised ed., 1898) and of the *Octavius* of Minucius Felix (1853). His chief works, however, were his *Foliorum silvula* (1852), a collection of English extracts for translation into Greek and Latin verse; *Folia silvulae* (translations of the same); and *Foliorum centuriae*, a companion volume of extracts for Latin prose translation. In English schools these books have been widely used for the teaching of Latin and Greek composition.

HOLDEN, SIR ISAAC, BART. (1807–1897), English inventor and manufacturer, was the son of Isaac Holden, a native of Cumberland, and was born at Hurlet, a village between Paisley and Glasgow, on the 7th of May 1807. His early life was passed in very straitened circumstances, but his father spared no pains to give him as much elementary education as possible. At the age of ten he began to work as weaver's draw-boy, and afterwards was employed in a cotton mill. Meanwhile his education was continued at the night schools, and from time to time, as funds allowed, he was taken from work and sent to the grammar-school, to which he at last went regularly for a year or two until he was fifteen, when his father removed to Paisley and apprenticed him to an uncle, a shawl-weaver there. This proving too much for his strength, in 1823 he became assistant teacher in a school at Paisley, and in 1828 he was appointed mathematical teacher in the Queen's Square Academy, Leeds. At the end of six months he was transferred to Lingard's grammar school, near Huddersfield, and shortly afterwards became classical master at Castle Street Academy, Reading. It was here that in 1829 he invented a lucifer match by adopting sulphur as the medium between the explosive material and the wood, but he refused to patent the invention. In 1830 his health again failed, and he returned to Scotland, where a Glasgow friend set up a school for him. After six months, however, he was recommended for the post of bookkeeper to Messrs. Townend Brothers, worsted manufacturers, of Cullingworth, where his interest in machinery soon led to his transfer from the counting-house to the mill. There his experiments led him to the invention of his square motion wool-comber and of a process for making genappe yarns, a patent for which was taken out by him in conjunction with S. C. Lister (Lord Masham) in 1847. The firm of Lister & Holden, which established a factory near Paris in 1848, carried on a successful business, and in 1859, when Lister retired, was succeeded by Isaac Holden and Sons, which became the largest wool-combing business in the world, employing upwards of 4000 workpeople. In 1865 Holden's medical advisers insisted on complete change of occupation, and he entered parliament as Liberal member for Knaresborough. From 1868 to 1882 he was without a seat, but in the latter year he was elected for the northern division of the West Riding, and in 1885 for Keighley. He was created a baronet in 1893, and died suddenly at Oakworth House, near Keighley, on the 13th of August 1897.

His son and heir, Sir Angus Holden, was in 1908 created a peer with the title of Baron Holden of Alston.

HÖLDERLIN, JOHANN CHRISTIAN FRIEDRICH (1770–1843), German poet, was born on the 20th of March 1770, at Lauffen on the Neckar. His mother removing, after a second marriage, to Nürtingen, he began his education at the classical school there. He was destined by his relations for the church, and with this view was later admitted to the seminaries at Denkendorf and Maulbronn. At the age of eighteen he entered as a student of theology the university of Tübingen, where he remained till 1793. He was already the writer of occasional verses, and had begun to sketch his novel *Hyperion*, when he was introduced in this year to Schiller, and obtained through him the post of tutor to the young son of Charlotte von Kalb. A year later he left this situation to attend Fichte's lectures, and to be near Schiller in Jena. The latter recognized in the young poet something of his own genius, and encouraged him by publishing some of his early writings in his periodicals *Die neue Thalia* and *Die Horen*. In 1796 Hölderlin obtained the post of tutor in the family of the banker J. F. Gontard in Frankfort-on-Main. For Gontard's beautiful and gifted wife, Susette, the "Diotima" of his *Hyperion*, he conceived a violent passion; and she became at once his inspiration and his ruin. At the end of two years, during which time the first volume of *Hyperion* was published (1797), a crisis appears to have occurred in their relations, for the young poet suddenly left Frankfort. In spite of ill-health, he now completed *Hyperion*, the second volume of which appeared in 1799, and began a tragedy, *Der Tod des Empedokles*, a fragment of which is published among his works. His friends became alarmed at the alternate depression and nervous irritability from which he suffered, and he was induced to go to Switzerland, as tutor in a family at Hauptwill. There his health improved; and several of his poems, among which are *Der blinde Sänger*, *An die Hoffnung* and *Dichtermut*, were written at this time. In 1801 he returned home to arrange for the publication of a volume of his poems; but, on the failure of this enterprise, he was obliged to accept a tutorship at Bordeaux. "Diotima" died a year later, in June 1802, and the news is supposed to have reached Hölderlin shortly afterwards, for in the following month he suddenly left Bordeaux, and travelled homewards on foot through France, arriving at Nürtingen destitute and insane. Kind treatment gradually alleviated his condition, and in lucid intervals he occupied himself by writing verses and translating Greek plays. Two of these translations—the *Antigone* and *Oedipus rex* of Sophocles—appeared in 1804, and several of his short poems were published by Franz K. L. von Seckendorff in his *Musenalmanach*, 1807 and 1808. In 1804 Hölderlin obtained the sinecure post of librarian to the landgrave Frederick V. of Hesse-Homburg, and went to live in Homburg under the supervision of friends; but two years later becoming irremediably but harmlessly insane, he was taken in the summer of 1807 to Tübingen, where he remained till his death on the 7th of June 1843.

Hölderlin's writings are the production of a beautiful and sensitive mind; but they are intensely, almost morbidly, subjective, and they lack real human strength. Perhaps his strongest characteristic was his passion for Greece, the result of which was that he almost entirely discarded rhyme in favour of the ancient verse measures. His poems are all short pieces; of his tragedy only a fragment was written. *Hyperion, oder der Eremit in Griechenland* (1797–1799), is a romance in letters, in which the stormy fervour of the "Sturm und Drang" is combined with a romantic enthusiasm for Greek antiquity. The interest centres not in the story, for the novel has little or none—Hyperion is a young Greek who takes part in the rising of his people against the Turks in 1770—but in its lyric subjectivity and the dithyrambic beauty of its language.

Hölderlin's lyrics, *Lyrische Gedichte*, were edited by L. Uhland and G. Schwab in 1826. A complete edition of his works, *Sämtliche Werke*, with a biography by C. T. Schwab, appeared in 1846; also *Dichtungen* by K. Köstlin (Tübingen, 1884), and (the best edition) *Gesammelte Dichtungen* by B. Litzmann (2 vols., Stuttgart, 1897). For biography and criticism, see C. C. T. Litzmann, *F. Hölderlins Leben* (Berlin, 1890), A. Wilbrandt, *Hölderlin* (2nd ed., Berlin, 1891), and C. Müller, *Friedrich Hölderlin, sein Leben und sein Dichten* (Bremen, 1894).

HOLDERNESSE, EARL OF, an English title borne by Sir John Ramsay and later by the family of Darcy. John Ramsay (*c.* 1580–1626), a member of the Scottish family of Ramsay of Dalhousie, was knighted for his share in rescuing James VI. from the hands of John Ruthven, earl of Gowrie, in August 1600. In 1606 the king created him Viscount Haddington and Lord Ramsay of Barns, and in 1621 made him an English peer as earl of Holdernesse. Ramsay died without surviving issue in February 1626, when his titles became extinct. In 1644 Charles I. created his nephew, Prince Rupert, earl of Holdernesse, but when the prince died unmarried in November 1682 the earldom again became extinct. Conyers Darcy (1599–1689), who was made earl of Holdernesse in 1682 only a few days after the death of Rupert, was the son and heir of Conyers Darcy, Lord Darcy and Conyers (*c.* 1571–1654), and succeeded his father in these baronies in March 1654. He was succeeded as 2nd earl by his only son Conyers (*c.* 1620–1692), who was member of parliament for Yorkshire during the reign of Charles II. In his turn he was succeeded by his grandson Robert (1681–1722). Robert's only son, Robert Darcy, 4th earl of Holdernesse (1718–1778), was a diplomatist and a politician. From 1744 to 1746 he was ambassador at Venice and from 1749 to 1751 he represented his country at the Hague. In 1751 he became one of the secretaries of state, and he remained in office until March 1761, when he was dismissed by George III. From 1771 to 1776 he acted as governor to two of the king's sons, a "solemn phantom" as Horace Walpole calls him. He left no sons, and all his titles became extinct except the barony of Conyers, which had been created by writ in 1509 in favour of his ancestor Sir William Conyers (d. 1525). This descended to his only daughter Amelia (1754–1784), the wife of Francis Osborne, afterwards 5th duke of Leeds, and when the 7th duke of Leeds died in 1859 it passed to his nephew, Sackville George Lane-Fox (1827–1888), falling into abeyance on his death. Hornby castle in Yorkshire, now the principal seat of the dukes of Leeds, came to them through marriage of the 5th duke with the heiress of the families of Conyers and of Darcy.

HOLDHEIM, SAMUEL (1806–1860), Jewish rabbi, a leader of reform in the German Synagogue, was born in Posen in 1806 and died in Berlin in 1860. In 1836 he was appointed rabbi at Frankfort-on-the-Oder, in 1840 he was transferred to the rabbinate of Mecklenburg-Schwerin. He then became prominent as an advocate on the one hand of religious freedom (much trammelled at the time by Prussian state laws) and on the other of reform within the Jewish community. Various rabbinical conferences were held, at Brunswick (1844), Frankfort-on-the-Main (1845) and Breslau (1846). At all of these Holdheim was a strong supporter of the policy of modifying ritual (especially with regard to Sabbath observance, marriage laws and liturgical customs). In 1846 he was chosen Rabbi of the new Berlin congregation and there exercised considerable influence on the course of Jewish reform.

See I. H. Ritter in the *Jewish Quarterly Review*, i. 202. The same authority has written the life of Holdheim in vol. iii. of his *Geschichte der jüdischen Reformation* (Berlin, 1865). Graetz in his *History* passes an unfavourable judgment on Holdheim, and there were admittedly grounds for opposition to Holdheim's attitude. A moderate criticism is contained in Dr D. Philipson's *History of the Reform Movement in Judaism* (London, 1906).

HOLGUÍN, a town of the high plateau country in the interior of Oriente province, Cuba, about 65 m. N.W. of Santiago de Cuba. Pop. (1907) 7592. The town is near the Marañon and Jigüé rivers, on a plain from which hills rise on all sides except the E., on which side it is open to the winds of the plateau. Holguín was long the principal acclimatization station for Spanish troops. The oldest public buildings are two churches built in 1800 and 1809 respectively. Holguín has trade in cabinet woods, tobacco, Indian corn and cattle products, which it exports through its port Gibara, about 25 m. N.N.E., with which it is connected by railway. Holguín was settled about 1720 and became a *ciudad* (city) in 1751. In the Ten Years' War of 1868–78 and in the revolution of 1895–98 Holguín was an insurgent centre.

SpinSmart Software http://www.spinsmart.com

HOLIDAY, originally the "holy day," a festival set apart for religious observances as a memorial of some sacred event or sacred person; hence a day on which the ordinary work or business ceases. For the religious sense see FEASTS AND FESTIVALS, and SUNDAY. Apart from the use of the term for a single day of rest or enjoyment, it is commonly used in the plural for a recognized and regular period (as at schools, &c.) of absence from work. It is unnecessary here to deal with what may be regarded as private holidays, which are matters of agreement between employer and employed or between the authorities of this or that institution and those who attend it. In recent years there has been a notable tendency in most occupations to shorten the hours of labour, and make holidays more regular. It will suffice to deal here with public holidays, the observance of which is prescribed by the state. In one respect these have been diminished, in so far as saints' days are no longer regarded as entailing non-attendance at the government offices in England, as was the case at the beginning of the 19th century. But while the influence of religion in determining such holidays has waned, the importance of making some compulsory provision for social recreation has made itself felt. In England four days, known as Bank Holidays (*q.v.*), are set apart by statute to be observed as general holidays, while the sovereign may by proclamation appoint any day to be similarly observed. Endeavours have been made from time to time to get additional days recognized as general holidays, such as Empire Day (May 24th), Arbor Day, &c. In the British colonies there is no uniform practice. In Canada eight days are generally observed as public holidays: New Year's Day, Good Friday, Easter Monday, Christmas Day, the birthday of the sovereign, Victoria Day, Dominion Day and Labour Day. Some of the provinces have followed the American example by adding an Arbor Day. Alberta and Saskatchewan observe Ash Wednesday. In Quebec, where the majority of the population is Roman Catholic, the holy days are also holidays, namely, the Festival of the Epiphany, Ash Wednesday, Good Friday, Easter Monday, the Ascension, All Saint's Day, Conception Day, Christmas Day. In 1897 Labour Day was added. In New South Wales, the 1st of January, Good Friday, Easter Eve, Easter Monday, the birthday of the sovereign, the 1st of August, the birthday of the prince of Wales, Christmas Day and the 26th of December, are observed as holidays. In Victoria there are thirteen public holidays during the year, and in Queensland fourteen. In New Zealand the public holidays are confined to four, Christmas Day, New Year's Day, Good Friday and Labour Day. In most of the other British colonies the usual number of public holidays is from six to eight.

In the United States there is no legal holiday in the sense of the English bank holidays. A legal holiday is dependent upon state and territorial legislation. It is usual for the president to proclaim the last Thursday in November as a day of thanksgiving; this makes it only a legal holiday in the District of Columbia, and in the territories, but most states make it a general holiday. Independence Day (July 4th) and Labour Day (first Monday in September) are legal holidays in most states. There are other days which, in connexion with particular events or in remembrance of particular persons, have been made legal holidays by particular states. For example, Lincoln's birthday, Washington's birthday, Memorial Day (May 30th), Patriots' Day (April 19th, Maine and Mass.), R. E. Lee's birthday (Jan. 19th, Ala., Fla., Ga., Va.), Pioneers' Day (July 24th, Utah), Colorado Day (Aug. 1st), Battle of New Orleans (Jan. 8th, La.), Bennington Battle Day (Aug. 16th, Vt.), Defenders's Day (Sept. 12th, Md.), Arbor Day (April 22nd, Nebraska; second Friday in May R.I., &c.), Admission Day (September 9th, Cal.; Oct. 31st, Nev.), Confederate Memorial Day (April 26th, Ala., Fla., Ga., Miss., May 10th, N. & S. Car., June 3rd, La., Miss., Texas), &c.

See M'Curdy, *Bibliography of Articles relating to Holidays* (Boston, 1905). (T. A. I.)

HOLINSHED (or HOLLINGSHEAD), **RAPHAEL** (d. *c.* 1580), English chronicler, belonged probably to a Cheshire family, and according to Anthony Wood was educated at one of the English universities, afterwards becoming a "minister of God's Word." The authenticity of these facts is doubtful, although it is possible that Raphael was the Holinshed who matriculated from Christ's College, Cambridge, in 1544. About 1560 he came to London and was employed as a translator by Reginald or Reyner Wolfe, to whom he says he was "singularly beholden." Wolfe was already engaged in the preparation of a universal history, and Holinshed worked for some years on this undertaking; but after Wolfe's death in 1573 the scope of the work was abridged, and it appeared in 1578 as the *Chronicles of England, Scotland, and Ireland.* The work was in two volumes, which were illustrated, and although Holinshed did a great deal of the work he received valuable assistance from William Harrison (1534–1593) and others, while the part dealing with the history of Scotland is mainly a translation of Hector Boece's *Scotorum historiae.* Afterwards, as is shown by his will, Holinshed served as steward to Thomas Burdet of Bramcott, Warwickshire, and died about 1580.

A second edition of the *Chronicles*, enlarged and improved but without illustrations, which appeared in 1587, contained statements which were offensive to Queen Elizabeth and her advisers, and immediately after publication some of the pages were excised by order of the privy council. These excisions were published separately in 1723. An edition of the *Chronicles*, in accordance with the original text, was published in six volumes in 1808. The work contains a large amount of information, and shows that its compilers were men of great industry; but its chief interest lies in the fact that it was largely used by Shakespeare and other Elizabethan dramatists; Shakespeare, who probably used the edition of 1587, obtaining from the *Chronicles* material for most of his historical plays, and also for *Macbeth, King Lear* and part of *Cymbeline.* A single manuscript by Holinshed is known to be extant. This is a translation of Florence of Worcester, and is in the British Museum. See W. G. Boswell-Stone, *Shakspere's Holinshed. The Chronicle and the historical plays compared* (London, 1896).

HOLKAR, the family name of the Mahratta ruler of Indore (*q.v.*), which has been adopted as a dynastic title. The termination *-kar* implies that the founder of the family came from the village of Hol near Poona.

HOLL, FRANK (1845–1888), English painter, was born in London on the 4th of July 1845, and was educated chiefly at University College School. He was a grandson of William Holl, an engraver of note, and the son of Francis Holl, A.R.A., another engraver, whose profession he originally intended to follow. Entering the Royal Academy schools as a probationer in painting in 1860, he rapidly progressed, winning silver and gold medals, and making his début as an exhibitor in 1864 with "A Portrait," and "Turned out of Church," a subject picture. "A Fern Gatherer" (1865); "The Ordeal" (1866); "Convalescent" (the somewhat grim pathos of which attracted much attention), and "Faces in the Fire" (1867), succeeded. Holl gained the travelling studentship in 1868; the successful work was characteristic of the young painter's mood, being "The Lord gave, and the Lord hath taken away." His insatiable zeal for work of all kinds began early to undermine the artist's health, but his position was assured by the studentship picture, which created a sort of *furore*, although, as with most of his works, the blackness of its coloration, probably due to his training as an engraver, was even more decidedly against it than the sadness of its theme. Otherwise, this painting exhibited nearly all the best technical qualities to which he ever attained, except high finish and clearness, and a very sincere vein of pathos. Holl was much below Millais in portraiture, and far inferior in all the higher ways of design; in technical resources, relatively speaking, he was but scantily provided. The range of his studies and the manner of his painting were narrower than those of Josef Israels, with whom, except as a portrait-painter, he may better be compared than with Millais. In 1870 he painted "Better is a Dinner of Herbs where Love is, than a Stalled Ox and Hatred therewith"; "No Tidings from the Sea," a scene in a fisherman's cottage, in 1871—a story told with breath-catching pathos and power; "I am the Resurrection and the Life" (1872); "Leaving Home" (1873), "Deserted" (1874), both of which had great success; "Her First-born," girls carrying a baby to the grave (1876); and "Going Home" (1877). In 1877 he painted the two pictures "Hush" and

SpinSmart Software http://www.spinsmart.com

"Hushed." "Newgate, Committed for Trial," a very sad and telling piece, first attested the breaking down of the painter's health in 1878. In this year he was elected A.R.A., and exhibited "The Gifts of the Fairies," "The Daughter of the House," "Absconded," and a very fine portrait of Samuel Cousins, the mezzotint engraver. This last canvas is a masterpiece, and deserved the success which attended the print engraved from it. Holl was overwhelmed with commissions, which he would not decline. The consequences of this strain upon a constitution which was never strong were more or less, though unequally, manifest in "Ordered to the Front," a soldier's departure (1880); "Home Again," its sequel, in 1883 (after which he was made R.A.). In 1886 he produced a portrait of Millais as his diploma work, but his health rapidly declined and he died at Hampstead, on the 31st of July 1888. Holl's better portraits, being of men of rare importance, attest the commanding position he occupied in the branch of art he so unflinchingly followed. They include likenesses of Lord Roberts, painted for queen Victoria (1882); the prince of Wales, Lord Dufferin, the duke of Cleveland (1885); Lord Overstone, Mr Bright, Mr Gladstone, Mr Chamberlain, Sir J. Tenniel, Earl Spencer, Viscount Cranbrook, and a score of other important subjects. (F. G. S.)

HOLLAND, CHARLES (1733–1769), English actor, was born in Chiswick, the son of a baker. He made his first appearance on the stage in the title rôle of *Oroonoko* at Drury Lane in 1755, John Palmer, Richard Yates and Mrs Cibber being in the cast. He played under Garrick, and was the original Florizel in the latter's adaptation of Shakespeare's *Winter's Tale*. Garrick thought highly of him, and wrote a eulogistic epitaph for his monument in Chiswick church.

His nephew, Charles Holland (1768–1849) was also an actor, who played with Mrs Siddons and Kean.

HOLLAND, SIR HENRY, BART. (1788–1873), English physician and author, was born at Knutsford, Cheshire, on the 27th of October 1788. His maternal grandmother was the sister of Josiah Wedgwood, whose grandson was Charles Darwin; and his paternal aunt was the mother of Mrs Gaskell. After spending some years at a private school at Knutsford, he was sent to a school at Newcastle-on-Tyne, whence after four years he was transferred to Dr J. P. Estlin's school near Bristol. There he at once took the position of head boy, in succession to John Cam Hobhouse, afterwards Lord Broughton, an honour which required to be maintained by physical prowess. On leaving school he became articled clerk to a mercantile firm in Liverpool, but, as the privilege was reserved to him of passing two sessions at Glasgow university, he at the close of his second session sought relief from his articles, and in 1806 began the study of medicine in the university of Edinburgh, where he graduated in 1811. After several years spent in foreign travel, he began practice in 1816 as a physician in London—according to his own statement, "with a fair augury of success speedily and completely fulfilled." This "success," he adds, "was materially aided by visits for four successive years to Spa, at the close of that which is called the London season." It must also, however, be in a great degree attributed to his happy temperament and his gifts as a conversationalist—qualities the influence of which, in the majority of cases belonging to his class of practice, is often of more importance than direct medical treatment. In 1816 he was elected F.R.S., and in 1828 F.R.C.S. He became physician in ordinary to Prince Albert in 1840, and was appointed in 1852 physician in ordinary to the queen. In April 1853 he was created a baronet. He was also a D.C.L. of Oxford and a member of the principal learned societies of Europe. He was twice married, his second wife being a daughter of Sydney Smith, a lady of considerable literary talent, who published a biography of her father. Sir Henry Holland at an early period of his practice resolved to devote to his professional duties no more of his time than was necessary to secure an income of £5000 a year, and also to spend two months of every year solely in foreign travel. By the former resolution he secured leisure for a wide acquaintance with general literature, and for a more than superficial cultivation of several branches of science; and the latter enabled him, besides visiting, "and most of them repeatedly, every country of Europe," to make extensive tours in the other three continents, journeying often to places little frequented by European travellers. As, moreover, he procured an introduction to nearly all the eminent personages in his line of travel, and knew many of them in his capacity of physician, his acquaintance with "men and cities" was of a species without a parallel. The *London Medical Record*, in noticing his death, which took place on his eighty-fifth birthday, October 27, 1873, remarked that it "had occurred under circumstances highly characteristic of his remarkable career." On his return from a journey in Russia he was present, on Friday, October 24th, at the trial of Marshal Bazaine in Paris, dining with some of the judges in the evening. He reached London on the Saturday, took ill the following day, and died quietly on the Monday afternoon.

Sir Henry Holland was the author of *General View of the Agriculture of Cheshire* (1807); *Travels in the Ionian Isles, Albania, Thessaly and Greece* (1812–1813, 2nd ed., 1819); *Medical Notes and Reflections* (1839); *Chapters on Mental Physiology* (1852); *Essays on Scientific and other Subjects contributed to the Edinburgh and Quarterly Reviews* (1862); and *Recollections of Past Life* (1872).

HOLLAND, HENRY FOX, 1ST BARON (1705–1774), English statesman, second son of Sir Stephen Fox, was born on the 28th of September 1705. Inheriting a large share of the riches which his father had accumulated, he squandered it soon after attaining his majority, and went to the Continent to escape from his creditors. There he made the acquaintance of a countrywoman of fortune, who became his patroness and was so lavish with her purse that, after several years' absence, he was in a position to return home and, in 1735, to enter parliament as member for Hindon in Wiltshire. He became the favourite pupil and devoted supporter of Sir Robert Walpole, achieving unequalled and unenviable proficiency in the worst political arts of his master and model. As a speaker he was fluent and self-possessed, imperturbable under attack, audacious in exposition or retort, and able to hold his own against Pitt himself. Thus he made himself a power in the House of Commons and an indispensable member of several administrations. He was surveyor-general of works from 1737 to 1742, was member for Windsor from 1741 to 1761; lord of the treasury in 1743, secretary at war and member of the privy council in 1746, and in 1755 became leader of the House of Commons, secretary of state and a member of the cabinet under the duke of Newcastle. In 1757, in the rearrangements of the government, Fox was ultimately excluded from the cabinet, and given the post of paymaster of the forces. During the war, which Pitt conducted with extraordinary vigour, and in which the nation was intoxicated with glory, Fox devoted himself mainly to accumulating a vast fortune. In 1762 he again accepted the leadership of the House, with a seat in the cabinet, under the earl of Bute, and exercised his skill in cajolery and corruption to induce the House of Commons to approve of the treaty of Paris of 1763; as a recompense, he was raised to the House of Lords with the title of Baron Holland of Foxley, Wiltshire, on the 16th of April 1763. In 1765 he was forced to resign the paymaster generalship, and four years later a petition of the livery of the city of London against the ministers referred to him as "the public defaulter of unaccounted millions." The proceedings brought against him in the court of exchequer were stayed by a royal warrant; and in a statement published by him he proved that in the delays in making up the accounts of his office he had transgressed neither the law nor the custom of the time. From the interest on the outstanding balances he had, none the less, amassed a princely fortune. He strove, but in vain, to obtain promotion to the dignity of an earl, a dignity upon which he had set his heart, and he died at Holland House, Kensington, on the 1st of July 1774, a sorely disappointed man, with a reputation for cunning and unscrupulousness which cannot easily be matched, and with an unpopularity which justifies the conclusion that he was the most thoroughly hated statesman of his day. Lord Holland married in 1744

SpinSmart Software http://www.spinsmart.com

Lady Georgina Caroline Lennox, daughter of the duke of Richmond, who was created Baroness Holland, of Holland, Lincolnshire, in 1762. There were four sons of the marriage: Stephen, 2nd Lord Holland (d. 1774); Henry (d. an infant); Charles James (the celebrated statesman); and Henry Edward (1755–1811), soldier and diplomatist.

See Walpole's and other memoirs of the time, also the article Fox, CHARLES JAMES.

HOLLAND, HENRY RICH, 1ST EARL OF (1590–1649), 2nd son of Robert, 1st earl of Warwick, and of Penelope, Sir Philip Sidney's "Stella," daughter of Walter Devereux, 1st earl of Essex, was baptized on the 19th of August 1590, educated at Emmanuel College, Cambridge, knighted on the 3rd of June 1610, and returned to parliament for Leicester in 1610 and 1614. In 1610 he was present at the siege of Juliers. Favours were showered upon him by James I. He was made gentleman of the bedchamber to Charles, prince of Wales, and captain of the yeomen of the guard; and on the 8th of March 1623 he was raised to the peerage as Baron Kensington. In 1624 he was sent to Paris to negotiate the marriage treaty between Charles and Henrietta Maria. On the 15th of September he was created earl of Holland, and in 1625 was sent on two further missions, first to Paris to arrange a treaty between Louis XIII. and the Huguenots, and later to the Netherlands in company with Buckingham. In October 1627 he was given command of the troops sent to reinforce Buckingham at Rhé, but through delay in starting only met the defeated troops on their return. He succeeded Buckingham as chancellor of Cambridge University; was master of the horse in 1628, and was appointed constable of Windsor and high steward to the queen in 1629. He interested himself, like his elder brother, Lord Warwick, in the plantations; and was the first governor of the Providence company in 1630, and one of the proprietors of Newfoundland in 1637. In 1631 he was made chief-justice-in-eyre south of the Trent, and in this capacity was responsible for the unpopular revival of the obsolete forest laws. He intrigued at court against Portland and against Strafford, who expressed for him the greatest contempt. In 1636 he was disappointed at not obtaining the great office of lord high admiral, but was made instead groom of the stole. In 1639 he was appointed general of the horse, and drew ridicule upon himself by the fiasco at Kelso. In the second war against the Scots he was superseded in favour of Conway. He opposed the dissolution of the Short Parliament, joined the peers who supported the parliamentary cause, and gave evidence against Strafford. He was, however, won back to the king's side by the queen, and on the 16th of April 1641 made captain general north of the Trent. Dissatisfied, however, with Charles's refusal to grant him the nomination of a new baron, he again abandoned him, refused the summons to York, and was deprived of his office as groom of the stole at the instance of the queen, who greatly resented his ingratitude. He was chosen by the parliament in March and July 1642 to communicate its votes to Charles, who received him, much to his indignation, with studied coldness. He was appointed one of the committee of safety in July; made zealous speeches on behalf of the parliamentary cause to the London citizens; and joined Essex's army at Twickenham, where, it is said, he persuaded him to avoid a battle. In 1643 he appeared as a peacemaker, and after failing to bring over Essex, he returned to the king. His reception, however, was not a cordial one, and he was not reinstated in his office of groom of the stole. After, therefore, accompanying the king to Gloucester and taking part in the first battle of Newbury, he once more returned to the parliament, declaring that the court was too much bent on continuing hostilities, and the influence of the "papists" too strong for his patriotism. He was restored to his estates, but the Commons obliged the Lords to exclude him from the upper house, and his petition in 1645 for compensation for his losses and for a pension was refused. His hopes being in this quarter also disappointed, he once again renewed his allegiance to the king's cause; and after endeavouring to promote the negotiations for peace in 1645 and 1647 he took up arms in the second Civil War, received a commission as general, and put himself at the head of 600 men at Kingston. He was defeated on the 7th of July 1647, captured at St Neots shortly afterwards, and imprisoned at Warwick Castle. He was tried before a "high court of justice" on the 3rd of February 1649, and in spite of his plea that he had received quarter was sentenced to death. He was executed together with Hamilton and Capel on the 9th of March. Clarendon styles him "a very well-bred man and a fine gentleman in good times."[1] He was evidently a man of shallow character, devoid of ability, raised far above his merits and hopelessly unfit for the great times in which he lived. Lord Holland married Elizabeth, daughter and heiress of Sir Walter Cope of Kensington, and, besides several daughters, had four sons, of whom the eldest, Robert, succeeded him as 2nd earl of Holland, and inherited the earldom of Warwick in 1673.

HOLLAND, HENRY RICHARD VASSALL FOX, 3RD BARON (1773–1840), was the son of Stephen Fox, 2nd Baron Holland, his mother, Lady Mary Fitzpatrick, being the daughter of the earl of Upper Ossory. He was born at Winterslow House in Wiltshire, on the 21st of November 1773, and his father died in the following year. He was educated at Eton and at Christ Church, Oxford, where he became the friend of Canning, of Hookham Frere, and of other wits of the time. Lord Holland did not take the same political side as his friends in the conflicts of the revolutionary epoch. He was from his boyhood deeply attached to his uncle, C. J. Fox, and remained steadily loyal to the Whig party. In 1791 he visited Paris and became acquainted with Lafayette and Talleyrand, and in 1793 he again went abroad to travel in France and Italy. At Florence he met with Lady Webster, wife of Sir Godfrey Webster, Bart., who left her husband for him. She was by birth Elizabeth Vassall (1770–1845), daughter of Richard Vassall, a planter in Jamaica. A son was born of their irregular union, a Charles Richard Fox (1796–1873), who after some service in the navy entered the Grenadiers, and was known in later life as a collector of Greek coins. His collection was bought for the royal museum of Berlin when he died in 1873. He married Lady Mary Fitzclarence, a daughter of William IV. by Mrs Jordan. Sir Godfrey Webster having obtained a divorce, Lord Holland was enabled to marry on the 6th of July 1797. He had taken his seat in the House of Lords on the 5th of October 1796. During several years he may be said almost to have constituted the Whig party in the Upper House. His protests against the measures of the Tory ministers were collected and published, as the *Opinions of Lord Holland* (1841), by Dr Moylan of Lincoln's Inn. In 1800 he was authorized to take the name of Vassall, and after 1807 he signed himself Vassall Holland, though the name was no part of his title. In 1800 Lord and Lady Holland went abroad and remained in France and Spain till 1805, visiting Paris during the Peace of Amiens, and being well received by Napoleon. Lady Holland always professed a profound admiration of Napoleon, of which she made a theatrical display after his fall, and he left her a gold snuff-box by his will. In public life Lord Holland took a share proportionate to his birth and opportunities. He was appointed to negotiate with the American envoys, Monroe and W. Pinkney, was admitted to the privy council on the 27th of August 1806, and on the 15th of October entered the cabinet "of all the talents" as lord privy seal, retiring with the rest of his colleagues in March 1807. He led the opposition to the Regency bill in 1811, and he attacked the "orders in council" and other strong measures of the government taken to counteract Napoleon's Berlin decrees. He was in fact in politics a consistent Whig, and in that character he denounced the treaty of 1813 with Sweden which bound England to consent to the forcible union of Norway, and he resisted the bill of 1816 for confining Napoleon in St Helena. His loyalty as a Whig secured recognition when his party triumphed in the struggle for parliamentary reform, by his appointment as chancellor of the duchy of Lancaster in the cabinet of Lord Grey and Lord Melbourne, and he was still in office when he died on the 22nd of October 1840. Lord Holland is notable, not for his somewhat

[1] *Hist. of the Rebellion*, xi. 263.

SpinSmart Software http://www.spinsmart.com

insignificant political career, but as a patron of literature, as a writer on his own account, and because his house was the centre and the headquarters of the Whig political and literary world of the time; and Lady Holland (who died on the 16th of November 1845) succeeded in taking the sort of place in London which had been filled in Paris during the 18th century by the society ladies who kept "salons." Lord Holland's *Foreign Reminiscences* (1850) contain much amusing gossip from the Revolutionary and Napoleonic era. His *Memoirs of the Whig Party* (1852) is an important contemporary authority. His small work on *Lope de Vega* (1806) is still of some value. Holland had two legitimate sons, Stephen, who died in 1800, and Henry Edward, who became 4th Lord Holland. When this peer died in December 1859 the title became extinct.

See *The Journal of Elizabeth, Lady Holland*, edited by the earl of Ilchester (1908); and Lloyd Sanders, *The Holland House Circle* (1908).

HOLLAND, JOSIAH GILBERT (1819–1881), American author and editor, was born in Belchertown, Massachusetts, on the 24th of July 1819. He graduated in 1843 at the Berkshire Medical College (no longer in existence) at Pittsfield, Mass., and after practising medicine in 1844–1847, and making an unsuccessful attempt, with Charles Robinson (1818–1894), later first governor of the state of Kansas, to establish a hospital for women, he taught for a brief period in Richmond, Virginia, and in 1848 was superintendent of schools in Vicksburg, Mississippi. In 1849 he became assistant editor under Samuel Bowles, and three years later one of the owners, of the Springfield (Massachusetts) *Republican*, with which he retained his connexion until 1867. He then travelled for some time in Europe, and in 1870 removed to New York, where he helped to establish and became editor and one-third owner of *Scribner's Monthly* (the title of which was changed in 1881 to *The Century*), which absorbed the periodicals *Hours at Home*, *Putnam's Magazine* and the *Riverside Magazine*. He remained editor of this magazine until his death. Dr Holland's books long enjoyed a wide popularity. The earlier ones were published over the pseudonym "Timothy Titcomb." His writings fall into four classes: history and biography, represented by a *History of Western Massachusetts* (1855), and a *Life of Abraham Lincoln* (1865); fiction, of which *Miss Gilbert's Career* (1860) and *The Story of Sevenoaks* (1875) remain faithful pictures of village life in eastern United States; poetry, of which *Bitter-Sweet* (1858) and *Kathrina, Her Life and Mine* (1867) were widely read; and a series of homely essays on the art of living, of which the most characteristic were *Letters to Young People, Single and Married* (1858), *Gold Foil, hammered from Popular Proverbs* (1859), *Letters to the Jonses* (1863), and *Every-Day Topics* (2 series, 1876 and 1882). While a resident of New York, where he died on the 12th of October 1881, he identified himself with measures for good government and school reform, and in 1872 became a member and for a short time in 1873 was president of the Board of Education.

See Mrs H. M. Plunkett's *Josiah Gilbert Holland* (New York, 1894).

HOLLAND, PHILEMON (1552–1637), English scholar, "the translator-general in his age," was born at Chelmsford in Essex. He was the son of a clergyman, John Holland, who had been obliged to take refuge in Germany and Denmark with Miles Coverdale during the Marian persecution. Having become a fellow of Trinity College, Cambridge, and taken the degree of M.A., he was incorporated at Oxford (July 11th, 1585). Having subsequently studied medicine, about 1595 he settled as a doctor in Coventry, but chiefly occupied himself with translations. In 1628 he was appointed headmaster of the free school, but, owing probably to advancing age, he held office for only eleven months. His latter days were oppressed by poverty, partly relieved by the generosity of the common council of Coventry, which in 1632 assigned him £3, 6s. 8d. for three years, "if he should live so long." He died on the 9th of February, 1636–1637. His fame is due solely to his translations, which included Livy, Pliny's *Natural History*, Plutarch's *Morals*, Suetonius, Ammianus Marcellinus and Xenophon's *Cyropaedia*. He published also an English version, with additions, of Camden's *Britannia*. His Latin translation of Brice Bauderon's *Pharmacopaea* and his *Regimen sanitatis Salerni* were published after his death by his son, HENRY HOLLAND (1583–?1650), who became a London bookseller, and is known to bibliographers for his *Baziliwlogia; a Booke of Kings, beeing the true and liuely Effigies of all our English Kings from the Conquest* (1618), and his *Herwologia Anglica* (1620).

HOLLAND, RICHARD, or RICHARD DE HOLANDE (fl. 1450), Scottish writer, author of the *Buke of the Howlat*, was secretary or chaplain to the earl of Moray (1450) and rector of Halkirk, near Thurso. He was afterwards rector of Abbreochy, Loch Ness, and later held a chantry in the cathedral of Norway. He was an ardent partisan of the Douglases, and on their overthrow retired to Orkney and later to Shetland. He was employed by Edward IV. in his attempt to rouse the Western Isles through Douglas agency, and in 1482 was excluded from the general pardon granted by James III. to those who would renounce their fealty to the Douglases.

The poem, entitled the *Buke of the Howlat*, written about 1450, shows his devotion to the house of Douglas:—

> "On ilk beugh till embrace
> Writtin in a bill was
> O Dowglass, O Dowglass
> Tender and trewe!"
>
> (ii. 400-403).

and is dedicated to the wife of a Douglas—

> "Thus for ane Dow of Dunbar drew I this Dyte,
> Dowit with ane Dowglass, and boith war thei dowis."

but all theories of its being a political allegory in favour of that house may be discarded. Sir Walter Scott's judgment that the *Buke* is "a poetical apologue . . . without any view whatever to local or natural politics" is certainly the most reasonable. The poem, which extends to 1001 lines written in the irregular alliterative rhymed stanza, is a bird-allegory, of the type familiar in the *Parlement of Foules*. It has the incidental interest of showing (especially in stanzas 62 and 63) the antipathy of the "Inglis-speaking Scot" to the "Scots-speaking Gael" of the west, as is also shown in Dunbar's *Flyting with Kennedy*.

The text of the poem is preserved in the Asloan and Bannatyne MSS. Fragments of an early 16th century black-letter edition, discovered by D. Laing, are reproduced in the *Adversaria* of the Bannatyne Club. The poem has been frequently reprinted, by Pinkerton, in his *Scottish Poems* (1792); by D. Laing (Bannatyne Club 1823; reprinted in "New Club" series, Paisley, 1882); by the Hunterian Club in their edition of the Bannatyne MS., and by A. Diebler (Chemnitz, 1893). The latest edition is that by F. J. Amours in *Scottish Alliterative Poems* (Scottish Text Society, 1897), pp. 47-81. (See also Introduction pp. xx.-xxxiv.)

HOLLAND, officially the kingdom of the Netherlands (*Koningrijk der Nederlanden*), a maritime country in the north-west of Europe. The name Holland is that of the former countship, which forms part of the political, as well as the geographical centre of the kingdom (see the next article).

Topography.—Holland is bounded on the E. by Germany, on the S. by Belgium, on the W. and N. by the North Sea, and at the N.E. corner by the Dollart. From Stevensweert southward to the extreme corner of Limburg the boundary line is formed by the river Maas or Meuse.[1] On the east a natural geographical boundary was formed by the long line of marshy fens extending along the borders of Overysel, Drente and Groningen. The kingdom extends from 53° 32′ 21″ (Groningen Cape on Rottum Island) to 50° 45′ 49″ N. (Mesch in the province of Limburg), and from 3° 23′ 27″ (Sluis in the province of Zeeland) to 7° 12′ 20″ E. (Langakkerschans in the province of Groningen). The greatest length from north to south, viz. that from Rottum Island to Eisden near Maastricht is 164 m., and the greatest breadth from south-west to north-east, or from Zwin near Sluis to Losser in Overysel, 144 m. The area is subject

[1] At Maastricht, however, a portion lies on the left bank of the river, measured, according to the treaty with Belgium, 19th of April 1839, art. 4, by an average radius of 1200 Dutch fathoms (7874 ft.) from the outer glacis of the fortress.

SpinSmart Software http://www.spinsmart.com

to perpetual variation owing, on the one hand, to the erosion of the coasts, and, on the other, to reclamation of land by means of endiking and drainage operations. In 1889 the total area was calculated at 12,558 sq. m., and, including the Zuider Zee and the Wadden (2050 sq. m.) and the Dutch portion of the Dollart (23 sq. m.), 14, 613 sq. m. In no country in Europe has the character of the territory exercised so great an influence on the inhabitants as in the Netherlands; and, on the other hand, no people has so extensively modified the condition of its territory as the Dutch. The greatest importance attaches therefore to the physical conformation of the country.

Coast.

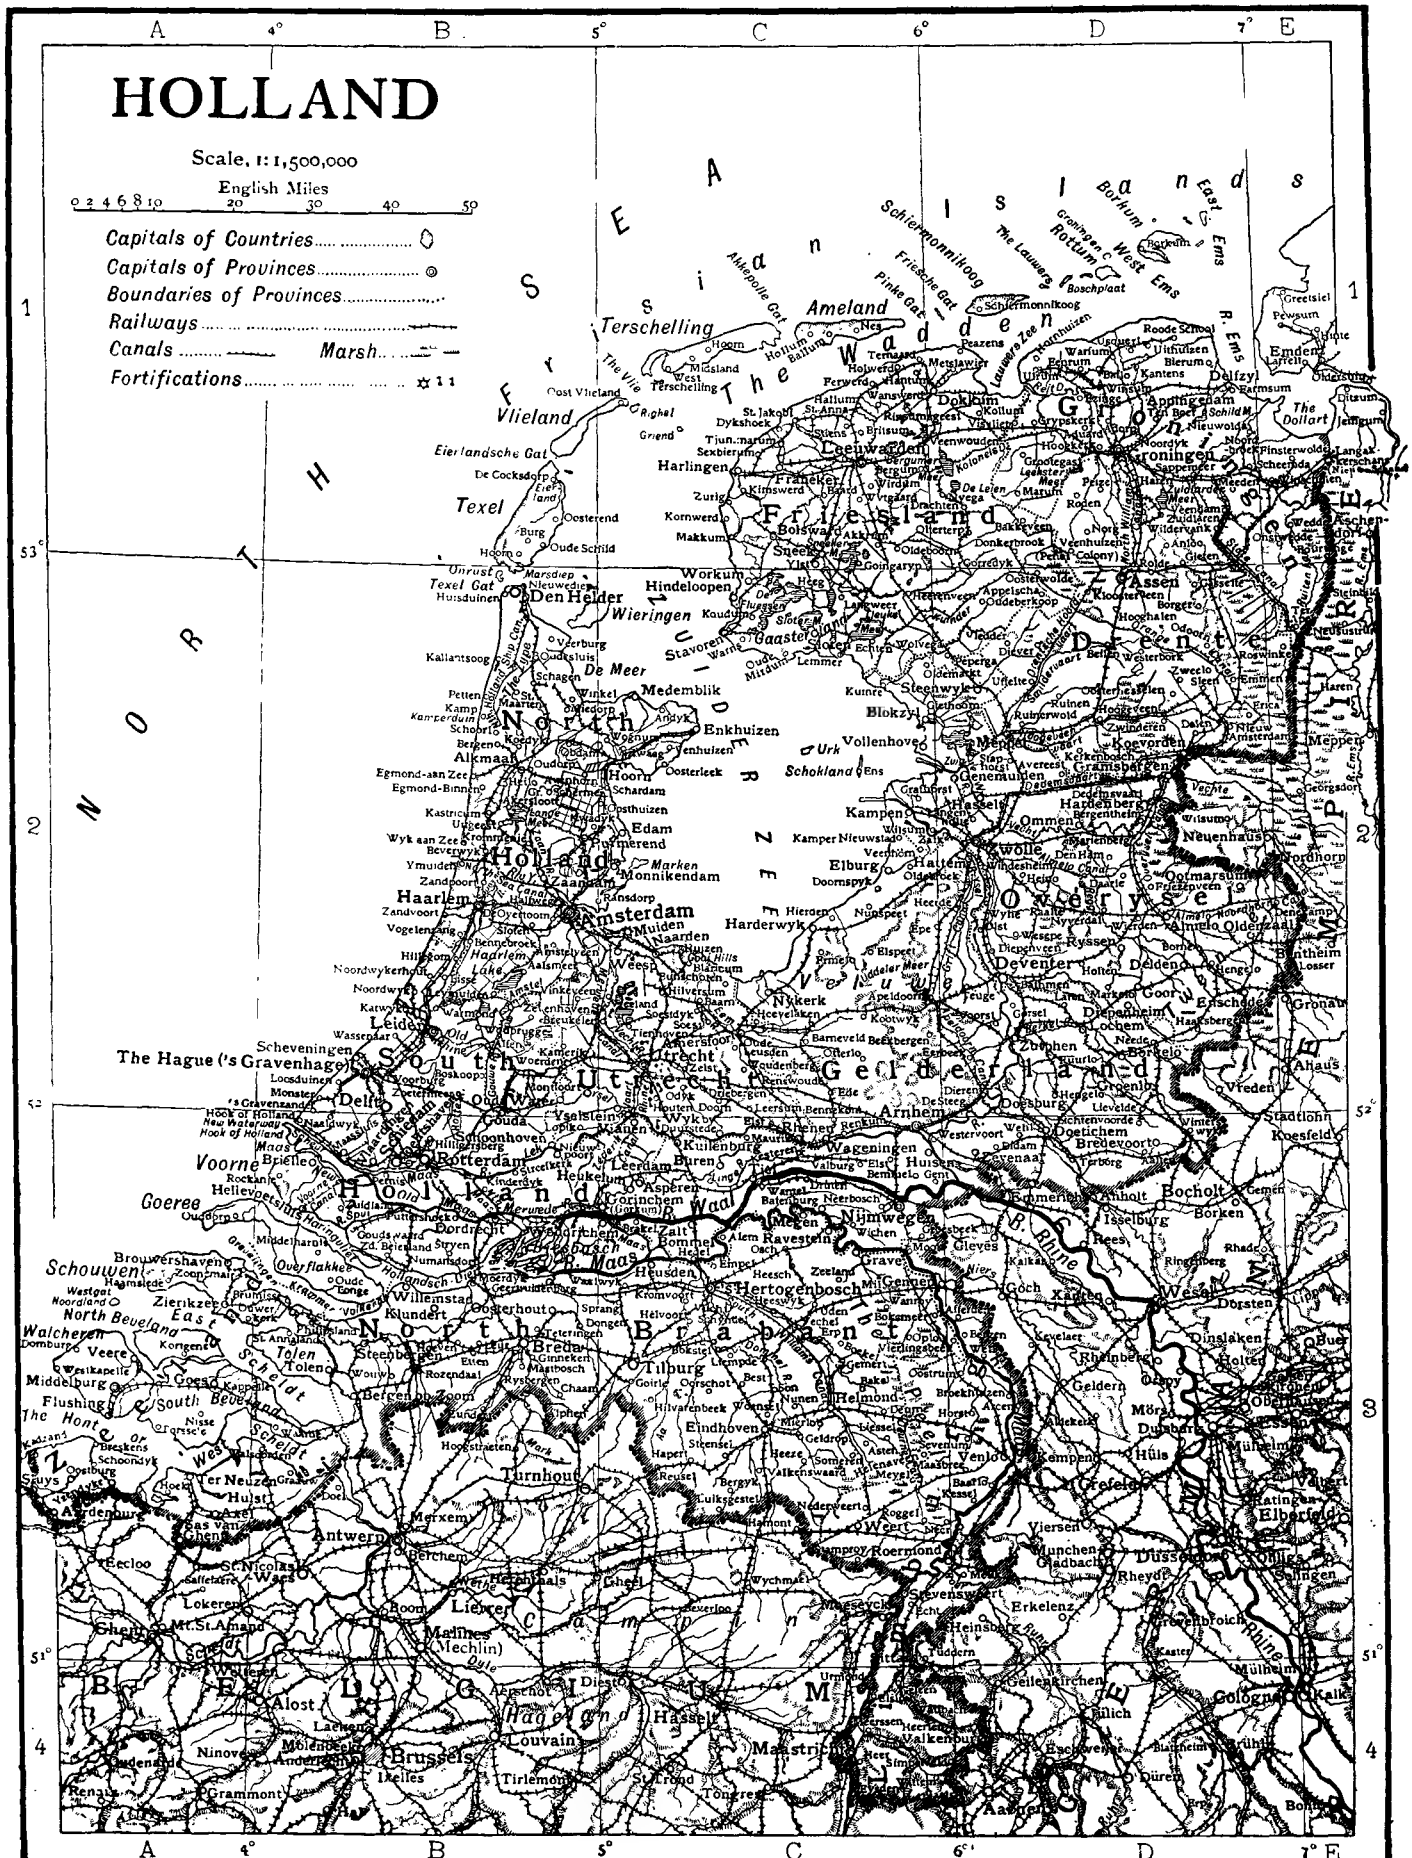
The coast-line extends in a double curve from south-west to north-east, and is formed by a row of sand dunes, 171 m. in length, fringed by a broad sandy beach descending very gradually into the sea. In the north and south, however, this line is broken by the inlets of the sea which form the Frisian and the South Holland and Zeeland islands respectively; but the dunes themselves are found continued along the seaward side of these islands, thus indicating the original continuity of the coast-line. The breadth of the dunes naturally varies greatly, the maximum width of about 4375 yds. being found at Schoorl, north-west of Alkmaar. The average height of the individual dune-tops is not above 33 ft., but attains a maximum of 197 ft. at the High Blinkert, near Haarlem. The steepness of the dunes on the side towards the sea is caused by the continual erosion, probably traceable, in part at least, to the channel current (which at mean tide has a velocity of 14 or 15 in. per second), and to the strong west or north-west winds which carry off large quantities of material. This alteration of coast-line appears at Loosduinen, where the moor or fenland formerly developed behind the dunes now crops out on the shore amid the sand, being pressed to the compactness of lignite by the weight of the sand drifted over it. Again, the remains of the Roman camp Brittenburg or Huis te Britten, which originally lay within the dunes and, after being covered by them, emerged again in 1520, were, in 1694, 1600 paces out to sea, opposite Katwijk; while, besides Katwijk itself, several other villages of the west coast, as Domburg, Scheveningen, Egmond, have been removed further inland. The tendency of the dunes to drift off on the landward side is prevented by the planting of bent-grass (*Arundo arenaria*), whose long roots serve to bind the sand together. It must be further remarked that both the "dune-pans," or depressions, which are naturally marshy through their defective drainage, and the *geest* grounds—that is, the grounds along the foot of the downs—have been in various places either planted with wood or turned into arable and pasture land; while the numerous springs at the base of the dunes are of the utmost value to the great cities situated on the marshy soil inland, the example set by Amsterdam in 1853 in supplying itself with this water having been readily followed by Leiden, the Hague, Flushing, &c.

As already remarked, the coast-line of Holland breaks up into a series of islands at its northern and southern extremities. The principal sea-inlets in the north are the Texel Gat or Marsdiep and the Vlie, which lead past the chain of the Frisian Islands into the large inland sea or gulf called the Zuider Zee, and the Wadden or "shallows," which extend along the shores of Friesland and Groningen as far as the Dollart and the mouth of the Ems. The inland sea-board thus formed consists of low coasts of sea-clay protected by dikes, and of some high diluvial strata which rise far enough above the level of the sea to make dikes unnecessary, as in the case of the Gooi hills between Naarden and the Eem, the Veluwe hills between Nykerk and Elburg, and the steep cliffs of the Gaasterland between Oude Mirdum and Stavoren. The Dollart was formed in 1277 by the inundation of the Ems basin, more than thirty villages being destroyed at once. The Zuider Zee and the bay in the Frisian coast known as the Lauwers Zee also gradually came into existence in the 13th century. The extensive sea-arms forming the South Holland and Zeeland archipelago are the Hont or West Scheldt, the East Scheldt, the Grevelingen (communicating with Krammer and the Volkerak) and the Haringvliet, which after being joined by the Volkerak is known as the Hollandsch Diep. These inlets were formerly of much greater extent than now, but are gradually closing up owing to the accumulation of mud deposits, and no longer have the same freedom of communication with one another. At the head of the Hollandsch Diep is the celebrated railway bridge of the Moerdyk (1868–1871) 1667 yds. in length; and above this bridge lies the Biesbosch ("reed forest"), a group of marshy islands formed by a disastrous inundation in 1421, when seventy-two villages and upwards of 100,000 lives were destroyed.

Relief and levels.

Besides the dunes the only hilly regions of Holland are the southern half of the province of Limburg, the neighbourhood of Nijmwegen, the hills of Utrecht, including the Gooi hills, the Veluwe region in Gelderland, the isolated hills in the middle and east of Overysel and the Hondsrug range in Drente. The remainder of the country is flat, and shows a regular downward slope from south-east to north-west, in which direction the rivers mainly flow. The elevation of the surface of the country ranges between the extreme height of 1057 ft. near Vaals in the farthest corner of Limburg, and 16-20 ft. below the Amsterdam zero[1] in some of the drained lands in the western half of the country. In fact, one quarter of the whole kingdom, consisting of the provinces of North and South Holland, the western portion of Utrecht as far as the Vaart Rhine, Zeeland, except the southern part of Zeeland-Flanders, and the north-west part of North Brabant, lies below the Amsterdam zero; and altogether 38% of the country, or all that part lying west of a line drawn through Groningen, Utrecht and Antwerp, lies within one metre above the Amsterdam zero and would be submerged if the sea broke down the barrier of dunes and dikes. This difference between the eastern and western divisions of Holland has its counterpart in the landscape and the nature of the soil. The western division consists of low fen or clay soil and presents a monotonous expanse of rich meadow-land, carefully drained in regular lines of canals bordered by stunted willows, and dotted over with windmills, the sails of canal craft and the clumps of elm and poplar which surround each isolated farm-house. The landscape of the eastern division is considered less typical. Here the soil consists mainly of sand and gravel, and the prevailing scenery is formed of waste heaths and patches of wood, while here and there fertile meadows extend along the banks of the streams, and the land is laid out in the highly regular manner characteristic of fen reclamation (see DRENTE).

Rivers.



The entire drainage of Holland is into the North Sea. The three principal rivers are the Rhine, the Maas (Meuse) and the Scheldt (Schelde), and all three have their origin outside the country, whilst the Scheldt has its mouth only in Holland, giving its name to the two broad inlets of the sea which bound the Zeeland islands. The Rhine in its course through Holland is merely the parent stream of several important branches, splitting up into Rhine and Waal, Rhine and Ysel, Crooked Rhine and Lek (which takes two-thirds of the waters), and at Utrecht into Old Rhine and Vecht, finally reaching the sea through the sluices at Katwijk as little more than a drainage canal. The Ysel and the Vecht flow to the Zuider Zee; the other branches to the North Sea. The Maas, whose course is almost parallel to that of the Rhine, follows in a wide curve the general slope of the country, receiving the Roer, the Mark and the Aa. Towards its mouth its waters find their way into all the channels intersecting the South Holland archipelago. The main stream joining the Waal at Gorinchem flows on to Dordrecht as the Merwede, and is continued thence to the sea by the Old Maas, the North, and the New Maas, the New Maas being formed by the junction of the Lek and the North. From Gorinchem the New Merwede (constructed in the second half of the 19th century) extends between dykes through the marshes of the Biesbosch to the Hollandsch Diep. These great rivers render very important service as waterways. The mean velocity of their flow seldom exceeds 4·9 ft., but rises to 6·4 ft. when the river is high. In the lower reaches of the streams the velocity and slope are of course affected by the tides. In the Waal ordinary high water is perceptible as far up as Zalt Bommel in Gelderland, in the Lek the maximum limits or ordinary and spring tides are at Vianen and Kuilenburg respectively, in the Ysel above the Katerveer at the junction of the Willemsvaart and past Wyhe midway between Zwolle and Deventer; and in the Maas near Heusden and at Well in Limburg. Into the Zuider Zee there also flow the Kuinder, the Zwarte Water, with its tributary the Vecht, and the Eem. The total length of navigable channels is about 1150 m., but sand banks and shallows not infrequently impede the shipping traffic at low water during the summer. The smaller streams are often of great importance. Except where they rise in the fens they call into life a strip of fertile grassland in the midst of the barren sand, and are responsible for the existence of many villages along their banks. Following the example of the great Kampen irrigation canal in Belgium, artificial irrigation is also practised by means of some of the smaller streams, especially in North Brabant, Drente and Overysel, and in the absence of streams, canals and sluices are sometimes specially constructed to perform the same service. The low-lying spaces at the confluences of the rivers, being readily laid under water, have been not infrequently chosen as sites for fortresses. As a matter of course, the streams are also turned to account in connexion with the canal system—the Dommel, Berkel, Vecht, Regge, Holland Ysel, Gouwe, Rotte, Schie, Spaarne, Zaan, Amstel, Dieze, Amer, Mark, Zwarte Water, Kuinder and the numerous Aas in Drente and Groningen being the most important in this respect.

Lakes.

It is unnecessary to mention the names of the numerous marshy lakes which exist, especially in Friesland and Groningen, and are connected with rivers or streamlets. Those of Friesland are of note for the abundance of their fish and their beauty of situation, on which last account the Uddelermeer in Gelderland is also celebrated. The Rockanje Lake near Brielle is remarkable for the strong salty solution which covers even the growing reeds with a

[1] The datum plane, or basis of the measurement of heights, is throughout Holland, and also in some of the border districts of Germany, the *Amsterdamsch Peil* (A.P.), or Amsterdam water-level, and represents the average high water-level of the Y at Amsterdam at the time when it was still open to the Zuider Zee. Local and provincial "peils" are, however, also in use on some water-ways.

SpinSmart Software http://www.spinsmart.com

SpinSmart Software http://www.spinsmart.com

hard crust. Many of the lakes are nothing more than deep pits or marshes from which the peat has been extracted.

Dikes.—The circumstance that so much of Holland is below the sea-level necessarily exercises a very important influence on the drainage, the climate and the sanitary conditions of the country, as well as on its defence by means of inundation. The endiking of low lands against the sea which had been quietly proceeding during the first eleven centuries of the Christian era, received a fresh impetus in the 12th and 13th centuries from the fact that the level of the sea then became higher in relation to that of the land. This fact is illustrated by the broadening of river mouths and estuaries at this time, and the beginning of the formation of the Zuider Zee. A new feature in diking was the construction of dams or sluices across the mouths of rivers, sometimes with important consequences for the villages situated on the spot. Thus the dam on the Amstel (1257) was the origin of Amsterdam, and the dam on the Ye gave rise to Edam. But Holland's chief protection against inundation is its long line of sand dunes, in which only two real breaches have been effected during the centuries of erosion. These are represented by the famous sea dikes called the Westkapelle dike and the Hondsbossche Zeewering, or sea-defence, which were begun respectively in the first and second halves of the 15th century. The first extends for a distance of over 4000 yds. between the villages of Westkapelle and Domburg in the island of Walcheren; the second is about 4900 yds. long, and extends from Kamperduin to near Petten, whence it is continued for another 1100 yds. by the Pettemer dike. These two sea dikes were reconstructed by the state at great expense between the year 1860 and 1884, having consisted before that time of little more than a protected sand dike. The earthen dikes are protected by stone-slopes and by piles, and at the more dangerous points also by *zinkstukken* (sinking pieces), artificial structures of brushwood laden with stones, and measuring some 400 yds. in circuit, by means of which the current is to some extent turned aside. The Westkapelle dike, 12,468 ft. long, has a seaward slope of 300 ft., and is protected by rows of piles and basalt blocks. On its ridge, 39 ft. broad, there is not only a roadway but a service railway. The cost of its upkeep is more than £6000 a year, and of the Hondsbossche Zeewering £2000 a year. When it is remembered that the woodwork is infested by the pile worm (*Teredo navalis*), the ravages of which were discovered in 1731, the labour and expense incurred in the construction and maintenance of the sea dikes now existing may be imagined. In other parts of the coast the dunes, though not pierced through, have become so wasted by erosion as to require artificial strengthening. This is afforded, either by means of a so-called sleeping dike (*slaperdyk*) behind the weak spot, as, for instance, between Kadzand and Breskens in Zeeland-Flanders, and again between 's Gravenzande and Loosduinen; or by means of piers or breakwaters (*hoofden*, heads) projecting at intervals into the sea and composed of piles, or brushwood and stones. The first of such breakwaters was that constructed in 1857 at the north end of the island of Goeree, and extends over 100 yds. into the sea at low water. Similar constructions are to be found on the seaward side of the islands of Walcheren, Schouwen and Voorne, and between 's Gravenzande and Scheveningen, and Katwijk and Noordwijk. Owing to the obstruction which they offer to drifting sands, artificial dunes are in course of time formed about them, and in this way they become at once more effective and less costly to maintain. The firm and regular dunes which now run from Petten to Kallantsoog (formerly an island), and thence northwards to Huisduinen, were thus formed about the Zyper (1617) and Koegras (1610) dikes respectively. From Huisduinen to Nieuwediep the dunes are replaced by the famous Helder seawall. The shores of the Zuider Zee and the Wadden, and the Frisian and Zuider Zee islands, are also partially protected by dikes. In more than one quarter the dikes have been repeatedly extended so as to enclose land conquered from the sea, the work of reclamation being aided by a natural process. Layer upon layer of clay is deposited by the sea in front of the dikes, until a new fringe has been added to the coast-line on which seagrasses begin to grow. Upon these clay-lands (*kwelders*) horses, cattle and sheep are at last able to pasture at low tide, and in course of time they are in turn endiked.

River dikes are as necessary as sea dikes, elevated banks being found only in a few places, as on the Lower Rhine. Owing to the unsuitability of the foundations, Dutch dikes are usually marked by a great width, which at the crown varies between 13 and 26 ft. The height of the dike ranges to 40 in. above high water-level. Between the dikes and the stream lie "forelands" (*interwaarden*), which are usually submerged in winter, and frequently lie 1 or 2 yds, higher than the country within the dikes. These forelands also offer in course of time an opportunity for endiking and reclamation. In this way the towns of Rotterdam, Schiedam, Vlaardingen and Maasluis have all gradually extended over the Maas dike in order to keep in touch with the river, and the small town of Delftshaven is built altogether on the outer side of the same dike.

Impoldering.—The first step in the reclamation of land is to "impolder" it, or convert it into a "polder" (*i.e.* a section of artificially drained land), by surrounding it with dikes or quays for the twofold purpose of protecting it from all further inundation from outside and of controlling the amount of water inside. Impoldering for its own sake or on a large scale was impossible as long as the means of drainage were restricted. But in the beginning of the 15th century new possibilities were revealed by the adaptation of the windmill to the purpose of pumping water. It was gradually recognized that the masses of water which collected wherever peat-digging had been carried on were an unnecessary menace to the neighbouring lands, and also that a more enduring source of profit lay in the bed of the fertile sea-clay under the peat. It became usual, therefore, to make the subsequent drainage of the land a condition of the extraction of peat from it, this condition being established by proclamation in 1595.

Drainage.—It has been shown that the western provinces of Holland may be broadly defined as lying below sea-level. In fact the surface of the sea-clay in these provinces is from 11½ to 16½ ft. below the Amsterdam zero. The ground-water is, therefore, relatively very high and the capacity of the soil for further absorption proportionately low. To increase the reservoir capacity of the polder, as well as to conduct the water to the windmills or engines, it is intersected by a network of ditches cut at right angles to each other, the amount of ditching required being usually one-twelfth of the area to be drained. In modern times pumping engines have replaced windmills, and the typical old Dutch landscape with its countless hooded heads and swinging arms has been greatly transformed by the advent of the chimney stacks of the pumping-stations. The power of the pumping-engines is taken on the basis of 12 h.p. per 1000 hectares for every metre that the water has to be raised, or stated in another form, the engines must be capable of raising nearly 9 lb of water through 1 yd. per acre per minute. The main ditches, or canals, afterwards also serve as a means of navigation. The level at which it is desired to keep the water in these ditches constitutes the unit of water measurement for the polder, and is called the polder's *zomer peil* (Z.P.) or summer water-level. In pasture-polders (*koepolders*) Z.P. is 1 to 1½ ft. below the level of the polder, and in agricultural polders 2½ to 3½ ft. below. Owing to the shrinkage of the soil in reclaimed lands, however, that is, lands which have been drained after fen or other reclamation, the sides of the polder are often higher than the middle, and it is necessary by means of small dams or sluices to make separate water-tight compartments (*afpolderingen*), each having its own unit of measurement. Some polders also have a winter peil as a precaution against the increased fall of water in that season. The summer water-level of the pasture polders south of the former Y is about 4 to 8 ft. below the Amsterdam zero, but in the Noorderkwartier to the north, it reaches 10½ ft. below A.P. in the Beschotel polder, and in reclaimed lands (*droogmakerijen*) may be still lower, thus in the Reeuwyk polder north of Gouda it is 21¼ ft. below.

The drainage of the country is effected by natural or artificial means, according to the slope of the ground. Nearly all the polders of Zeeland and South Holland are able to discharge naturally into the sea at average low water, self-regulating sluices being used. But in North Holland and Utrecht on the contrary the polder water has generally to be raised. In some deep polders and drained lands where the water cannot be brought to the required height at once, windmills are found at two or even three different levels. The final removal of polder water, however, is only truly effected upon its discharge into the "outer waters" of the country, that is, the sea itself or the large rivers freely communicating with it; and this happens with but a small proportion of Dutch polders, such as those of Zeeland, the Holland Ysel and the Noorderkwartier.

As the system of impoldering extended, the small sluggish rivers were gradually cut off by dikes from the marshy lands through which they flowed, and by sluices from the waters with which they communicated. Their level ranges from about 1½ to 4 ft. above that of the pasture polders. In addition, various kinds of canals

SpinSmart Software http://www.spinsmart.com

and endiked or embanked lakes had come into existence, forming altogether a vast network of more or less stagnant waters. These waters are utilized as the temporary reservoirs of the superfluous polder water, each system of reservoirs being termed a *boezem* (bosom or basin), and all lands watering into the same boezem being considered as belonging to it. The largest boezem is that of Friesland, which embraces nearly the whole province. It sometimes happens that a polder is not in direct contact with the boezem to which it belongs, but first drains into an adjacent polder, from which the water is afterwards removed. In the same way, some boezems discharge first into others, which then discharge into the sea or rivers. This is usually the case where there is a great difference in height between the surface of the boezem and the outer waters, and may be illustrated by the Alblasserwaard and the Rotte boezems in the provinces of South and North Holland respectively. In time of drought the water in the canals and boezems is allowed to run back into the polders, and so serve a double purpose as water-reservoirs. Boezems, like polders, have a standard water-level which may not be exceeded, and as in the polder this level may vary in the different parts of an extended boezem. The height of the *boezem peil* ranges beween $1\frac{1}{3}$ ft. above to $1\frac{1}{6}$ ft. below the Amsterdam zero, though the average is about 1 to $1\frac{2}{3}$ ft. below. Some boezems, again, which are less easily controlled, have a "danger water-level" at which they refuse to receive any more water from the surrounding polders. The Schie or Delflands boezem of South Holland is of this kind, and such a boezem is termed *besloten* or "sequestered," in contradistinction to a "free" boezem. A third kind of boezem is the reserve or *berg-boezem*, which in summer may be made dry and used for agriculture, while in winter it serves as a special reserve. The centuries of labour and self-sacrifice involved in the making of this complete and harmonious system of combined defence and reclamation are better imagined than described, and even at the present day the evidences of the struggle are far less apparent than real.

Geology.—Except in Limburg, where, in the neighbourhood of Maastricht, the upper layers of the chalk are exposed and followed by Oligocene and Miocene beds, the whole of Holland is covered by recent deposits of considerable thickness, beneath which deep borings have revealed the existence of Pliocene beds similar to the "Crags" of East Anglia. They are divided into the *Diestien*, corresponding in part with the English Coralline Crag, the *Scaldisien* and *Poederlien* corresponding with the Walton Crag, and the *Amstelien* corresponding with the Red Crag of Suffolk. In the south of Holland the total thickness of the Pliocene series is only about 200 ft., and they are covered by about 100 ft. of Quaternary deposits; but towards the north the beds sink down and at the same time increase considerably in thickness, so that at Utrecht a deep boring reached the top of the Pliocene at a depth of 513 ft. and at 1198 ft. it had not touched the bottom. At Amsterdam the top of the Pliocene lay 625 ft. below the surface, but the boring, 1098 ft. deep, did not reach the base of the uppermost division of the Pliocene, viz. the *Amstelien*. Eastward and westward of Amsterdam, as well as southward, the Pliocene beds rise slowly to the surface, and gradually decrease in thickness. They were laid down in a broad bay which covered the east of England and nearly the whole of the Netherlands, and was open to the North Sea. There is evidence that the sea gradually retreated northwards during the deposition of these beds, until at length the Rhine flowed over to England and entered the sea north of Cromer. The appearance of northern shells in the upper divisions of the Pliocene series indicates the approach of the Glacial period, and glacial drift containing Scandinavian boulders now covers much of the country east of the Zuider Zee. The more modern deposits of Holland consist of alluvium, wind-blown sands and peat.[1]

Climate.—Situated in the temperate zone between 50° and 53° N. the climate of Holland shows a difference in the lengths of day and night extending in the north to nine hours, and there is a correspondingly wide range of temperature; it also belongs to the region of variable winds. On an average of fifty years the mean annual temperature was 49·8° Fahr.; the maximum, 93·9° Fahr.; the minimum, −5·8° Fahr. The mean annual barometric height is 29·93 in.; the mean annual moisture, 81%; the mean annual rainfall, 27·99 in. The mean annual number of days with rain is 204, with snow 19, and with thunder-storms 18. The increased rainfall from July to December (the summer and autumn rains), and the increased evaporation in spring and summer (5·2 in. more than the rainfall), are of importance as regards "poldering" and draining operations. The prevalence of south-west winds during nine months of the year and of north-west during three (April–June) has a strong influence on the temperature and rainfall, tides, river mouths and outlets, and also, geologically, on dunes and sand drifts, and on fens and the accumulation of clay on the coast. The west winds of course increase the moisture, and moderate both the winter cold and the summer heat, while the east winds blowing over the continent have an opposite influence. It cannot be said that the climate is particularly good, owing to the changeableness of the weather, which may alter completely within a single day. The heavy atmosphere likewise, and the necessity of living within doors or in confined localities, cannot but exercise an influence on the character and temperament of the inhabitants. Only of certain districts, however, can it be said that they are positively unhealthy; to this category belong some parts of the Holland provinces, Zeeland, and Friesland, where the inhabitants are exposed to the exhalations from the marshy ground, and the atmosphere is often burdened with sea-fogs.

Fauna.—In the densely populated Netherlands, with no extensive forests, the fauna does not present any unusual varieties. The otter, martin and badger may be mentioned among the rarer wild animals, and the weasel, ermine and pole-cat among the more common. In the 18th century wolves still roamed the country in such large numbers that hunting parties were organized against them; now they are unknown. Roebuck and deer are found in a wild state in Gelderland and Overysel, foxes are plentiful in the dry wooded regions on the borders of the country, and hares and rabbits in the dunes and other sandy stretches. Among birds may be reckoned about two hundred and forty different kinds which are regular inhabitants, although nearly two hundred of these are migratory. The woodcock, partridge, hawk, water-ousel, magpie, jay, raven, various kinds of owls, wood-pigeon, golden-crested wren, tufted lark and titmouse are among the birds which breed here. Birds of passage include the buzzard, kite, quail, wild fowl of various kinds, golden thrush, wagtail, linnet, finch and nightingale. Storks are plentiful in summer and might almost be considered the most characteristic feature of the prevailing landscape.

Flora.—The flora may be most conveniently dealt with in the four physiographical divisions to which it belongs. These are, namely, the heath-lands, pasture-lands, dunes and coasts. Heath (*Erica tetralix*) and ling (*Calluna vulgaris*) cover all the waste sandy regions in the eastern division of the country. The vegetation of the meadow-lands is monotonous. In the more damp and marshy places the bottom is covered with marsh trefoil, carex, smooth equisetum, and rush. In the ditches and pools common yellow and white water-lilies are seen, as well as water-soldier (*Stratiotes aloides*), great and lesser reed-mace, sweet flag and bur-reed. The plant forms of the dunes are stunted and meagre as compared with the same forms elsewhere. The most common plant here is the stiff sand-reed (*Arundo arenaria*), called sand-oats in Drente and Overysel, where it is much used for making mats. Like the sand-reed, the dewberry bramble and the shrub of the buckthorn (*Hippophae rhamnoides*) perform a useful service in helping to bind the sand together. Furze and the common juniper are regular dune plants, and may also be found on the heaths of Drente, Overysel and Gelderland. Thyme and the small white dune-rose (*Rosa pimpinellifolia*) also grow in the dunes, and wall-pepper (*Sedum acre*), field fever-wort, reindeer moss, common asparagus, sheep's fescue grass, the pretty Solomon-seal (*Polygonatum officinale*), and the broad-leaved or marsh orchis (*Orchis latifolia*). The sea-plants which flourish on the sand and mud-banks along the coasts greatly assist the process of littoral deposits and are specially cultivated in places. Sea-aster flourishes in the Wadden of Friesland and Groningen, the Dollart and the Zeeland estuaries, giving place nearer the shore to sandspurry (*Spergularia*), or sea-poa or floating meadow grass (*Glyceria maritima*), which grows up to the dikes, and affords pasture for cattle and sheep. Along the coast of Overysel and in the Biesbosch lake club-rush, or scirpus, is planted in considerable quantities for the hat-making industry, and common sea-wrack (*Zostera marina*) is found in large patches in the northern half of the Zuider Zee, where it is gathered for trade purposes during the months of June, July and August. Except for the willow-plots found along the rivers on the clay lands, nearly all the wood is confined to the sand and gravel soils, where copses of birch and alder are common.

Population.—The following table shows the area and population in the eleven provinces of the Netherlands:—

Province	Area in sq. m.	Population 1890.	Population 1900.	Density per sq. m. in 1900.
North Brabant	1,980	509,628	553,842	280
Gelderland	1,965	512,202	566,549	288
South Holland	1,166	949,641	1,144,448	981
North Holland	1,070	829,489	968,131	905
Zeeland	690	199,234	216,295	313
Utrecht	534	221,007	251,034	470
Friesland	1,282	335,558	340,262	265
Overysel	1,291	295,445	333,338	258
Groningen	790	272,786	299,602	379
Drente	1,030	130,704	148,544	144
Limburg	850	255,721	281,934	332
Total	12,648	4,511,415	5,104,137[2]	404

[2] This total includes 158 persons assigned to no province.

SpinSmart Software http://www.spinsmart.com

The extremes of density of population are found in the provinces of North Holland and South Holland on the one hand, and Drente on the other. This divergence is partly explained by the difference of soil—which in Drente comprises the maximum of waste lands, and in South Holland the minimum—and partly also by the greater facilities which the seaward provinces enjoy of earning a subsistence, and the greater variety of their industries. The largest towns are Amsterdam, Rotterdam, the Hague, Utrecht, Groningen, Haarlem, Arnhem, Leiden, Nijmwegen, Tilburg. Other considerable towns are Dordrecht, Maastricht, Leeuwarden, Zwolle, Delft, 's Hertogenbosch, Schiedam, Deventer, Breda, Apeldoorn, Helder, Enschedé, Gouda, Zaandam, Kampen, Hilversum, Flushing, Amersfoort, Middelburg, Zutphen and Alkmaar. Many of the smaller towns, such as Assen, Enschedé, Helmond, Hengelo, Tiel, Venlo, Vlaardingen, Zaandam, Yerseke, show a great development, and it is a noteworthy fact that the rural districts, taken as a whole, have borne an equal share in the general increase of population. This, taken in conjunction with the advance in trade and shipping, the diminution in emigration, and the prosperity of the savings banks, points to a favourable state in the condition of the people.

Communications.—The roads are divided into national or royal roads, placed directly under the control of the *waterstaat* and supported by the state; provincial roads, under the direct control of the states of the provinces, and almost all supported by the provincial treasuries; communal and polder roads, maintained by the communal authorities and the polder boards; and finally, private roads. The system of national roads, mainly constructed between 1821 and 1827, but still in process of extension, brings into connexion nearly all the towns. **Roads.**

The canal system of Holland is peculiarly complete and extends into every part of the country, giving to many inland towns almost a maritime appearance. The united length of the canals exceeds 1500 m. As a matter of course the smaller streams have been largely utilized in their formation, while the necessity for a comprehensive drainage system has also contributed in no small degree. During the years 1815–1830 a large part of the extensive scheme of construction inaugurated by King William I. was carried out, the following canals, among others, coming into existence in that period: the North Holland ship canal (depth, 16½ ft.) from Amsterdam to den Helder, the Grift canal between Apeldoorn and Hattem, the Willemsvaart connecting Zwolle with the Ysel, the Zuid Willemsvaart, or South William's canal (6½ ft.), from 's Hertogenbosch to Maastricht, and the Ternuzen-Ghent ship canal. After 1849 the canal programme was again taken up by the state, which alone or in conjunction with the provincial authorities constructed the Apeldoorn-Dieren canal (1859–1869), the drainage canals of the "Peel" marsh in North Brabant, and of the eastern provinces, namely, the Deurne canal (1876–1892) from the Maas to Helenaveen, the Almelo (1851–1858) and Overysel (1884–1888) canals from Zwolle, Deventer and Almelo to Koevorden, and the Stieltjes (1880–1884), and Orange (1853–1858 and 1881–1889) canals in Drente, the North Williams canal (1856–1862) between Assen and Groningen, the Ems (1866–1876) ship canal from Groningen to Delfzyl, and the New Merwede, and enlarged the canal from Harlingen by way of Leeuwarden to the Lauwars Zee. The large ship canals to Rotterdam and Amsterdam, called the New Waterway and the North Sea canal respectively, were constructed in 1866–1872 and 1865–1876 at a cost of 2½ and 3 million pounds sterling, the former by widening the channel of the Scheur north of Rozenburg, and cutting across the Hook of Holland, the latter by utilizing the bed of the Y and cutting through the dunes at Ymuiden. In 1876 an agreement was arrived at with Germany for connecting the important drainage canals in Overysel, Drente and Groningen with the Ems canal system, as a result of which the Almelo-Noordhorn (1884–1888) and other canals came into existence. **Canals.**

The canals differ in character in the different provinces. In Zeeland they connect the towns of the interior with the sea or the river mouths; for example, the one from Middelburg to Veere and Flushing (1866–1878), from Goes to the East Scheldt, and from Zierikzee also to the East Scheldt. The South Beveland (1862–1866) canal connects the East and West Scheldt; similarly in South Holland the Voorne canal unites the Haringvliet with the New Maas, which does not allow the passage of large vessels above Brielle; whilst owing to the banks and shallows in front of Hellevoetsluis the New Waterway was cut to Rotterdam. Of another character is the Zederik canal, which unites the principal river of central Holland, the Lek, at Vianen by means of the Linge with the Merwede at Gorkum. Amsterdam is connected with the Lek and the Zederik canal via Utrecht by the Vecht and the Vaart Rhine (1881–1893; depth 10·2 ft.). Again, a totally different character belongs to the canals in North Brabant, and the east and north-east of Holland where, in the absence of great rivers, they form the only waterways which render possible the drainage of the fens and the export of peat; and unite the lesser streams with each other. Thus in Overysel, in addition to the canals already mentioned, the Dedemsvaart connects the Vecht with the Zwarte Water near Hasselt; in Drente the Smildervaart and Drentsche Hoofdvaart unites Assen with Meppel, and receives on the eastern side the drainage canals of the Drente fens, namely, the Orange canal and the Hoogeveen Vaart (1850–1860; 1880–1893). Groningen communicates with the Lauwers Zee by the Reitdiep (1873–1876), while the canal to Winschoten and the Stadskanaal, or State canal (1877–1880), bring it into connexion with the flourishing fen colonies in the east of the province and in Drente. In Friesland, finally, besides the ship canal from Harlingen to the Lauwers Zee there are canals from Leeuwarden to the Lemmer, whence there is a busy traffic with Amsterdam; and the Caspar Robles or Kolonels Diep, and the Hoendiep connect it with Groningen.

The construction of railways was long deferred and slowly accomplished. The first line was that between Amsterdam and Haarlem, opened in 1839 by the Holland railway company (*Hollandsch Yzeren Spoorweg Maatschappij*). In 1845 the state undertook to develop the railway system, and a company of private individuals was formed to administer it under the title of the *Maatschappij tot Exploitatie van Staatspoorwegen*. In 1860, however, the total length of railways was only 208 m., and in that year a parliamentary bill embodying a comprehensive scheme of construction was adopted. By 1872 this programme was nearly completed, and 542 m. of new railway had been added. In 1873 and 1875 a second and a third bill provided for the extension of the railway system at the cost of the state, and, in 1876, 1882 and 1890 laws were introduced readjusting the control of the various lines, some of which were transferred to the Holland railway. The state railway system was completed in 1892, and since that time the utmost that the state has done has been to subsidize new undertakings. These include various local lines such as the line Alkmaar-Hoorn (1898), Ede-Barneveld-Nykerk, Enschedé-Ahaus in Germany (1902), Leeuwarden to Franeker, Harlingen and Dokkum, and the line Zwolle-Almelo (junction at Marienberg) Koevorden-Stadskanal-Veendam-Delfzyl, connecting all the fen countries on the eastern borders. The electric railway Amsterdam-Zandvoort was opened in 1904. The frame upon which the whole network of the Dutch railways may be said to depend is formed of two main lines from north and south and four transverse lines from west to east. The two longitudinal lines are the railway den Helder via Haarlem (1862–1867),[1] Rotterdam (1839–1847), and Zwaluwe (1869–1877) to Antwerp (1852–1855), belonging to the Holland railway company, and the State railway from Leeuwarden and Groningen (1870) (junction at Meppel, 1867) Zwolle (1866)—Arnhem (1865)—Nijmwegen (1879)—Venlo (1883)—Maastricht (1865). The four transverse lines belong to the State and Holland railways alternately and are, beginning with the State railway: (1) the line Flushing (1872)—Rozendaal (1860)—Tilburg (1863)—Bokstel (whence there is a branch line belonging to the North Brabant and Germany railway company via Vechel to Goch in Germany, opened in 1873)—Eindhoven—Venlo and across Prussian border (1866); (2) the line Hook of Holland—Rotterdam (1893)—Dordrecht (1872–1877)—Elst (1882–1885)—Nijmwegen (1879)—Cleves, Germany (1865); (3) the line Rotterdam-Utrecht (1866–1869) and Amsterdam—Utrecht—Arnhem (1843–1845) to Emmerich in Germany (1856): this line formerly belonged to the Netherlands-Rhine railway company, but was bought by the state in 1890; and finally (4) the line Amsterdam—Hilversum—Amersfoort—Apeldoorn (1875), whence it is continued (*a*) via Deventer, Almelo and Hengelo to Salzbergen, Germany (1865); (*b*) via Zutphen, Hengelo (1865), Enschedé (1866) to Gronau, Germany; (*c*) via Zutphen (1876) and Ruurlo to Winterswyk (1878). Of these (1) and (2) form the main transcontinental routes in connexion with the steamboat service to England (ports of Queenborough and Harwich respectively). Two other lines of railway, both belonging to the state, also traverse the country west to east, namely, the line Rozendaal—'s Hertogenbosch (1890)—Nijmwegen, and in the extreme north, the line from Harlingen through Leeuwarden (1863) and Groningen (1866) to the border at Nieuwe Schans (1869), whence it was connected with the German railways in 1876. The northern and southern provinces are further connected by the lines Amsterdam—Zaandam (1878)—Enkhuizen (1885), whence there is a steam ferry across the Zuider Zee to Stavoren, from where the railway is continued to Leeuwarden (1883–1885); the Netherlands Central railway, Utrecht—Amersfoort—Zwoole—Kampen (1863); and the line Utrecht—'s Hertogenbosch (1868–1869) which is continued southward into Belgium by the lines bought in 1898 from the Grand Central Belge railway, namely, via Tilburg to Turnhout (1867), and via Eindhoven (1866) to Hasselt. In 1892 Greenwich mean time was adopted on the railways and in the post-offices, making a difference of twenty minutes with mean Amsterdam time. **Railways.**

Since 1877 railway communication has been largely supplemented by steam-tramways, which either run along the main roads or across the country on special embankments, while one of them is

[1] The dates indicate the period of construction of the different sections.

SpinSmart Software http://www.spinsmart.com

carried across the river Ysel at Doesburg on a pontoon bridge. The state first began to encourage the construction of these local light railways by means of subsidies in 1893, since when some of the most prominent lines have come into existence, such as Purmerend—Alkmaar (1898), Zutphen—Emmerich (1902), along the Dedemsvaart in Overysel (1902), from 's Hertogenbosch via Utrecht and Eindhoven to Turnhout in Belgium (1898), and especially those connecting the South Holland and Zeeland islands with the railway, namely, between Rotterdam and Numansdorp on the Hollandsch Diep (1898), and from Breda or Bergen-op-Zoom, via Steenbergen to St Philipsland, Zierikzee and Brouwershaven (1900). An electric tramway connects Haarlem and Zandvoort. The number of passengers carried by the steam-tramways is relatively higher than that of the railways. The value of the goods traffic is not so high, owing, principally, to the want of intercommunication between the various lines on account of differences in the width of the gauge.

Tramways.

Agriculture.—Waste lands are chiefly composed of the barren stretches of heaths found in Drente, Overysel, Gelderland and North Brabant. They formerly served to support large flocks of sheep and some cattle, but are gradually transformed by the planting of woods, as well as by strenuous efforts at cultivation. Zeeland and Groningen are the two principal agricultural provinces, and after them follow Limburg, North Brabant, Gelderland and South Holland. The chief products of cultivation on the heavy clay soil are oats, barley and wheat, and on the sand-grounds rye, buckwheat and potatoes. Flax and beetroot are also cultivated on the clay lands. Tobacco, hemp, hops, colza and chicory form special cultures. With the possible exception of oats, the cereals do not suffice for home consumption, and maize is imported in large quantities for cattle-feeding, and barley for the distilleries and breweries. Horticulture and market-gardening are of a high order, and flourish especially on the low fen soil and *geest* grounds along the foot of the dunes in the provinces of North and South Holland. The principal market products are cauliflower, cabbage, onions, asparagus, gherkins, cucumbers, beans, peas, &c. The principal flowers are hyacinths, tulips, crocuses, narcissus and other bulbous plants, the total export of which is estimated at over £200,000. Fruit is everywhere grown, and there is a special cultivation of grapes and figs in the Westland of South Holland. The woods, or rather the plantations, covering 6%, consist of (1) the so-called forest timber (*opgaandhout*; Fr. *arbres de haute futaie*), including the beech, oak, elm, poplar, birch, ash, willow and coniferous trees; and (2) the copse wood (*akkermaal* or *hakhout*), embracing the elder, willow, beech, oak, &c. This forms no unimportant branch of the national wealth.

With nearly 35% of the total surface of the country under permanent pasture, cattle-breeding forms one of the most characteristic industries of the country. The provinces of Friesland, North and South Holland, and Utrecht take the lead as regards both quality and numbers. A smaller, hardier kind of cattle and large numbers of sheep are kept upon the heath-lands in the eastern provinces, which also favour the rearing of pigs and bee-culture. Horse-breeding is most important in Friesland, which produces the well-known black breed of horse commonly used in funeral processions. Goats are most numerous in Gelderland and North Brabant. Poultry, especially fowls, are generally kept. Stock-breeding, like agriculture, has considerably improved under the care of the government (state and provincial), which grants subsidies for breeding, irrigation of pasture-lands, the importation of finer breeds of cattle and horses, the erection of factories for dairy produce, schools, &c.

Live-stock.

Fisheries.—The fishing industry of the Netherlands may be said to have been in existence already in the 13th century, and in the following century received a considerable impetus from the discovery how to cure herring by William Beukelszoon, a Zeeland fisherman. It steadily declined during the 17th and 18th centuries, however, but again began to revive in the last half of the 19th century. The fisheries are commonly divided into four particular fishing areas, namely, the "deep-sea" fishery of the North Sea, and the "inner" (*binnengaatsch*) fisheries of the Wadden, the Zuider Zee, and the South Holland and Zeeland waters. The deep-sea fishery may be further divided into the so-called "great" or "salt-herring" fishery, mainly carried on from Vlaardingen and Maasluis during the summer and autumn, and the "fresh-herring" fishery, chiefly pursued at Scheveningen, Katwijk and Noordwijk. The value of the herring fisheries is enhanced by the careful methods of smoking and salting, the export of salted fish being considerable. In the winter the largest boats are laid up and the remainder take to line-fishing. Middelharnis, Pernis and Zwartewaal are the centres of this branch of fishery, which yields halibut, cod, ling and haddock. The trawl fisheries of the coast yield sole, plaice, turbot, brill, skate, &c., of which a large part is brought alive to the market. In the Zuider Zee small herring, flat fish, anchovies and shrimps are caught, the chief fishing centres being the islands of Texel, Urk and Wieringen, and the coast towns of Helder, Bunschoten, Huizen, Enkhuizen, Vollendam, Kampen, Harderwyk, Vollenhove. The anchovy fishing which takes place in May, June and July sometimes yields very productive results. Oysters and mussels are obtained on the East Scheldt, and anchovies at Bergen-op-Zoom; while salmon, perch and pike are caught in the Maas, the Lek and the New Merwede. The oyster-beds and salmon fisheries are largely in the hands of the state, which lets them to the highest bidder. Large quantities of eels are caught in the Frisian lakes. The fisheries not only supply the great local demand, but allow of large exports.

Manufacturing Industries.—The mineral resources of Holland give no encouragement to industrial activity, with the exception of the coal-mining in Limburg, the smelting of iron ore in a few furnaces in Overysel and Gelderland, the use of stone and gravel in the making of dikes and roads, and of clay in brick-works and potteries, the quarrying of stone at St Pietersberg, &c. Nevertheless the industry of the country has developed in a remarkable manner since the separation from Belgium. The greatest activity is shown in the cotton industry, which flourishes especially in the Twente district of Overysel, where jute is also worked into sacks. In the manufacture of woollen and linen goods Tilburg ranks first, followed by Leiden, Utrecht and Eindhoven; that of half-woollens is best developed at Roermond and Helmond. Other branches of industry include carpet-weaving at Deventer, the distillation of brandy, gin and liqueurs at Schiedam, Rotterdam and Amsterdam, and beer-brewing in most of the principal towns; shoe-making and leather-tanning in the Langstraat district of North Brabant; paper-making at Apeldoorn, on the Zaan, and in Limburg; the manufacture of earthenware and faïence at Maastricht, the Hague and Delft, as well as at Utrecht, Purmerend and Makkum; clay pipes and stearine candles at Gouda; margarine at Osch; chocolate at Weesp and on the Zaan; mat-plaiting and broom-making at Genemuiden and Blokzyl; diamond-cutting and the manufacture of quinine at Amsterdam; and the making of cigars and snuff at Eindhoven, Amsterdam, Utrecht, Kampen, &c. Shipbuilding is of no small importance in Holland, not only in the greater, but also in the smaller towns along the rivers and canals. The principal shipbuilding yards are at Amsterdam, Kinderdijk, Rotterdam and at Flushing, where there is a government dockyard for building warships.

Trade and Shipping.—To obtain a correct idea of the trade of Holland, greater attention than would be requisite in the case of other countries must be paid to the inland traffic. It is impossible to state the value of this in definite figures, but an estimate may be formed of its extent from the number of ships which it employs in the rivers and canals, and from the quantity of produce brought to the public market. In connexion with this traffic there is a large fleet of tug boats; but steam- or petroleum-propelled barges are becoming more common. Some of the lighters used in the Rhine transport trade have a capacity of 3000 tons. A great part of the commercial business at Rotterdam belongs to the commission and transit trade. The other principal ports are Flushing, Terneuzen (for Belgium), Harlingen, Delfzyl, Dordrecht, Zaandam, Schiedam, Groningen, den Helder, Middelburg, Vlaardingen. Among the national mail steamship services are the lines to the East and West Indies, Africa and the United States. An examination of its lists of exports and imports will show that Holland receives from its colonies its spiceries, coffee, sugar, tobacco, indigo, cinnamon; from England and Belgium its manufactured goods and coals; petroleum, raw cotton and cereals from the United States; grain from the Baltic provinces, Archangel, and the ports of the Black Sea; timber from Norway and the basin of the Rhine, yarn from England, wine from France, hops from Bavaria and Alsace; iron-ore from Spain; while in its turn it sends its colonial wares to Germany, its agricultural produce to the London market, its fish to Belgium and Germany, and its cheese to France, Belgium and Hamburg, as well as England. The bulk of trade is carried on with Germany and England; then follow Java, Belgium, Russia, the United States, &c. In the last half of the 19th century the total value of the foreign commerce was more than trebled.

Constitution and Government.—The government of the Netherlands is regulated by the constitution of 1815, revised in 1848 and 1887, under which the sovereign's person is inviolable and

SpinSmart Software http://www.spinsmart.com

the ministers are responsible. The age of majority of the sovereign is eighteen. The crown is hereditary in both the male and the female line according to primogeniture; but it is only in default of male heirs that females can come to the throne. The crown prince or heir apparent is the first subject of the sovereign, and bears the title of the prince of Orange. The sovereign alone has executive authority. To him belong the ultimate direction of foreign affairs, the power to declare war and peace, to make treaties and alliances, and to dissolve one or both chambers of parliament, the supreme command of the army and navy, the supreme administration of the state finances and of the colonies and other possessions of the kingdom, and the prerogative of mercy. By the provisions of the same constitution he establishes the ministerial departments, and shares the legislative power with the first and second chambers of parliament, which constitute the states-general and sit at the Hague. The heads of the departments to whom the especial executive functions are entrusted are eight in number—ministers respectively of the interior, of " water-staat," trade and industry (that is, of public works, including railways, post-office, &c.), of justice, of finance, of war, of marine, of the colonies and of foreign affairs. There is a department of agriculture, but without a minister at its head. The heads of departments are appointed and dismissed at the pleasure of the sovereign, usually determined, however, as in all constitutional states, by the will of the nation as indicated by its representatives.

The number of members in the first chamber is 50, South Holland sending 10, North Holland 9, North Brabant and Gelderland each 6, Friesland 4, Overysel, Limburg and Groningen each 3, Zeeland, Utrecht and Drente each 2. According to the fundamental law (*Grondwet*) of 1887, they are chosen by the provincial states, not only from amongst those who bear the greatest burden of direct taxation in each province, but also from amongst great functionaries and persons of high rank. Those deputies who are not resident in the Hague are entitled to receive 16s. 8d. a day during the session. The duration of parliament is nine years, a third of the members retiring every three years. The retiring members are eligible for re-election. The members of the second chamber are chosen in the electoral districts by all capable male citizens not under 23 years of age, who pay one or more direct taxes, ranging from a minimum of one guilder (1s. 8d.) towards the income tax. The number of members is 100, Amsterdam returning 9, Rotterdam 5, the Hague 3, Groningen and Utrecht 2 members each. Members must be at least thirty years old, and receive an annual allowance of £166, besides travelling expenses. They only, and the government, have the right of initiating business, and of proposing amendments. Their term is four years, but they are re-eligible. All communications from the sovereign to the states-general and from the states to the sovereign, as well as all measures relating to internal administration or to foreign possessions, are first submitted to the consideration of the council of state, which consists of 14 members appointed by the sovereign, who is the president. The state council also has the right of making suggestions to the sovereign in regard to subjects of legislation and administration.

The provincial administration is entrusted to the provincial states, which are returned by direct election by the same electors as vote for the second chamber. The term is for six years, but one-half of the members retire every three years subject to re-election or renewal. The president of the assembly is the royal commissioner for the province. As the provincial states only meet a few times in the year, they name a committee of deputy-states which manages current general business, and at the same time exercises the right of control over the affairs of the communes. At the head of every commune stands a communal council, whose members must be not under 23 years of age. They are elected for six years (one-third of the council retiring every two years) by the same voters as for the provincial states. Communal franchise is further restricted, however, to those electors who pay a certain sum to the communal rates. The number of councillors varies according to the population between 7 and 45. One of the special duties of the council is the supervision of education. The president of the communal council is the burgomaster, who is named by the sovereign in every instance for six years, and receives a salary varying from £40 to over £600. Provision is made for paying the councillors a certain fee—called " presence-money "—when required. The burgomaster has the power to suspend any of the council's decrees for 30 days. The executive power is vested in a college formed by the burgomaster and two, three or four magistrates (*wethouders*) to be chosen by and from the members of the council. The provinces are eleven in number.

National Defence.—The home defence system of Holland is a militia with strong cadres based on universal service. Service in the " militia " or 1st line force is for 8 years, in the 2nd line for 7. Every year in the drill season contingents of militiamen are called up for long or short periods of training, and the maximum peace strength under arms in the summer is about 35,000, of whom half are permanent cadres and half militiamen. In 1908 12,300 of the year's contingent were trained for eight months and more, and 5200 for four months. The war strength of the militia is 105,000, that of the second line or reserve 70,000. The defence of the country is based on the historic principle of concentrating the people and their resources in the heart of the country, covered by a wide belt of inundations. The chosen line of defence is marked by a series of forts which control the sluices, extending from Amsterdam, through Muiden, thence along the Vecht and through Utrecht to Gorinchem (Gorkum) on the Waal. The line continues thence by the Hollandsche Diep and Volkerak to the sea, and the coast also is fortified. The army in the colonies numbers in all about 26,000, all permanent troops and for the most part voluntarily enlisted European regulars. The military expenditure in 1908 was £2,331,255. The Dutch navy at home and in Indian waters consists (1909) of 9 small battleships, 6 small cruisers and 80 other vessels, manned by 8600 officers and men of the navy and about 2250 marines. Recruiting is by voluntary enlistment, with contingent powers of conscription amongst the maritime population.

Justice.—The administration of justice is entrusted (1) to the high council (*hooge raad*) at the Hague, the supreme court of the whole kingdom, and the tribunal for all high government officials and for the members of the states-general; (2) to the five courts of justice established at Amsterdam, the Hague, Arnhem, Leeuwarden and 's Hertogenbosch; (3) to tribunals established in each arrondissement; (4) to cantonal judges appointed over a group of communes, whose jurisdiction is restricted to claims of small amount (under 200 guilders), and to breaches of police regulations, and who at the same time look after the interest of minors. The high council is composed of 12 to 14 councillors, a procureur-general and three advocates-general. Criminal and correctional procedure were formerly divided between the courts of justice and the arrondissement tribunals; but this distinction was suppressed by the penal code of 1886, thereby increasing the importance of the arrondissement courts, which also act as court of appeal of the cantonal courts.

Besides the prisons, which include one built on the cellular principle at Breda, the state supports three penal workhouses for drunkards and beggars. There are also the penal colonies at Veenhuizen in Drente, which were brought from the Society of Charity (*Maatschappij van Weldadigkeid*) in 1859. The inmates practise agriculture, as well as various industries for supplying all the requirements of the colony. The objection raised against these establishments is that the prisoners do not represent the real vagabondage of the country, but a class of more or less voluntary inmates. Children under 16 years of age are placed in the three state reformatories, and there is an institution for vagabond women at Rotterdam.

Charitable and other Institutions.—Private charities have always occupied a distinguished position in the Netherlands, and the principle of the law of 1854 concerning the relief of the poor is, that the state shall only interfere when private charity fails. All private and religious institutions have to be inscribed before they can collect public funds. In some cases these institutions are organized and administered conjointly with the civil authorities. At the head of the charitable institutions stand the agricultural colonies belonging to the Society of Charity (see DRENTE). Of the numerous institutions for the encouragement of the sciences and the fine arts, the following are strictly national—the Royal Academy of Sciences (1855), the Royal Netherlands Meteorological Institute (1854), the National Academy of the Plastic Arts, the Royal School of Music, the National Archives, besides various other national collections and museums. Provincial scientific societies exist at Middelburg, Utrecht, 's Hertogenbosch and Leeuwarden, and there are private and municipal associations, institutions and collections in a large number of the smaller towns. Among societies of general utility are the Society for Public Welfare (*Maatschappij tot nut van't algemeen*, 1785), whose efforts have been mainly in the direction of educational reform; the Geographical Society at Amsterdam (1873); Teyler's Stichting or foundation at Haarlem (1778), and the societies for the promotion of industry (1777), and of sciences (1752) in the same town; the Institute of Languages, Geography and Ethnology of the Dutch Indies (1851), and the Indian Society at the Hague, the Royal Institute of Engineers at Delft (1848), the Association for the Encouragement of Music at Amsterdam, &c.

Religion.—Religious conviction is one of the most characteristic traits of the Dutch people, and finds expression in a large number of independent religious congregations. The bond between church

SpinSmart Software http://www.spinsmart.com

and state which had been established by the synod of Dort (1618) and the organization of the Low-Dutch Reformed Church (*Nederlandsche Hervormde Kerk*) as the national Protestant church, practically came to an end in the revolution of 1795, and in the revision of the Constitution in 1848 the complete religious liberty and equality of all persons and congregations was guaranteed. The present organization of the Reformed Church dates from 1852. It is governed by a general assembly or "synod" of deputies from the principal judicatures, sitting once a year. The provinces are subdivided into "classes," and the classes again into "circles" (*ringen*), each circle comprising from 5 to 25 congregations, and each congregation being governed by a "church council" or session. The provincial synods are composed of ministers and elders deputed by the classes; and these are composed of the ministers belonging to the particular class and an equal number of elders appointed by the local sessions. The meetings of the circles have no administrative character, but are mere brotherly conferences. The financial management in each congregation is entrusted to a special court (*kerk-voogdij*) composed of "notables" and church wardens. In every province there is besides, in the case of the Reformed Church, a provincial committee of supervision for the ecclesiastical administration. For the whole kingdom this supervision is entrusted to a common "collegium" or committee of supervision, which meets at the Hague, and consists of 11 members named by the provincial committee and 3 named by the synod. Some congregations have withdrawn from provincial supervision, and have thus free control of their own financial affairs. The oldest secession from the Orthodox Church is that of the Remonstrants, who still represent the most liberal thought in the country, and have their own training college at Leiden. Towards 1840 a new congregation calling itself the Christian Reformed Church (*Christelijke Gereformeerde Kerk*) arose as a protest against the government and the modern tendencies of the Reformed Church; and for the same reason those who had founded the Free University of Amsterdam (1880) formed themselves in 1886 into an independent body called the *Nederlandsche Gereformeerde Kerk*. In 1892 these two churches united under the name of the Reformed Churches (*Gereformeerde Kerken*) with the doctrine and discipline of Dort. They have a theological seminary at Kampen. Other Protestant bodies are the Walloons, who, though possessing an independent church government, are attached to the Low-Dutch Reformed Church; the Lutherans, divided into the main body of Evangelical Lutherans and a smaller division calling themselves the Re-established or Old Lutherans (*Herstelde Lutherschen*) who separated in 1791 in order to keep more strictly to the Augsburg confession; the Mennonites founded by Menno Simons of Friesland, about the beginning of the 16th century; the Baptists, whose only central authority is the General Baptist Society founded at Amsterdam in 1811; the Evangelical Brotherhood of Hernhutters or Moravians, who have churches and schools at Zeist and Haarlem; and a Catholic Apostolic Church (1867) at the Hague. There are congregations of English Episcopalians at the Hague, Amsterdam and Rotterdam, and German Evangelicals at the Hague (1857) and Rotterdam (1861). In 1853 the Roman Catholic Church, which before had been a mission in the hands of papal legates and vicars, was raised into an independent ecclesiastical province with five dioceses, namely, the archbishopric of Utrecht, and the suffragan bishoprics of Haarlem, Breda, 's Hertogenbosch and Roermond, each with its own seminary. Side by side with the Roman Catholic hierarchy are the congregations of the Old Catholics or Old Episcopalian Church (*Oud Bisschoppelijke Clerezie*), and the Jansenists (see JANSENISM). The Old Catholics, with whom the Jansenists are frequently confused, date from the 17th century. Besides an archbishop at Utrecht, the Old Catholics have bishops at Deventer and Haarlem, and a training college at Amersfoort. They numbered in 1905 about 9000 (see UTRECHT). The large Jewish population in Holland had its origin in the wholesale influx of Portuguese Jews at the end of the 16th, and of German Jews in the beginning of the 17th century. In 1870 they were reorganized under the central authority of the Netherlands Israelite Church, and divided into head and "ring" synagogues and associated churches. The Roman Catholic element preponderates in the southern provinces of Limburg, and North Brabant, but in Friesland, Groningen and Drente the Baptists and Christian Reformed are most numerous.

Education.—Every grade of education in the Netherlands is under the control and supervision of the state, being administered by a special department under the ministry for the interior. In 1889 the state recognized private denominational schools, and in 1900 passed a law of compulsory attendance. Infant schools, which are generally in the hands of private societies or the municipal authorities, are not interfered with by the state. According to the law of 1889 primary education is carried on in the ordinary and in continuation schools for boys and girls (co-education having been long in vogue). These schools are established in every commune, the state contributing aid at the rate of 25% of the total expenditure. The age of admission is six; and the course is for six years, 7–13 being the legal age limits; the fee, from which poverty exempts, is almost nominal. Nature-study, continued in the secondary schools, is an essential part in the curriculum of these schools, and elementary general history, English, French and German are among the optional subjects. While the boys are instructed in woodwork, needlework is taught to the girls, its introduction in 1889 having been the first recognition of practical instruction in any form. Continuation schools (*herhalingsscholen*) must be organized wherever required, and are generally open for six months in winter, pupils of twelve to fourteen or sixteen attending. Secondary schools were established by the law of 1863 and must be provided by every commune of 10,000 inhabitants; they comprise the Burgher-Day-and-Evening schools and the Higher-Burgher schools. The first named schools being mainly intended for those engaged in industrial or agricultural pursuits, the day classes gradually fell into disuse. The length of the course as prescribed by law is two years, but it is usually extended to three or four years, and the instruction, though mainly theoretical, has regard to the special local industries; the fees, if any, may not exceed one pound sterling per annum. Special mention must be made in this connexion of the school of engineering in Amsterdam (1878) and the Academy of Plastic Arts at Rotterdam. The higher-burgher schools have either a three or a five years' course, and the fees vary from £2, 10s. to £5 a year. The instruction given is essentially non-classical and scientific. In both schools certificates are awarded at the end of the course, that of the higher-burgher schools admitting to the natural science and medical branches of university education, a supplementary examination in Greek and Latin being required for other branches. The gymnasia, or classical schools, fall legally speaking under the head of higher education. By the law of 1876, every town of 20,000 inhabitants, unless specially exempted, must provide a gymnasium. A large proportion of these schools are subsidized by the state to the extent of half their net cost. The curriculum is classical and philological, but in the two upper classes there is a bifurcation in favour of scientific subjects for those who wish. The fees vary from £5 to £8 a year, but, owing to the absence of scholarships and bursaries, are sometimes remitted, as in the case of the higher-burgher schools. Among the schools which give specialized instruction, mention must be made of the admirable trade schools (*ambachtsscholen*) established in 1861, and the corresponding industrial schools for girls; the fishery schools and schools of navigation; the many private schools of domestic science, and of commerce and industry, among which the municipal school at Enschedé (1886) deserves special mention; and the school of social work, "Das Huis," at Amsterdam (1900). For the education of medical practitioners, civil and military, the more important institutions are the National Obstetrical College at Amsterdam, the National Veterinary School at Utrecht, the National College for Military Physicians at Amsterdam and the establishment at Utrecht for the training of military apothecaries for the East and West Indies. The organization of agricultural education under the state is very complete, and includes a state professor of agriculture for every province (as well as professors of horticulture in several cases), "winter schools" of agriculture and horticulture, and a state agricultural college at Wageningen (1876) with courses in home and colonial agriculture. The total fees at this college, including board and lodging, are about £50 a year. According to the law of 1898, the state also maintains or subsidizes experimental or testing-stations. Other schools of the same class are the Gerard Adriaan van Swieten schools of agriculture, gardening and forestry in Drente, the school of instruction in butter and cheese making (*zuivelbereiding*) at Bolsward and the state veterinary college at Utrecht.

There are three state universities in Holland, namely, Leiden (1575), Groningen (1585) and Utrecht (1634). The ancient athenaeums of Franeker (1585) and Harderwyk (1603) were closed in 1811, but that of Amsterdam was converted into a municipal university in 1877. In each of these universities there are five faculties, namely, law, theology, medicine, science and mathematics, and literature and philosophy, the courses for which are respectively four, five, eight, and six or seven years for the two last named. The fees amount to 200 florins (£16, 13s. 4d.) per annum and are payable for four years. Two kinds of degrees are conferred, namely, the ordinary (*candidaats*) and the "doctor's" degrees. Pupils from the higher-burgher schools are only eligible for the first. There is also a free (Calvinistic) university at Amsterdam founded in 1880 and enjoying, since 1905, the right of conferring degrees. It has, however, no faculties of law or science. The state polytechnic school at Delft (1864) for the study of engineering in all its branches, architecture and naval construction, has a nominal course of four years, and confers the degree of "engineer." The fees are the same as those of the universities, and as at the universities there are bursaries. A national institution at Leiden for the study of languages, geography and ethnology of the Dutch Indies has given place to communal institutions of the same nature at Delft and at Leiden, founded in 1864 and 1877. The centre of Dutch university life, which is non-residential, is the students' corps, at the head of which is a "senate," elected annually from among the students of four years' standing. Membership of the corps is gained after a somewhat trying novitiate, but is the only passport to the various social and sports societies.

All teachers in the Netherlands must qualify for their profession by examination. Under the act of 1898 they are trained either in the state training-colleges, or in state-aided municipal, and private

SpinSmart Software http://www.spinsmart.com

denominational colleges; or else by means of state or private state-aided courses of instruction. The age of admission to this class of training is from 14 to 18, and the course is for four years. In the last year practice in teaching is obtained at the primary "practice" school attached to each college, and students are also taught to make models explanatory of the various subjects of instruction after the manner of the Swedish Sloyd (Slöjd) system. Assistant-teachers wishing to qualify as head-teachers must have had two years' practical experience. Pupil-teachers can only give instruction under the supervision of a certificated teacher. The minimum salary of teachers is determined by law. The teaching, which follows the so-called "Heuristic" method, and the equipment of schools of every description, are admirable.

Finance.—The following statement shows the revenue and expenditure of the kingdom for the years 1889, 1900–1901 and 1905:—

Revenue.

Source.	1889.	1901.	1905.

[1] Including various miscellaneous items not specified in detail.

[2] Including, besides the ordinary budget, the outlays in payment of annuities, in funding and discharging debt, in railway extension, &c.

Colonies.—The Dutch colonies in the Malay Archipelago have an area of 600,000 sq. m., with a population of 23,000,000, among which are 35,000 Europeans, 319,000 Chinese, 15,000 Arabs, and 10,000 other immigrant Asiatics. The West Indian possessions of Holland include Dutch Guiana or the government of Surinam, and the Dutch Antilles or the government of Curaçoa and its dependencies (St Eustatius, Saba, the southern half of St Martin, Curaçoa, Bonaire and Aruba), a total area of 60,000 sq. m., with 90,000 inhabitants, of whom a small portion are Europeans, and the rest negroes and other people of colour, and Chinese.

BIBLIOGRAPHY.—The chief place is due to the following geographical publications:—Dr H. Blink, *Nederland en zijne Bewoners* (Amsterdam, 1888–1892), containing a copious bibliography; *Tegenwoordige Staat van Nederland* (Amsterdam, 1897); R. Schuiling, *Aardrijkskunde van Nederland* (Zwolle, 1884); A. A. Beekman, *De Strijd om het Bestaan* (Zutphen, 1887), a manual on the characteristic hydrography of the Netherlands; and E. Reclus' *Nouvelle géographie universelle* (1879; vol. iv.). The *Gedenboek uitgeven ter gelegenheid van het fijftig-jarig bestaan van het Koninklijk Instituut van Ingenieurs, 1847–1897* ('s Gravenhage, 1898), is an excellent aid in studying technically the remarkable works on Dutch rivers, canals, sluices, railways and harbours, and drainage and irrigation works. The *Aardrijkskundig Woordenboek van Nederland*, by P. H. Witkamp (Arnhem, 1895), is a complete gazetteer with historical notes, and *Nomina Geographica Neerlandica*, published by the Netherlands Geographical Society (Amsterdam, 1885, &c.), contains a history of geographical names. *Geschiedenis van den Boereastand en den landbouw in Nederland*, H. Blink (Groningen, 1902), and the report on agriculture, published at the Hague by the Royal Commission appointed in 1896, furnish special information in connexion with this subject. Of more general interest are: *Eene halve Eeuw, 1848–1898*, edited by Dr P. H. Ritter (Amsterdam, 1898), containing a series of articles on all subjects connected with the kingdom during the second half of the 19th century, written by specialists; and *Les Pays Bas* (Leiden, 1899), and *La Hollande géographique, ethnologique, politique, &c.* (Paris, 1900), both works of the same class as the preceding.

Books of travel include some of considerable topographical as well as literary interest, from Lodovico Guicciardini (1567) down to Edmondo de Amicis (*Holland*, translated from the Italian, London, 1883); H. Havard, *Dead Cities of the Zuider Zee, &c.* (translated from the French, London 1876), and D. S. Meldrum, *Holland and the Hollanders* (London, 1899) in the 19th century. Mention may also be made of *Old Dutch Towns and Villages of the Zuider Zee*, by W. J. Tuyn (translated from the Dutch, London, 1901), *Nieuwe Wanderlingen door Nederland*, by J. Craandijk and P. A. Schipperns (Haarlem ,1888); *Friesland Meres and through the Netherlands*, by H. M. Doughty (London, 1887); *On Dutch Waterways*, by G. C. Davis (London, 1887); *Hollande et hollandais*, by H. Durand (Paris, 1893); and *Holland and Belgium* by Professor N. G. van Kampen (translated from the Dutch, London, 1860), the last three being chiefly remarkable for their fine illustrations. Works of historical and antiquarian interest of a high order are *Merkwaardige Kasteelen in Nederland*, by J. van Lennep and W. J. Hofdyk (Leiden, 1881–1884); *Noord-Hollandsche Oudheden*, by G. van Arkel and A. W. Weisman, published by the Royal Antiquarian Society (Amsterdam, 1891); and *Oud Holland*, edited by A. D. de Vries and N. de Roever (Amsterdam, 1883–1886), containing miscellaneous contributions to the history of ancient Dutch art, crafts and letters. Natural history is covered by various periodical publications of the Royal Zoological Society "Natura Artis Magistra" at Amsterdam, and the *Natuurlijke Historie van Nederland* (Haarlem, 1856–1863) written by specialists, and including ethnology and flora. Military and naval defence may be studied in *De vesting Holland*, by A. L. W. Seijffardt (Utrecht, 1887), and the *Handbook of the Dutch Army*, by Major W. L. White, R.A. (London, 1896); ecclesiastical history in *The Church in the Netherlands*, by P. H. Ditchfield (London, 1893); and education in vol. viii. of the *Special Reports on Educational Subjects* issued by the Board of Education, London. Statistics are furnished by the annual publication of the Society for Statistics in the Netherlands, Amsterdam.

HISTORY FROM 1579 TO MODERN TIMES[3]

Consequences of the Union o. Utrecht.

The political compact known as the Union of Utrecht differed from its immediate predecessors, the Pacification of Ghent, the Union of Brussels and the Perpetual Edict, in its permanence. The confederacy of the northern provinces of the Netherlands which was effected (29th of January 1579) by the exertions of John of Nassau, was destined to be the beginning of a new national life. The foundation was laid on which the Republic of the

[3] For the history of the Netherlands previous to the confederacy of the northern provinces in 1579 see NETHERLANDS.

SpinSmart Software http://www.spinsmart.com

United Netherlands was to be raised. Its immediate results were far from promising. The falling away of the Walloon provinces and the Catholic nobles from the patriot cause threatened it with ruin. Nothing but the strong personal influence and indefatigable labours of the prince of Orange stood in the way of a more general defection. Everywhere, save in staunch and steadfast Holland and Zeeland, a feeling of wavering and hesitation was spreading through the land. In Holland and Zeeland William was supreme, but elsewhere his aims and his principles were misrepresented and misunderstood. He saw that unaided the patriotic party could not hope to resist the power of Philip II., and he had therefore resolved to gain the support of France by the offer of the sovereignty of the Netherlands to the duke of Anjou. But Anjou was a Catholic, and this fact aroused among the Protestants a feeling that they were being betrayed. But the prince persisted in the policy he felt to be a necessity, and (23rd of Jan. 1581) a treaty was concluded with the duke, by which he, under certain conditions, agreed to accept the sovereignty of the Netherland provinces, except Holland and Zeeland. These two provinces were unwilling to have any sovereign but William himself, and after considerable hesitation he agreed to become their Count (24th of July 1581). He felt that he was justified in taking this step because of the Ban which Philip had published on the 15th of March 1581, in which Orange had been proclaimed a traitor and miscreant, and a reward offered to any one who would take his life. His practical answer to the king was the act of Abjuration, by which at his persuasion the representatives of the provinces of Brabant, Flanders, Holland, Zeeland, Gelderland and Utrecht, assembled at the Hague, declared that Philip had forfeited his sovereignty over them, and that they held themselves henceforth absolved from their allegiance to him. In a written defence, the famous *Apology*, published later in the year, William replied at great length to the charges that had been brought against him, and carrying the war into the enemy's camp, endeavoured to prove that the course he had pursued was justified by the crimes and tyranny of the king.

Sovereignty offered to the Duke of Anjou.

The Ban against William of Orange.

The Act of Abjuration.

The Apology.

The duke of Anjou was solemnly inaugurated as duke of Brabant (February 1582), and shortly afterwards as duke of Gelderland, count of Flanders and lord of Friesland. William had taken up his residence at Antwerp in order to give the French prince his strongest personal support, and while there a serious attempt was made upon his life (March 18th) by a youth named Jean Jaureguy. He fired a pistol at the prince close to his head, and the ball passed under the right ear and out at the left jaw. It was a terrible wound, but fortunately not fatal. Meanwhile Anjou soon grew tired of his dependent position and of the limitations placed upon his sovereignty. He resolved by a secret and sudden attack (17th of January 1583) to make himself master of Antwerp and of the person of Orange. The assault was made, but it proved an utter failure. The citizens resisted stoutly behind barricades, and the French were routed with heavy loss. The "French Fury" as it was called, rendered the position of Anjou in the Netherlands impossible, and made William himself unpopular in Brabant. He accordingly withdrew to Delft. In the midst of his faithful Hollanders he felt that he could still organize resistance, and stem the progress made by Spanish arms and Spanish influence under the able leadership of Alexander of Parma. Antwerp, with St Aldegonde as its burgomaster, was still in the hands of the patriots and barred the way to the sea, and covered Zeeland from invasion. Never for one moment did William lose heart or relax his efforts and vigilance; he felt that with the two maritime provinces secure the national cause need not be despaired of. But his own days had now drawn to their end. The failure of Jaureguy did not deter a young Catholic zealot, by name Balthazar Gérard, from attempting to assassinate the man whom he looked upon as the arch-enemy of God and the king. Under the pretext of seeking a passport, Gérard penetrated into the Prinsenhof at Delft, and firing point blank at William as he left the dining hall, mortally wounded him (10th of July 1584). Amidst general lamentations "the Father of his Country," as he was called, was buried with great state in the Nieuwe Kerk at Delft at the public charge.

Attempt on the Life of Orange by Jean Jaureguy.

The French Fury.

Assassination of William the Silent.

But though the great leader was dead, he had not striven or worked in vain. The situation was critical, but there was no panic. Throughout the revolted provinces there was a general determination to continue the struggle to the bitter end. To make head, however, against the victorious advance of Parma, before whose arms all the chief towns of Brabant and Flanders, Bruges, Ghent, Brussels and lastly—after a valiant defence—Antwerp itself had fallen, it was necessary to look for the protection of a foreign ruler. The government, now that the commanding personal influence of William was no more, was without any central authority which could claim obedience. The States-General were but the delegates of a number of sovereign provinces, and amongst these Holland by its size and wealth (after the occupation by the Spaniards of Brabant and Flanders) was predominant. Maurice of Nassau, William's second son, had indeed on his father's death been appointed captain and admiral-general of the Union, president of the Council of State, and stadholder of Holland and Zeeland, but he was as yet too young, only seventeen, to take a leading part in affairs. Count Hohenloo took the command of the troops with the title of lieutenant-general. Two devoted adherents of William of Orange, Paul Buys, advocate of Holland, and Johan van Oldenbarneveldt, pensionary of Rotterdam, were the statesmen who at this difficult juncture took the foremost part in directing the policy of the confederacy. They turned first to France. The sovereignty of the provinces was offered to Henry III., but the king, harassed by civil discords in his own country, declined the dangerous honour (1585). Repelled in this direction, the States-General next turned themselves to England. Elizabeth was alarmed by the successes of the Spanish arms, and especially by the fall of Antwerp; and, though refusing the sovereignty, she agreed to send a force of 5000 foot and 1000 horse to the aid of the Provinces under the command of the earl of Leicester, her expenses being guaranteed by the handing over to her the towns of Flushing, Brill and Rammekens as pledges (10th of August 1585). Leicester, on landing in Holland, was in the presence of the States-General and of Maurice of Nassau invested with the title of governor-general and practically sovereign powers (February 1586).

Maurice of Nassau.

The Sovereignty offered to Henry III. and declined.

Leicester Governor-general.

The new governor had great difficulties to contend with. He knew nothing of the language or the character of the people he was called upon to govern; his own abilities both as general and statesman were mediocre; and he was hampered constantly in his efforts by the niggardliness and changing whims of his royal mistress. In trying to consolidate the forces of the Provinces for united action and to centralize its government, he undoubtedly did his best, according to his lights, for the national cause. But he was too hasty and overbearing. His edict prohibiting all commercial intercourse with the enemy at once aroused against him the bitter hostility of the merchants of Holland and Zeeland, who thrived by such traffic. His attempts to pack the council of State, on which already two Englishmen had seats, with personal adherents and to override the opposition of the provincial states of Holland to his arbitrary acts, at last made his position impossible. The traitorous surrender of Deventer and Zutphen by their English governors, Stanley and York, both Catholics, rendered all Englishmen suspect. The States of Holland under the leadership of Johan van Oldenbarneveldt, took up an attitude of resolute hostility to him, and the States of Holland dominated the States-General. In the midst of these divided councils the important seaport of Sluis was taken by Parma. Utterly discredited, Leicester (6th of August 1587) abandoned the task,

Failure and withdrawal of Leicester.

SpinSmart Software http://www.spinsmart.com

in which he had met with nothing but failure, and returned to England.

Nothing could have been worse than the position of the States at the beginning of 1588. Had Parma had a free hand, in all probability he would have crushed out the revolt and reconquered the northern Netherlands. But the attention of the Spanish king was at this time concentrated upon the success of the Invincible Armada. The army of Parma was held in readiness for the invasion of England, and the United Provinces had a respite. They were fortunately able to avail themselves of it. The commanding abilities of Oldenbarneveldt, now advocate of Holland, gradually gathered into his hands the entire administration of the Republic. He became indispensable and, as his influence grew, more and more did the policy of the provinces acquire unity and consistency of purpose. At the same time Maurice of Nassau, now grown to man's estate, began to display those military talents which were to gain for him the fame of being the first general of his time. But Maurice was no politician. He had implicit trust in the advocate, his father's faithful friend and counsellor, and for many years to come the statesman and the soldier worked in harmony together for the best interests of their country (see OLDENBARNEVELDT, and MAURICE, prince of Orange). At the side of Maurice, as a wise adviser, stood his cousin William Louis, stadholder of Friesland, a trained soldier and good commander in the field.

Johan van Oldenbarneveldt.

Maurice of Nassau.

After the destruction of the Armada, Parma had been occupied with campaigns on the southern frontier against the French, and the Netherlanders had been content to stand on guard against attack. The surprise of Breda by a stratagem (8th of March 1590) was the only military event of importance up to 1591. But the two stadholders had not wasted the time. The States' forces had been reorganized and brought to a high state of military discipline and training. In 1591 the States-General, after considerable hesitation, were persuaded by Maurice to sanction an offensive campaign. It was attended by marvellous success. Zutphen was captured on the 20th of May, Deventer on the 20th of June. Parma, who was besieging the fort of Knodsenburg, was forced to retire with loss. Hulst fell after a three days' investment, and finally Nymegen was taken on the 21st of October. The fame of Maurice, a consummate general at the early age of twenty-four, was on all men's lips. The following campaign was signalized by the capture of Steenwyk and Koevorden. On the 8th of December 1592 Parma died, and the States were delivered from their most redoubtable adversary. In 1593 the leaguer of Geertruidenburg put the seal on Maurice's reputation as an invincible besieger. The town fell after an investment of three months. Groningen was the chief fruit of the campaign of 1594. With its dependent district it was formed into a new province under the name of Stadt en Landen. William Louis became the stadholder (see GRONINGEN). The soil of the northern Netherlands was at last practically free from the presence of Spanish garrisons.

Campaign of 1591.

Death of Parma.

New province of Stadt en Landen.

The growing importance of the new state was signalized by the conclusion, in 1596, of a triple alliance between England, France and the United Provinces. It was of short duration and purchased by hard conditions, but it implied the recognition by Henry IV. and Elizabeth of the States-General, as a sovereign power, with whom treaties could be concluded. Such a recognition was justified by the brilliant successes of the campaign of 1597. It began with the complete rout of a Spanish force of 4500 men at Turnhout in January, with scarcely any loss to the victors. Then in a succession of sieges Rheinberg, Meurs, Groenlo, Bredevoort, Enschede, Ootmarsum, Oldenzaal and Lingen fell into the hands of Maurice.

Triple Alliance of France, England and the United Provinces.

The relations of the Netherlands to Spain were in 1598 completely changed. Philip II. feeling death approaching, resolved to marry his elder daughter, the Infanta Isabel Clara Eugenia, to her cousin, the Cardinal Archduke Albert of Austria, who had been governor-general of the Netherlands since 1596, and to erect the Provinces into an independent sovereignty under their joint rule. The instrument was executed in May; Philip died in September; the marriage took place in November. In case the marriage should have no issue, the sovereignty of the Netherlands was to revert to the king of Spain. The archdukes (such was their official title) did not make their *joyeuse entrée* into Brussels until the close of 1599. The step was taken too late to effect a reconciliation with the rebel provinces. Peace overtures were made, but the conditions were unacceptable. The States-General never seriously considered the question of giving in their submission to the new sovereigns. The traders of Holland and Zeeland had thriven mightily by the war. Their ships had penetrated to the East and West Indies, and were to be found in every sea. The year 1600 saw the foundation of the Chartered East India Company (see DUTCH EAST INDIA COMPANY). The question of freedom of trade with the Indies had become no less vital to the Dutch people than freedom of religious worship. To both these concessions Spanish policy was irreconcilably opposed.

Albert and Isabel, Sovereigns of the Netherlands.

Dunkirk, as a nest of freebooters who preyed upon Dutch commerce, was made the objective of a daring offensive campaign in 1600 by the orders of the States-General under the influence of Oldenbarneveldt in the teeth of the opposition of the stadholders Maurice and William Louis. By a bold march across Flanders, Maurice reached Nieuport on the 1st of July, and proceeded to invest it. The archduke Albert, however, followed hard on his steps with an army of seasoned troops, and Maurice, with his communications cut, was forced to fight for his existence. A desperate combat took place on the dunes between forces of equal strength and valour. Only by calling up his last reserves did victory declare for Maurice. The archduke had to fly for his life. Five thousand Spaniards were killed; seven hundred taken, and one hundred and five standards. To have thus worsted the dreaded Spanish infantry in open fight was a great triumph for the States troops and their general, but it was barren of results. Maurice refused to run further risks and led back his army to Holland. For the following three years all the energies alike of the archdukes and the States-General were concentrated on the siege of Ostend (15th of July 1601–20th of Sept. 1604), the solitary possession of the Dutch in Flanders. The heroic obstinacy of the defence was equalled by the perseverance of the attack, and there was a vast expenditure, especially on the side of the Spaniards, of blood and treasure. At last when reduced to a heap of ruins, Ostend fell before the resolution of Ambrosio de Spinola, a Genoese banker, to whom the command of the besiegers had been entrusted (see SPINOLA). A month before the surrender, however, another and more commodious seaport, Sluis, had fallen into the possession of the States army under Maurice, and thus the loss of Ostend was discounted.

The Battle of Nieuport.

Siege of Ostend.

Spinola proved himself to be a general of a high order, and the campaigns of 1606 and 1607 resolved themselves into a duel of skill between him and Maurice without much advantage accruing to either side. But the archdukes' treasury was now empty, and their credit exhausted; both sides were weary of fighting, and serious negotiations for peace were set on foot. The disposition of the Spaniards to make concessions was further quickened by the destruction of their fleet at Gibraltar by the Dutch admiral Heemskerk, (April 1607). But there were many difficulties in the way. The peace party in the United Provinces headed by Oldenbarneveldt was opposed by the stadholders Maurice and William Louis, the great majority of the military and naval officers, the Calvinist preachers and many leading merchants. The Spaniards on their side were obdurate on the subjects of freedom of trade in the Indies and of freedom of religious worship. At last, after the negotiations had been repeatedly on the point of breaking off, a compromise was effected by the mediation of the envoys of France and England. On the 9th of April 1609

Negotiations for Peace.

SpinSmart Software http://www.spinsmart.com

a truce for twelve years was agreed upon. On all points the Dutch demands were granted. The treaty was concluded with the Provinces, "in the quality of free States over whom the archdukes made no pretentions." The *uti possidetis* as regards territorial possession was recognized. Neither the granting of freedom of worship to Roman Catholics nor the word "Indies" was mentioned, but in a secret treaty King Philip undertook to place no hindrance in the way of Dutch trade, wherever carried on.

The Twelve Years' Truce.

One of the immediate results of this triumph of his policy was the increase of Oldenbarneveldt's influence and authority in the government of the Republic. But though Maurice and his other opponents had reluctantly yielded to the advocate's skilful diplomacy and persuasive arguments, a soreness remained between the statesman and the stadholder which was destined never to be healed. The country was no sooner relieved from the pressure of external war than it was torn by internal discords. After a brief interference in the affairs of Germany, where the intricate question of the Cleves-Jülich succession was already preparing the way for the Thirty Years' War, the United Provinces became immersed in a hot and absorbing theological struggle with which were mixed up important political issues. The province of Holland was the arena in which it was fought out. Two professors of theology at Leiden, Jacobus Arminius (see ARMINIUS) and Franciscus Gomarus, became the leaders of two parties, who differed from one another upon certain tenets of the abstruse doctrine of predestination. Gomarus supported the orthodox Calvinist view; Arminius assailed it. The Arminians appealed to the States of Holland (1610) in a Remonstrance in which their theological position was defined. They were henceforth known as "Remonstrants"; their opponents were styled "Contra-Remonstrants." The advocate and the States of Holland took sides with the Remonstrants, Maurice and the majority of the States-General (four provinces out of seven) supported the Contra-Remonstrants. It became a question of the extent of the rights of sovereign princes under the Union. The States-General wished to summon a national synod, the States of Holland refused their assent, and made levies of local militia (*waard-gelders*) for the maintenance of order. The States-General (9th of July 1618) took up the challenge, and the prince of Orange, as captain-general, was placed at the head of a commission to go in the first place to Utrecht, which supported Oldenbarneveldt, and then to the various cities of Holland to insist on the disbanding of the *waard-gelders*. On the side of Maurice, whom the army obeyed, was the power of the sword. The opposition collapsed; the recalcitrant provincial states were purged; and the leaders of the party of state rights—the advocate himself, Hugo de Groot (see GROTIUS), pensionary of Rotterdam, and Hoogerbeets, pensionary of Leiden, were arrested and thrown into prison. The whole proceedings were illegal, and the illegality was consummated by the prisoners being brought before a special tribunal of 24 judges, nearly all of whom were personal enemies of the accused. The trial was merely a preliminary to condemnation. The advocate was sentenced to death, and executed (13th of May 1619) in the Binnenhof at the Hague. The sentences of Grotius and Hoogerbeets were commuted to perpetual imprisonment.

Waard-gelders.

Oldenbarneveldt executed.

Meanwhile the National Synod had been summoned and had met at Dort on the 13th of November 1618. One hundred members, many of them foreign divines, composed this great assembly, who after 154 sittings gave their seal to the doctrines of the Netherlands Confession and the Heidelberg Catechism. The Arminians were condemned, their preachers deprived, and the Remonstrant party placed under a ban (6th of May 1619).

Synod of Dort.

In 1621 the Twelve Years' Truce came to an end, and war broke out once more with Spain. Maurice, after the death of Oldenbarneveldt, was supreme in the land, but he missed sorely the wise counsels of the old statesman whose tragic end he had been so largely instrumental in bringing about. He and Spinola found themselves once more at the head of the armies in the field, but the health of the stadholder was undermined, and his military genius was under a cloud. Deeply mortified by his failure to relieve Breda, which was blockaded by Spinola, Maurice fell seriously ill, and died on the 23rd of April 1625. He was succeeded in his dignities by his younger brother Frederick Henry (see FREDERICK HENRY, prince of Orange), who was appointed stadholder of Holland, Zeeland, Utrecht, Overyssel and Gelderland, captain and adjutant-general of the Union and head of the Council of State. Frederick Henry was as a general scarcely inferior to Maurice, and a far more able statesman. The moderation of his views and his conciliatory temper did much to heal the wounds left by civil and religious strife, and during his time the power and influence of the stadholderate attained their highest point. Such was his popularity and the confidence he inspired that in 1631 his great offices of state were declared hereditary, in favour of his five-year-old son, by the *Acte de Survivance*. He did much to justify the trust placed in him, for the period of Frederick Henry is the most brilliant in the history of the Dutch Republic. During his time the East India Company, which had founded the town of Batavia in Java as their administrative capital, under a succession of able governor-generals almost monopolized the trade of the entire Orient, made many conquests and established a network of factories and trade posts stretching from the Cape of Good Hope to Japan (see DUTCH EAST INDIA COMPANY). The West India Company, erected in 1621, though framed on the same model, aimed rather at waging war on the enemies' commerce than in developing their own. Their fleets for some years brought vast booty into the company's coffers. The Mexican treasure ships fell into the hands of Piet Heyn, the boldest of their admirals, in 1628; and they were able to send armies across the ocean, conquer a large part of Brazil, and set up a flourishing Dutch dominion in South America (see DUTCH WEST INDIA COMPANY). The operations of these two great chartered companies occupy a place among memorable events of Frederick Henry's stadholderate; they are therefore mentioned here, but for further details the special articles must be consulted.

Renewal of the war.

Death of Maurice.

The period of Frederick Henry.

The East and West India Companies.

When Frederick Henry stepped into his brother's place, he found the United Provinces in a position of great danger and of critical importance. The Protestants of Germany were on the point of being crushed by the forces of the Austrian Habsburgs and the Catholic League. It lay with the Netherlands to create a diversion in the favour of their co-religionists by keeping the forces of the Spanish Habsburgs fully occupied. But to do so with their flank exposed to imperialist attack from the east, was a task involving grave risks and possible disaster. In these circumstances, Frederick Henry saw the necessity of securing French aid. It was secured by the skilful diplomacy of Francis van Aarssens (*q.v.*) but on hard conditions. Richelieu required the assistance of the Dutch fleet to enable him to overcome the resistance of the Huguenot stronghold of La Rochelle. The far-sighted stadholder, despite popular opposition, by his powerful personal influence induced the States-General to grant the naval aid, and thus obtain the French alliance on which the safety of the republic depended.

Policy of Frederick Henry.

The first great military success of Frederick Henry was in 1629. His capture of Hertogenbosch (Bois-le-duc), hitherto supposed to be impregnable, after a siege of five months was a triumph of engineering skill. Wesel also was taken by surprise this same year. In 1631 a large Spanish fleet carrying a picked force of 6000 soldiers, for the invasion of Zeeland, was completely destroyed by the Dutch in the Slaak and the troops made prisoners. The campaign of the following year was made memorable by the siege of Maestricht. This important frontier town lying on both sides of the river Meuse was taken by the prince of Orange in the teeth of two relieving armies, Spanish

Sieges of Hertogenbosch and Maestricht.

SpinSmart Software http://www.spinsmart.com

and Imperialist, whose united forces were far larger than his own. This brilliant feat of arms was the prelude to peace negotiations, which led to a lengthy exchange of diplomatic notes. No agreement, however, was reached. The death of the Infanta Isabel in November 1633, and the reversion of the Netherlands to the sovereignty of the king of Spain, rendered all efforts to end the war, for the time being, fruitless.

Death of the Infanta Isabel.

At this juncture a strengthening of the French alliance seemed to the prince not merely expedient, but necessary. He had to contend against a strong peace party in Holland headed by the pensionary Pauw, but with the aid of the diplomatic skill of Aarssens all opposition was overcome. Pauw was replaced as pensionary by Jacob Cats, and the objections of Richelieu were met and satisfied. A defensive and offensive alliance with France was concluded early in 1635 against the king of Spain, and each party bound itself not to make a peace or truce without the assent of the other. A large French force was sent into the Netherlands and placed under the command of the prince of Orange. The military results of the alliance were during the first two campaigns inconsiderable. The Cardinal Infant Ferdinand had been appointed governor of the Netherlands, and he proved himself an excellent general, and there were dissensions in the councils of the allies. In 1637 the stadholder was able to add to his fame as an invincible besieger of cities. His failure to relieve Breda had hastened the death of Maurice. It fell in 1625 into the hands of Spinola after a blockade of eleven months; it was now retaken by Frederick Henry after a siege of eleven weeks, in the face of immense difficulties. The reluctance of the States of Holland, and of Amsterdam in particular, to grant adequate supplies caused the campaigns of 1638 and 1639 to be in the main defensive and dilatory. An attempted attack on Antwerp was foiled by the vigilance of the Cardinal Infant. A body of 6000 men under Count William of Nassau were surprised and utterly cut to pieces. The year 1639, which had begun with abortive negotiations, and in which the activity of the stadholder had been much hampered by ill-health, was not to end, however, without a signal triumph of the Dutch arms, but it was to be on sea and not on land. A magnificent Spanish armada consisting of 77 vessels, manned by 24,000 soldiers and sailors under the command of Admiral Oquendo, were sent to the Channel in September with orders to drive the Dutch from the narrow seas and land a large body of troops at Dunkirk. Attacked by a small Dutch fleet under Admiral Marten Tromp, the Spaniards sheltered themselves under the English Downs by the side of an English squadron. Tromp kept watch over them until he had received large reinforcements, and then (21st of October) boldly attacked them as they lay in English waters. Oquendo himself with seven vessels escaped under cover of a fog; all the rest of the fleet was destroyed. This crushing victory assured to the Dutch the command of the sea during the rest of the war. The naval power of Spain never in fact recovered from the blow.

Alliance with France.

Capture of Breda.

Battle of the Downs.

The triumph of Tromp had, however, a bad effect on public feeling in England. The circumstances under which the battle of the Downs was won were galling to the pride of the English people, and intensified the growing unfriendliness between two nations, one of whom possessed and the other claimed supremacy upon the seas. The prosperity of the world-wide Dutch commerce was looked upon with eyes of jealousy across the Channel. Disputes had been constantly recurring between Dutch and English traders in the East Indies and elsewhere, and the seeds were already sown of that stern rivalry which was to issue in a series of fiercely contested wars. But in 1639–1640 civil discords in England stood in the way of a strong foreign policy, and the adroit Aarssens was able so "to sweeten the bitterness of the pill" as to bring King Charles not merely to "overlook the scandal of the Downs," but to consent to the marriage of the princess royal with William, the only son of the stadholder. The wedding of the youthful couple (aged respectively 14 and 10 years) took place on the 12th of May 1641 (see WILLIAM II., prince of Orange). This royal alliance gave added influence and position to the house of Orange-Nassau.

English and Dutch Commercial Rivalry.

Marriage of William and Mary.

About this time various causes brought about a change in the feelings which had hitherto prevented any possibility of peace between Spain and the United Netherlands. The revolt of Portugal (December 1640) weakened the Spanish power, and involved the loss to Spain of the Portuguese colonies. But it was in the Portuguese colonies that the conquests of the Dutch East and West India Companies had been made, and the question of the Indies as between Netherlander and Spaniard assumed henceforth quite a different complexion. Aarssens, the strongest advocate of the French alliance, passed away in 1641, and his death was quickly followed by those of Richelieu and Louis XIII. The victory of Condé at Rocroy opened the eyes of Frederick Henry to the danger of a French conquest of the Belgian provinces; and, feeling his health growing enfeebled, the prince became anxious before his death to obtain peace and security for his country by means of an accommodation with Spain. In 1643 negotiations were opened which, after many delays and in the face of countless difficulties, were at length, four years later, to terminate successfully.

Changed relations of the United Provinces with France and Spain.

The course of the *pourparlers* would doubtless have run more smoothly but for the infirm health and finally the death of the prince of Orange himself. Frederick Henry expired on the 14th of March 1647, and was buried by the side of his father and brother in Delft. In his last campaigns he had completed with signal success the task which, as a military commander, he had set himself,—of giving to the United Provinces a thoroughly defensible frontier of barrier fortresses. In 1644 he captured Sas de Ghent; in 1645 Hulst. That portion of Flanders which skirts the south bank of the Scheldt thus passed into the possession of the States, and with it the complete control of all the waterways to the sea.

Death of Frederick Henry—his last campaigns.

The death of the great stadholder did not, however, long delay the carrying out of the policy on which he had set his heart, of concluding a separate peace with Spain behind the back of France, notwithstanding the compact of 1635 with that power. A provisional draft of a treaty had already been drawn up before the demise of Frederick Henry, and afterwards, despite the strenuous opposition of the new prince of Orange (who, under the *Acte de Survivance*, had inherited all his father's offices and dignities) and of two of the provinces, Zeeland and Utrecht, the negotiations were by the powerful support of the States of Holland and of the majority of the States-General, quickly brought to a successful issue. The treaty was signed at Münster on the 30th of January 1648. It was a peace practically dictated by the Dutch, and involved a complete surrender of everything for which Spain had so long fought. The United Provinces were recognized as free and independent, and Spain dropped all her claims; the *uti possidetis* basis was adopted in respect to all conquests; the Scheldt was declared entirely closed—a clause which meant the ruin of Antwerp for the profit of Amsterdam; the right to trade in the East and West Indies was granted, and all the conquests made by the Dutch from the Portuguese were ceded to them; the two contracting parties agreed to respect and keep clear of each other's trading grounds; each was to pay in the ports of the other only such tolls as natives paid. Thus, triumphantly for the revolted provinces, the eighty years' war came to an end. At this moment the republic of the United Netherlands touched, perhaps, the topmost point of its prosperity and greatness.

The Peace of Munster.

Complete triumph of the Dutch.

No sooner was peace concluded than bitter disputes arose between the provincial States of Holland and the prince of Orange, supported by the other six provinces, upon the question of the disbanding of the military forces. William was a young man (he was twenty-one at the time of his father's death) of

SpinSmart Software http://www.spinsmart.com

the highest abilities and of soaring ambition. He was totally opposed to the peace with Spain, and wished to bring about a speedy resumption of the war. With this view he entered into secret negotiations for a French alliance which, as far as can be gathered from extant records, had for its objects the conquest and partition by the allies of the Belgic provinces, and joint action in England on behalf of Charles II. As a preliminary step William aimed at a centralization of the powers of government in the United Provinces in his own person. He saw clearly the inherent defects of the existing federation, and he wished to remedy a system which was so complicated as to be at times almost unworkable. The States-General were but the delegates, the stadholders the servants, of a number of sovereign provinces, each of which had different historical traditions and a different form of government, and one of which—Holland—in wealth and importance outweighed the other six taken together. Between the States of Holland and the States-General there was constant jealousy and friction. And yet strangely enough the States of Holland themselves were not really representative of the people of that province, but only of the limited, self-coopting burgher aristocracies of certain towns, each of which with its rights and liberties had a quasi-independence of its own. Foremost among these was the great commercial capital, Amsterdam, whose rich burgher patriciate did not scruple on occasion to defy the authority of the States-General, the stadholder and even of the States of Holland themselves.

The form of Government in the United Provinces.

The position of Holland and Amsterdam.

The States of Holland had, in the years that followed the truce of 1609, measured their strength with that of the States-General, but the issue had been decided conclusively in favour of the federal authority by the sword of Maurice. The party and the principles of Oldenbarneveldt, however, though crushed, were not extinguished, and though Frederick Henry by his personal influence and prudent statesmanship had been able to surmount the difficulties placed in his way, he had had to encounter at times strong opposition, and had been much hampered in the conduct both of his campaigns and of his policy. With the conclusion of the peace of Munster and the death of the veteran stadholder the struggle for predominance in the Union between the Orange-federalist and the Hollander States-rights parties was certain to be renewed. The moment seemed to be favourable for the assertion of provincial sovereignty because of the youth and inexperience of the new prince of Orange. But William II., though little more than a boy, was endowed with singular capacity and great strength of will, and he was intent upon ambitious projects, the scope of which has been already indicated. The collision came, which was perhaps inevitable. The States-General in the disbanding of the forces wished to retain the *cadres* of the regiments complete in case of a renewal of the war. The States of Holland objected, and, although the army was a federal force, gave orders for the general disbanding of the troops in the pay of the province. The officers refused to obey any orders but those of the council of State of the Union. The provincial states, on their part, threatened them with loss of pay. At this juncture the States-General, as in 1618, appointed a commission headed by the prince of Orange to visit the towns of Holland, and provide for the maintenance of order and the upholding of the Union. Both parties put themselves in the wrong, the province by refusing its quota to the federal war-sheet, the generality by dealing with individual towns instead of with the states of the province. The visitation was a failure. The town councils, though most of them willing to receive William in his capacity as stadholder, declined to give a hearing to the commission. Amsterdam refused absolutely to admit either stadholder or commission. In these circumstances William resolved upon strong measures. Six leading members of the States of Holland were seized (30th of July 1650) and imprisoned in Loevenstein Castle, and troops under the command of William Frederick stadholder of Friesland, were sent to surprise Amsterdam. But the town council had been warned, and the gates were shut and guarded. The *coup d'état* nevertheless was completely successful. The anti-Orange party, remembering the fate of Oldenbarneveldt, were stricken with panic at the imprisonment of their leaders. The States of Holland and the town council of Amsterdam gave in their submission. The prisoners were released, and public thanks were rendered to the prince by the various provincial states for "his great trouble, care and prudence." William appeared to be master of the situation but his plans for future action were never to be carried into effect. Busily engaged in secret negotiations with France, he had retired to his hunting seat at Dieren, when he fell ill with smallpox on the 27th of October. A few days later he expired at the Hague (6th of November), aged but twenty-four years. A week after his death, his widow, the princess Mary of England, gave birth to a son who, as William III., was to give added lustre to the house of Orange.

The position in 1650.

The question of disbanding the forces.

The Prisoners of Loevenstein.

Sudden Death of William II.

The anti-Orange particularist party, which had just suffered decisive defeat, now lifted up its head again. At the instance of Holland a Grand Assembly was summoned, consisting of delegates from all the provinces, to consider the state of the Union, the army and religion. It met at the Hague on the 18th of January 1651. The conclusions arrived at were that all sovereign powers resided in the provinces, and that to them severally, each within its own borders, belonged the control of the military forces and of religion. There was to be no captain-general of the Union. All the provinces, except Friesland and Groningen, which remained true to William Frederick of Nassau-Dietz, agreed to leave the office of stadholder vacant. The practical result was the establishment of the hegemony of Holland in the Union, and the handing over of the control of its policy to the patrician oligarchies who formed the town councils of that province.

The Grand Assembly.

Such a system would have been unworkable but for the fact that with the revival of the political principles of Oldenbarneveldt, there was found a statesman of commanding ability to fill the office in which the famous advocate of Holland had for so many years been "minister of all affairs" in the forming state. The title of advocate had indeed been replaced by that of grand pensionary (*Raad Pensionaris*), but the duties assigned to the office remained the same, the only change of importance being that the advocate was appointed for life, the grand pensionary for a term of five years. The grand pensionary was nominally the paid servant of the States of Holland, but his functions were such as to permit a man of talent and industry in the stadholderless republic to exercise control in all departments of policy and of government. All correspondence passed through his hands, he wrote all despatches, conducted the debates over which he presided, kept the minutes, drafted the resolutions, and was *ex officio* the leader and spokesman of the delegates who represented the Province of Holland in the States-General. Such was the position to which John de Witt, a young man of twenty-eight years of age, belonging to one of the most influential patrician families of Dordrecht (his father, Jacob de Witt, was one of the prisoners of Loevenstein) was appointed in 1653. From that date until 1672 it was his brain and his will that guided the affairs of the United Netherlands. He was supreme in the States of Holland, and Holland was dominant in the States-General (see JOHN DE WITT).

The office of Grand Pensionary.

John de Witt.

The death of William II. had left the Dutch republic at the very highest point of commercial prosperity, based upon an almost universal carrying trade, and the strictest system of monopoly. Friction and disputes had frequently arisen between the Dutch and the English traders in different parts of the world, and especially in the East Indies, culminating in the so-called "Massacre of Amboyna"; and the strained relations between the two nations would, but for the civil discords in England, have probably led to active hostilities during the reign of Charles I. With the accession of Cromwell to power the breach

Disputes between English and Dutch Traders.

SpinSmart Software http://www.spinsmart.com

was widened. A strong party in the Provinces were unfriendly to the Commonwealth, and insults were offered in the Hague to the English envoys. The parliament replied by passing the memorable Navigation Act (Oct. 1651), which struck a deadly blow at the Dutch carrying trade. It was the beginning of that struggle for supremacy upon the seas which was to end, after three great wars, in the defeat of the weaker country. The first English war lasted from May 1652 to April 1654, and within fifteen months twelve sea-fights took place, which were desperately contested and with varying success. The leaders on both sides—the Netherlanders Tromp (killed in action on the 10th of August 1653) and de Ruyter, the Englishmen Blake and Monk—covered themselves with equal glory. But the losses to Dutch trade were so serious that negotiations for peace were set on foot by the burgher party of Holland, and Cromwell being not unwilling, an agreement was reached in the Treaty of Westminster, signed on the 5th of April 1654. The Dutch conceded the striking of the flag and compensation for English claims against the Dutch in the East Indies and elsewhere. The act of Seclusion, which barred the young prince of Orange from holding the office of stadholder and of captain-general, had been one of the conditions on which Cromwell had insisted. The consent of the States-General was refused, but by a secret treaty Holland, under the influence of de Witt, accepted it in their own name as a sovereign province. The popular feeling throughout the United Provinces was strongly antagonistic to the act of Seclusion, by which at the dictation of a foreign power a ban of exclusion was pronounced against the house of Orange-Nassau, to which the republic owed its independence.

Naval struggle with England.

Peace of Westminster.

Act of Seclusion.

In 1658, the States-General interfered to save the Danes from Charles Gustavus of Sweden. In 1659 a treaty of peace was concluded between France, England and the United Provinces with a view to the settlement of the Dano-Swedish question, which ended in securing a northern peace in 1660, and in keeping the Baltic open for Dutch trade. The foreign affairs of the republic were throughout these years ably conducted by de Witt, and the position of Dutch colonial expansion in the Eastern seas made secure and firm. An advantageous peace with Portugal was made in 1662.

War with Sweden.

Meanwhile the Commonwealth in England had been followed in 1660 by the restoration of the monarchy. To conciliate the new king the act of Seclusion was repealed, and the education of the young prince of Orange was undertaken by the States of Holland under the superintendence of de Witt. But Charles owed a grudge against Holland, and he was determined to gratify it. The Navigation Act was re-enacted, old grievances revived, and finally the Dutch colony of New Netherland was seized in time of peace (1664) and its capital, New Amsterdam, renamed New York. War broke out in 1665, and was marked by a series of terrific battles. On the 13th of June 1665 the Dutch admiral Obdam was completely defeated by the English under the duke of York. The four days' fight (11th–14th of June 1666) ended in a hard-won victory by de Ruyter over Monk, but later in this year (August 3rd) de Ruyter was beaten by Ayscue and forced to take refuge in the Dutch harbours. He had his revenge, for on the 22nd of June 1667 the Dutch fleet under de Ruyter and Cornelius de Witt made their way up the Medway as far as Chatham and burnt the English fleet as it lay at anchor. Negotiations between the two countries were already in progress and this event hastened a settlement. The peace of Breda was signed (31st of July 1667) on terms on the whole favourable to the Dutch. New Netherland was retained by England in exchange for Suriname. In the following year by the efforts of Sir William Temple the much vaunted Triple Alliance was concluded between Great Britain, the United Provinces and Sweden to check the ambitious designs of Louis XIV. The instability of Charles II., who sold himself to Louis by the treaty of Dover (1670), speedily rendered it of no effect, and left the United Provinces to face unaided the vengeance of the French king.

Second English war.

Peace of Breda.

The Triple Alliance.

From 1668 to 1672 Louis made ready to destroy the Dutch, and so well had his diplomacy served him that they were left without a friend in Europe. In 1672 the storm broke: the English without a declaration of war tried, unsuccessfully, to intercept the Dutch Mediterranean fleet; and the French at the same time set forth in apparently irresistible strength to overcome the despised traders of Holland. The States were ill-prepared on land though their fleet was strong and ready; party spirit had become intensely bitter as the prince of Orange (see WILLIAM III.) grew to man's estate, and the ruling burgher party, knowing how great was the popularity of William, especially in the army, had purposely neglected their land forces. Town after town fell before the French armies, and to de Witt and his supporters there seemed to be nothing left but to make submission and accept the best terms that Louis XIV. would grant. The young prince alone rose to the height of the occasion, and set his face against such cowardly counsels, and he had the enthusiastic support of the great majority of the people. Amidst general acclamation William was elected stadholder, first of Zeeland, then of Holland, and was appointed captain-general of the Union (June 1672). Meanwhile the fleet under de Ruyter had encountered a combined English and French force in Solebay (7th of June), and after a desperate fight, in which the French had but slackly supported their allies, had more then held its own. William, in his turn, with an army wholly insufficient to meet the French in the open field, was able to persuade his countrymen to open the dikes and by flooding the land to prevent its occupation by the enemy. The courage and resourcefulness of their youthful leader inspired the people to make heroic sacrifices for their independence, but unfortunately such was the revulsion of feeling against the grand pensionary, that he himself and his brother Cornelius were torn in pieces by an infuriated mob at the Hague (20th of August).

The French invasion.

William III. Stadholder and Captain-general.

The third English war.

Murder of the Brothers de Witt.

William, now supreme in the States, while on land struggling with chequered success against the superior forces of the French, strove by his diplomacy, and not in vain, to gain allies for the republic. The growing power of France caused alarm to her neighbours, and Sweden, Denmark, Spain and the emperor lent a willing ear to the persuasions of the stadholder and were ready to aid his efforts to curb the ambition of Louis. On sea in 1673 de Ruyter, in a series of fiercely contested battles, successfully maintained his strenuous and dogged conflict against the united English and French fleets. In England the war was exceedingly unpopular, and public opinion forced Charles II. to conclude peace. The treaty of Westminster, which provided that all conquests should be restored, was signed on the 14th of February 1674. The French now found themselves threatened on many sides, and were reduced to the defensive. The prince, however, suffered a defeat at Seneff, and was in 1674 prevented from invading France. The war, nevertheless, during the following years was on the whole advantageous to the Dutch. In 1676 a Dutch squadron fought two hard but indecisive battles with a superior French force, off Stromboli (8th of January) and off Messina (22nd of April). In the last-named fight Admiral de Ruyter was badly wounded and died (29th of April). In 1677 negotiations for peace went on, and were forwarded by the marriage, at the close of the year, of William of Orange with his cousin the princess Mary, daughter of the duke of York. At last (August 1678) a peace was concluded at Nymwegen by which the Dutch secured the integrity and independence of their country. All the conquests made by the French were given up.

Peace of Westminster.

The war with France.

Death of de Ruyter.

Peace of Nymwegen.

The aggressive policy of Louis XIV. in the years that followed the peace of Nymwegen enabled William to lay the foundations of the famous confederacy which changed the whole aspect

SpinSmart Software http://www.spinsmart.com

of European politics. The league of Augsburg (1686), which followed the revocation of the edict of Nantes, placed Orange at the head of the resistance to French domination. The league was formed by the emperor, Spain, Sweden, the United Provinces and by several German states. In England William and Mary were looked upon as the natural successors to the throne on the death of James II., and William kept up close relations with the malcontents in Church and State, who disliked the arbitrary and papistical policy of his father-in-law. But with the birth of a prince of Wales the situation was changed, and William determined to intervene actively in English affairs. His opportunity came when Louis XIV., having declared war against the Empire, had invaded the Palatinate. The opposition of Amsterdam to an English expedition, in the absence of danger from the side of France, was overcome. The Revolution of 1688 ensued, and England became, under William's strong rule, the chief member of the Great Coalition against French aggression. In the Grand Alliance of 1689–1690 he was accused of sacrificing Dutch to English interests, but there can be no doubt that William loved his native country better than his adopted one, and was a true patriot. If the United Provinces suffered in prosperity through their close relations with and subordination to Great Britain during a long series of years, it was due not to the policy of William, but to the fact that the territory of the republic was small, open to attack by great military powers, and devoid of natural resources. The stadholder's authority and popularity continued unimpaired, despite of his frequent absences in England. He had to contend, like his predecessors, with the perennial hostility of the burgher aristocracy of Amsterdam, and at times with other refractory town councils, but his power in the States during his life was almost autocratic. His task was rendered lighter by the influence and ability of Heinsius, the grand pensionary of Holland, a wise and prudent statesman, whose tact and moderation in dealing with the details and difficulties of internal administration were conspicuous. The stadholder gave to Heinsius his fullest confidence, and the pensionary on his part loyally supported William's policy and placed his services ungrudgingly at his disposal (see HEINSIUS).

League of Augsburg.

Revolution of 1688.

The Grand Alliance.

William and Heinsius.

The conduct of the war by the allies was far from successful. In 1690 (July 1st) Waldeck was defeated by Luxemburg at Fleurus; and the Anglo-Dutch fleet was so severely handled by Tourville (10th July) off Beachy Head that for two years the command of the sea remained in the possession of the French. A striking victory off Cape la Hogue (29th of May 1692) restored, however, supremacy to the allies. On land the combined armies fared ill. In 1691 the French took Mons, and in 1692 Namur, in which year after a hard-fought battle William was defeated at Steenkirk and in 1693 at Neerwinden. But William's military genius never shone so brightly as in the hour of defeat; he never knew what it was to be beaten, and in 1695 his recapture of Namur was a real triumph of skill and resolution. At last, after long negotiations, exhaustion compelled the French king to sign the peace of Ryswick in 1697, in which William was recognized by France as king of England, the Dutch obtaining a favourable commercial treaty, and the right to garrison the Netherland barrier towns. This peace, however, did no more than afford a breathing space during which Louis XIV. prepared for a renewal of the struggle. The great question of the Spanish succession was looming in all men's eyes, and though partition treaties between the interested powers were concluded in 1698 and 1700, it is practically certain that the French king held himself little bound by them. In 1701 he elbowed the Dutch troops out of the barrier towns; he defied England by recognizing James III. on the death of his father; and it was clear that another war was imminent when William III. died in 1702.

War with France.

Peace of Ryswick.

Death of William III.

In 1672 the stadholdership in five provinces had been made hereditary in the family of the prince of Orange, but William died childless, and the republican burgher party was strong enough to prevent the posts being filled up. William had wished that his cousin, Count John William Friso of Nassau, stadholder of Friesland and Groningen, should succeed him, but his extreme youth and the jealousy of Holland against a "Frisian" stood in the way of his election. The result was a want of unity in counsel and action among the provinces, Friesland and Groningen standing aloof from the other five, while Holland and Zeeland had to pay for their predominance in the Union by being left to bear the bulk of the charges. Fortunately there was no break of continuity in the policy of the States, the chief conduct of affairs remaining, until his death in 1720, in the capable and tried hands of the grand pensionary Heinsius, who had at his side a number of exceptionally experienced and wise counsellors—among these Simon van Slingeland, for forty-five years (1680–1725) secretary of the council of state, and afterwards grand pensionary of Holland (1727–1736), and Francis Fagel, who succeeded his father in 1699 as recorder (*Griffier*) of the States-General, and held that important office for fifty years. The tradition of William III. was thus preserved, but with the loss of the firm hand and strong personality of that great ruler the United Provinces were relegated to a subordinate place in the councils of the nations, and with the gradual decadence of its navy the Dutch republic ceased to rank as a power to be reckoned with.

Stadholderless Government.

In the War of the Spanish Succession, which broke out in 1702, Dutch troops took part in the campaigns of Marlborough and Eugene, and had their share in winning the great victories of Blenheim (1704), Ramillies (1706), Oudenarde (1708) and Malplaquet (1709). At the peace of Utrecht, concluded in 1713, the interests of the Netherlands were but half-heartedly supported by the English plenipotentiaries, and the French were able to obtain far more favourable terms than they had the power to exact. But they were compelled to abandon all claim to the Spanish Netherlands, which were formally handed over to the United Provinces, as trustees, to be by them, after the conclusion of a satisfactory barrier treaty, given up to the emperor, and be known henceforth as the Austrian Netherlands. The peace of Utrecht taught the Dutch that the great powers around them, while ready to use their resources for war, would not scruple to abandon them when they wanted peace; they, therefore, determined henceforth to stand clear of all foreign complications. With 1713 the influence of the United Netherlands upon European politics comes almost to an end.

War of the Spanish Succession.

Treaty of Utrecht.

The ruling party in the States took an active part in securing George I. on the throne of England; and they succeeded in coming to an agreement both with France and with Austria over the difficulties connected with the barrier towns, and were thus able in tranquillity to concentrate their energies upon furthering the interests of their trade. Under the close oligarchical rule of the patrician families, who filled all offices in the town councils, the States of Holland, in which the influence of Amsterdam was dominant, and which in their turn exercised predominance in the States-General, became more and more an assembly of "shopkeepers" whose policy was to maintain peace for the sake of the commerce on which they thrived. For thirty years after the peace of Utrecht the Provinces kept themselves free from entanglement in the quarrels of their neighbours. The foundation of the Ostend East India Company (see OSTEND COMPANY), however, by the emperor Joseph II. in 1723, at once aroused the strong opposition of the Amsterdam merchants who looked upon this invasion of their monopoly with alarm, and declared that the Ostend Company had been set up in contravention to the terms of Article V. of the treaty of Munster. In maintaining this position the States had the support of England, but it was not until 1731 that they succeeded in obtaining the suppression of the company by consenting to

guarantee the Pragmatic Sanction of Charles VI. This step led in 1743 to their being involved in the War of the Austrian Succession, and thus being drawn into hostilities with France, which invaded the barrier country. In 1744 they formed with Great Britain, Austria and Saxony, a Quadruple Alliance, and put a contingent of troops in the field. The Dutch took an active part in the campaign of 1745 and suffered heavily at Fontenoy, after which battle Marshal Saxe overran the Austrian Netherlands. The French captured all the barrier towns, and in 1747 entered Dutch Flanders and made an easy conquest. The United Provinces, as in 1672, seemed to lie at the mercy of their enemies, and as in that eventful year, popular feeling broke down the opposition of the burgher oligarchies, and turned to William IV., prince of Orange, as the saviour of the state. John William Friso had died young in 1711, leaving a posthumous son, William Charles Henry Friso, who was duly elected stadholder by the two provinces, Friesland and Groningen, which were always faithful to his family, and in 1722 he became also, though with very limited powers, stadholder of Gelderland. The other provinces, however, under pressure from Holland, bound themselves not to elect stadholders, and they refused to revive the office of captain-general of the Union. By the conquest of Dutch Flanders Zeeland was threatened, and the states of that province, in which there were always many Orange partisans, elected (April 1747) William stadholder, captain-general and admiral of Zeeland. The example once given was infectious, and was followed in rapid succession by Holland, Utrecht and Overysel. Finally the States-General (May 4) appointed the prince, who was the first member of his family to be stadholder of all the seven provinces, captain and admiral-general of the Union, and a little later these offices were declared hereditary in both the male and female lines.

War of the Austrian Succession.

Revolution of 1747.

William IV.

William IV., though not a man of great ability, was sincerely anxious to do his utmost for securing the maintenance of peace, and the development of the resources and commercial prosperity of the country, and his powerful dynastic connexions (he had married Anne, eldest daughter of George II.) gave him weight in the councils of Europe. The peace of Aix-la-Chapelle, in 1748, in which the influence of Great Britain was exerted on behalf of the States, though it nominally restored the old condition of things, left the Provinces crippled by debt, and fallen low from their old position among the nations. At first the stadholder's efforts to promote the trade and welfare of the country were hampered by the distrust and opposition of Amsterdam, and other strongholds of anti-Orange feeling, and just as his good intentions were becoming more generally recognized, William unfortunately died, on the 22nd of October 1751, aged forty years, leaving his three-year-old son, William V., heir to his dignities. The princess Anne of England became regent, but she had a difficult part to play, and on the outbreak of the Seven Years' War in which the Provinces were determined to maintain neutrality, her English leanings brought much unpopularity upon her. She died in 1759, and for the next seven years the regency passed into the hands of the States, and the government was practically stadholderless.

Peace of Aix-la-Chapelle.

Death of William IV.

Anne of England Regent.

In 1766 William V. was declared to be of age; and his accession to power was generally welcomed. He was, however, a weak man, without energy or resolution, and he allowed himself to be entirely led by his old guardian the duke of Brunswick, and by his wife Frederica Wilhelmina of Prussia, a woman of marked ability, to whom he entirely deferred. In the American War of Independence William's sympathies were strongly on the English side, while those of the majority of the Dutch people were with the revolted colonies. It is, however, certain that nothing would have driven the Provinces to take part in the war but for the overbearing attitude of the British government with regard to the right of neutral shipping upon the seas, and the heavy losses sustained by Dutch commerce at the hands of British privateers. The famous agreement, known as the "Armed Neutrality," with which in 1780 the States of the continent at the instigation of Catherine II. of Russia replied to the maritime claims put forward by Great Britain drew the Provinces once more into the arena of European politics. Every effort was made by the English to prevent the Dutch from joining the league, and in this they were assisted by the stadholder, but at last the States-General, though only by the bare majority of four provinces against three, determined to throw in their lot with the opponents of England. Nothing could have been more unfortunate, for the country was not ready for war, and party spirit was too strong for united action to be taken or vigorous preparations to be made. When war broke out Dutch commerce was destroyed, and the Dutch colonies were at the mercy of the English fleet without the possibility of a blow being struck in their defence. An indecisive, but bravely fought action with Admiral Parker at the Dogger Bank showed, however, that the Dutch seamen had lost none of their old dogged courage, and did much to soothe the national sense of humiliation. In the negotiations of the Treaty of Paris (1783) the Dutch found themselves abandoned by their allies, and compelled to accept the disadvantageous but not ungenerous terms accorded to them by Great Britain. They had to sacrifice some of their East Indian possessions and to concede to the English freedom of trade in the Eastern seas.

The Armed Neutrality.

War with England.

Peace of Paris.

One result of this humiliating and disastrous war was the strengthening of the hands of the anti-Orange burgher-regents, who had now arrogated to themselves the name of "patriots." It was they, and not the stadholder, who had been mainly responsible for the Provinces joining "the Armed Neutrality," but the consequences of the war, in which this act had involved them, was largely visited upon the prince of Orange. The "patriot" party did their utmost to curtail his prerogatives, and harass him with petty insults, and at last the Prussian king was obliged to interfere to save his niece, who was even more unpopular than her weak husband, from being driven from the country. In 1784 the emperor Joseph II. took advantage of the dissensions in the Provinces to raise the question of the opening of the Scheldt. He himself was, however, no more prepared for attack than the Republic for defence, but the Dutch had already sunk so low, that they agreed to pay a heavy indemnity to induce the Austrians to drop a demand they were unable to enforce. To hold the mouth of the Scheldt and prevent at all costs a revival of Antwerp as a commercial port had been for two centuries a cardinal point of Dutch policy. This difficulty removed, the agitation of the "patriots" against the stadholderate form of government increased in violence, and William speedily found his position untenable. An insult offered to the prince of Orange in 1787 led to an invasion of the country by a Prussian army. Amsterdam capitulated, the country was occupied, and the patriot leaders declared incapable of holding any office. The Orange party was completely triumphant, and William V., under the protection of Prussia and England, with which states the United Provinces were compelled to ally themselves, was restored to power. It was, however, impossible to make the complicated and creaking machinery of the constitution of the worn-out republic of the United Netherlands work smoothly, and in all probability it would have been within a very short time replaced by an hereditary monarchy, had not the cataclysm of the French Revolution swept it away from its path, never to be revived.

The "Patriot" Party.

Difficulty with the Emperor.

Prussian invasion.

Restoration to power of William V.

When war broke out between the French revolutionary government and the coalition of kings, the Provinces remained neutral as long as they could. It was not till Dumouriez had overrun all the Austrian Netherlands in 1792, and had thrown open the passage of the Scheldt, that they were drawn into the war. The patriot party sided with

The French invade the Netherlands.

SpinSmart Software http://www.spinsmart.com

the French, but for various reasons the conquest of the country was delayed until 1795. In the closing months of 1794 Pichegru, at the head of a large and victorious army, invaded the Provinces. The very severe frost of that winter gave his troops an easy passage over all the rivers and low-lying lands; town after town fell before him; he occupied Amsterdam, and crossing the ice with his cavalry took the Dutch fleet, as it lay frost-bound at the Texel. The stadholder and his family fled to England, and the disorganized remnants of the allied forces under the duke of York retreated into Germany. The "patriots," as the anti-Orange republicans still styled themselves, received the French with open arms and public rejoicings, and the government was reorganized so as to bring it into close harmony with that of Paris. The stadholderate, the offices of captain and admiral-general, and all the ancient organization of the United Netherlands were abolished, and were transformed into the Batavian Republic, in close alliance with France. But the Dutch had soon cause to regret their revolutionary ardour. French alliance meant French domination, and participation in the wars of the Revolution. Its consequences were the total ruin of Dutch commerce, and the seizure of all the Dutch colonies by the English. Internally one change of government succeeded another; after the States-General came a national convention; then in 1798 a constituent assembly with an executive directory; then chambers of representatives; then a return to the earlier systems under the names of the eight provincial and one central Commissions (1801). These changes were the outcome of a gradual reaction in a conservative direction.

Overthrow of the Stadholderate.

Flight of William V.

The Batavian Republic.

Changes of Government.

The peace of Amiens gave the country a little rest, and the Dutch got back the Cape of Good Hope and their West Indian colonies; it was, however, but the brief and deceptive interlude between two storms; when war began again England once more took possession of all she had restored. In 1805 the autocratic will of Napoleon Bonaparte imposed upon them a new constitution, and Rutger Jan Schimmelpenninck (1765–1825) was made, under the ancient title of grand pensionary, head of the government. In the next year the French emperor added Holland, as the United Provinces were now named, to the ring of dependent sovereignties, by means of which he sought to build up a universal empire, and he forced his brother Louis to be the unwilling king of an unwilling people. The new king was a man of excellent intentions and did his best to promote the interest of his subjects, but finding himself unable to protect them from the despotic overlordship of his brother, after a four years' reign, Louis abdicated. In 1810 the Northern Netherlands by decree of Napoleon were incorporated in the French empire, and had to bear the burdens of conscription and of a crushing weight of taxation. The defeat of Leipzig in 1813 was the signal for a general revolt in the Netherlands; the prince of Orange (son of William V.) was recalled, and amidst general rejoicing accepted at Amsterdam the offer of the sovereignty under a free constitution (Dec. 1, 1813), with the title of sovereign prince. On the downfall of Napoleon the great powers determined to create in the Low Countries a powerful state, and by the treaty of London (June 14, 1814) the Belgians were united with the Dutch provinces to form the kingdom of the Netherlands, which was also to include the bishopric of Liège and the duchy of Bouillon, and the prince of Orange was placed upon the throne on the 15th of March 1815 as William I., king of the Netherlands (see WILLIAM I., king of the Netherlands). The ancestral possessions of the House of Nassau were exchanged for Luxemburg, of which territory King William in his personal capacity became grand duke. The carrying out of the treaty was delayed by the Hundred Days' campaign, which for a short time threatened its very existence. The daring invasion of Napoleon, however, afforded the Dutch and Belgian contingents of the allied army the opportunity to fight side by side under the command of William, prince of Orange, eldest son of the new king, who highly distinguished himself by his gallantry at Quatre Bras, and afterwards at Waterloo where he was wounded (see WILLIAM II., king of the Netherlands). The Congress of Vienna confirmed the arrangements made by the treaty of London, and William I. was crowned king of the Netherlands at Brussels on the 27th of September 1815. Under the constitution the king, as hereditary sovereign, possessed full executive powers, and the initiative in proposing laws. He had the power of appointing his own council of state. The legislative body bore the time-honoured title of States-General, and was divided into an Upper Chamber nominated by the king, and a Lower Chamber elected by the people. Freedom of worship, freedom of the press, and political equality were principles of the constitution, guaranteed to all.

Constitution of the Netherlands.

The union of the Dutch and Belgian provinces, like so many of the territorial arrangements of the Congress of Vienna, was an attempt to create a strong state out of diverse and jarring elements. It was an artificial union, which nothing but consummate tact and statesmanship could have rendered permanent and solid. North and south were divided from one another by religious belief, by laws and usages, by material interests, and by two centuries and a half of widely severed national life. The Belgians were strict Catholics, the Dutch Calvinistic Protestants. The Dutch were chiefly a commercial and seafaring people, with interests in distant lands and colonial possessions; the Belgians were agriculturists, except where their abundance of minerals made them manufacturers. The national traits of the Dutch were a blend of German and English, the national leaning of the Belgians was towards France and French ideals. Nevertheless the materials were there out of which a really broad-minded and conciliatory handling of religion and racial difficulties might have gradually built up a Netherland nation able to hold from its population and resources a considerable place among European powers. For it must not be forgotten that some two-thirds of the Belgian people are by origin and language of the same race as the Dutch. But when difficulties and differences arose between North and South, as they were sure to arise, they were not dealt with wisely. The king had good intentions, but his mind was warped by Dutch prejudices, and he was ill-advised and acted unadvisedly. The consequences were the Belgian Revolution of 1830, which ended in the intervention of the great powers, and the setting up, in 1831, of Belgium as an independent kingdom. The final settlement of outstanding questions between the two countries was not reached till 1839 (for an account of the Belgian Revolution, see BELGIUM). King William I. in the following year, having become unpopular through his resistance to reform, resigned his crown to his son William II., who reigned in peace till his death in 1849, when he was succeeded by his eldest son William III. (see WILLIAM III., king of the Netherlands). His accession marked the beginning of constitutional government in the Netherlands. William I. had been to a large extent a personal ruler, but William II., though for a time following in his father's steps, had been moved by the revolutionary outbreaks of 1848 to concede a revision of the constitution. The fundamental law of 1848 enacted that the first chamber of the States-General should be elected by the Provincial Estates instead of being appointed by the king, and that the second chamber should be elected directly by all persons paying a certain amount in taxation. Ministers were declared responsible to the States-General, and a liberal measure of self-government was also granted. During the long reign of William III. (1849–1890) the chief struggles of parties in the Netherlands centred round religious education. On

the one side are the liberals, divided into moderates and progressives, the representatives to a large extent of the commercial towns. Opposed to them is the coalition of the orthodox Protestant conservatives, styled anti-revolutionaries, supported by the Calvinistic peasantry, and the Catholics, who represent about one-third of the population and have their headquarters in Dutch Brabant, Dutch Flanders and Limburg. There is also in the Netherlands a small, but very strenuous socialist party, which was founded by the active propaganda of an ex-pastor Domela-Nieuwenhuis. It draws its chief strength from Amsterdam and certain country districts of Friesland.

Political parties in the Netherlands.

The liberals were in power from 1871 to 1888 continuously, but a Catholic-anti-revolutionary ministry under Baron Mackay held office from 1888 to 1891, and again a coalition ministry was formed in 1901 with Dr Kuyper at its head. From 1894 to 1897 a ministry of moderate liberals supported by a large part of the Catholic and anti-revolutionary parties were in power. The constitution of 1848 made it the duty of the state to provide free primary secular education, but it allowed to members of all creeds the liberty of establishing private schools, and this was carried into effect by a law passed in 1857 by the joint efforts of the liberals and Catholics against the opposition of the orthodox Calvinists. But the long liberal ascendancy closed the ranks of the Catholic-Calvinist coalition, and united them against the neutral schools, and in 1889 they were able to pass a law enabling not only the unsectarian public schools, but all private schools organized by societies and bodies recognized by the law to receive subventions from the state. In 1890 there were 3000 public schools with 450,000 scholars and 1300 private schools with 195,000 scholars.

Religious education.

The subject of the extension of the franchise has also been the cause of violent party strife and controversy. It was taken in hand as early as 1872, but as a revision of the constitution was necessary, no change was actually carried out till 1887. The law of that year lowered the qualification of the payer of a direct tax to 10 fl. Votes were given to all householders paying a certain *minimum* house duty, and to all lodgers who had for a given time paid a *minimum* of rent, also to all who possessed certain educational and social qualifications, whose definition was left to be specified by a later law. The passing of such a law was deferred by the coalition (Catholic-Orthodox) ministry of 1888–1891. The liberal ministry of 1891 attempted to deal with the question, and a proposal was made by the minister Tak van Poortvliet, which almost amounted to universal suffrage. The educational qualification was to be able to write, the social that of not receiving charitable relief. This proposal caused a cleavage right through all parties. It was supported by the radical left, by a large portion of the Orthodox-Calvinists under Dr Kuyper, and by some Catholics; it had against it the moderate liberals, the aristocratic section of the Orthodox-Calvinists, the bulk of the Catholics, and a few radicals under an influential leader van Houten. After a fierce electoral fight the Takkians were victors at the first polls, but were beaten at the second ballots. Of the 46 Takkians, 35 were liberals; of the 54 anti-Takkians, 24 were Catholics. A moderate liberal ministry was formed (1894) and in 1896 carried into law what was known as the van Houten project. It gave the right of voting to all Dutchmen over twenty-five years of age, who paid 1 fl. in direct taxation; were householders or lodgers as defined in 1887, or tenants of a vessel of, at least, 24 tons; were the recipients of certain salaries or had certain deposits in the public funds or savings banks. By this reform the number of electors, which had been raised in 1887 from 140,000 to 300,000, was augmented to 700,000. The question of universal military service has also divided parties. The principle of personal service has been strongly opposed by the Catholics and conservatives, but became the law of the land in 1898, though exemptions were conceded in favour of ecclesiastics and certain classes of students.

Extension of the suffrage.

Military service.

The long-continued and costly wars with the sultan of Achin have during a series of years been a source of trouble to Dutch ministries. In 1871–1872 Great Britain, in exchange for certain possessions of Holland on the coast of Guinea, agreed to recognize the right of the Dutch to occupy the north of Sumatra. The sultan of Achin opposed by force of arms the efforts of the Dutch to make their occupation effective, and has succeeded in maintaining a vigorous resistance, the Dutch colonial troops suffering severely from the effects of the insalubrious climate. Until 1871 the surplus derived from the colonial budget had been turned into a deficit, and the necessity of imposing fresh taxes to meet the war expenses has led to the downfall both of individual ministries and of cabinets.

The Achin war.

William III. dying in 1890 was succeeded by his only surviving child, Wilhelmina. The new queen being a minor, her mother, the queen-dowager Emma, became regent. One effect of the accession of Queen Wilhelmina was the severance of the bond between the Netherlands and Luxemburg. The grand duchy, being hereditary only in the male line, passed to the nearest agnate, the duke of Nassau. In 1898 the queen, having reached the age of eighteen, assumed the government. She married in 1901 Prince Henry of Mecklenburg. The outbreak of the Boer War in 1899 led to a strong outburst of sympathy among the Dutch on behalf of their kinsmen in South Africa, and there were times during the war, especially after President Kruger had fled from the Transvaal in a Dutch war vessel and had settled in Holland, when it was a task of some difficulty for the Dutch government to prevent the relations between Great Britain and the Netherlands from becoming strained. The ministry, however, under Dr Kuyper were able to keep the popular feeling in favour of the Boers in restraint, and to maintain towards Great Britain a correct attitude of strict neutrality. In 1903 the government took strong measures to prevent a threatened general strike of railway employees, the military were called out, and occupied the stations. A bill was passed by the States-General declaring railway strikes illegal. The elections of 1905 for the Second Chamber gave the liberals a narrow majority of four. Dr Kuyper accordingly resigned, and a moderate liberal cabinet was formed by Th. H. de Meester. The fact that up to 1908 the queen had not become a mother gradually caused some public concern as to the succession; but in 1909 Queen Wilhelmina, amid national rejoicings, gave birth to a princess.

Queen Wilhelmina.

HOLLAND, COUNTY AND PROVINCE OF.—The first mention of Holland in any document is found in an imperial *gift brief* dated May 2nd, 1064. In this the phrase "*omnis comitatus in Hollandt*" occurs, but without any further description of the locality indicated. A comparison with other documentary evidence, however, leads to the identification of Holland with the *forestum Merweda*, or the bush-grown fenland lying between the Waal, the old Meuse and the Merwe. It is the district surrounding the town of Dordrecht. A portion of the original Holland was submerged by a great inundation in 1421, and its modern appellation of Biesbosch (reed-forest) is descriptive of what must have been the condition of the entire district in early times. The word Holland is indeed by many authorities thought to be a corruption of Holt-land (it was sometimes so spelt by 13th-century writers) and to signify wood-land. The earliest spelling is, however, Holland, and it is more probable that it means lowlying-land (hol=hollow), a derivation which is equally applicable to the district in Lincolnshire which bears the same name.

The title count of Holland appears to have been first borne by the Frisian count Dirk III., who founded Dordrecht (about 1015) and made it his residence (see below). It was not, however, till late in the 11th century that his successors adopted the style "*Hollandensis comes*" as their territorial designation (it is found for the first time on a seal of Dirk V. 1083), and that the name Holland became gradually extended northwards to connote all the land subject to the rule of the counts between Texel and the Maas.

The first Count of Holland.

The beginnings of the history of this feudal state (the later Holland) centre round the abbey of Egmont in whose archives its records have been preserved. In 922 Charles the Simple gave in full possession to a count in Frisia, Dirk by name (a shortened form of Diederic, Latin Theodoricus), "the church of Egmont with all that belonged to it from Swithardeshage to Kinhem." This man, usually known as Dirk I., died about 939 and was succeeded by his son of the same name. Among the records of the abbey of Egmont is a document by which the emperor Arnulf gave to a certain count Gerolf the same land "between Swithardeshage and Kinhem," afterwards held by Dirk I. It is generally assumed that this Gerolf was his father, otherwise their deed of gift would not have been preserved among the family papers. Dirk II. was the founder of the abbey of Egmont. His younger son Egbert became archbishop of Treves. His elder son Arnulf married Liutgardis, daughter of Siegfried of Luxemburg and sister-in-law of the emperor Henry II. He obtained from the emperor Otto III., with whom he was in great favour in 983, a considerable extension of territory, that now covered by the Zuider Zee and southward down to Nijmwegen. In the deed of gift he is spoken of as holding the three countships of Maasland, Kinhem or Kennemerland and Texla or Texel; in other words his rule extended over the whole country from the right bank of the Maas or Meuse to the Vlie. He appears also to have exercised authority at Ghent. He died in 988. Arnulf was count till 993, when he was slain in battle against the west Frisians, and was succeeded by his twelve-year-old son Dirk III. During the guardianship of his mother, Liutgardis, the boy was despoiled of almost all his possessions, except Kennemerland and Maasland. But no sooner was he arrived at man's estate than Dirk turned upon his enemies with courage and vigour. He waged war successfully with Adelbold, the powerful bishop of Utrecht, and made himself master not only of his ancestral possessions, but of the district on the Meuse known as the Bushland of Merweda (*forestum Merweda*), hitherto subject to the see of Utrecht. In the midst of this marshy tract, at a point commanding the courses of the Meuse and the Waal, he built a castle (about 1015) and began to levy tolls. Around this castle sprang up the town of Thuredrecht or Dordrecht. The possession of this stronghold was so injurious to the commerce of Tiel, Cologne and the Rhenish towns with England that complaints were made by the bishop of Utrecht and the archbishop of Cologne to the emperor. Henry II. took the part of the complainants and commissioned Duke Godfrey of Lorraine to chastise the young Frisian count. Duke Godfrey invaded Dirk's lands with a large army, but they were impeded by the swampy nature of the country and totally defeated with heavy loss (July 29, 1018). The duke was himself taken prisoner. The result was that Dirk was not merely confirmed in his possession of Dordrecht and the Merweda Bushland (the later Holland) but also of the territory of a vassal of the Utrecht see, Dirk Bavo by name, which he conquered. This victory of 1018 is often regarded as the true starting-point of the history of the county of Holland. Having thus established his rule in the south, Dirk next proceeded to bring into subjection the Frisians in the north. He appointed his brother Siegfrid or Sikka as governor over them. In his later years Dirk went upon a pilgrimage to the Holy Land from which he returned in 1034; and ruled in peace until his death in 1039.

Foundation of Dordrecht.

Defeat of Godfrey of Lorraine.

Beginning of the County of Holland.

His son, Dirk IV., was one of the most enterprising of his warlike and strenuous race. He began the long strife with the counts of Flanders, as to the lordship over Walcheren and other islands of Zeeland; the quarrel was important, as dealing with the borderland between French and German overlordship. This strife, which lasted 400 years, did not at first break out into actual warfare, because both Dirk and Baldwin V. of Flanders had a common danger in the emperor Henry III., who in 1046 occupied the lands in dispute. Dirk allied himself with Godfrey the Bearded of Lorraine, who was at war with the emperor, and his territory was invaded by a powerful imperial fleet and army (1047). But Dirk entrenched himself in his stronghold at Vlaardingen, and when winter came on he surrounded and cut off with his light boats a number of the enemy's ships, and destroyed a large part of their army as they made their way amidst the marches, which impeded their retreat. He was able to recover what he had lost and to make peace on his own terms. Two years later he was again assailed by a coalition headed by the archbishop of Cologne and the bishop of Utrecht. They availed themselves of a very hard winter to penetrate into the land over the frozen water. Dirk offered a stout resistance, but, according to the most trustworthy account, was enticed into an ambuscade and was killed in the fight (1049). He died unmarried and was succeeded by his brother Floris I.

Dirk IV.

Quarrel with Flanders about Zeeland.

Floris, like his predecessors, was hard-fighting and tenacious. He gradually recovered possession of his ancestral lands. He found a formidable adversary in the able and warlike William, who, becoming bishop of Utrecht in 1054, was determined to recover the lost possessions of his see; and in 1058, in alliance with Hanno, archbishop of Cologne, Egbert, margrave of Brandenburg, the bishop of Liége and others, invaded the Frisian territory. At first success attended the invaders and many places fell into their hands, but finally they were surprised and defeated near Dordrecht. The counts of Guelders and Louvain were among the prisoners that fell into the hands of Floris. The attack was renewed in 1061. In a battle at Nederhemert Floris met with his death in the hour of victory. He is said to have been killed as, wearied with pursuing, he lay asleep under a tree. He was succeeded by his son, Dirk V., a child, under the guardianship of his mother, Gertrude of Saxony. Bishop William seems now to have seized his opportunity and occupied all the territory that he claimed. In this he was confirmed by two charters of the emperor Henry IV. (April 30 and May 2, 1064). Among the possessions thus assigned to him is found *comitatus omnis*

in Hollandt cum omnibus ad bannum regalem pertinentibus. An examination of these documents shows the possessions of Dirk as *in Westflinge et circa oras Rheni, i.e.* west of the Vlie and around the mouths of the Rhine. Gertrude and her son appear to have withdrawn to the islands of Frisia (Zeeland), leaving William in undisturbed occupation of the disputed lands. In 1063 Gertrude contracted a marriage with Robert, the second son of Baldwin V. of Flanders, a man famous for his adventurous career (see FLANDERS). On his marriage his father invested him with Imperial Flanders, as an apanage including the islands of Frisia (Zeeland) west of the Scheldt. He now became guardian to his stepson, in whose inheritance lay the islands east of the Scheldt. Robert thus, in his own right and that of Dirk, was ruler of all Frisia (Zeeland), and thus became known among his Flemish countrymen as Robert the Frisian. The death of his brother Baldwin VI. in 1070 led to civil war in Flanders, the claim of Robert to the guardianship of his nephew Arnulf being disputed by Richilde, the widow of Baldwin. The issue was decided by the decisive victory of Robert at Cassel (February 1071) when Arnulf was killed and Richilde taken prisoner (see FLANDERS). While Robert was thus engaged in Flanders, an effort was made to recover "the County of Holland" and other lands now held by William of Utrecht. The people rose in revolt, but by command of the emperor Henry IV. were speedily brought back under episcopal rule by an army under the command of Godfrey the Hunchback, duke of Lower Lorraine. Again in 1076, at the request of the bishop, Duke Godfrey visited his domains in the Frisian borderland. At Delft, of which town tradition makes Godfrey the founder, the duke was treacherously murdered (February 26, 1076). William of Utrecht died on the 17th of the following April. Dirk V., now grown to man's estate, was not slow to take advantage of the favourable juncture. With the help of Robert (his stepfather) he raised an army, besieged Conrad, the successor of William, in the castle of Ysselmonde and took him prisoner. The bishop purchased his liberty by surrendering all claim to the disputed lands. Henceforth the Frisian counts became definitively known as counts of Holland. Dirk V. died in 1091 and was succeeded by his son Floris II. the Fat. This count had a peaceful and prosperous reign of thirty-one years. After his death (1122) his widow, Petronilla of Saxony, governed in the name of Dirk VI., who was a minor. The accession of her half-brother, Lothaire of Saxony, to the imperial throne on the death of Henry V. greatly strengthened her position. The East Frisian districts, Oostergoo and Westergoo, were by Lothaire transferred from the rule of the bishops of Utrecht to that of the counts of Holland (1125). These Frisians proved very troublesome subjects to Dirk VI. In 1132 they rose in insurrection under the leadership of Dirk's own brother, Floris the Black. The emperor Conrad III. (1138), who was of the rival house of Hohenstaufen, gave back these Frisian districts to the bishop; it was in truth somewhat of an empty gift. The Frisian peasants and fisher folk loved their independence, and were equally refractory to the rule of any distant overlord, whether count or bishop. Dirk VI. was succeeded in 1157 by Floris III.

Robert the Frisian guardian to his stepson.

Godfrey the Hunchback of Lorraine conquers Holland.

The Bishop of Utrecht surrenders it to Dirk V.

Floris II.

Dirk VI.

Floris III. reversed the traditional policy of his house by allying himself with the Hohenstaufens. He became a devoted adherent and friend of Frederick Barbarossa. He had troubles with West Friesland and Groningen, and a war with the count of Flanders concerning their respective rights in West Zeeland, in which he was beaten. In 1170 a great flood caused immense devastation in the north and helped to form the Zuider Zee. In 1189 Floris accompanied Frederick Barbarossa upon the third Crusade, of which he was a distinguished leader. He died in 1190 at Antioch of pestilence. His son, Dirk VII., had a stormy, but on the whole successful reign. Contests with the Flemings in West Zeeland and with the West Frisians, stirred up to revolt by his brother William, ended in his favour. The brothers were reconciled and William was made count of East Friesland. In 1202, however, Dirk was defeated and taken prisoner by the duke of Brabant, and had to purchase peace on humiliating terms. He only survived his defeat a short time and died early in 1204, leaving as his only issue a daughter, Ada, 17 years of age. The question of female succession thus raised was not likely to be accepted without a challenge by William. It had been the intention of Dirk VII. to secure the recognition of his daughter's rights by appointing his brother her guardian. His widow Alida, however, an ambitious woman of strong character, as soon as her husband was dead, hurried on a marriage between Ada and Count Louis of Loon; and attempted with the nobles of Holland, who now for the first time make their appearance as a power in the country, to oppose the claim which William had made to the countship as heir in the male line. A struggle ensued. William was supported by the Zeelanders and Ada was forced to fly to England. William, by a treaty concluded with Louis of Loon in 1206, became undisputed count. He took an active part in the events of his time. He fought by the side of the emperor Otto IV. in the great battle of Bouvines in 1214 (see PHILIP AUGUSTUS), and was taken prisoner. Two years later he accompanied Louis, the eldest son of Philip Augustus, in his expedition against King John of England. William is perhaps best known in history by his taking part in the fourth Crusade. He distinguished himself greatly at the capture of Damietta (1219). He did not long survive his return home, dying in 1222. The earliest charters conveying civic privileges in the county of Holland date from his reign—those of Geertruidenberg (1213) and of Dordrecht (1220). His son Floris IV., being a minor, succeeded him under the guardianship of his maternal uncle, Gerard III. of Gelderland. He maintained in later life close relations of friendship with Gerard, and supported him in his quarrel with the bishop of Utrecht (1224–1226). Floris was murdered in 1235 at a tournament at Corbie in Picardy by the count of Clermont. Another long minority followed his death, during which his brother Otto, bishop of Utrecht, acted as guardian to his nephew William II.

Floris III.

Dirk VII.

William I.

Floris IV.

William II. became a man of mark. Pope Innocent IV., having deposed the emperor Frederick II., after several princes had refused to allow themselves to be nominated in the place of the Hohenstaufen, caused the young count of Holland to be elected king of the Romans (1247) by an assembly composed chiefly of German ecclesiastics. William took Aachen in 1248 and was there crowned king; and after Frederick's death in 1250, he had a considerable party in Germany. He brought a war with Margaret of Flanders (Black Margaret) to a successful conclusion (1253). He was on the point of proceeding to Rome to be crowned emperor, when in an expedition against the West Frisians he perished, going down, horse and armour, through the ice (1256). Like so many of his predecessors he left his inheritance to a child. Floris V. was but two years old on his father's death; and he was destined during a reign of forty years to leave a deeper impress upon the history of Holland than any other of its counts. Floris was a man of chivalrous character and high capacity, and throughout his reign he proved himself an able and beneficent ruler. Alike in his troubles with his turbulent subjects and in the perennial disputes with his neighbours he pursued a strong, far-sighted and successful policy. But his active interest in affairs was not limited to the Netherlands. He allied himself closely with Edward I. of England in his strife with France, and secured from the English king great trading advantages for his people; the staple of wool was placed at Dort (Dordrecht) and the Hollanders and Zeelanders got fishing rights on the English coast. So intimate did their relations become that Floris sent his son John to be educated at the court of Edward with a view to his marriage with an English princess. To

balance the power of the nobles he granted charters to many of the towns. Floris made himself master of Amstelland and Gooiland; and Amsterdam, destined to become the chief commercial town of Holland, counts him the founder of its greatness. Its earliest extant charter dates from 1275. In 1296 Floris forsook the alliance of Edward I. for that of Philip IV. of France, probably because Edward had given support to Guy, count of Flanders, in his dynastic dispute with John of Avesnes, count of Hainaut, Floris's nephew (see FLANDERS). The real motives of his policy will, however, never be known, for shortly afterwards a conspiracy of disaffected nobles, headed by Gijsbrecht van Amstel, Gerard van Velzen and Wolfert van Borselen, was formed against him. He was by them basely murdered in the castle of Muiden (June 27, 1296). The tragic event has been immortalized in dramas from the pens of Holland's most famous writers (see VONDEL, HOOFT). The burghers and people, who knew him to be their best friend, took such vengeance on his slayers as permanently to reduce the power of the nobles.

First Charter to Amsterdam.

Murder of Floris V.

John I., his son, was in England when his father was murdered; he was but 15 years of age, feeble in body and mind. He was married to Eleanor, daughter of Edward I. His reign was a struggle between John of Avesnes, the young count's guardian and next heir, and Wolfert van Borselen, who had a strong following in Zeeland. In 1299 van Borselen was killed, and a few months later John I. died. John of Avesnes was at once recognized as his successor by the Hollanders. Thus with John I. ended the first line of counts, after a rule of nearly 400 years. Europe has perhaps never seen an abler series of princes than these fourteen lineal descendants of Dirk I. Excepting the last there is not a weak man among them. Physically handsome and strong, model knights of the days of chivalry, hard fighters, wise statesmen, they were born leaders of men; always ready to advance the commerce of the country, they were the supporters of the growing towns, and likewise the pioneers in the task of converting a land of marshes and swamps into a fertile agricultural territory rich in flocks and herds. As individuals they had their failings, but one and all were worthy members of a high-souled race.

John I.

Extinction of the first line of Counts. Their high character.

John of Avesnes, who took the title of John II., was the son of John of Avesnes, count of Hainaut, and Alida, sister of William II. of Holland. On his succession to the countship the Hollanders were willing to receive him, but the Zeelanders were hostile; and a long struggle ensued before his authority was generally recognized. In 1301 Bishop William of Utrecht invaded Amstelland, but was killed in battle. John made use of his victory to secure the election of his brother Guy as bishop in his place. A war with the Flemings followed, in which the Flemings were at first victorious, but after a struggle of many vicissitudes they were at length driven out of Holland and Zeeland in 1304. John II. died in that year and was succeeded by his son William III., surnamed the Good (1304–1337). In his reign the long-standing quarrel with Flanders, which had during a century and a half caused so many wars, was finally settled by the treaty of 1323, by which the full possession of West Zeeland was granted to William, who on his part renounced all claim in Imperial Flanders. The Amstelland with its capital, Amsterdam, which had hitherto been held as a fief of Utrecht, was by William, on the death of his uncle Bishop Guy, finally annexed to Holland. This count did much to encourage civic life and to develop the resources of the country. He had close relations through marriage with the three principal European dynasties of his time. His wife was Jeanne of Valois, niece of the French king; in 1323 the emperor Louis the Bavarian wedded his daughter Margaret; and in 1328 his third daughter, Philippa of Hainaut, was married to Edward III. of England. By their alliance William III. occupied a position of much dignity and influence, which he used to further the interests and increase the welfare of his hereditary lands. He was in all respects a great prince and a wise and prudent statesman. He was succeeded by his son, William IV., who was the ally of his brother-in-law, Edward III., in his French wars. He was fond of adventure, and in 1343 made a journey to the Holy Land in disguise, and on his way took part in an expedition of the knights of the Teutonic Order against the infidel Wends and Lithuanians. He was killed in battle against the Frisians in 1345. He left no children, and the question as to the succession now brought on Holland a period of violent civil commotions. His inheritance was claimed by his eldest sister, the empress Margaret, as well as by Philippa of Hainaut, or in other words, by Edward III. of England. Margaret came in person and was duly recognized as countess in Holland, Zeeland and Hainaut; but returned to her husband after appointing her second son (the eldest, Louis, renounced his rights) Duke William of Bavaria, as stadholder in her place. William was but sixteen, and disorder and confusion soon reigned in the land. The sudden death of the emperor in 1347 added to the difficulties of his position. In 1349 Margaret was induced to resign her sovereignty, and the stadholder became count under the title of William V. This was the time of the formation of the famous parties in Holland, known as Kabbeljauws (Cods) and Hoeks (Hooks); the former, the burgher party, were the supporters of William (possibly the name was derived from the light blue, scaly looking Bavarian coat of arms), the latter the party of the disaffected nobles, who wanted to catch and devour the fat burgher fish. In 1350 such was the disorder in the land that Margaret, at the request of the nobles, came to Holland to take into her own hands the reins of government. The struggle between the nobles and the cities broke out into civil war. Edward III. came to Margaret's aid, winning a sea-fight off Veere in 1351; a few weeks later the Hooks and their English allies were defeated by William and the Cods at Vlaardingen—an overthrow which ruined Margaret's cause. Edward III. shortly afterwards changed sides, and the empress saw herself compelled (1354) to come to an understanding with her son, he being recognized as count of Holland and Zeeland, she of Hainaut. Margaret died two years later, leaving William, who had married Matilda of Lancaster, in possession of the entire Holland-Hainaut inheritance (July 1356). His tenure of power was, however, very brief. Before the close of 1357 he showed such marked signs of insanity that his wife, with his own consent and the support of both parties, invited Duke Albert of Bavaria, younger brother of William V., to be regent, with the title of *Ruward* (1358). William lived in confinement for 31 years. Albert died in 1404, having ruled the land well and wisely for 46 years, first as Ruward, then as count. Despite outbreaks from time to time of the Hook and Cod troubles, he was able to make his authority respected, and to help forward in many ways the social progress of the country. The influence of the towns was steadily on the increase, and their government began to fall into the hands of the burgher patrician class, who formed the Cod party. Opposed to them were the nobility and the lower classes, forming the Hook party. In Albert's latter years a fresh outbreak of civil war (1392–1395) was caused by the count's espousing the side of the Cods, while the Hooks had the support of his eldest son, William. Albert was afterwards reconciled to his son, who succeeded him as William VI. in 1404. On his accession to power William upheld the Hooks, and secured their ascendancy. His reign was much troubled with civil discords, but he was a brave soldier, and was generally successful in his enterprises. He died in 1417, leaving an only child, a daughter, Jacqueline (or Jacoba), who had in her early youth been married to John, heir to the throne of France. At a gathering held at the Hague (August 15, 1416) the nobles and representatives of the cities of Holland and Zeeland had promised at William's request to support his daughter's claims to the succession. But John of France died (April 1417), and William VI.

about a month later, leaving the widowed Jacqueline at 17 years of age face to face with a difficult situation. She was at first welcomed in Holland and Zeeland, but found her claims opposed by her uncle, John of Bavaria, supported by the Cod party. Every one from whom she might have expected help betrayed her in turn, her second husband John IV. of Brabant, her third husband Humphrey of Gloucester, her cousin Philip the Good of Burgundy, all behaved shamefully to her. Her romantic and sad life has rendered the courageous and accomplished Jacqueline the most picturesque figure in the whole history of Holland. She struggled long against her powerful kinsfolk, nor did she know happiness till near the end of her life, when she abandoned the unequal strife, and found repose with Francis of Borselen, Ruward of Holland, her fourth husband. Him Philip the Good, duke of Burgundy, craftily seized; and thereby in 1433 the Duchess Jacqueline was compelled to cede her rights over the counties of Holland and Hainaut. Consequently at her death in 1436, as she left no children, Philip succeeded to the full and undisputed possession of her lands. He had already acquired by inheritance, purchase or force almost all the other Netherland states; and now, with the extinction of the Bavarian line of counts, Holland ceased to have an independent existence and became an outlying province of the growing Burgundian power (see BURGUNDY). During the years that followed the accession to the sovereignty of Duke Philip, Holland plays but an insignificant part. It was governed by a stadholder, and but small respect was shown for its chartered rights and privileges. The quarrels between the Hook and Cod factions still continued, but the outbreaks of civil strife were quickly repressed by the strong hand of Philip. Holland during this time contented herself with growing material prosperity. Her herring fishery, rendered more valuable by the curing process discovered or introduced by Benkelszoon, brought her increasing wealth, and her fishermen were already laying the foundations of her future maritime greatness. It was in the days of Duke Philip that Lorenz Koster of Haarlem contributed his share to the discovery of printing. During the reign of Charles the Bold (1467–1477) the Hollanders, like the other subjects of that warlike prince, suffered much from the burden of taxation. An outbreak at Hoorn was by Charles sternly repressed. The Hollanders were much aggrieved by the establishment of a high court of justice for the entire Netherlands at Mechlin. (1474). This was regarded as a serious breach of their privileges. The succession of Mary of Burgundy led to the granting to Holland as to the other provinces of the Netherlands, of the Great Privilege of March 1477, which restored the most important of their ancient rights and liberties (see NETHERLANDS). A high court of justice was established for Holland, Zeeland and Friesland, and the use of the native language was made official. The Hook and Cod troubles again disturbed the country. Hook uprisings took place at Leiden and Dordrecht and had to be repressed by armed force.

Accession of the Burgundian Dynasty.

Philip the Good.

Flourishing state of Holland.

Charles the Bold.

Mary of Burgundy.

By the sudden death of the Duchess Mary in 1482 her possessions, including the county of Holland, passed to her infant son, Philip, under the guardianship of his father the Archduke Maximilian of Austria. Thus the Burgundian dynasty was succeeded by that of the Habsburgs. During the regency of Maximilian the turbulence of the Hooks caused much strife and unrest in Holland. Their leaders, Francis of Brederode and John of Naaldwijk, seized Rotterdam and other places. Their overthrow finally ended the strife between Hooks and Cods. The "Bread and Cheese War," an uprising of the peasants in North Holland caused by famine, is a proof of the misery caused by civil discords and oppressive taxation. In 1494, Maximilian having been elected emperor, Philip was declared of age. His assumption of the government was greeted with joy in Holland, and in his reign the province enjoyed rest and its fisheries benefited from the commercial treaty concluded with England. The story of Holland during the long reign of his son and successor Charles III. (1506–1555), better known as the emperor Charles V., belongs to the general history of the Netherlands (see NETHERLANDS). On the abdication of Charles, his son Philip II. of Spain became Philip III., count of Holland, the ruler whose arbitrary rule in church and state brought about the revolt of the Netherlands. His appointment of William, prince of Orange, as stadholder of Holland and Zeeland was destined to have momentous results to the future of those provinces (see WILLIAM THE SILENT). The capture of Brill and of Flushing in 1572 by the Sea-Beggars led to the submission of the greater part of Holland and Zeeland to the authority of the prince of Orange, who, as stadholder, summoned the states of Holland to meet at Dordrecht. This act was the beginning of Dutch independence. From this time forward William made Holland his home. It became the bulwark of the Protestant faith in the Netherlands, the focus of the resistance to Spanish tyranny. The sieges of Haarlem, Alkmaar and Leiden saved Holland from being overwhelmed by the armies of Alva and Requesens and stemmed the tide of Spanish victory. The act of federation between Holland and Zeeland brought about by the influence of William was the germ of the larger union of Utrecht between the seven northern provinces in 1579. But within the larger union the inner and closer union between Holland and Zeeland continued to subsist. In 1580, when the sovereignty of the Netherlands was offered to the duke of Anjou, the two maritime provinces refused to acquiesce, and forced William to accept the title of count of Holland and Zeeland. In the following year William in the name of the two provinces solemnly abjured the sovereignty of the Spanish king (July 24). After the assassination of William (1584) the title of count of Holland was never revived.

The Emperor Charles V. (Charles III.).

Philip III.

William of Orange Stadholder.

The revolt of the Netherlands.

Union of Utrecht.

Abjuration of Philip's Sovereignty.

In the long struggle of the united provinces with Spain, which followed the death of Orange, the brunt of the conflict fell upon Holland. More than half the burden of the charges of the war fell upon this one province; and with Zeeland it furnished the fleets which formed the chief defence of the country. Hence the importance attached to the vote of Holland in the assembly of the States-General. That vote was given by deputies at the head of whom was the advocate (in later times called the grand pensionary) of Holland, and who were responsible to, and the spokesmen of, the provincial states. These states, which met at the Hague in the same building as the States-General, consisted of representatives of the burgher oligarchies (regents) of the principal towns, together with representatives of the nobles, who possessed one vote only. The advocate was the paid minister of the states. He presided over their meetings, kept their minutes and conducted all correspondence, and, as stated above, was their spokesman in the States-General. The advocate (or grand pensionary) of Holland therefore, if an able man, had opportunities for exercising a very considerable influence, becoming in fact a kind of minister of all affairs. It was this influence as exerted by the successive advocates of Holland, Paul Buys and Johan van Oldenbarneveldt, which rendered abortive the well-meant efforts of the earl of Leicester to centralize the government of the United Provinces. After his departure (1587) the advocate of Holland, Oldenbarneveldt, became the indispensable statesman of the struggling republic. The multiplicity of his functions gave to the advocate an almost unlimited authority in the details of administration, and for thirty years the conduct of affairs remained in his hands (see OLDENBARNEVELDT). This meant the undisputed hegemony of Holland in the federation, in other words of the burgher oligarchies who controlled the town corporations of the province, and especially of Amsterdam. This authority of Holland was, however, more than counterbalanced

Johan van Oldenbarneveldt.

SpinSmart Software http://www.spinsmart.com

by the extensive powers with which the stadholder princes of Orange were invested; and the chief crises in the internal history of the Dutch republic are to be found in the struggles for supremacy between two, in reality, different principles of government. On the one side the principle of provincial sovereignty which gave to the voice of Holland a preponderating weight that was decisive; on the other side the principle of national sovereignty personified in the princes of Orange, to whom the States-General and the provincial states delegated executive powers that were little less than monarchical.

Contest between the Principles of National and Provincial Sovereignty.

The conclusion of the twelve years' truce in 1609 was a triumph for Oldenbarneveldt and the province of Holland over the opposition of Maurice, prince of Orange. In 1617 the outbreak of the religious dispute between the Remonstrant and Contra-remonstrant parties brought on a life and death struggle between the sovereign province of Holland and the States-General of the union. The sword of Maurice decided the issue in favour of the States-General. The claims of Holland were overthrown and the head of Oldenbarneveldt fell upon the scaffold (1619). The stadholder, Frederick Henry of Orange, ruled with well-nigh monarchical authority (1625–1647), but even he at the height of his power and popularity had always to reckon with the opposition of the states of Holland and of Amsterdam, and many of his plans of campaign were thwarted by the refusal of the Hollanders to furnish supplies. His son William II. was but 21 years of age on succeeding to the stadholdership, and the states of Holland were sufficiently powerful to carry through the negotiations for the peace of Münster (1648) in spite of his opposition. A life and death conflict again ensued, and once more in 1650 the prince of Orange by armed force crushed the opposition of the Hollanders. The sudden death of William in the hour of his triumph caused a complete revolution in the government of the republic. He left no heir but a posthumous infant, and the party of the burgher regents of Holland was once more in the ascendant. The office of stadholder was abolished, and John de Witt, the grand pensionary (*Raad-Pensionaris*) of Holland, for two decades held in his hands all the threads of administration, and occupied the same position of undisputed authority in the councils of the land as Oldenbarneveldt had done at the beginning of the century. Amsterdam during this period was the centre and head of the United Provinces. The principle of provincial sovereignty was carried to its extreme point in the separate treaty concluded with Cromwell in 1654, in which the province of Holland agreed to exclude for ever the prince of Orange from the office of stadholder of Holland or captain-general of the union. In 1672 another revolution took place. John de Witt was murdered, and William III. was called to fill the office of dignity and authority which had been held by his ancestors of the house of Orange, and the stadholdership was declared to be hereditary in his family. But William died without issue (see WILLIAM III.) and a stadholderless period, during which the province of Holland was supreme in the union, followed till 1737. This change was effected smoothly, for though William had many differences with Amsterdam, he had in Anthony Heinsius (van der Heim), who was grand pensionary of Holland from 1690 to his death in 1720, a statesman whom he thoroughly trusted, who worked with him in the furtherance of his policy during life and who continued to carry out that policy after his death. In 1737 there was once more a reversion to the stadholdership in the person of William IV., whose powers were strengthened and declared hereditary both in the male and female line in 1747. But until the final destruction of the federal republic by the French armies, the perennial struggle went on between the Holland or federal party (*Staatsgesinden*) centred at Amsterdam —out of which grew the patriot party under William V.—and the Orange or unionist party (*Oranjegesinden*), which was strong in the smaller provinces and had much popular support among the lower classes. The French conquest swept away the old condition of things never to reappear; but allegiance to the Orange dynasty survived, and in 1813 became the rallying point of a united Dutch people. At the same time the leading part played by the province of Holland in the history of the republic has not been unrecognized, for the country ruled over by the sovereigns of the house of Orange is always popularly, and often officially, known as Holland.

The full title of the states of Holland in the 17th and 18th centuries was: *de Edele Groot Mogende Heeren Staaten van Holland en Westfriesland.* After 1608 this assembly consisted of nineteen members, one representing the nobility (*ridderschap*), and eighteen, the towns. The member for the nobles had precedence and voted first. The interests of the country districts (*het platte land*) were the peculiar charges of the member for the nobles. The nobles also retained the right of appointing representatives to sit in the College of Deputed Councillors, in certain colleges of the admiralty, and upon the board of directors of the East India Company, and to various public offices. The following eighteen towns sent representatives: South Quarter—(1) Dordrecht, (2) Haarlem, (3) Delft, (4) Leiden, (5) Amsterdam, (6) Gouda, (7) Rotterdam, (8) Gorinchem, (9) Schiedam, (10) Schoonhoven, (11) Brill; North Quarter:—(12) Alkmaar, (13) Hoorn, (14) Enkhuizen, (15) Edam, (16) Monnikendam, (17) Medemblik, (18) Purmerend. Each town (as did also the nobles) sent as many representatives as they pleased, but the nineteen members had only one vote each. Each town's deputation was headed by its pensionary, who was the spokesman on behalf of the representatives. Certain questions such as peace and war, voting of subsidies, imposition of taxation, changes in the mode of government, &c., required unanimity of votes. The grand pensionary (*Raad-Pensionaris*) was at once the president and chief administrative officer of the states. He presided over all meetings, conducted the business, kept the minutes, and was charged with the maintenance of the rights of the states, with the execution of their resolutions and with the entire correspondence. Nor were his functions only provincial. He was the head and the spokesman of the deputation of the states to the States-General of the union; and in the stadholderless period the influence of such grand pensionaries of Holland as John de Witt and Anthony Heinsius enabled the complicated and intricate machinery of government in a confederacy of many sovereign and semi-sovereign authorities without any recognized head of the state, to work with comparative smoothness and a remarkable unity of policy. This was secured by the indisputable predominance in the union of the province of Holland. The policy of the states of Holland swayed the policy of the generality, and historical circumstances decreed that the policy of the states of Holland during long and critical periods should be controlled by a succession of remarkable men filling the office of grand pensionary. The states of Holland sat at the Hague in the months of March, July, September and November. During the periods of prorogation the continuous oversight of the business and interests of the province was, however, never neglected. This duty was confided to a body called the College of Deputed Councillors (*het Kollegie der Gekommitteerde Raden*), which was itself divided into two sections, one for the south quarter, another for the north quarter. The more important—that for the south quarter —consisted of ten members, (1) the senior member of the nobility, who sat for life, (2) representatives (for periods of three years) of the eight towns: Dordrecht, Haarlem, Delft, Leiden, Amsterdam, Gouda, Rotterdam and Gorinchem, with a tenth member (usually elected biennially) for the towns of Schiedam, Schoonhoven and Brill conjointly. The grand pensionary presided over the meetings of the college, which had the general charge of the whole provincial administration, especially of finance, the carrying out of the resolutions of the states, the maintenance of defences, and the upholding of the privileges and liberties of the land. With particular regard to this last-

Constitution of the States of Holland.

The Grand Pensionary.

College of Deputed Councillors.

SpinSmart Software http://www.spinsmart.com

named duty the college deputed two of its members to attend all meetings of the states-general, to watch the proceedings and report at once any proposals which they held to be contrary to the interests or to infringe upon the rights of the province of Holland. The institution of the College of Deputed Councillors might thus be described as a vigilance committee of the states in perpetual session. The existence of the college, with its many weighty and important functions, must never be lost sight of by students who desire to have a clear understanding of the remarkable part played by the province of Holland in the history of the United Netherlands. (G. E.)

HOLLAND, a city of Ottawa county, Michigan, U.S.A., on Macatawa Bay (formerly called Black Lake), near Lake Michigan, and 25 m. W.S.W. of Grand Rapids. Pop. (1890) 3945; (1900) 7790, of whom a large portion were of Dutch descent; (1904) 8966; (1910) 10,490 It is served by the Père Marquette Railroad, by steamboat lines to Chicago and other lake ports, and by electric lines connecting with Grand Rapids, Saugatuck, and the neighbouring summer resorts. On Macatawa Bay are Ottawa Beach, Macatawa Park, Jenison Park, Central Park, Castle Park and Waukezoo. In the city itself are Hope College (co-educational; founded in 1851 and incorporated as a college in 1866), an institution of the (Dutch) Reformed Church in America; and the Western Theological Seminary (1869; suspended 1877–1884) of the same denomination. Holland is a grain and fruit shipping centre, and among its manufactures are furniture, leather, grist mill products, iron, beer, pickles, shoes, beet sugar, gelatine, biscuit (Holland rusk), electric and steam launches, and pianos. In 1908 seven weekly, one daily, and two monthly papers (four denominational) were published at Holland, five of them in Dutch. The municipality owns its water-works and electric-lighting plant. Holland was founded in 1847 by Dutch settlers, under the leadership of the Rev. A. C. Van Raalte, and was chartered as a city in 1867. In 1871 much of it was destroyed by a forest fire.

HOLLAND, a cloth so called from the country where it was first made. It was originally a fine plain linen fabric of a brownish colour—unbleached flax. Several varieties are now made: hollands, pale hollands and fine hollands. They are used for aprons, blinds, shirts, blouses and dresses.

HOLLAR, WENZEL or **WENCESLAUS** [VACLAF HOLAR] (1607–1677), Bohemian etcher, was born at Prague on the 13th of July 1607, and died in London, being buried at St Margaret's church, Westminster, on the 28th of March 1677. His family was ruined by the capture of Prague in the Thirty Years' War, and young Hollar, who had been destined for the law, determined to become an artist. The earliest of his works that have come down to us are dated 1625 and 1626; they are small plates, and one of them is a copy of a Virgin and Child by Dürer, whose influence upon Hollar's work was always great. In 1627 he was at Frankfort, working under Matthew Merian, an etcher and engraver; thence he passed to Strassburg, and thence, in 1633, to Cologne. It was there that he attracted the notice of the famous amateur Thomas, earl of Arundel, then on an embassy to the imperial court; and with him Hollar travelled to Vienna and Prague, and finally came in 1637 to England, destined to be his home for many years. Though he lived in the household of Lord Arundel, he seems to have worked not exclusively for him, but to have begun that slavery to the publishers which was afterwards the normal condition of his life. In his first year in England he made for Stent, the printseller, the magnificent View of Greenwich, nearly a yard long, and received thirty shillings for the plate,—perhaps a twentieth part of what would now be paid for a single good impression. Afterwards we hear of his fixing the price of his work at fourpence an hour, and measuring his time by a sandglass. The Civil War had its effect on his fortunes, but none on his industry. Lord Arundel left England in 1642, and Hollar passed into the service of the duke of York, taking with him a wife and two children. With other royalist artists, notably Inigo Jones and Faithorne, he stood the long and eventful siege of Basing House; and as we have some hundred plates from his hand dated during the years 1643 and 1644 he must have turned his enforced leisure to good purpose. Taken prisoner, he escaped or was released, and joined Lord Arundel at Antwerp, and there he remained eight years, the prime of his working life, when he produced his finest plates of every kind, his noblest views, his miraculous "muffs" and "shells," and the superb portrait of the duke of York. In 1652 he returned to London, and lived for a time with Faithorne the engraver near Temple Bar. During the following years were published many books which he illustrated:—Ogilby's *Virgil* and *Homer*, Stapylton's *Juvenal*, and Dugdale's *Warwickshire*, *St Paul's* and *Monasticon* (part i.). The booksellers continued to impose on the simple-minded foreigner, pretending to decline his work that he might still further reduce the wretched price he charged them. Nor did the Restoration improve his position. The court did nothing for him, and in the great plague he lost his young son, who, we are told, might have rivalled his father as an artist. After the great fire he produced some of his famous "Views of London"; and it may have been the success of these plates which induced the king to send him, in 1668, to Tangier, to draw the town and forts. During his return to England occurred the desperate and successful engagement fought by his ship the "Mary Rose," under Captain Kempthorne, against seven Algerine men-of-war,—a brilliant affair which Hollar etched for Ogilby's *Africa*. He lived eight years after his return, still working for the booksellers, and retaining to the end his wonderful powers; witness the large plate of Edinburgh (dated 1670), one of the greatest of his works. He died in extreme poverty, his last recorded words being a request to the bailiffs that they would not carry away the bed on which he was dying.

Hollar's variety was boundless; his plates number some 2740, and include views, portraits, ships, religious subjects, heraldic subjects, landscapes, and still life in a hundred different forms. No one that ever lived has been able to represent fur, or shells, or a butterfly's wing as he has done. His architectural drawings, such as those of Antwerp and Strassburg cathedrals, and his views of towns, are mathematically exact, but they are pictures as well. He could reproduce the decorative works of other artists quite faultlessly, as in the famous chalice after Mantegna's drawing. His *Theatrum mulierum* and similar collections reproduce for us with literal truth the outward aspects of the people of his day; and his portraits, a branch of art in which he has been unfairly disparaged, are of extraordinary refinement and power.

Almost complete collections of Hollar's works exist in the British Museum and in the library at Windsor Castle. Two admirable catalogues of his plates have been made, one in 1745 (2nd ed. 1759) by George Vertue, and one in 1853 by Parthey. The latter, published at Berlin, is a model of German thoroughness and accuracy.

HOLLES, DENZIL HOLLES, BARON (1599–1680), English statesman and writer, second son of John Holles, 1st earl of Clare (*c.* 1564–1637), by Anne, daughter of Sir Thomas Stanhope, was born on the 31st of October 1599. The favourite son of his father and endowed with great natural abilities, Denzil Holles grew up under advantageous circumstances. Destined to become later one of the most formidable antagonists of King Charles's arbitrary government, he was in early youth that prince's playmate and intimate companion. The earl of Clare was, however, no friend to the Stuart administration, being especially hostile to the duke of Buckingham; and on the accession of Charles to the throne the king's offers of favour were rejected. In 1624 Holles was returned to parliament for Mitchell in Cornwall, and in 1628 for Dorchester. He had from the first a keen sense of the humiliations which attended the foreign policy of the Stuart kings. Writing to Strafford, his brother-in-law, on the 29th of November 1627, he severely censures Buckingham's conduct of the expedition to the Isle of Rhé; "since England was England," he declared, "it received not so dishonourable a blow"; and he joined in the demand for Buckingham's impeachment in 1628. To these discontents were now added the abuses arising from the king's arbitrary administration. On the 2nd of March 1629, when Sir John Finch, the speaker, refused to put Sir John Eliot's Protestations and was about to adjourn the House by the king's

SpinSmart Software http://www.spinsmart.com

command, Holles with another member thrust him back into the chair and swore "he should sit still till it pleased them to rise." Meanwhile Eliot, on the refusal of the speaker to read the Protestations, had himself thrown them into the fire; the usher of the black rod was knocking at the door for admittance, and the king had sent for the guard. But Holles, declaring that he could not render the king or his country better service, put the Protestations to the House from memory, all the members rising to their feet and applauding. In consequence a warrant was issued for his arrest with others on the following day. They were prosecuted first in the Star Chamber and subsequently in the King's Bench. When brought upon his *habeas corpus* before the latter court Holles offered with the rest to give bail, but refused sureties for good behaviour, and argued that the court had no jurisdiction over offences supposed to have been committed in parliament. On his refusal to plead he was sentenced to a fine of 1000 marks and to imprisonment during the king's pleasure. Holles had at first been committed and remained for some time a close prisoner in the Tower of London. The "close" confinement, however, was soon changed to a "safe" one, the prisoner then having leave to take the air and exercise, but being obliged to maintain himself at his own expense. On the 29th of October Holles, with Eliot and Valentine, was transferred to the Marshalsea. His resistance to the king's tyranny did not prove so stout as that of some of his comrades in misfortune. Among the papers of the secretary Sir John Coke is a petition of Holles, couched in humble and submissive terms, to be restored to the king's favour;[1] having given the security demanded for his good behaviour, he was liberated early in 1630, and on the 30th of October was allowed bail. Being still banished from London he retired to the country, paying his fine in 1637 or 1638. The fine was repaid by the parliament in July 1644, and the judgment was revised on a writ of error in 1668. In 1638 we find him, notwithstanding his recent experiences, one of the chief leaders in his county of the resistance to ship money, though it would appear that he subsequently made submission.

Holles was a member of the Short and Long Parliaments assembled in 1640. According to Laud he was now "one of the great leading men in the House of Commons," and in Clarendon's opinion he was "a man of more accomplished parts than any of his party" and of most authority. He was not, however, in the confidence of the republican party. Though he was at first named one of the managers for the impeachment of Strafford, Holles had little share in his prosecution. According to Laud he held out to Strafford hopes of saving his life if he would use his influence with the king to abolish episcopacy, but the earl refused, and Holles advised Charles that Strafford should demand a short respite, of which he would take advantage to procure a commutation of the death sentence. In the debate on the attainder he spoke on behalf of Strafford's family, and later obtained some favours from the parliament for his eldest son. In all other matters in parliament Holles took a principal part. He was one of the chief movers of the Protestation of the 3rd of May 1641, which he carried up to the Lords, urging them to give it their approval. Although, according to Clarendon, he did not wish to change the government of the church, he showed himself at this time decidedly hostile to the bishops. He took up the impeachment of Laud to the House of Peers, supported the Londoners' petition for the abolition of episcopacy and the Root and Branch Bill, and afterwards urged that the bishops impeached for their conduct in the affair of the late canons should be accused of treason. He showed equal energy in the affairs of Ireland at the outbreak of the rebellion, supported strongly the independence and purity of the judicial bench, and opposed toleration of the Roman Catholics. On the 9th of July 1641 he addressed the Lords on behalf of the queen of Bohemia, expressing great loyalty to the king and royal family and urging the necessity of supporting the Protestant religion everywhere. Together with Pym, Holles drew up the Grand Remonstrance, and made a vigorous speech in its support on the 22nd of November 1641, in which he argued for the right of one House to make a declaration, and asserted: "If kings are misled by their counsellors we may, we must tell them of it." On the 15th of December he was a teller in the division in favour of printing it. On the great subject of the militia he also showed activity. He supported Hesilriges' Militia Bill of the 7th of December 1641, and on the 31st of December he took up to the king the Commons' demand for a guard under the command of Essex. "Holles's force and reputation," said Sir Ralph Verney, "are the two things that give the success to all actions." After the failure of the attempt by the court to gain over Holles and others by offering them posts in the administration, he was one of the "five members" impeached by the king.[2] Holles at once grasped the full significance of the king's action, and after the triumphant return to the House of the five members, on the 11th of January, threw himself into still more pronounced opposition to the arbitrary policy of the crown. He demanded that before anything further was done the members should be cleared of their impeachment; was himself leader in the impeachment of the duke of Richmond; and on the 31st of January, when taking up the militia petition to the House of Lords, he adopted a very menacing tone, at the same time presenting a petition of some thousands of supposed starving artificers of London, congregated round the House. On the 15th of June he carried up the impeachment of the nine Lords who had deserted the parliament; and he was one of the committee of safety appointed on the 4th of July.

On the outbreak of the Civil War (see GREAT REBELLION) Holles, who had been made lieutenant of Bristol, was sent with Bedford to the west against the marquess of Hertford, and took part in the unsuccessful siege of the latter at Sherborne Castle. He was present at Edgehill, where his regiment of Puritans recruited in London was one of the few which stood firm and saved the day for the parliament. On the 13th of November his men were surprised at Brentford during his absence, and routed after a stout resistance. In December he was proposed for the command of the forces in the west, an appointment which he appears to have refused. Notwithstanding his activity in the field for the cause of the parliament, the appeal to arms had been distasteful to Holles from the first. As early as September he surprised the House by the marked abatement of his former "violent and fiery spirit," and his changed attitude did not escape the taunts of his enemies, who attributed it scornfully to his disaster at Brentford or to his new wife. He probably foresaw that, to whichever side victory fell, the struggle could only terminate in the suppression of the constitution and of the moderate party on which all his hopes were based. His feelings and political opinions, too, were essentially aristocratic, and he regarded with horror the transference of the government of the state from the king and the ruling families to the parliamentary leaders. He now advocated peace and a settlement of the disputes by concessions on both sides; a proposal full of danger because impracticable, and one therefore which could only weaken the parliamentary resistance and prolong the struggle. He warmly supported the peace negotiations on the 21st of November and the 22nd of December, and his attitude led to a breach with Pym and the more determined party. In June 1643 he was accused of complicity in Waller's plot, but swore to his innocency; and his arrest with others of the peace party was even proposed in August, when Holles applied for a pass to leave the country. The king's successes, however, for the moment put a stop to all hopes of peace; and in April 1644 Holles addressed the citizens of London at the Guildhall, calling upon them "to join with their purses, their persons, and their prayers together" to support the army of Essex. In November Holles and Whitelocke headed the commission appointed to treat with the king at Oxford. He endeavoured to convince the royalists of the necessity of yielding in time, before the "new party of hot men" should gain the upper hand. Holles and Whitelocke had a

[1] *Hist. MSS. Comm., MSS. of Earl Cowper*, i. 422.

[2] The speech of January 5 attributed to him and printed in *Thomason Tracts*, E 199 (55), is a forgery.

SpinSmart Software http://www.spinsmart.com

private meeting with the king, when at Charles's request they drew up the answer which they advised him to return to the parliament. This interview was not communicated to the other commissioners or to parliament, and though doubtless their motives were thoroughly patriotic, their action was scarcely compatible with their position as trustees of the parliamentary cause. Holles was also appointed a commissioner at Uxbridge in January 1645 and endeavoured to overcome the crucial difficulty of the militia by postponing its discussion altogether. As leader of the moderate (or Presbyterian) party Holles now came into violent antagonism with Cromwell and the army faction. "They hated one another equally"; and Holles would not allow any merit in Cromwell, accusing him of cowardice and attributing his successes to chance and good fortune. With the support of Essex and the Scottish commissioners Holles endeavoured in December 1644 to procure Cromwell's impeachment as an incendiary between the two nations, and "passionately" opposed the self-denying ordinance. In return Holles was charged with having held secret communications with the king at Oxford and with a correspondence with Lord Digby; but after a long examination by the House he was pronounced innocent on the 19th of July 1645. Determined on Cromwell's destruction, he refused to listen to the prudent counsels of Sir Anthony Ashley Cooper, who urged that Cromwell was too strong to be resisted or provoked, and on the 29th of March 1647 drew up in parliament a hasty proclamation declaring the promoters of the army petition enemies to the state; in April challenging Ireton to a duel.

The army party was now thoroughly exasperated against Holles. "They were resolved one way or other to be rid of him," says Clarendon. On the 16th of June 1647 eleven members including Holles were charged by the army with various offences against the state, followed on the 23rd by fresh demands for their impeachment and for their suspension, which was refused. On the 26th, however, the eleven members, to avoid violence, asked leave to withdraw. Their reply to the charges against them was handed into the House on the 19th of July, and on the 20th Holles took leave of the House in *A grave and learned speech* . . . After the riot of the apprentices on the 26th, for which Holles disclaimed any responsibility, the eleven members were again (30th of July) recalled to their seats, and Holles was one of the committee of safety appointed. On the flight of the speaker, however, and part of the parliament to the army, and the advance of the latter to London, Holles, whose party and policy were now entirely defeated, left England on the 22nd of August for Sainte-Mère Eglide in Normandy. On the 26th of January 1648 the eleven members, who had not appeared when summoned to answer the charges against them, were expelled. Not long afterwards, however, on the 3rd of June, these proceedings were annulled; and Holles, who had then returned and was a prisoner in the Tower with the rest of the eleven members, was discharged. He returned to his seat on the 14th of August.

Holles was one of the commissioners appointed to treat with the king at Newport on the 18th of September 1648. Aware of the plans of the extreme party, Holles threw himself at the king's feet and implored him not to waste time in useless negotiations, and he was one of those who stayed behind the rest in order to urge Charles to compliance. On the 1st of December he received the thanks of the House. On the occasion of Pride's Purge on the 6th of December Holles absented himself and escaped again to France. From his retirement there he wrote to Charles II. in 1651, advising him to come to terms with the Scots as the only means of effecting a restoration; but after the alliance he refused Charles's offer of the secretaryship of state. In March 1654 Cromwell, who in alarm at the plots being formed against him was attempting to reconcile some of his opponents to his government, sent Holles a pass "with notable circumstances of kindness and esteem." His subsequent movements and the date of his return to England are uncertain, but in 1656 Cromwell's resentment was again excited against him as the supposed author of a tract, really written by Clarendon. He appears to have been imprisoned, for his release was ordered by the council on the 2nd of September 1659.

Holles took part in the conference with Monk at Northumberland House, when the Restoration was directly proposed, and with the secluded members took his seat again in parliament on the 21st of February 1660. On the 23rd of February he was chosen one of the council to carry on the government during the interregnum; on the 2nd of March the votes passed against him and the sequestration of his estates were repealed, and on the 7th he was made custos rotulorum for Dorsetshire. He took a leading part in bringing about the Restoration, was chairman of the committee of seven appointed to prepare an answer to the king's letter, and as one of the deputed Lords and Commons he delivered at the Hague the invitation to Charles to return. He preceded Charles to England to prepare for his reception, and was sworn of the privy council on the 5th of June. He was one of the thirty-four commissioners appointed to try the regicides in September and October. On the 20th of April 1661 he was created Baron Holles of Ifield in Sussex, and became henceforth one of the leading members of the Upper House.

Holles, who was a good French scholar, was sent as ambassador to France on the 7th of July 1663. He was ostentatiously English, and a zealous upholder of the national honour and interests; but his position was rendered difficult by the absence of home support. On the 27th of January 1666 war was declared, but Holles was not recalled till May. Pepys remarks on the 14th of November: "Sir G. Cartaret tells me that just now my Lord Holles had been with him and wept to think in what a condition we are fallen." Soon afterwards he was employed on another disagreeable mission in which the national honour was again at stake, being sent to Breda to make a peace with Holland in May 1667. He accomplished his task successfully, the articles being signed on the 21st of June.

On the 12th of December he protested against Lord Clarendon's banishment and was nearly put out of the council in consequence. In 1668 he was manager for the Lords in the celebrated Skinner's case, in which his knowledge of precedents was of great service, and on which occasion he published the tract *The Grand Question concerning the Judicature of the House of Peeres* (1669). Holles, who was honourably distinguished by Charles as a "stiff and sullen man," and as one who would not yield to solicitation, now became with Halifax and Shaftesbury a leader in the resistance to the domestic and foreign policy of the court. Together with Halifax he opposed both the arbitrary Conventicle Act of 1670 and the Test Oath of 1675, his objection to the latter being chiefly founded on the invasion of the privileges of the peers which it involved; and he defended with vigour the right of the Peers to record their protests. On the 7th of January 1676 Holles with Halifax was summarily dismissed from the council. On the occasion of the Commons petitioning the king in favour of an alliance with the Dutch, Holles addressed a Letter to Van Beuninghen at Amsterdam on "Love to our Country and Hatred of a Common Enemy," enlarging upon the necessity of uniting in a common defence against French aggression and in support of the Protestant religion. "The People are strong but the Government is weak," he declares; and he attributes the cause of weakness to the transference of power from the nobility to the people, and to a succession of three weak princes. "Save what (the Parliament) did, we have not taken one true step nor struck one true stroke since Queen Elizabeth." He endeavoured to embarrass the government this year in his tract on *Some Considerations upon the Question whether the parliament is dissolved by its prorogation for 15 months.* It was held by the Lords to be seditious and scandalous; while for publishing another pamphlet written by Holles entitled *The Grand Question concerning the Prorogation of this Parliament* (otherwise *The Long Parliament dissolved*) the corrector of the proof sheets was committed to the Tower and fined £1000. In order to bring about the downfall of Danby (afterwards duke of Leeds) and the disbanding of the army, which he believed to be intended for the suppression of the national liberties, Holles at this time (1677–1679) engaged, as did many others, in a

SpinSmart Software http://www.spinsmart.com

dangerous intrigue with Courtin and Barillon, the French envoys, and Louis XIV.; he refused, however, the latter's presents on the ground that he was a member of the council, having been appointed to Sir William Temple's new modelled cabinet in 1679. Barillon described him as at this period in his old age "the man of all England for whom the different cabals have the most consideration," and as firmly opposed to the arbitrary designs of the court. He showed moderation in the Popish Plot, and on the question of the exclusion followed Halifax rather than Shaftesbury. His long and eventful career closed by his death on the 17th of February 1680.

The character of Holles has been drawn by Burnet, with whom he was on terms of friendship. "Hollis was a man of great courage and of as great pride. . . . He was faithful and firm to his side and never changed through the whole course of his life. . . . He argued well but too vehemently; for he could not bear contradiction. He had the soul of an old stubborn Roman in him. He was a faithful but a rough friend, and a severe but fair enemy. He had a true sense of religion; and was a man of an unblameable course of life and of a sound judgment when it was not biased by passion."[1] Holles was essentially an aristocrat and a Whig in feeling, making Cromwell's supposed hatred of "Lords" a special charge against him; regarding the civil wars rather as a social than as a political revolution, and attributing all the evils of his time to the transference of political power from the governing families to the "meanest of men." He was an authority on the history and practice of parliament and the constitution, and besides the pamphlets already mentioned was the author of *The Case Stated concerning the Judicature of the House of Peers in the Point of Appeals* (1675); *The Case Stated of the Jurisdiction of the House of Lords in the point of Impositions* (1676); *Letter of a Gentleman to his Friend showing that the Bishops are not to be judges in Parliament in Cases Capital* (1679); *Lord Holles his Remains, being a 2nd letter to a Friend concerning the judicature of the Bishops in Parliament. . . .*[2] He also published *A True Relation of the unjust accusation of certain French gentlemen* (1671), an account of Holles's intercession on their behalf and of his dispute with Lord Chief Justice Keeling; and he left *Memoirs*, written in exile in 1649, and dedicated "to the unparalleled Couple, Mr Oliver St John . . . and Mr Oliver Cromwell . . ." published in 1699 and reprinted in Baron Maseres's *Select Tracts relating to the Civil Wars*, i. 189. Several speeches of Holles were printed and are extant, and his Letter to Van Beuninghen has been already quoted.

Holles married (1) in 1628 Dorothy, daughter and heiress of Sir Francis Ashley; (2) in 1642 Jane, daughter and co-heiress of Sir John Shirley of Ifield in Sussex and widow of Sir Walter Covert of Slougham, Sussex; and (3) in 1666 Esther, daughter and co-heiress of Gideon Le Lou of Columbiers in Normandy, widow of James Richer. By his first wife he left one son, Francis, who succeeded him as 2nd baron. He had no children by his other wives, and the peerage became extinct in the person of his grandson Denzil, 3rd Baron Holles, in 1694, the estates devolving on John Holles (1662–1711), 4th earl of Clare and duke of Newcastle.

Holles's brother, JOHN HOLLES, 2nd earl of Clare (1595–1666), was member of parliament for East Retford in three parliaments before succeeding to the peerage in 1637. He took some part in the Civil War, but "he was very often of both parties, and never advantaged either." The earldom of Clare, which had been granted in 1624 by James I. to his father, John Holles, in return for the payment of £5000, became merged in the dukedom of Newcastle in 1694, when John Holles, the 4th earl, was created duke of Newcastle.

Holles's Life has been written by C. H. Firth in the *Dictionary of National Biography*; by Horace Walpole in *Royal and Noble Authors*, ii. 28; by Guizot in *Monk's Contemporaries* (Eng. trans., 1851); and by A. Collins in *Historical Collections of Noble Families* (1752), and in the *Biographia Britannica*. See also S. R. Gardiner, *History of England* (1883–1884), and *History of the Great Civil War* (1893); Lord Clarendon, *History of the Rebellion*, edited by W. D. Macray; G. Burnet, *History of His Own Time* (1833); and B. Whitelock, *Memorials* (1732). (P. C. Y.)

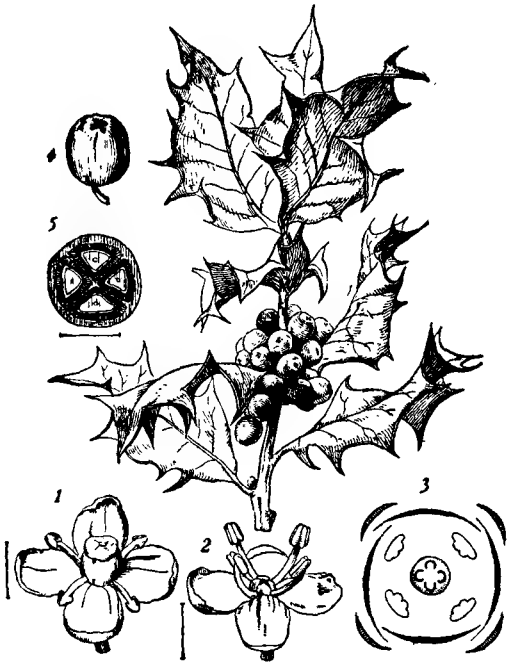
[1] Burnet's *History of His Own Times*, vi. 257, 268.

[2] The rough draft, apparently in Holles's handwriting, is in *Egerton MSS.* ff. 136-149.

HOLLOWAY, THOMAS (1800–1883), English patent-medicine vendor and philanthropist, was born at Devonport, on the 22nd of September 1800, of humble parents. Until his twenty-eighth year he lived at Penzance, where he assisted his mother and brother in the baker's shop which his father, once a warrant officer in a militia regiment, had left them at his death. On coming to London he made the acquaintance of Felix Albinolo, an Italian, from whom he obtained the idea for the ointment which was to carry his name all over the world. The secret of his enormous success in business was due almost entirely to advertisement, in the efficacy of which he had great faith. He soon added the sale of pills to that of the ointment, and began to devote the larger part of his profits to advertising. Holloway's first newspaper announcement appeared on the 15th of October 1837, and in 1842 his yearly expenses for publicity had reached the sum of £5000; this expenditure went on steadily increasing as his sales increased, until it had reached the figure of £50,000 per annum at the time of his death. It is, however, chiefly by the two princely foundations—the Sanatorium and the College for Women at Egham (*q.v.*), endowed by Holloway towards the close of his life—that his name will be perpetuated, more than a million sterling having been set apart by him for the erection and permanent endowment of these institutions. In the deed of gift of the college the founder credited his wife, who died in 1875, with the advice and counsel that led him to provide what he hoped might ultimately become the nucleus of a university for women. The philanthropic and somewhat eccentric donor (he had an unconcealed prejudice against doctors, lawyers and parsons) died of congestion of the lungs at Sunninghill on the 26th of December 1883.

HOLLY (*Ilex Aquifolium*), the European representative of a large genus of trees and shrubs of the natural order Ilicineae, containing about 170 species. The genus finds its chief development in Central and South America; is well developed in Asia, especially the Chinese-Japanese area, and has but few species in Europe, Africa and Australia. In Europe, where *I. Aquifolium* is the sole surviving species, the genus was richly represented during the Miocene period by forms at first South American and Asiatic, and later North American in type (Schimper, *Paléont. végét.* iii. 204, 1874). The leaves are generally leathery and evergreen, and are alternate and stalked; the flowers are commonly dioecious, are in axillary cymes, fascicles or umbellules, and have a persistent four- to five-lobed calyx, a white, rotate four- or rarely five- or six-cleft corolla, with the four or five stamens adherent to its base in the male, sometimes hypogynous in the female flowers, and a two- to twelve-celled ovary; the fruit is a globose, very seldom ovoid, and usually red drupe, containing two to sixteen one-seeded stones.

The common holly, or Hulver (apparently the κήλαστρος of Theophrastus; [3] Ang.-Sax. *holen* or *holegn*; Mid. Eng. *holyn* or *holin*, whence *holm* and *holmtree*;[4] Welsh, *celyn*; Ger. *Stechpalme*, *Hulse*, *Hulst*; O. Fr. *houx*; and Fr. *houlx*),[5] *I. Aquifolium*, is an evergreen shrub or low tree, having smooth, ash-coloured bark, and wavy, pointed, smooth and glossy leaves, 2 to 3 in. long, with a spinous margin, raised and cartilaginous below, or, as commonly on the upper branches of the older trees, entire



[3] *Hist. Plant.* i. 9. 3, iii. 3. 1, and 4. 6, *et passim*. On the *aquifolium* or *aquifolia* of Latin authors, commonly regarded as the holly, see A. de Grandsagne, *Hist. Nat. de Pline*, bk. xvi., "Notes," pp. 199, 206.

[4] The term "holm," as indicative of a prevalence of holly, is stated to have entered into the names of several places in Britain. From its superficial resemblance to the holly, the tree *Quercus Ilex*, the evergreen oak, received the appellation of "holm-oak."

[5] Skeat (*Etymolog. Dict.*, 1879) with reference to the word holly remarks: "The form of the base KUL (=Teutonic HUL) is probably connected with Lat. *culmen*, a peak, *culmus*, a stalk; perhaps because the leaves are 'pointed.'" Grimm (*Deut. Wörterb.* Bd. iv.) suggests that the term *Hulst*, as the O.H.G. *Hulis*, applied to the butcher's broom, or knee-holly, in the earliest times used for hedges, may have reference to the holly as a protecting (*hüllender*) plant.

—a peculiarity alluded to by Southey in his poem *The Holly Tree*. The flowers, which appear in May, are ordinarily dioecious, as in all the best of the cultivated varieties in nurseries (*Gard. Chron.*, 1877, i. 149). Darwin (*Diff. Forms of Flow.*, 1877, p. 297) says of the holly: "During several years I have examined many plants, but have never found one that was really hermaphrodite." Shirley Hibberd, however (*Gard. Chron.*, 1877, ii. 777), mentions the occurrence of "flowers bearing globose anthers well furnished with pollen, and also perfect ovaries." In his opinion, *I. Aquifolium* changes its sex from male to female with age. In the female flowers the stamens are destitute of pollen, though but slightly or not at all shorter than in the male flowers; the latter are more numerous than the female, and have a smaller ovary and a larger corolla, to which the filaments adhere for a greater length. The corolla in male plants falls off entire, whereas in fruit-bearers it is broken into separate

Ilex Aquifolium. Shoot bearing leaves and fruit about ½ nat. size.

segments by the swelling of the young ovary. The holly occurs in Britain, north-east Scotland excepted, and in western and southern Europe, from as high as 62° N. lat. in Norway to Turkey and the Caucasus and in western Asia. It is found generally in forest glades or in hedges, and does not flourish under the shade of other trees. In England it is usually small, probably on account of its destruction for timber, but it may attain to 60 or 70 ft. in height, and Loudon mentions one tree at Claremont, in Surrey, of 80 ft. Some of the trees on Bleak Hill, Shropshire, are asserted to be 14 ft. in girth at some distance from the ground(*N. and Q.*, 5th ser., xii. 508). The holly is abundant in France, especially in Brittany. It will grow in almost any soil not absolutely wet, but flourishes best in rather dry than moist sandy loam. Beckmann (*Hist. of Invent.*, 1846, i. 193) says that the plant which first induced J. di Castro to search for alum in Italy was the holly, which is there still considered to indicate that its habitat is aluminiferous. The holly is propagated by means of the seeds, which do not normally germinate until their second year, by whip-grafting and budding, and by cuttings of the matured summer shoots, which, placed in sandy soil and kept under cover of a hand-glass in sheltered situations, generally strike root in spring. Transplantation should be performed in damp weather in September and October, or, according to some writers, in spring or on mild days in winter, and care should be taken that the roots are not dried by exposure to the air. It is rarely injured by frosts in Britain, where its foliage and bright red berries in winter render it a valuable ornamental tree. The yield of berries has been noticed to be less when a warm spring, following on a wet winter season, has promoted excess of growth. There are numerous varieties of the holly. Some trees have yellow, and others white or even black fruit. In the fruitless variety *laurifolia*, "the most floriferous of all hollies" (Hibberd), the flowers are highly fragrant; the form known as *femina* is, on the other hand, remarkable for the number of its berries. The leaves in the unarmed varieties *aureo-marginata* and *albo-marginata* are of great beauty, and in *ferox* they are studded with sharp prickles. The holly is of importance as a hedge-plant, and is patient of clipping, which is best performed by the knife. Evelyn's holly hedge at Say's Court, Deptford, was 400 ft. long, 9 ft. high and 5 ft. in breadth. To form fences, for which Evelyn recommends the employment of seedlings from woods, the plants should be 9 to 12 in. in height, with plenty of small fibrous roots, and require to be set 1 to 1½ ft. apart, in well-manured and weeded ground and thoroughly watered.

The wood of the holly is even-grained and hard, especially when from the heartwood of large trees, and almost as white as ivory, except near the centre of old trunks, where it is brownish. It is employed in inlaying and turning, and, since it stains well, in the place of ebony, as for teapot handles. For engraving it is inferior to box. When dry it weighs about 47½ lb. per cub. ft. From the bark of the holly bird-lime is manufactured. From the leaves are obtainable a colouring matter named *ilixanthin*, *ilicic acid*, and a bitter principle, *ilicin*, which has been variously described by different analytical chemists. They are eaten by sheep and deer, and in parts of France serve as a winter fodder for cattle. The berries provoke in man violent vomiting and purging, but are eaten with immunity by thrushes and other birds. The larvae of the moths *Sphinx ligustri* and *Phoxopteryx naevana* have been met with on holly. The leaves are mined by the larva of a fly, *Phytomyza ilicis*, and both on them and the tops of the young twigs occurs the plant-louse *Aphis ilicis* (Kaltenbach, *Pflanzenfeinde*, 1874, p. 427). The custom of employing holly and other plants for decorative purposes at Christmas is one of considerable antiquity, and has been regarded as a survival of the usages of the Roman Saturnalia, or of an old Teutonic practice of hanging the interior of dwellings with evergreens as a refuge for sylvan spirits from the inclemency of winter. A Border proverb defines an habitual story-teller as one that "lees never but when the hollen is green." Several popular superstitions exist with respect to holly. In the county of Rutland it is deemed unlucky to introduce it into a house before Christmas Eve. In some English rural districts the prickly and non-prickly kinds are distinguished as "he" and "she" holly; and in Derbyshire the tradition obtains that according as the holly brought at Christmas into a house is smooth or rough, the wife or the husband will be master. Holly that has adorned churches at that season is in Worcestershire and Herefordshire much esteemed and cherished, the possession of a small branch with berries being supposed to bring a lucky year; and Lonicerus mentions a notion in his time vulgarly prevalent in Germany that consecrated twigs of the plant hung over a door are a protection against thunder.

Among the North American species of *Ilex* are *I. opaca*, which resembles the European tree, the Inkberry, *I.* (*Prinos*) *glabra*, and the American Black Alder, or Winterberry, *I.* (*Prinos*) *verticillata*. Hooker (*Fl. of Brit. India*, i. 598, 606) enumerates twenty-four Indian species of *Ilex*. The Japanese *I. crenata*, and *I. latifolia*, a remarkably hardy plant, and the North American *I. Cassine*, are among the species cultivated in Britain. The leaves of several species of *Ilex* are used by dyers. The member of the genus most important economically is *I. paraguariensis*, the prepared leaves of which constitute Paraguay tea, or MATÉ (*q.v.*). Knee holly is *Ruscus aculeatus*, or butcher's broom (see BROOM); sea holly, *Eryngium maritimum*, an umbelliferous plant; and the mountain holly of America, *Nemopanthes canadensis*, also a member of the order Ilicineae.

Besides the works above mentioned, see Louden, *Arboretum*, ii. 506 (1844).

HOLLYHOCK (from M.E. *holi*—doubtless because brought from the Holy Land, where it is indigenous (Wedg.)—and A.-S.

SpinSmart Software http://www.spinsmart.com

hoc, a mallow), *Althaea rosea*, a perennial plant of the natural order *Malvaceae*, a native of the East, which has been cultivated in Great Britain for about three centuries. The ordinary hollyhock is single-blossomed, but the florists' varieties have all double flowers, of white, yellow, rose, purple, violet and other tints, some being almost black. The plant is in its prime about August, but by careful management examples may be obtained in blossom from July to as late as November. Hollyhocks are propagated from seed, or by division of the root, or by planting out in rich sandy soil, in a close frame, with a gentle bottom heat, single eyes from woodshoots, or cuttings from outgrowths of the old stock or of the lateral offsets of the spike. The seed may be sown in October under cover, the plants obtained being potted in November, and kept under glass till the following April, or, if it be late-gathered, in May or June, in the open ground, whence, if required, the plants are best removed in October or April. In many gardens, when the plants are not disturbed, self-sown seedlings come up in abundance about April and May. Seedlings may also be raised in February or March, by the aid of a gentle heat, in a light and rich moist soil; they should not be watered till they have made their second leaves, and when large enough for handling should be pricked off in a cold frame; they are subsequently transferred to the flower-bed. Hollyhocks thrive best in a well-trenched and manured sandy loam. The spikes as they grow must be staked; and water and, for the finest blossoms, liquid manure should be liberally supplied to the roots. Plants for exhibition require the side growths to be pinched out; and it is recommended, in cold, bleak or northerly localities, when the flowering is over, and the stalks have been cut off 4 to 6 in. above the soil, to earth up the crowns with sand. Some of the finest double-flowered kinds of hollyhock do not bloom well in Scotland. The plant is susceptible of great modification under cultivation. The forms now grown are due to the careful selection and crossing of varieties. It is found that the most diverse varieties may be raised with certainty from plants growing near together.

The young shoots of the hollyhock are very liable to the attacks of slugs, and to a disease occasioned by a fungus, *Puccinia malvacearum*, which is a native of Chile, attained notoriety in the Australian colonies, and finally, reaching Europe in 1869, threatened the extermination of the hollyhock, the soft parts of the leaves of which it destroys, leaving the venation only remaining. It has been found especially hurtful to the plant in dry seasons. It is also parasitic on the wild mallows. The disease appears on the leaves as minute hard pale-brown pustules, filled with spores which germinate without a resting-period, but when produced late in the season may last as resting-spores until next spring. Spraying early in the season with Bordeaux mixture is an effective preventive, but the best means of treatment is to destroy all leaves as soon as they show signs of being attacked, and to prevent the growth of other host-plants such as mallows, in the neighbourhood. In hot dry seasons, red-spider injures the foliage very much, but may be kept at bay by syringing the plants frequently with plenty of clean water.

HOLLY SPRINGS, a city and the county-seat of Marshall county, Mississippi, U.S.A., in the N. part of the state, 45 m. S.E. of Memphis. Pop. (1890) 2246; (1900) 2815 (1559 negroes); (1910) 2192. Holly Springs is served by the Illinois Central and the Kansas City, Memphis & Birmingham (Frisco System) railways. The city has broad and well-shaded streets, and a fine court-house and court-house square. It is the seat of Rust University (opened in 1867), a Methodist Episcopal institution for negroes; of the Mississippi Synodical College (1905; Presbyterian), for white girls; and of the North Mississippi Agricultural Experiment Station. The principal industries are the ginning, compressing and shipping of cotton, and the manufacture of cotton-seed oil, but the city also manufactures pottery and brick from clay obtained in the vicinity, and has an ice factory, bottling works and marble works. The municipality owns and operates its water-works and electric-lighting plant. Holly Springs was founded in 1837 and was chartered as a city in 1896. Early in December 1862 General Grant established here a large depot of supplies designed for the use of the Federal army while on its march toward Vicksburg, but General Earl Van Dorn, with a brigade of cavalry, surprised the post at daylight on the 20th of this month, burned the supplies and took 1500 prisoners. Holly Springs was the home and is the burial-place of Edward Cary Walthall (1831–1898), a Democratic member of the United States Senate in 1885–1894 and in 1895–1898.

HOLMAN, JAMES (1786–1857), known as the "Blind Traveller," was born at Exeter on the 15th of October 1786. He entered the British navy in 1798 as first-class volunteer, and was appointed lieutenant in April 1807. In 1810 he was invalided by an illness which resulted in total loss of sight. In consideration of his helpless circumstances he was in 1812 appointed one of the royal knights of Windsor, but the quietness of such a life harmonized so ill with his active habits and keen interests that he requested leave of absence to go abroad, and in 1819, 1820 and 1821 journeyed through France, Italy, Switzerland, the parts of Germany bordering on the Rhine, Belgium and the Netherlands. On his return he published *The Narrative of a Journey through France*, &c. (London, 1822). He again set out in 1822 with the design of making the circuit of the world, but after travelling through Russia into Siberia, he was suspected of being a spy, was arrested when he had managed to penetrate 1000 m. beyond Smolensk, and after being conducted to the frontiers of Poland, returned home by Austria, Saxony, Prussia and Hanover. He now issued *Travels through Russia, Siberia*, &c. (London, 1825). Shortly afterwards he again set out to accomplish by a somewhat different method the design which had been frustrated by the Russian authorities; and an account of his remarkable achievement was published in four volumes in 1834–1835, under the title of *A Voyage round the World, including Travels in Africa, Asia, Australasia, America, &c., from 1827 to 1832.* His last journeys were through Spain, Portugal, Moldavia, Montenegro, Syria and Turkey; and he was engaged in preparing an account of this tour when he died in London on the 29th of July 1857.

HOLMES, OLIVER WENDELL (1809–1894), American writer and physician, was born on the 29th of August 1809 at Cambridge, Mass. His father, Abiel Holmes (1763–1837), was a Calvinist clergyman, the writer of a useful history, *Annals of America*, and of much very dull poetry. His mother (the second wife of Abiel) was Sarah Wendell, of a distinguished New York family. Through her Dr Holmes was descended from Governors Thomas Dudley and Simon Bradstreet of Massachusetts, and from her he derived his cheerfulness and vivacity, his sympathetic humour and wit. From Phillips (Andover) Academy he entered Harvard in the "famous class of '29," made further illustrious by the charming lyrics which he wrote for the anniversary dinners from 1851 to 1889, closing with the touching "After the Curfew." After graduation he studied law perfunctorily for a year and dabbled in literature, winning the public ear by a spirited lyric called forth by the order to destroy the old frigate *Constitution*. These verses were sung all over the land, and induced the Navy Department to revoke its order and save the old ship. Turning next to medicine, and convinced by a brief experience in Boston that he liked it, he went to Paris in March 1833. He studied industriously under Louis and other famous physicians and surgeons in France, and in his vacations visited the Low Countries, England, Scotland and Italy. Returning to Boston at the close of 1835, filled with a high professional ambition, he sought practice, but achieved only moderate success. Social, brilliant in conversation, and a writer of gay little poems, he seemed to the grave Bostonians not sufficiently serious. He won prizes, however, for professional papers, and lectured on anatomy at Dartmouth College. He wrote two papers on homoeopathy, which he attacked with trenchant wit; also a valuable paper on the malarial fevers of New England. In 1843 he published his essay on the *Contagiousness of Puerperal Fever*, which stirred up a fierce controversy and brought upon him bitter personal abuse; but he maintained his position with dignity, temper and judgment; and in time he was honoured

SpinSmart Software http://www.spinsmart.com

as the discoverer of a beneficent truth. The volume of his medical essays holds some of his most sparkling wit, his shrewdest observation, his kindliest humanity. In 1840 he married Amelia Lee Jackson, daughter of the Hon. Charles Jackson (1775–1855), formerly associate justice of the State supreme judicial court, a lady of rare charm alike of mind and character. She died in the winter of 1887–1888. Their first-born child, Oliver Wendell Holmes, afterwards became chief justice of that same bench on which his grandfather sat. In 1847 Dr Holmes was appointed professor of anatomy and physiology in the Medical School of Harvard University, the duties involving the giving of instruction also in kindred departments, so that, as he said, he occupied "not a chair, but a settee in the school." He delivered the anatomical lectures until November 1882, and in later years these were his only link with the medical profession. They were fresh, witty and lively; and the students were sent to him at the end of the day, when they were fagged, because he alone could keep them awake. In later years he made few finished contributions to medical knowledge; his eager and impetuous temperament caused him to leave more patient investigators to push to ultimate results the suggestions thrown out by his fertile and imaginative mind.

In 1836, being in that year the Phi Beta Kappa poet at Harvard University, he published his first volume of *Poems*, which afterwards reached a second edition. Among these earlier lyrics was "The Last Leaf," one of the most delicate combinations of pathos and humour in literature. His collected poetry fills three volumes. In 1856–1857 a Boston publishing house (Phillips, Sampson, and Co.) invited James Russell Lowell to edit a new magazine, which he agreed to do on condition that he could secure the assistance of Dr Holmes. By this urgent invitation the Doctor was equally surprised and flattered, for heretofore he had stood rather outside the literary coterie of Cambridge and Boston. He accepted with pleasure, and at once threw himself into the enterprise with zeal. He christened it *The Atlantic Monthly*; and, as Mr Howells afterwards said, he "not only named but made" it, for in each number of its first volume there appeared one of the papers of the *Autocrat of the Breakfast Table*. The opening of the *Autocrat*—"I was just going to say when I was interrupted"—is explained by the fact that in the old *New England Magazine* (1831 to 1833) the Doctor had published two *Autocrat* papers, which, by his wish, have never been reprinted. In the commercial panic of 1857 the new magazine would inevitably have failed had it not been for these fascinating essays. Their originality of conception, their wit and humour, their suggestions of what then seemed bold ideas, and their expression of New Englandism, all combined to make them so popular that the most harassed merchant in that gloomy winter purchased them as a dose of cheering medicine. Thus Dr Holmes made *The Atlantic Monthly*, which in return made him. A success so immediate and so splendid settled the rest of his career; he ceased to be a physician and became an author. These twelve papers were immediately (1858) published as a volume. No sooner was the *Autocrat* silent than the *Professor* (1859) succeeded him at the breakfast table. The *Professor* was preferred by more thoughtful readers, though it has hardly been so widely popular as the *Autocrat*. Its theology, which seemed in those days audacious, frightened many of the strict and old-fashioned religionists of New England, though to-day it seems mild enough. Twelve years later, in 1871, the Landlady had another boarder, who took the vacant chair—the *Poet* (published 1872). But here Holmes fell a little short. In these three books, especially in the *Autocrat* and the *Professor*, the Doctor wrote as he talked at many a dinner table in Boston, but less well. The animation and clash of talk roused him. The dinners of the Saturday Club are among Boston's proudest traditions, as they were the chief pleasure of Dr Holmes's life. There he met Emerson, Longfellow, Whittier, Lowell, Sumner, Agassiz, Motley, and many other charming talkers, and among them all he was admitted to be the best.

There were characters and incidents, but hardly a story, in the *Autocrat* and the *Professor*. Holmes had an ambition for more sustained work, and in 1861 his novel, *Elsie Venner*, at first called *The Professor's Story*, was published. The book was illuminated throughout by admirable pictures of character and society in the typical New England town. But the rattlesnake element was unduly extravagant, and in other respects the book was open to criticism as a work of art. It was written with the same purpose which informed the greatest part of the Doctor's literary work, and which had already been scented and nervously condemned by the religious world. By heredity the Doctor was a theologian; no other topic enchained him more than did the stern and merciless dogmas of his Calvinist forefathers. His humanity revolted against them, his reason condemned them, and he set himself to their destruction as his task in literature. The religious world of his time was still so largely under the control of old ideas that he was assailed as a freethinker and a subverter of Christianity; though before his death opinions had so changed that the bitterness of the attacks upon him seemed incredible, even to some of those who had most vehemently made them. None the less, undaunted and profoundly earnest, he returned, six years later, to the same line of thought in his second novel, *The Guardian Angel* (published 1867). This, though less well known than *Elsie Venner*, is in many respects better. No more lifelike and charming picture of the society of the New England country-town of the middle third of the 19th century has ever been drawn, and every page sparkles with wit and humour. In 1884 and 1885 it was followed, still in the same line, by *A Mortal Antipathy*, a production inferior to its predecessors.

Holmes generally held himself aloof from politics, and from those "causes" of temperance, abolition and woman's rights which enthralled most of his contemporaries in New England. The Civil War, however, aroused him for the time; finding him first a strenuous Unionist, it quickly converted him into an ardent advocate of emancipation. His interest was enhanced by the career of his elder son Oliver (see below), who was three times severely wounded, and finally rose to the rank of lieut.-colonel in the Northern army. He wrote some ringing war lyrics, and in 1863 delivered the Fourth of July oration in Boston, which showed a masterly appreciation of the stirring public questions of the day. In 1878 Dr Holmes wrote a memoir of the historian John Lothrop Motley, an affectionate tribute to one who had been his dear friend. In 1884 he contributed the life of Emerson to the American "Men of Letters" series. He admired the "Sage of Concord," but was not quite in intellectual sympathy with him. Both were Liberals in thought, but in widely different ways. But in spite of this handicap the volume proved very popular. In 1888 he began the papers which he happily christened *Over the Tea Cups*. As a *tour de force* on the part of a man of nearly fourscore years they are very remarkable.

After his return from Paris in 1835 Dr Holmes lived in Boston, with summer sojournings at Pittsfield and Beverly Farms, and occasional trips to neighbouring cities, until 1886. He then undertook a four months' journey in Europe, and in England had a sort of triumphal progress. On his return he wrote *Our Hundred Days in Europe* (1887), a courteous recognition of the hospitality and praise which had been accorded to him. During this visit Cambridge University made him Doctor of Letters, Edinburgh University made him Doctor of Laws, and Oxford University made him Doctor of Civil Law. Already, in 1880, Harvard University had made him Doctor of Laws. He died on the 7th of October 1894, and was buried from King's Chapel, Boston, in the cemetery of Mount Auburn.

His eldest son Oliver Wendell (b. 1841), who graduated from Harvard in 1861 and fought in the Civil War, retiring from the army as brevet lieut.-colonel in 1864, took up the study of law and was admitted to the bar in Boston in 1866. He was for some years editor of the *American Law Review*, and after being professor in the Harvard Law School in 1882 was appointed in the same year a judge of the Massachusetts supreme court, rising to be chief justice in 1899. In 1902 he was made a judge of the United States Supreme Court. His work on *The Common Law* (1881) and his edition (1873) of Kent's *Commentaries*

SpinSmart Software http://www.spinsmart.com

are his principal publications; and he became widely recognized as one of the great jurists of his day.

BIBLIOGRAPHY.—Holmes's *Complete Works*, in 13 volumes, were published at Boston in 1891. See J. T. Morse, *Life and Letters of Oliver Wendell Holmes* (London, 1896); G. B. Ives, *Bibliography* (Boston, 1907); and the bibliography in P. K. Foley's *American Authors* (Boston, 1897). An essay by Sir Leslie Stephen is prefixed to the "Golden Treasury" edition (1903) of *The Autocrat of the Breakfast Table*. See also monographs by William Sloane Kennedy (Boston, 1882); Emma E. Brown (Boston, 1884). (J. T. Mo.)

HOLMFIRTH, an urban district in the Holmfirth parliamentary division of the West Riding of Yorkshire, England, on and Holme and the Ribble, 6 m. S. of Huddersfield, and on the Lancashire and Yorkshire railway. Pop. (1901) 8977. The valley, walled by bold hills, is very picturesque. In 1852 great destruction was wrought in the town by the bursting of a reservoir in the vicinity. The large industrial population is employed in woollen manufactories, and in the neighbouring stone quarries.

HOLOCAUST (Gr. ὁλόκαυστον, or ὁλόκαυτον, wholly burnt), strictly a sacrifice wholly destroyed by fire, such as the sacrifices of the Jews, described in the Pentateuch as "whole burnt offerings" (see SACRIFICE). The term is now often applied to a catastrophe on a large scale, whether by fire or not, or to a massacre or slaughter.

HOLOCENE (from Gr. ὅλος, whole, καινός, recent), in geology, the time division which embraces the youngest of all the formations; it is equivalent to the "Recent" of some authors. The name was proposed in 1860 by P. Gervais. The oldest deposits that may be included are those containing neolithic implements; deposits of historic times should also be grouped here; presumably the youngest are those to be chronicled by the last man. The Holocene formations obviously include all the varieties of deposits which are accumulating at the present day: the gravels and alluvia of rivers; boulder clays, moraines and fluvio-glacial deposits; estuarine, coastal and abyssal deposits of the seas, and their equivalents in lakes; screes, taluses, wind-borne dust and sand and desert formations; chemical deposits from saline waters; peat, diatomite, marls, foraminiferal and other oozes; coral, algal and shell banks, and other organic deposits; mud, lava and dust deposits of volcanic origin and extrusions of asphalt and pitch; to all these must be added the works of man.

HOLROYD, SIR CHARLES (1861–), British artist, was born in Leeds on the 9th of April 1861. He received his art education under Professor Legros at the Slade School, University College, London, where he had a distinguished career. After passing six months at Newlyn, where he painted his first picture exhibited in the Royal Academy, "Fishermen Mending a Sail" (1885), he obtained a travelling scholarship and studied for two years in Italy, a sojourn which greatly influenced his art. At his return, on the invitation of Legros, he became for two years assistant-master at the Slade School, and there devoted himself to painting and etching. Among his pictures may be mentioned "The Death of Torrigiano" (1886), "The Satyr King" (1889), "The Supper at Emmaus," and, perhaps his best picture, "Pan and Peasants" (1893). For the church of Aveley, Essex, he painted a triptych altarpiece, "The Adoration of the Shepherds," with wings representing "St Michael" and "St Gabriel," and designed as well the window, "The Resurrection." His portraits, such as that of "G. F. Watts, R.A.," in the Legros manner, show much dignity and distinction. Sir Charles Holroyd has made his chief reputation as an etcher of exceptional ability, combining strength with delicacy, and a profound technical knowledge of the art. Among the best known are the "Monte Oliveto" series, the "Icarus" series, the "Monte Subasio" series, and the "Eve" series, together with the plates, "The Flight into Egypt," "The Prodigal Son," "A Barn on Tadworth Common" (etched in the open air), and "The Storm." His etched heads of "Professor Legros," "Lord Courtney" and "Night," are admirable alike in knowledge and in likeness. His principal dry-point is "The Bather." In all his work Holroyd displays an impressive sincerity, with a fine sense of composition, and of style, allied to independent and modern feeling. He was appointed the first keeper of the National Gallery of British Art (Tate Gallery), and on the retirement of Sir Edward Poynter in 1906 he received the directorship of the National Gallery. He was knighted in 1903. His *Michael Angelo Buonarotti* (London, Duckworth, 1903) is a scholarly work of real value.

HOLSTEIN, FRIEDRICH VON (1837–1909), German statesman, for more than thirty years head of the political department of the German Foreign Office. Holstein's importance began with the dismissal of Bismarck in 1890. The new chancellor, Caprivi, was ignorant of foreign affairs; and Holstein, as the repository of the Bismarckian tradition, became indispensable. This reluctance to emerge into publicity has been ascribed to the part he had played under Bismarck in the Arnim affair, which had made him powerful enemies; it was, however, possibly due to a shrinking from the responsibility of office. Yet the weakness of his position lay just in the fact that he was not ultimately responsible. He protested against the despatch of the "Kruger telegram," but protested in vain. On the other hand, where his ideas were acceptable, he was generally able to realize them. Thus it was almost entirely due to him that Germany acquired Kiao-chau and asserted her interests in China, and the acquisition of Samoa was also largely his work. If the skill and pertinacity with which Holstein carried through his plans in these matters was learned in the school of Bismarck, he had not acquired Bismarck's faculty for foreseeing their ulterior consequences. This is true of his Chinese policy, and true also of his part in the Morocco crisis. The emperor William II.'s journey to Tangier was undertaken on his advice, as a protest against the supposed attempt at the isolation of Germany; but of the later developments of German policy in the Morocco question he did not approve, on the ground that the result would merely be to strengthen the Anglo-French *entente*; and from the 12th of March 1906 onwards he took no active part in the matter. To the last he believed that the position of Germany would remain unsafe until an understanding had been arrived at with Great Britain, and it was this belief that determined his attitude towards the question of the fleet, "beside which," he wrote in February 1909, "all other questions are of lesser account." His views on this question were summarized in a memorandum of December 1907, of which Herr von Rath gives a *résumé*. He objected to the programme of the German Navy League on three main grounds: (1) the ill-feeling likely to be aroused in South Germany, (2) the inevitable dislocation of the finances through the huge additional charges involved, (3) the suspicion of Germany's motives in foreign countries, which would bind Great Britain still closer to France. As for the idea that Germany's power would be increased, this—he wrote in reply to a letter from Admiral Galster—was "a simple question of arithmetic"; for how would the sea-power of Germany be relatively increased if for every new German ship Great Britain built two? Herr von Holstein retired on the resignation of Prince Bülow, and died on the 8th of May 1909.

See Hermann von Rath, "Erinnerungen an Herrn von Holstein" in the *Deutsche Revue* for October 1909. He is also frequently mentioned *passim* in Prince Chlodwig Hohenlohe's *Memoirs*.

HOLSTEIN, formerly a duchy of Germany. Until about 1110 the county of Holstein formed part of the duchy of Saxony, and it was made a duchy in 1472. From 1460 to 1864 it was ruled by members of the house of Oldenburg, some of whom were also kings of Denmark. It is now the southern part of the Prussian province of Schleswig-Holstein. (See SCHLESWIG-HOLSTEIN, and for history SCHLESWIG-HOLSTEIN QUESTION.

HOLSTEN, KARL CHRISTIAN JOHANN (1825–1897), German theologian, was born at Güstrow, Mecklenburg, on the 31st of March 1825, and educated at Leipzig, Berlin and Rostock, where in 1852 he became a teacher of religion in the Gymnasium. In 1870 he went to Bern as professor of New Testament studies, passing thence in 1876 to Heidelberg, where he remained until his death on the 26th of January 1897. Holsten was an adherent of the Tübingen school, and held to Baur's views on the alleged antagonism between Petrinism and Paulinism.

Among his writings are *Zum Evangelium d. Paulus und d. Petrus* (1867); *Das Evangelium des Paulus dargestellt* (1880); *Die synoptischen Evangelien nach der Form ihres Inhalts* (1886).

SpinSmart Software http://www.spinsmart.com

HOLSTENIUS, LUCAS, the Latinized name of Luc Holste (1596–1661), German humanist, geographer and theological writer, was born at Hamburg. He studied at Leiden university, where he became intimate with the most famous scholars of the age—J. Meursius, D. Heinsius and P. Cluverius, whom he accompanied on his travels in Italy and Sicily. Disappointed at his failure to obtain a post in the gymnasium of his native town, he left Germany for good. Having spent two years in Oxford and London, he went to Paris. Here he obtained the patronage of N. de Peiresc, who recommended him to Cardinal Francesco Barberini, papal nuncio and the possessor of the most important private library in Rome. On the cardinal's return in 1627 he took Holstenius to live with him in his palace and made him his librarian. Although converted to Roman Catholicism in 1625, Holstenius showed his liberal-mindedness by strenuously opposing the strict censorship exercised by the Congregation of the Index. He was appointed librarian of the Vatican by Innocent X., and was sent to Innsbruck by Alexander VII. to receive Queen Christina's abjuration of Protestantism. He died in Rome on the 2nd of February 1661. Holstenius was a man of unwearied industry and immense learning, but he lacked the persistency to carry out the vast literary schemes he had planned. He was the author of notes on Cluvier's *Italia antiqua* (1624); an edition of portions of Porphyrius (1630), with a dissertation on his life and writings, described as a model of its kind; notes on Eusebius *Against Hierocles* (1628), on the Sayings of the later Pythagoreans (1638), and the *De diis et mundo* of the neo-Platonist Sallustius (1638); *Notae et castigationes in Stephani Byzantini ethnica* (first published in 1684); and *Codex regularum, Collection of the Early Rules of the Monastic Orders* (1661). His correspondence (*Epistolae ad diversos*, ed. J. F. Boissonade, 1817) is a valuable source of information on the literary history of his time.

See N. Wilckens, *Leben des gelehrten Lucae Holstenii* (Hamburg, 1723); Johann Moller, *Cimbria literata*, iii. (1744).

HOLSTER, a leather case to hold a pistol, used by a horseman and properly fastened to the saddle-bow, but sometimes worn in the belt. The same word appears in Dutch, from which the English word probably directly derives. The root is *hel-* or *hul-* to cover, and is seen in the O. Eng. *heolster*, a place of shelter or concealment, and in "hull" a sheath or covering. The German word for the same object, *holfter*, is, according to the *New English Dictionary*, from a different root.

HOLT, SIR JOHN (1642–1710), lord chief justice of England, was born at Thame, Oxfordshire, on the 30th of December 1642. His father, Sir Thomas Holt, possessed a small patrimonial estate, but in order to supplement his income had adopted the profession of law, in which he was not very successful, although he became sergeant in 1677, and afterwards for his political services to the "Tories" was rewarded with knighthood. After attending for some years the free school of the town of Abingdon, of which his father was recorder, young Holt in his sixteenth year entered Oriel College, Oxford. He is said to have spent a very dissipated youth, and even to have been in the habit of taking purses on the highway, but after entering Gray's Inn about 1660 he applied himself with exemplary diligence to the study of law. He was called to the bar in 1663. An ardent supporter of civil and religious liberty, he distinguished himself in the state trials which were then so common by the able and courageous manner in which he supported the pleas of the defendants. In 1685–1686 he was appointed recorder of London, and about the same time he was made king's sergeant and received the honour of knighthood. His giving a decision adverse to the pretensions of the king to exercise martial law in time of peace led to his dismissal from the office of recorder, but he was continued in the office of king's sergeant in order to prevent him from becoming counsel for accused persons. Having been one of the judges who acted as assessors to the peers in the Convention parliament, he took a leading part in arranging the constitutional change by which William III. was called to the throne, and after his accession he was appointed lord chief justice of the King's Bench. His merits as a judge are the more apparent and the more remarkable when contrasted with the qualities displayed by his predecessors in office. In judicial fairness, legal knowledge and ability, clearness of statement and unbending integrity he has had few if any superiors on the English bench. Over the civil rights of his countrymen he exercised a jealous watchfulness, more especially when presiding at the trial of state prosecutions, and he was especially careful that all accused persons should be treated with fairness and respect. He is, however, best known for the firmness with which he upheld his own prerogatives in opposition to the authority of the Houses of Parliament. On several occasions his physical as well as his moral courage was tried by extreme tests. Having been requested to supply a number of police to help the soldiery in quelling a riot, he assured the messenger that if any of the people were shot he would have the soldiers hanged, and proceeding himself to the scene of riot he was successful in preventing bloodshed. While steadfast in his sympathies with the Whig party, Holt maintained on the bench entire political impartiality, and always held himself aloof from political intrigue. On the retirement of Somers from the chancellorship in 1700 he was offered the great seal, but declined it. His death took place in London on the 5th of March 1710. He was buried in the chancel of Redgrave church.

Reports of Cases determined by Sir John Holt (1681–1710) appeared at London in 1738; and *The Judgments delivered in the case of Ashby v. White and others, and in the case of John Paty and others, printed from original MSS.*, at London (1837). See Burnet's *Own Times*; *Tatler*, No. xiv.; a *Life*, published in 1764; Welsby, *Lives of Eminent English Judges of the 17th and 18th Centuries* (1846); Campbell's *Lives of the Lord Chief Justices*; and Foss, *Lives of the Judges*.

HOLTEI, KARL EDUARD VON (1798–1880), German poet and actor, was born at Breslau on the 24th of January 1798, the son of an officer of Hussars. Having served in the Prussian army as a volunteer in 1815, he shortly afterwards entered the university of Breslau as a student of law; but, attracted by the stage, he soon forsook academic life and made his début in the Breslau theatre as Mortimer in Schiller's *Maria Stuart*. He led a wandering life for the next two years, appearing less on the stage as an actor than as a reciter of his own poems. In 1821 he married the actress Luise Rogée (1800–1825), and was appointed theatre-poet to the Breslau stage. He next removed to Berlin, where his wife fulfilled an engagement at the Court theatre. During his sojourn here he produced the vaudevilles *Die Wiener in Berlin* (1824), and *Die Berliner in Wien* (1825), pieces which enjoyed at the time great popular favour. In 1825 his wife died; but soon after her death he accepted an engagement at the Königsstädter theatre in Berlin, when he wrote a number of plays, notably *Lenore* (1829) and *Der alte Feldherr* (1829). In 1830 he married Julie Holzbecher (1809–1839), an actress engaged at the same theatre, and with her played in Darmstadt. Returning to Berlin in 1831 he wrote for the composer Franz Gläser (1798–1861) the text of the opera *Des Adlers Horst* (1835), and for Ludwig Devrient the drama, *Der dumme Peter* (1837). In 1833 Holtei again went on the stage and toured with his wife to various important cities, Hamburg, Leipzig, Dresden, Munich and Vienna. In the last his declamatory powers as a reciter, particularly of Shakespeare's plays, made a furore, and the poet-actor was given the appointment of manager of the Josefstädter theatre in the last-named city. Though proud of his successes both as actor and reciter, Holtei left Vienna in 1836, and from 1837 to 1839 conducted the theatre in Riga. Here his second wife died, and after wandering through Germany reciting and accepting a short engagement at Breslau, he settled in 1847 at Graz, where he devoted himself to a literary life and produced the novels *Die Vagabunden* (1851), *Christian Lammfell* (1853) and *Der letzte Komödiant* (1863). The last years of his life were spent at Breslau, where being in poor circumstances he found a home in the *Kloster der barmherzigen Brüder*, and here he died on the 12th of February 1880.

As a dramatist Holtei may be said to have introduced the "vaudeville" into Germany; as an actor, although remaining behind the greater artists of his time, he contrived to fascinate his audience by the dramatic force of his exposition of character; as a reciter, especially of Shakespeare, he knew no rival. August

SpinSmart Software http://www.spinsmart.com

Lewald said of Holtei that by the energy of his poetic conception and plastic force he brought his audience round to his own ideas; and he added, "an eloquence such as his I have never met with in any other German."

Holtei was not only a stage-poet but a lyric-writer of great charm. Notable among such productions are *Schlesische Gedichte* (1830; 20th ed., 1893), *Gedichte* (5th ed., 1861), *Stimmen des Waldes* (2nd ed., 1854). Mention ought also to be made of Holtei's interesting autobiography, *Vierzig Jahre* (8 vols., 1843–1850; 3rd ed., 1862) with the supplementary volume *Noch ein Jahr in Schlesien* (1864).

Holtei's *Theater* appeared in 6 vols. (1867); his *Erzählende Schriften*, 39 vols. (1861–1866). See M. Kurnick, *Karl von Holtei, ein Lebensbild* (1880); F. Wehl, *Zeit und Menschen* (1889); O. Storch, *K. von Holtei* (1898).

HÖLTY, LUDWIG HEINRICH CHRISTOPH (1748–1776), German poet, was born on the 21st of December 1748 at the village of Mariensee in Hanover, where his father was pastor. In 1769 he went to study theology at Göttingen. Here he formed a close friendship with J. M. Miller, J. H. Voss, H. Boie, the brothers Stolberg and others, and became one of the founders of the famous society of young poets known as the *Göttinger Dichterbund* or *Hain*. When in 1774 he left the university he had abandoned all intention of becoming a clergyman; but he was not destined to enter any other profession. He died of consumption on the 1st of September 1776 at Hanover. Hölty was the most gifted lyric poet of the Göttingen circle. He was influenced both by Uz and Klopstock, but his love for the Volkslied and his delight in nature preserved him from the artificiality of the one poet and the unworldliness of the other. A strain of melancholy runs through all his lyrics. His ballads are the pioneers of the rich ballad literature on English models, which sprang up in Germany during the next few years. Among his most familiar poems may be mentioned *Üb' immer Treu' und Redlichkeit*, *Tanzt dem schönen Mai entgegen*, *Rosen auf dem Weg gestreut*, and *Wer wollte sich mit Grillen plagen?*

Hölty's *Gedichte* were published by his friends Count Friedrich Leopold zu Stolberg and J. H. Voss (Hamburg, 1783); a new edition, enlarged by Voss, with a biography (1804); a more complete but still imperfect edition by F. Voigts (Hanover, 1857). The first complete edition was that of Karl Halm (Leipzig, 1870), who had access to MSS. not hitherto known. See H. Ruete, *Hölty, sein Leben und Dichten* (Guben, 1883), and A. Sauer, *Der Göttinger Dichterbund*, vol. ii. (Stuttgart, 1894), where an excellent selection of Hölty's poetry will be found.

HOLTZENDORFF, JOACHIM WILHELM FRANZ PHILIPP VON (1829–1889), German jurist, born at Vietmannsdorf, in the Mark of Brandenburg, on the 14th of October 1829, was descended from a family of the old nobility. He was educated at Berlin and at Pforta, afterwards studying law at the universities of Bonn, Heidelberg and Berlin. The struggles of 1848 inspired him with youthful enthusiasm, and he remained for the rest of his life a strong advocate of political liberty. In 1852 he graduated LL.D. at Berlin; in 1857 he became a Privatdocent, and in 1860 he was nominated a professor extraordinary. The predominant party in Prussia regarded his political opinions with mistrust, and he was not offered an ordinary professorship until February 1873, after he had decided to accept a chair at the university of Munich. At Munich he passed the last nineteen years of his life. During the thirty years that he was professor he successively taught several branches of jurisprudence, but he was chiefly distinguished as an authority on criminal and international law. He was especially well fitted for organizing collective work, and he has associated his name with a series of publications of the first value. While acting as editor he often reserved for himself, among the independent monographs of which the work was composed, only those on subjects distasteful to his collaborators on account of their obscurity or lack of importance. Among the compilations which he superintended may be mentioned his *Encyclopädie der Rechtswissenschaft* (Leipzig, 1870–1871, 2 vols.; his *Handbuch des deutschen Strafrechts* (Berlin, 1871–1877, 4 vols.), and his *Handbuch des Völkerrechts auf Grundlage europäischer Staatspraxis* (Berlin, 1885–1890, 4 vols.). Among his many independent works may be mentioned: *Das irische Gefängnissystem* (Leipzig, 1859), *Französische Rechtszustände* (Leipzig, 1859), *Die Deportation als Strafmittel* (Leipzig, 1859), *Die Kürzungsfähigkeit der Freiheitsstrafen* (Leipzig, 1861), *Die Reform der Staatsanwaltschaft in Deutschland* (Berlin, 1864), *Die Umgestaltung der Staatsanwaltschaft* (Berlin, 1865), *Die Principien der Politik* (Berlin, 1869), *Das Verbrechen des Mordes und die Todesstrafe* (Berlin, 1875), *Rumäniens Uferrechte an der Donau* (Leipzig, 1883; French edition, 1884). He also edited or assisted in editing a number of periodical publications on legal subjects. From 1866 to the time of his death he was associated with Rudolf Ludwig Carl Virchow in editing *Sammlung gemeinverständlicher wissenschaftlicher Vorträge* (Berlin). Von Holtzendorff died at Munich on the 4th of February 1889.

HOLTZMANN, HEINRICH JULIUS (1832–), German Protestant theologian, son of Karl Julius Holtzmann (1804–1877), was born on the 17th of May 1832 at Karlsruhe, where his father ultimately became prelate and counsellor to the supreme consistory. He studied at Berlin, and eventually (1874) was appointed professor ordinarius at Strassburg. A moderately liberal theologian, he became best known as a New Testament critic and exegete, being the author of the Commentary on the Synoptics (1889; 3rd ed., 1901), the Johannine books (1890; 2nd ed., 1893), and the Acts of the Apostles (1901), in the series *Handkommentar zum Neuen Testament*. On the question of the relationship of the Synoptic Gospels, Holtzmann in his early work, *Die synoptischen Evangelien, ihr Ursprung und geschichtlicher Charakter* (1863), presents a view which has been widely accepted, maintaining the priority of Mark, deriving Matthew in its present form from Mark and from Matthew's earlier "collection of Sayings," the Logia of Papias, and Luke from Matthew and Mark in the form in which we have them.

Other noteworthy works are the *Lehrbuch der histor.-kritischen Einleitung in das Neue Testament* (1885, 3rd ed., 1892), and the *Lehrbuch der neutestamentlichen Theologie* (2 vols., 1896–1897). He also collaborated with R. Zöpffel in the preparation of a small *Lexikon für Theologie und Kirchenwesen* (1882; 3rd ed., 1895), and in 1893 became editor of the *Theol. Jahresbericht*.

HOLUB, EMIL (1847–1902), Bohemian traveller in south-central Africa, was born at Holitz, eastern Bohemia, on the 7th of October 1847. He was educated at Prague University, where he graduated M.D. In 1872 he went to the Kimberley diamond-fields, and with the money earned by his practice as a surgeon undertook expeditions into the northern Transvaal, Mashonaland and through Bechuanaland to the Victoria Falls, making extensive natural history collections, which he brought to Europe in 1879 and distributed among over a hundred museums and schools. In 1883 he went back to South Africa with his wife, intending to cross the continent to Egypt. In June 1886 the party crossed the Zambezi west of the Victoria Falls, and explored the then almost unknown region between that river and its tributary the Kafue. When beyond the Kafue the camp was attacked by the Mashukulumbwe, and Holub was obliged to retrace his steps. He returned to Austria in 1887 with a collection of great scientific interest, of over 13,000 objects, now in various museums. Holub died at Vienna on the 21st of February 1902.

His principal works are: *Eine Culturskizze des Marutse-Mambundareichs* (Vienna, 1879); *Sieben Jahre in Südafrika*, &c. (2 vols., Vienna, 1880–1881), of which an English translation appeared; *Die Colonisation Afrikas* (Vienna, 1882); and *Von der Kapstadt ins Land der Maschukulumbe* (2 vols., Vienna, 1818–1890).

HOLY, sacred, devoted or set apart for religious worship or observance; a term characteristic of the attributes of perfection and sinlessness of the Persons of the Trinity, as the objects of human worship and reverence, and hence transferred to those human persons who, either by their devotion to a spiritual ascetic life or by their approximation to moral perfection, are considered worthy of reverence. The word in Old English was *hâlig*, and is common to other Teutonic languages; cf. Ger. and Dutch *heilig*, Swed. *helig*, Dan. *hellig*. It is derived from *hâl*, hale, whole, and cognate with "health." The *New English Dictionary* suggests that the sense-development may be from "whole," *i.e.* inviolate, from "health,

SpinSmart Software http://www.spinsmart.com

well-being," or from "good-omen," "augury." It is impossible to get behind the Christian uses, in which from the earliest times it was employed as the equivalent of the Latin *sacer* and *sanctus*.

HOLY ALLIANCE, THE. The famous treaty, or declaration, known by this name was signed in the first instance by Alexander I., emperor of Russia, Francis I., emperor of Austria, and Frederick William III., king of Prussia, on the 26th of September 1815, and was proclaimed by the emperor Alexander the same day at a great review of the allied troops held on the Champ des Vertus near Paris. The English version of the text is as follows:—

In the name of the Most Holy and Indivisible Trinity.

Holy Alliance of Sovereigns of Austria, Prussia and Russia.

Their Majesties the Emperor of Austria, the King of Prussia, and the Emperor of Russia, having, in consequence of the great events which have marked the course of the three last years in Europe, and especially of the blessings which it has pleased Divine Providence to shower down upon those States which place their confidence and their hope on it alone, acquired the intimate conviction of the necessity of settling the steps to be observed by the Powers, in their reciprocal relations, upon the sublime truths which the Holy Religion of our Saviour teaches;

Government and Political Relations.

They solemnly declare that the present Act has no other object than to publish, in the face of the whole world, their fixed resolution, both in the administration of their respective States, and in their political relations with every other Government, to take for their sole guide the precepts of that Holy Religion, namely, the precepts of Justice, Christian Charity and Peace, which, far from being applicable only to private concerns, must have an immediate influence on the councils of Princes, and guide all their steps, as being the only means of consolidating human institutions and remedying their imperfections. In consequence, their Majesties have agreed on the following Articles:—

Principles of the Christian Religion.

Art. I. Conformably to the words of the Holy Scriptures which command all men to consider each other as brethren, the Three contracting Monarchs will remain united by the bonds of a true and indissoluble fraternity, and, considering each other as fellow countrymen, they will, on all occasions and in all places, lend each other aid and assistance; and, regarding themselves towards their subjects and armies as fathers of families, they will lead them, in the same spirit of fraternity with which they are animated, to protect Religion, Peace and Justice.

Fraternity and Affection.

Art. II. In consequence, the sole principle of force, whether between the said Governments or between their Subjects, shall be that of doing each other reciprocal service, and of testifying by unalterable good will the mutual affection with which they ought to be animated, to consider themselves all as members of one and the same Christian nation; the three allied Princes looking on themselves as merely delegated by Providence to govern three branches of the One family, namely, Austria, Prussia and Russia, thus confessing that the Christian world, of which they and their people form a part, has in reality no other Sovereign than Him to whom alone power really belongs, because in Him alone are found all the treasures of love, science and infinite wisdom, that is to say, God, our Divine Saviour, the Word of the Most High, the Word of Life. Their Majesties consequently recommend to their people, with the most tender solicitude, as the sole means of enjoying that Peace which arises from a good conscience, and which alone is durable, to strengthen themselves every day more and more in the principles and exercise of the duties which the Divine Saviour has taught to mankind.

Accession of Foreign Powers.

Art. III. All the Powers who shall choose solemnly to avow the sacred principles which have dictated the present Act, and shall acknowledge how important it is for the happiness of nations, too long agitated, that these truths should henceforth exercise over the destinies of mankind all the influence which belongs to them, will be received with equal ardour and affection into this Holy Alliance.

The credit for inspiring this singular document was claimed by the Baroness von Krüdener (*q.v.*); in any case it was the outcome of the tsar's mood of evangelical exaltation, and was in its inception perfectly sincere. Neither Frederick William nor Francis signed willingly, the latter remarking that "if it was a question of politics, he must refer it to his chancellor, if of religion, to his confessor." Metternich called it a "loud-sounding nothing," Castlereagh, "a piece of sublime mysticism and nonsense." None the less, in accordance with its last article, the signatures of all the European sovereigns were invited to the instrument, the pope and the Ottoman sultan alone being excepted. The prince regent courteously declined to sign, on the constitutional ground that all acts of the British crown required the counter-signature of a minister, but he sent a letter expressing his "entire concurrence with the principles laid down by the 'august sovereigns' and stating that it would always be his endeavour to regulate his conduct by their 'sacred maxims.'" With these exceptions, all the European sovereigns sooner or later appended their names.

In popular parlance, which has found its way into the language of serious historians, the "Holy Alliance" soon became synonymous with the combination of the great powers by whom Europe was ruled in concert during the period of the congresses, and associated with the policy of reaction which gradually dominated their counsels. For the understanding of the inner history of the diplomacy of this period, however, a clear distinction must be drawn between the Holy Alliance and the Grand, or Quadruple (Quintuple) Alliance. The Grand Alliance was established on definite treaties concluded for definite purposes, of which the chief was the preservation of peace on the basis of the territorial settlement of 1815. The Holy Alliance was a general treaty—hardly indeed a treaty at all—which bound its signatories to act on certain vague principles for no well-defined end; and in its essence it was so far from necessarily reactionary that the emperor Alexander at one time declared that it involved the grant of liberal constitutions by princes to their subjects. Its main significance was due to the persistent efforts of the tsar to make it the basis of the "universal union," or general confederation of Europe, which he wished to substitute for the actual committee of the great powers, efforts which were frustrated by the vigorous diplomacy of Castlereagh, acting as the mouthpiece of the British government (see EUROPE: *History*; ALEXANDER I. of Russia; LONDONDERRY, ROBERT STEWART, 2ND MARQUIS OF).

As a diplomatic instrument the Holy Alliance never, as a matter of fact, became effective. None the less, its principles and the fact of its signature powerfully affected the course of European diplomacy during the 19th century. It strongly influenced the emperor Nicholas I. of Russia, to whom the brotherhood of sovereigns by divine right was an article of faith, inspiring the principles of the convention of Berlin (between Russia, Austria and Prussia) in 1833, and the tsar's intervention in 1849 to crush the Hungarian insurrection on behalf of his brother of Austria. That it had become synonymous with a conspiracy against popular liberties was, however, a mere accident of the point of view of those who interpreted its principles. It was capable of other and more noble interpretations, and it was avowedly the inspiration of the famous rescript of the emperor Nicholas II., embodied in the circular of Count Muraviev to the European courts (August 4th, 1898), which issued in the first international peace conference at the Hague in 1899. (W. A. P.)

HOLYHEAD (Caergybi, the fort of Cybi, the saint mentioned by Matthew Arnold as meeting St Seiriol of Penmôn, Anglesey), a seaport and market-town of Anglesey, N. Wales, situated on the small Holy Island, at the western end of the county. Pop. of urban district (1901) 10,079. Here the London and North-Western railway has a terminus, 263½ m. from London by rail. Holy Island is connected with Anglesey by an embankment, ¾ m. long, over which pass the railway and main road, the tide flowing fast under the central piers. Once a small fishing village, the town has since William IV.'s reign acquired importance as the Dublin mail steam station. Its magnificent harbour of refuge was begun in 1847 and opened in September 1873. The east breakwater scheme, which would have covered the Platter's rocks—still very troublesome—and the Skinner's, was abandoned for buoys which mark the spots. The north breakwater is 7860 ft. long (instead of 5360, as originally planned). The roadstead (400 acres) and enclosed area (267 acres) together make a magnificent shelter for shipping. The rubble mound of the breakwater was very costly to the railway company, as time after time it was swept away by storms. On it is a central

SpinSmart Software http://www.spinsmart.com

wall of some 38 ft. above low water, and on the wall a promenade sheltered by a parapet. The lighthouse is at the end of the breakwater, of which the whole cost was nearly 1½ million sterling. Additional works, begun in 1873 by the company, to extend the old harbour and lengthen the quay by 4000 ft., were opened by King Edward VII. (as prince of Wales) in 1880. These cost another half million. George IV. passed through Holyhead in 1821 on his way to Ireland, and there is a commemorative tablet on the old harbour pier. The church is said to occupy the site of the old monastery (6th or early 7th century) of St Cybi, of whom there is a rude figure in the porch. The churchyard wall, 6 ft. thick, is possibly partly Roman. On the south of the harbour is an obelisk in memory of Captain Skinner, of the steam packets, washed overboard in 1833. Pen Caergybi rises perpendicularly from the sea to the height of 719 ft., at some 2 m. from the town; it is a mass of serpentine rocks, off which lie the North and South Stacks, each with a lighthouse with a revolving light, visible for 20 m., and 197 ft. above high water on the South Stack. On the hill are traces of British fortification, including a circular building, probably a Roman watch-tower. Coasting trade and fishing, with some shipbuilding and the Irish traffic, occupy most of the inhabitants.

See Hon. W. Stanley's *Holy Island and Holyhead.*

HOLY ISLAND, or LINDISFARNE, an irregularly shaped island in the North Sea, 2 m. from the coast of Northumberland, in which county it is included. Pop. (1901) 405. It is joined to the mainland at low water by flat sands, over which a track, marked by wooden posts and practicable for vehicles, leads to the island. There is a station on the North-Eastern railway at Beal, 9 m. S.E. of Berwick, opposite the island, but 1¼ m. inland. The island measures 3 m. from E. to W. and 1½ N. to S., extreme distances. Its total area is 1051 acres. On the N. it is sandy and barren, but on the S. very fertile and under cultivation. Large numbers of rabbits have their warrens among the sands, and, with fish, oysters and agricultural produce, are exported. There are several fresh springs on the island, and in the north-east is a lake of 6 acres. At the south-west angle is the little fishing village (formerly much larger) which is now a favourite summer watering-place. Here is the harbour, offering good shelter to small vessels. Holy Island derives its name from a monastery founded on it by St Aidan, and restored in 1082 as a cell of the Benedictine monastery at Durham. Its ruins, still extensive and carefully preserved, justify Scott's description of it as a "solemn, huge and dark-red pile." An islet, lying off the S.W. angle, has traces of a chapel upon it, and is believed to have offered a retreat to St Cuthbert and his successors. The castle, situated east of the village, on a basaltic rock about 90 ft. high, dates from *c.* 1500.

When St Aidan came at the request of King Oswald to preach to the Northumbrians he chose the island of Lindisfarne as the site of his church and monastery, and made it the head of the diocese which he founded in 635. For some years the see continued in peace, numbering among its bishops St Cuthbert, but in 793 the Danes landed on the island and burnt the settlement, killing many of the monks. The survivors, however, rebuilt the church and continued to live there until 883, when, through fear of a second invasion of the Danes, they fled inland, taking with them the body of St Cuthbert and other holy relics. The church and monastery were again destroyed and the bishop and monks, on account of the exposed situation of the island, determined not to return to it, and settled first at Chester-le-Street and finally at Durham. With the fall of the monastery the island appears to have become again untenanted, and probably continued so until the prior and convent of Durham established there a cell of monks from their own house. The inhabitants of Holy Island were governed by two bailiffs at least as early as the 14th century, and, according to J. Raine in his *History of North Durham* (1852), are called "burgesses or freemen" in a private paper dated 1728. In 1323 the bailiffs and community of Holy Island were commanded to cause all ships of the burthen of thirty tons or over to go to Ereswell with their ships provisioned for a month at least and under double manning to be ready to set out on the king's service. Towards the end of the 16th century the fort on Holy Island was garrisoned for fear of foreign invasion by Sir William Read, who found it very much in need of repair, the guns being so decayed that the gunners "dare not give fire but by trayne," and the master gunner had been "miserably slain" in discharging one of them. During the Civil Wars the castle was held for the king until 1646, when it was taken and garrisoned by the parliamentarians. The only other historical event connected with the island is the attempt made by two Jacobites in 1715 to hold it for the Pretender.

HOLYOAKE, GEORGE JACOB (1817–1906), English secularist and co-operator, was born at Birmingham, on the 13th of April 1817. At an early age he became an Owenite lecturer, and in 1841 was the last person convicted for blasphemy in a public lecture, though this had no theological character and the incriminating words were merely a reply to a question addressed to him from the body of the meeting. He nevertheless underwent six months' imprisonment, and upon his release invented the inoffensive term "secularism" as descriptive of his opinions, and established the *Reasoner* in their support. He was also the last person indicted for publishing an unstamped newspaper, but the prosecution dropped upon the repeal of the tax. His later years were chiefly devoted to the promotion of the co-operative movement among the working classes. He wrote the history of the Rochdale Pioneers (1857), *The History of Co-operation in England* (1875; revised ed., 1906), and *The Co-operative Movement of To-day* (1891). He also published (1892) his autobiography, under the title of *Sixty Years of an Agitator's Life*, and in 1905 two volumes of reminiscences, *Bygones worth Remembering*. He died at Brighton on the 22nd of January 1906.

See J. McCabe, *Life and Letters of G. J. Holyoake* (2 vols., 1908); C. W. F. Goss, *Descriptive Bibliography of the Writings of G. J. Holyoake* (1908).

HOLYOKE, a city of Hampden county, Massachusetts, U.S.A., in a bend of the Connecticut river, about 8 m. N. of Springfield. Pop. (1880) 21,915; (1890) 35,637; (1900) 45,712; (1910 census) 57,730. Of the total population in 1900, 18,921 were foreign-born, including 6991 French-Canadians, 5650 Irish, 1602 Germans and 1118 English; and 33,626 were of foreign parentage (both parents foreign-born), including 12,370 of Irish and 11,050 of French-Canadian parentage. The city's area is about 17 sq. m. The city is served by the Boston & Maine, and the New York, New Haven & Hartford railways, and by an interurban line. Holyoke is characteristically an industrial and mercantile city; it has some handsome public buildings (the city hall and the public library, founded in 1870, being especially noteworthy) and attractive environs. Holyoke is the railway station for Mt Holyoke College, in South Hadley, about 4 m. N. by E. of Holyoke; the city is connected with South Hadley by an electric line. Just above Holyoke the Connecticut leaves the rugged highlands through a rift between Mt Tom (1214 ft.; ascended by a mountain-railway from Holyoke) and Mt Holyoke (954 ft.), and begins a meandering valley course, falling (in the Hadley Falls) in great volume some 60 ft. in about 1½ m. The water-power was unutilized until 1849, when a great dam (1017 ft. long) was completed, which enabled vast power to be developed along a series of canals laid out from the river. This was, in its day, a colossal undertaking; and its success transformed Holyoke from a farming village into a great manufacturing centre—in 1900 and 1905 the ninth largest of the commonwealth. In 1900 a stone dam (1020 ft.), said to be the second largest in New England, was completed at a cost of about $750,000. Cotton manufactures first, and later paper products were chief in importance, and Holyoke now leads all the cities in the United States in the manufacture of fine paper. In 1905 the total value of all factory products was $30,731,332, of which $10,620,255 (or 34·6% of the total) represented paper and wood pulp; $5,919,817, cotton goods; $1,318,409, woollen goods; $1,756,473, book binding and blank books, and $2,022,759, foundry and machine-shop

SpinSmart Software http://www.spinsmart.com

products. Silk and worsted goods are other important manufactures. Opposite Holyoke, in Hampshire county, is South Hadley Falls. The municipality owns and operates the gas and electric-lighting plants and the water works (the water-supply being derived from natural ponds, some of which are outside the city limits), and owns and leases (to the New York, New Haven & Hartford railroad) a railway extending (10·3 m.) to Westfield, Mass. Holyoke was originally a part of Springfield, and after 1774 of West Springfield. In 1850 it was incorporated as a township, and in 1873 was chartered as a city.

HOLYSTONE, a soft kind of sandstone used by sailors for scrubbing and cleaning the decks of ships. The origin of the word is doubtful. Some authorities hold that it arose from the general practice of scrubbing the decks for Sunday service; while others think the name arises from the fact that the stone so employed is naturally porous and full of holes. A small flint or stone having a natural hole in it, and worn as a charm, is also called a holy-stone.

HOLY WATER, technically the water with which Christian believers sign the cross on their foreheads on entering or leaving church. The edict of Gratian lays down that it should be exorcized and blessed by the priest and sprinkled with exorcized salt. This rite is found in the Gelasian, Gregorian and other sacramentaries. In the East the water was blessed once a month, in the Latin Church it is now blessed every Sunday. In the 4th century in the East it was usual to wash the hands on entering the church (see ABLUTION).

In the early church water was not expressly consecrated for baptisms and other lustrations. "Water," says Tertullian in his tract on baptism, "was the abode at the first of the divine Spirit, being more acceptable then (to God) than the other elements." He pictures the world in the beginning: "total darkness, formless as yet, without tending of stars, the melancholy abyss, the earth unprepared, the heaven undevelopt. The liquid alone an ever perfect material, smiling, simple, pure in its own right, as a worthy vehicle underlay the God." Water was similarly pure in itself in the old Persian religion.

The *Canons of Hippolytus*, or Egyptian church order, of about A.D. 250, give no prayer for consecration of fonts, but enact that "at cock crow the baptismal party shall take their stand near waving water, pure, prepared, sacred, of the sea." The *Teaching of the Apostles*, *c.* 100, merely insists on "living," that is, clear and running water. The ancient feeling, especially Jewish, was that in lustrations the same water must not pass twice over the body. A stagnant pool was useless. Bubbling waters too seemed to have a spirit in them.

Either because running water was not always at hand, or as part of the growing tendency of the church to multiply ceremonies, rituals arose late in the 3rd century for consecrating water. The sacramentary of Serapion, *c.* 350, provides a prayer asking that the divine Word may descend into the water and hallow it, as of old it hallowed the Jordan. In the Roman order of baptism the priest prays that "the font may receive the grace of the only begotten Son from the holy Spirit, and that the latter may impregnate with hidden admixture of His light this water prepared for the regeneration of mankind, to the end that man through a sanctification conceived from the immaculate womb of the divine font, may emerge a heavenly offspring reborn as a new creature." The water is then exorcized and evil spirits warned off, and lastly blessed. During the prayer the priest twice signs the water with the cross, and once blows upon it.

The first mention of a special consecration of water for other ends than baptism is in the *Acts of Thomas* (? A.D. 200); it is for the purgation of a youth already baptized who had killed his mistress because she would not live chastely with him. The apostle prays: "Fountain sent unto us from Rest, Power of Salvation from that Power proceeding which overcomes and subjects all to its own will, come and dwell within these waters, that the *Charisma* (gift) of the holy Spirit may be fully perfected through them." The youth then washes his hands, which on touching the sacrament had withered up, and is healed.

The church shared the universal belief that holiness or the holy Spirit is quasi-material and capable of being held in suspense in water, just as sin is a half material infection, absorbed and carried away by it. So Tertullian writes: "The water which carried the Spirit of God (probably regarded as a shadow or reflection-soul) borrowed holiness from that which was carried upon it; for every underlying matter must needs absorb and take up the quality of that matter which overhangs it; especially does a corporeal so absorb a spiritual, as this can easily penetrate and settle into it owing to the subtlety of its substance."

"Water," he continues, "was generically hallowed by the Spirit of God brooding over it at creation, and therefore all special waters are holy, and at once obtain the sacrament of sanctification when God is invoked (over them.) For the Spirit from heaven instantly supervenes and is upon the waters, hallowing them out of itself, and being so hallowed they drink up a power of hallowing."

What is done in material semblance, he then argues, is repeated in the unseen medium of the Spirit. The stains of idolatry, vice and fraud are not visible on the flesh, yet they resemble real dirt. "The waters are medicated in a manner through the intervention of the angel, and the Spirit is corporeally washed in the water and the flesh is spiritually purified in the same."

Tertullian believed that an angel was sent down, when God was invoked, like that which stirred the pool of Bethesda. As regards rival Isiac and Mithraic baptisms, he asserts that their waters are destitute of divine power; nay, are rather tenanted by the devil who in this matter sets himself to rival God. "Without any religious rite at all," he urges, "unclean spirits brood upon waters, aspiring to repeat that primordial gestation of the divine Spirit." And he instances the "darkling springs and lonely rivers which are said to snatch, to wit by force of a harmful spirit." In the sequel he defines the rôle of the angel of baptism who does not infuse himself in waters, already holy from the first; but merely presides over the washing of the faithful, and ensures their being made pure for the reception of the holy Spirit in the rite of confirmation which immediately follows. "The devil who till now ruled over us, we leave behind overwhelmed in the water."

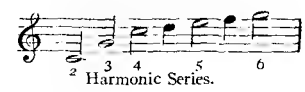
From all this we conclude that what is poetry to us—akin to the folk-lore of water-sprites, naiads, kelpies, river-gods and water-worship in general—was to Tertullian and to the generations of believers who fashioned the baptismal rites, ablutions and beliefs of the church, nothing less than grim reality and unquestionable fact.

See John, marquess of Bute, and E. A. Wallis Budge, *The Blessing of the Waters* (London, 1901); E. B. Tylor, *Primitive Culture* (London, 1903). (F. C. C.)

HOLY WEEK (*ἑβδομὰς μεγάλη, ἁγία* or *τῶν ἁγίων, ξηροφαγίας, ἄπρακτος*, also *ἡμέραι παθημάτων, ἡμέραι σταυρώσιμαι*: *hebdomas* [or *septimana*] *major, sancta, authentica* [*i.e. canonizata*, du Cange], *ultima, poenosa, luctuosa, nigra, inofficiosa, muta, crucis, lamentationum, indulgentiae*), in the Christian ecclesiastical year the week immediately preceding Easter. The earliest allusion to the custom of marking this week as a whole with special observances is to be found in the *Apostolical Constitutions* (v. 18, 19), dating from the latter half of the 3rd century A.D. Abstinence from wine and flesh is there commanded for all the days, while for the Friday and Saturday an absolute fast is enjoined. Dionysius Alexandrinus also, in his canonical epistle (260 A.D.), refers to the six fasting days (*ἓξ τῶν νηστειῶν ἡμέραι*) in a manner which implies that the observance of them had already become an established usage in his time. There is some doubt about the genuineness of an ordinance attributed to Constantine, in which abstinence from public business was enforced for the seven days immediately preceding Easter Sunday, and also for the seven which followed it; the *Codex Theodosianus*, however, is explicit in ordering that all actions at law should cease, and the doors of all courts of law be closed during those fifteen days (l. ii. tit. viii.). Of the particular days of the "great week" the earliest to emerge into special prominence was naturally Good Friday. Next came the Sabbatum Magnum (Holy Saturday or Easter Eve) with its vigil, which

SpinSmart Software http://www.spinsmart.com

in the early church was associated with an expectation that the second advent would occur on an Easter Sunday.



For details of the ceremonial observed in the Roman Catholic Church during this week, reference must be made to the *Missal* and *Breviary*. In the Eastern Church the week is marked by similar practices, but with less elaboration and differentiation of rite. See also EASTER, GOOD FRIDAY, MAUNDY THURSDAY, PALM SUNDAY and PASSION WEEK.

HOLYWELL (*Tre'ffynnon*, well-town), a market town and contributory parliamentary borough of Flintshire, N. Wales, situated on a height near the left bank of the Dee estuary, 196 m. from London by the London & North-Western railway (the station being 2 m. distant). Pop. of urban district (1901) 2652. The parish church (1769) has some columns of an earlier building, interesting brasses and strong embattled tower. The remains of Basingwerk Abbey (*Maes glas*, green field), partly Saxon and partly Early English, are near the station. It is of uncertain origin but was used as a monastery before 1119. In 1131 Ranulph, 2nd earl of Chester, introduced the Cistercians. In 1535, when its revenues were £150, 7s. 3d., it was dissolved, but revived under Mary I. and used as a Roman Catholic burial place in 1647. Scarcely any traces remain of Basingwerk castle, an old fort. Small up to the beginning of the 19th century, Holywell has increasingly prospered, thanks to lime quarries, lead, copper and zinc mines, smelting works, a shot manufactory, copper, brass, iron and zinc works; brewing, tanning and mineral water, flannel and cement works. St Winifred's holy well, one of the wonders of Wales, sends up water at the rate of 21 tons a minute, of an almost unvarying temperature, higher than that of ordinary spring water. To its curative powers many crutches and *ex voto* objects, hung round the well, as in the Lourdes Grot, bear ample witness. The stones at the bottom are slightly reddish, owing to vegetable substances. The well itself is covered by a fine Gothic building, said to have been erected by Margaret, countess of Richmond and mother of Henry VII., with some portions of earlier date. The chapel (restored) is used for public service. Catholics and others visit it in great numbers. There are swimming baths for general use. In 1870 a hospice for poorer pilgrims was erected. Other public buildings are St Winifred's (Catholic) church and a convent, a town hall and a market-hall. The export trade is expedited by quays on the Dee.

HOLYWOOD, a seaport of county Down, Ireland, on the east shore of Belfast Lough, 4½ m. N.E. from Belfast by the Belfast & County Down railway. Its pleasant situation renders it a favourite residential locality of the wealthier classes in Belfast. There was a religious settlement here from the 7th century, which subsequently became a Franciscan monastery. The old church dating from the late 12th or early 13th century marks its site. A Solemn League and Covenant was signed here in 1644 for the defence of the kingdom, and the document is preserved at Belfast.

HOLZMINDEN, a town of Germany, in the duchy of Brunswick, on the right bank of the Weser, at the foot of the Sollinger Mountains, at the junction of the railways Scherfede-Holzminden and Soest-Börssum, 56 m. S.W. of Brunswick. Pop. (1905) 9938. It has an Evangelical and a Roman Catholic church, a gymnasium, an architectural school and a school of engineering. The prosperity of the town depends chiefly on agriculture and the manufacture of iron and steel wares, and of chemicals, but weaving and the making of pottery are also carried on, and there are baryta mills and polishing-mills for sandstone. By means of the Weser it carries on a lively trade. Holzminden obtained municipal rights from Count Otto of Eberstein in 1245, and in 1410 it came into the possession of Brunswick.

HOLZTROMPETE (Wooden Trumpet), an instrument somewhat resembling the Alpenhorn (*q.v.*) in tone-quality, designed by Richard Wagner for representing the natural pipe of the peasant in *Tristan and Isolde*. This instrument is not unlike the cor anglais in rough outline, being a conical tube of approximately the same length, terminating in a small globular bell, but having neither holes nor keys; it is blown through a cup-shaped mouthpiece made of horn. The Holztrompete is in the key of C; the scale is produced by overblowing, whereby the upper partials from the 2nd to the 6th are produced. A single piston placed at a third of the distance from the mouthpiece to the bell gives the notes D and F. Wagner inserted a note in the score concerning the cor anglais for which the part was originally scored, and advised the use of oboe or clarinet to reinforce the latter, the effect intended being that of a powerful natural instrument, unless a wooden instrument with a natural scale be specially made for the part, which would be preferable. The Holztrompete was used at Munich for the first performance of *Tristan and Isolde*, and was still in use there in 1897. At Bayreuth it was also used for the Tristan performances at the festivals of 1886 and 1889, but in 1891 W. Heckel's clarina, an instrument partaking of the nature of both oboe and clarinet, was substituted for the Holztrompete and has been retained ever since, having been found more effective.[1] (K. S.)

Harmonic Series.

HOMAGE (from *homo*, through the Low Lat. *hominaticum*, which occurs in a document of 1035), one of the ceremonies used in the granting of a fief, and indicating the submission of a vassal to his lord. It could be received only by the suzerain in person. With head uncovered the vassal humbly requested to be allowed to enter into the feudal relation; he then laid aside his sword and spurs, ungirt his belt, and kneeling before his lord, and holding his hands extended and joined between the hands of his lord, uttered words to this effect: "I become your man from this day forth, of life and limb, and will hold faith to you for the lands I claim to hold of you." The oath of fealty, which could be received by proxy, followed the act of homage; then came the ceremony of investiture, either directly on the ground or by the delivery of a turf, a handful of earth, a stone, or some other symbolical object. Homage was done not only by the vassal to whom feudal lands were first granted but by every one in turn by whom they were inherited, since they were not granted absolutely but only on condition of military and other service. An infant might do homage, but he did not thus enter into full possession of his lands. The ceremony was of a preliminary nature, securing that the fief would not be alienated; but the vassal had to take the oath of fealty, and to be formally invested, when he reached his majority. The obligations involved in the act of homage were more general than those associated with the oath of fealty, but they provided a strong moral sanction for more specific engagements. They essentially resembled the obligations undertaken towards a Teutonic chief by the members of his "comitatus" or "gefolge," one of the institutions from which feudalism directly sprang. Besides *homagium ligeum*, there was a kind of homage which imposed no feudal duty; this was *homagium per paragium*, such as the dukes of Normandy rendered to the kings of France, and as the dukes of Normandy received from the dukes of Brittany. The act of liege homage to a particular lord did not interfere with the vassal's allegiance as a subject to his sovereign, or with his duty to any other suzerain of whom he might hold lands.

The word is also used of the body of tenants attending a manorial court, or of the court in a court baron (consisting of the tenants that do homage and make inquiries and presentments, termed a *homage jury*).

HOMBERG, WILHELM (1652–1715), Dutch natural philosopher, was the son of an officer of the Dutch East India Company, and was born at Batavia (Java) on the 8th of January 1652. Coming to Europe with his family in 1670, he studied law at Jena and Leipzig, and in 1674 became an advocate at Magdeburg. In that town he made the acquaintance of Otto von Guericke, and under his influence determined to devote himself to natural science. He, therefore, travelled in various parts of Europe for study, and after graduating in medicine at Wittenberg, settled in Paris in 1682. From 1685 to 1690 he practised as a physician at Rome; then returning to Paris in 1691, he was elected a member of the Academy of Sciences and appointed director of

[1] Communicated by Madame Wagner, December 28th, 1897.

SpinSmart Software http://www.spinsmart.com

its chemical laboratory. Subsequently he became teacher of physics and chemistry (1702), and private physician (1705) to the duke of Orleans. His death occurred at Paris on the 24th of September 1715. Homberg was not free from alchemistical tendencies, but he made many solid contributions to chemical and physical knowledge, recording observations on the preparation of Kunkel's phosphorus, on the green colour produced in flames by copper, on the crystallization of common salt, on the salts of plants, on the saturation of bases by acids, on the freezing of water and its evaporation *in vacuo*, &c. Much of his work was published in the *Recueil de l'Académie des Sciences* from 1692 to 1714. The *Sal Sedativum Hombergi* is boracic acid, which he discovered in 1702, and "Homberg's phosphorus" is prepared by fusing sal-ammoniac with quick lime.

HOMBURG-VOR-DER-HÖHE, a town and watering-place of Germany, in the Prussian province of Hesse-Nassau, prettily situated at the south-east foot of the Taunus Mountains, 12 m. N. of Frankfort-on-Main, with which it is connected by rail. Pop. (1905) 13,740. Homburg consists of an old and a new town, the latter, founded by the landgrave of Hesse-Homburg Frederick II. (d. 1708), being regular and well-built. Besides the palatial edifices erected in connexion with the mineral water-cure, there are churches of various denominations, Lutheran, Roman Catholic, Russian-Greek and Anglican, schools and benevolent institutions. On a neighbouring hill stands the palace of the former landgraves, built in 1680 and subsequently enlarged and improved. The White Tower, 183 ft. in height, is said to date from Roman times, and certainly existed under the lords of Eppstein, who held the district in the 12th century. The palace is surrounded by extensive grounds, laid out in the manner of an English park. The eight mineral springs which form the attraction of the town to strangers belong to the class of saline acidulous chalybeates and contain a considerable proportion of carbonate of lime. Their use is beneficial for diseases of the stomach and intestines, and externally, for diseases of the skin and rheumatism. The establishments connected with the springs are arranged on a scale of great magnificence, and include the Kurhaus (built 1841–1843), with a theatre, the Kaiser Wilhelmsbad and the Kurhausbad. They lie grouped round a pretty park which also furnishes the visitors with facilities for various recreations, such as lawn tennis, croquet, polo and other games. The industries of Homburg embrace iron founding and the manufacture of leather and hats, but they are comparatively unimportant, the prosperity of the town being almost entirely due to the annual influx of visitors, which during the season from May to October inclusive averages 12,000. In the beautiful neighbourhood lies the ancient Roman castle of Saalburg, which can be reached by an electric tramway.

Homburg first came into repute as a watering-place in 1834, and owing to its gaming-tables, which were set up soon after, it rapidly became one of the favourite and most fashionable health-resorts of Europe. In 1849 the town was occupied by Austrian troops for the purpose of enforcing the imperial decree against gambling establishments, but immediately on their withdrawal the bank was again opened, and play continued unchecked until 1872, when the Prussian government refused to renew the lease for gambling purposes, which then expired. As the capital of the former landgraviate of Hesse-Homburg, the town shared the vicissitudes of that state.

Homburg is also the name of a town in Bavaria. Pop. (1900) 4785. It has a Roman Catholic and an Evangelical church, and manufactures of iron goods. In the neighbourhood are the ruins of the castles of Karlsberg and of Hohenburg. The family of the counts of Homburg became extinct in the 15th century. The town came into the possession of Zweibrücken in 1755 and later into that of Bavaria.

E. Yorke-Davies, *Homburg and its Waters* (London, 1897).

HOME, EARLS OF. Alexander Home or Hume, 1st earl of Home (*c.* 1566–1619), was the son of Alexander, 5th Lord Home (d. 1575), who fought against Mary, queen of Scots, at Carberry Hill and at Langside, but was afterwards one of her most stalwart supporters, being taken prisoner when defending Edinburgh castle in her interests in 1573 and probably dying in captivity. He belonged to an old and famous border family, an early member of which, Sir Alexander Home, was killed at the battle of Verneuil in 1424. This Sir Alexander was the father of Sir Alexander Home (d. 1456), warden of the marches and the founder of the family fortunes, whose son, another Sir Alexander (d. 1491), was created a lord of parliament as Lord Home in 1473, being one of the band of nobles who defeated the forces of King James III. at the battle of Sauchieburn in 1488. Other distinguished members of the family were: the first lord's grandson and successor, Alexander, 2nd Lord Home (d. 1506), chamberlain of Scotland; and the latter's son, Alexander, 3rd Lord Home (d. 1516), a person of great importance during the reign of James IV., whom he served as chamberlain. He fought at Flodden, but before the death of the king he had led his men away to plunder. During the minority of the new king, James V., he was engaged in quarrelling with the regent, John Stewart, duke of Albany, and in intriguing with England. In September 1516 he was seized, was charged with treachery and beheaded, his title and estates being restored to his brother George in 1522. George, who was killed in September 1547 during a skirmish just before the battle of Pinkie, was the father of Alexander, the 5th lord.

Alexander Home became 6th Lord Home on his father's death in August 1575, and took part in many of the turbulent incidents which marked the reign of James VI. He was warden of the east marches, and was often at variance with the Hepburns, a rival border family whose head was the earl of Bothwell; the feud between the Homes and the Hepburns was an old one, and it was probably the main reason why Home's father, the 5th lord, sided with the enemies of Mary during the period of her intimacy with Bothwell. Home accompanied James to England in 1603 and was created earl of Home in 1605; he died in April 1619

His son James, the 2nd earl, died childless in 1633 when his titles passed to a distant kinsman, Sir James Home of Coldingknows (d. 1666), a descendant of the 1st Lord Home. This earl was in the Scottish ranks at the battle of Preston and lost his estates under the Commonwealth, but these were restored to him in 1661. His descendant, William, the 8th earl (d. 1761) fought on the English side at Prestonpans, and from his brother Alexander, the 9th earl (d. 1786), the present earl of Home is descended. In 1875 Cospatrick Alexander, the 11th earl (1799–1881), was created a peer of the United Kingdom as Baron Douglas, and his son Charles Alexander, the 12th earl (b. 1834), took the additional name of Douglas. The principal strongholds of the Homes were Douglas castle in Haddington and Home castle in Berwickshire.

See H. Drummond, *Histories of Noble British Families* (1846).

HOME, DANIEL DUNGLAS (1833–1886), Scottish spiritualist, was born near Edinburgh on the 20th of March 1833, his father being said to be a natural son of the 10th earl of Home, and his mother a member of a family credited with second sight. He went with his mother to America, and on her death was adopted by an aunt. In the United States he came out as a spiritualistic medium, though, it should be noted, he never sought to make money out of his exhibitions. In 1855 he came to England and gave numerous séances, which were attended by many well-known people. Robert Browning, the poet, went to one of these, but without altering his contempt for spiritualism, and he subsequently gave his impression of Home in the unflattering poem of "Sludge the Medium" (1864); Home, nevertheless, had many disciples, and gave séances at several European courts. He became a Roman Catholic, but was expelled from Rome as a sorcerer. In 1866 Mrs Lyon, a wealthy widow, adopted him as her son, and settled £60,000 upon him. Repenting, however, of her action, she brought a suit for the return of her money,

SpinSmart Software http://www.spinsmart.com

on the ground that it had been obtained by "spiritual" influence. It was held that the burden of establishing the validity of the gift lay on Home, and as he failed to do so the case was decided against him. He continued, however, to give séances, mostly on the Continent, and in 1871 appeared before the tsar of Russia and two Russian scientists, who attested the phenomena evoked. Returning to England he submitted to a series of experiments designed to test his pretensions before Professor (subsequently Sir William) Crookes, which the latter declared to be thoroughly genuine; and Professor von Boutlerow, of the Russian Academy of Science, after witnessing a similar series of experiments, expressed the same opinion. Home published two volumes of *Incidents of my Life* and *Lights and Shadows of Spiritualism*. He married successively two well-connected Russian ladies. He died at Auteuil, France, on the 21st of June 1886.

HOME, JOHN (1722–1808), Scottish dramatic poet, was born on the 22nd of September 1722 at Leith, where his father, Alexander Home, who was distantly related to the earls of Home, filled the office of town-clerk. He was educated at the grammar school of his native town, and at the university of Edinburgh, where he graduated M.A. in 1742. Though he showed a fondness for the profession of arms, he studied divinity, and was licensed by the presbytery of Edinburgh in 1745. In the same year he joined as a volunteer against the Pretender, and was taken prisoner at the battle of Falkirk (1746). With many others he was carried to the castle of Doune in Perthshire, but soon effected his escape. In July 1746 Home was presented to the parish of Athelstaneford, Haddingtonshire, vacant by the death of Robert Blair, the author of *The Grave*. He had leisure to visit his friends and became especially intimate with David Hume who belonged to the same family as himself. His first play, *Agis: a tragedy*, founded on Plutarch's narrative, was finished in 1747. He took it to London and submitted it to Garrick for representation at Drury Lane, but it was rejected as unsuitable for the stage. The tragedy of *Douglas* was suggested to him by hearing a lady sing the ballad of *Gil Morrice* or *Child Maurice* (F. J. Child, *Popular Ballads*, ii. 263). The ballad supplied him with the outline of a simple and striking plot. After five years' labour he completed his play, which he took to London for Garrick's opinion. It also was rejected, but on his return to Edinburgh his friends resolved that it should be brought out in that city. It was produced on the 14th of December 1756 with overwhelming success, in spite of the opposition of the presbytery, who summoned Alexander Carlyle to answer for having attended its representation. Home wisely resigned his charge in 1757, after a visit to London, where *Douglas* was brought out at Covent Garden on the 14th of March. Peg Woffington played Lady Randolph, a part which found a later exponent in Mrs Siddons. David Hume summed up his admiration for *Douglas* by saying that his friend possessed "the true theatric genius of Shakespeare and Otway, refined from the unhappy barbarism of the one and licentiousness of the other." Gray, writing to Horace Walpole (August, 1757), said that the author "seemed to have retrieved the true language of the stage, which has been lost for these hundred years," but Samuel Johnson held aloof from the general enthusiasm, and averred that there were not ten good lines in the whole play (Boswell, *Life*, ed. Croker, 1848, p. 300). In 1758 Home became private secretary to Lord Bute, then secretary of state, and was appointed tutor to the prince of Wales; and in 1760 his patron's influence procured him a pension of £300 per annum and in 1763 a sinecure worth another £300. Garrick produced *Agis* at Drury Lane on the 21st of February 1758. By dint of good acting and powerful support, according to Genest (*Short Account* &c., iv. 513 seq.), the piece kept the stage for eleven days, but it was lamentably inferior to *Douglas*. In 1760 his tragedy, *The Siege of Aquileia*, was put on the stage, Garrick taking the part of Aemilius. In 1769 his tragedy of *The Fatal Discovery* had a run of nine nights; *Alonzo* also (1773) had fair success in the representation; but his last tragedy, *Alfred* (1778), was so coolly received that he gave up writing for the stage. In 1778 he joined a regiment formed by the duke of Buccleuch. He sustained severe injuries in a fall from horseback which permanently affected his brain, and was persuaded by his friends to retire. From 1767 he resided either at Edinburgh or at a villa which he built at Kilduff near his former parish. It was at this time that he wrote his *History of the Rebellion of 1745*, which appeared in 1802. Home died at Merchiston Bank, near Edinburgh, on the 5th of September 1808, in his eighty-sixth year.

The Works of John Home were collected and published by Henry Mackenzie in 1822 with "An Account of the Life and Writings of Mr John Home," which also appeared separately in the same year, but several of his smaller poems seem to have escaped the editor's observation. These are—"The Fate of Caesar," "Verses upon Inveraray," "Epistle to the Earl of Eglintoun," "Prologue on the Birthday of the Prince of Wales, 1759" and several "Epigrams," which are printed in vol. ii. of *Original Poems by Scottish Gentlemen* (1762). See also Sir W. Scott, "The Life and Works of John Home" in the *Quarterly Review* (June, 1827). *Douglas* is included in numerous collections of British drama. Voltaire published his *Le Caffé, ou l'Écossaise* (1760), *Londres* (really Geneva), as a translation from the work of Mr Hume, described as *pasteur de l'église d'Édimbourg*, but Home seems to have taken no notice of the mystification.

HOMEL, or GOMEL, a town of Russia, in the government of Mogilev, and 132 m. by rail S.S.E. of the town of Mogilev, on the Sozh, a tributary of the Dnieper. Pop. (1900) 45,081, nearly half of whom are Jews. It is an important junction of the railways from Vilna to Odessa and from Orel to Poland, and is in steamer communication with Kiev and Mogilev. In front of Prince Paskevich's castle stands an equestrian statue of the Polish general Joseph Poniatowski, and in the cathedral is the tomb of the chancellor Nikolai Petrovich Rumantsev, by Canova. The town carries on a brisk trade in hops, corn and timber; there are also paper-pulp mills and oil factories. Homel was founded in the 12th century, and after changing hands several times between Poles and Russians was annexed to Russia in 1772. In 1648 it suffered at the hands of the Cossack chieftain Bogdan Chmielnicki.

HOME OFFICE, a principal government department in the United Kingdom, the creation of which dates from 1782, when the conduct of foreign affairs, which had previously been divided between the northern and southern secretaries, was handed over to the northern department (see FOREIGN OFFICE). The home department retained control of Irish and colonial affairs, and of war business until 1794, when an additional secretary of state was re-appointed. In 1801 the colonial business was transferred from the home department, which now attends only to domestic affairs. The head of the department, the principal secretary of state for home affairs, or home secretary, is a member of the government for the time being, and of the cabinet, receiving a salary of £5000 a year. He is the proper medium of communication between the sovereign and the subject, and receives petitions addressed to the crown. He is responsible for the maintenance of the king's peace and attends to the administration of criminal justice, police and prisons, and through him the sovereign exercises his prerogative of mercy. Within his department is the supervision of lunatic asylums, reformatories and industrial schools, and it is his duty to see after the internal well-being of the country, to enforce the rules made for the health or safety of the community generally, and especially of those classes employed in special trades or dangerous occupations. He is assisted by a permanent under-secretary, a parliamentary secretary and several assistant under-secretaries.

See Anson, *Law and Custom of the Constitution* (1907).

HOMER[1] (Ὅμηρος), the great epic poet of Greece. Many of the works once attributed to him are lost; those which remain are the two great epics, the *Iliad* and the *Odyssey*, thirty-three *Hymns*, a mock epic (the *Battle of the Frogs and Mice*), and some pieces of a few lines each (the so-called *Epigrams*).

Ancient Accounts of Homer.—Of the date of Homer probably no record, real or pretended, ever existed. Herodotus (ii. 53) maintains that Hesiod and Homer lived not more than 400 years

[1] This article was thoroughly revised by Dr D. B. Monro before his death in 1905; a few points have since been added by Mr. T. W. Allen.

SpinSmart Software http://www.spinsmart.com

before his own time, consequently not much before 850 B.C. From the controversial tone in which he expresses himself it is evident that others had made Homer more ancient; and accordingly the dates given by later authorities, though very various, generally fall within the 10th and 11th centuries B.C. But none of these statements has any claim to the character of external evidence.

The extant lives of Homer (edited in Westermann's *Vitarum Scriptores Graeci minores*) are eight in number, including the piece called the *Contest of Hesiod and Homer*. The longest is written in the Ionic dialect, and bears the name of Herodotus, but is certainly spurious. In all probability it belongs to the time which was fruitful beyond all others in literary forgeries, viz. the 2nd century of our era.[1] The other lives are certainly not more ancient. Their chief value consists in the curious short poems or fragments of verse which they have preserved—the so-called *Epigrams*, which used to be printed at the end of editions of Homer. These are easily recognized as "Popular Rhymes," a form of folk-lore to be met with in most countries, treasured by the people as a kind of proverbs.[2] In the Homeric *epigrams* the interest turns sometimes on the characteristics of particular localities—Smyrna and Cyme (*Epigr.* iv.), Erythrae (*Epigr.* vi., vii.), Mt Ida (*Epigr.* x.), Neon Teichos (*Epigr.* i.); others relate to certain trades or occupations—potters (*Epigr.* xiv.), sailors, fishermen, goat herds, &c. Some may be fragments of longer poems, but evidently they are not the work of any one poet. The fact that they were all ascribed to Homer merely means that they belong to a period in the history of the Ionian and Aeolian colonies when "Homer" was a name which drew to itself all ancient and popular verse.

Again, comparing the "epigrams" with the legends and anecdotes told in the Lives of Homer, we can hardly doubt that they were the chief source from which these Lives were derived. Thus in Epigr. iv. we find a blind poet, a native of Aeolian Smyrna, through which flows the water of the sacred Meles. Here is doubtless the source of the chief incident of the Herodotean Life—the birth of Homer "Son of the Meles." The epithet Aeolian implies high antiquity, inasmuch as according to Herodotus Smyrna became Ionian about 688 B.C. Naturally the Ionians had their own version of the story—a version which made Homer come out with the first Athenian colonists.

The same line of argument may be extended to the *Hymns*, and even to some of the lost works of the post-Homeric or so-called "Cyclic" poets. Thus:—

1. The hymn to the Delian Apollo ends with an address of the poet to his audience. When any stranger comes and asks who is the sweetest singer, they are to answer with one voice, the "blind man that dwells in rocky Chios; his songs deserve the prize for all time to come." Thucydides, who quotes this passage to show the ancient character of the Delian festival, seems to have no doubt of the Homeric authorship of the hymn. Hence we may most naturally account for the belief that Homer was a Chian.

2. The *Margites*—a humorous poem which kept its ground as the reputed work of Homer down to the time of Aristotle—began with the words, "There came to Colophon an old man, a divine singer, servant of the Muses and Apollo." Hence doubtless the claim of Colophon to be the native city of Homer—a claim supported in the early times of Homeric learning by the Colophonian poet and grammarian Antimachus.

3. The poem called the *Cypria* was said to have been given by Homer to Stasinus of Cyprus as a daughter's dowry. The connexion with Cyprus appears further in the predominance given in the poem to Aphrodite.

4. The *Little Iliad* and the *Phocaïs*, according to the Herodotean life, were composed by Homer when he lived at Phocaea with a certain Thestorides, who carried them off to Chios and there gained fame by reciting them as his own. The name Thestorides occurs in *Epigr.* v.

5. A similar story was told about the poem called the *Taking of Oechalia* (Οἰχαλίας Ἅλωσις), the subject of which was one of the exploits of Heracles. It passed under the name of Creophylus, a friend or (as some said) a son-in-law of Homer; but it was generally believed to have been in fact the work of the poet himself.

6. Finally the *Thebaid* always counted as the work of Homer. As to the *Epigoni*, which carried on the Theban story, some doubt seems to have been felt.

These indications render it probable that the stories connecting Homer with different cities and islands grew up after his poems had become known and famous, especially in the new and flourishing colonies of Aeolis and Ionia. The contention for Homer, in short, began at a time when his real history was lost, and he had become a sort of mythical figure, an "eponymous hero," or personification of a great school of poetry.

An interesting confirmation of this view from the negative side is furnished by the city which ranked as chief among the Asiatic colonies of Greece, viz. Miletus. No legend claims for Miletus even a visit from Homer, or a share in the authorship of any Homeric poem. Yet Arctinus of Miletus was said to have been a "disciple of Homer," and was certainly one of the earliest and most considerable of the "Cyclic" poets. His *Aethiopis* was composed as a sequel to the *Iliad*; and the structure and general character of his poems show that he took the *Iliad* as his model. Yet in his case we find no trace of the disputed authorship which is so common with other "Cyclic" poems. How has this come about? Why have the works of Arctinus escaped the attraction which drew to the name of Homer such epics as the *Cypria*, the *Little Iliad*, the *Thebaid*, the *Epigoni*, the *Taking of Oechalia* and the *Phocais*. The most obvious account of the matter is that Arctinus was never so far forgotten that his poems became the subject of dispute. We seem through him to obtain a glimpse of an early post-Homeric age in Ionia, when the immediate disciples and successors of Homer were distinct figures in a trustworthy tradition—when they had not yet merged their individuality in the legendary "Homer" of the Epic Cycle.

Recitation of the Poems.—The recitation of epic poetry was called in historical times "rhapsody" (ῥαψῳδία). The word ῥαψῳδός is post-Homeric, but was known to Pindar, who gives two different explanations of it—"singer of stitched verse" (ῥαπτῶν ἐπέων ἀοιδοί), and "singer with the wand" (ῥαβδός). Of these the first is etymologically correct (except that it should rather be "stitcher of verse"); the second was suggested by the fact, for which there is early evidence, that the reciter was accustomed to hold a wand in his hand—perhaps, like the sceptre in the Homeric assembly, as a symbol of the right to a hearing.[3]

The first notice of rhapsody meets us at Sicyon, in the reign of Cleisthenes (600–560 B.C.), who "put down the rhapsodists on account of the poems of Homer, because they are all about Argos and the Argives" (Hdt. v. 67). This description applies very well to the *Iliad*, in which Argos and Argives occur on almost every page. It may have suited the *Thebaid* still better, but there is no need to understand it only of that poem, as Grote does. The incident shows that the poems of the Ionic Homer had gained in the 6th century B.C., and in the Doric parts of the Peloponnesus, the ascendancy, the national importance and the almost canonical character which they ever afterwards retained.

At Athens there was a law that the Homeric poems should be recited (ῥαψῳδεῖσθαι) on every occasion of the Panathenaea. This law is appealed to as an especial glory of Athens by the orator Lycurgus (*Leocr.* 102). Perhaps therefore the custom of public recitation was exceptional,[4] and unfortunately we do not know when or by whom it was introduced. The Platonic dialogue *Hipparchus* attributes it to Hipparchus, son of Peisistratus. This, however, is part of the historical romance of

[1] See a paper in the *Diss. Philol. Halenses*, ii. 97-219.

[2] Compare the *Popular Rhymes of Scotland*, published by Robert Chambers.

[3] Compare the branch of myrtle at an Athenian feast (Aristoph., *Nub.*, 1364).

[4] The *Iliad* was also recited at the festival of the Brauronia, at Brauron in Attica (Hesych. *s.v.* βραυρωνίοις).

SpinSmart Software http://www.spinsmart.com

which the dialogue mainly consists. The author makes (perhaps wilfully) all the mistakes about the family of Peisistratus which Thucydides notices in a well-known passage (vi. 54-59). In one point, however, the writer's testimony is valuable. He tells us that the law required the rhapsodists to recite "taking each other up in order (ἐξ ὑπολήψεως ἐφεξῆς), as they still do." This recurs in a different form in the statement of Diogenes Laertius (i. 2. 57) that Solon made a law that the poems should be recited "with prompting" (ἐξ ὑποβολῆς). The question as between Solon and Hipparchus cannot be settled; but it is at least clear that a due order of recitation was secured by the presence of a person charged to give the rhapsodists their cue (ὑποβάλλειν). It was necessary, of course, to divide the poem to be recited into parts, and to compel each contending rhapsodist to take the part assigned to him. Otherwise they would have chosen favourite or show passages.

The practice of poets or rhapsodists contending for the prize at the great religious festivals is of considerable antiquity, though apparently post-Homeric. It is brought vividly before us in the Hymn to Apollo (see the passage mentioned above), and in two Hymns to Aphrodite (v. and ix.). The latter of these may evidently be taken to belong to Salamis in Cyprus and the festival of the Cyprian Aphrodite, in the same way that the Hymn to Apollo belongs to Delos and the Delian gathering. The earliest trace of such contests is to be found in the story of Thamyris, the Thracian singer, who boasted that he could conquer even the Muses in song (*Il.* ii. 594 ff.).

Much has been made in this part of the subject of a family or clan (γένος) of Homeridae in the island of Chios. On the one hand, it seemed to follow from the existence of such a family that Homer was a mere "eponymus," or mythical ancestor; on the other hand, it became easy to imagine the Homeric poems handed down orally in a family whose hereditary occupation it was to recite them, possibly to add new episodes from time to time, or to combine their materials in new ways, as their poetical gifts permitted. But, although there is no reason to doubt the existence of a family of "Homeridae," it is far from certain that they had anything to do with Homeric poetry. The word occurs first in Pindar (*Nem.* 2. 2), who applies it to the rhapsodists (Ὁμηρίδαι ῥαπτῶν ἐπέων ἀοιδοί). On this a scholiast says that the name "Homeridae" denoted originally descendants of Homer, who sang his poems in succession, but afterwards was applied to rhapsodists who did not claim descent from him. He adds that there was a famous rhapsodist, Cynaethus of Chios, who was said to be the author of the Hymn to Apollo, and to have first recited Homer at Syracuse about the 69th Olympiad. Nothing here connects the Homeridae with Chios. The statement of the scholiast is evidently a mere inference from the patronymic form of the word. If it proves anything, it proves that Cynaethus, who was a Chian and a rhapsodist, made no claim to Homeric descent. On the other hand our knowledge of Chian Homeridae comes chiefly from the lexicon of Harpocration, where we are told that Acusilaus and Hellanicus said that they were so called from the poet; whereas Seleucus pronounced this to be an error. Strabo also says that the Chians put forward the Homeridae as an argument in support of their claim to Homer. These Homeridae, then, belonged to Chios, but there is no indication of their being rhapsodists. On the contrary, Plato and other Attic writers use the word to include interpreters and admirers—in short, the whole "spiritual kindred"—of Homer. And although we hear of "descendants of Creophylus" as in possession of the Homeric poems, there is no similar story about descendants of Homer himself. Such is the evidence on which so many inferences are based.

The result of the notices now collected is to show that the early history of epic recitation consists of (1) passages in the Homeric hymns showing that poets contended for the prize at the great festivals, (2) the passing mention in Herodotus of rhapsodists at Sicyon, and (3) a law at Athens, of unknown date, regulating the recitation at the Panathenaea. Let us now compare these data with the account given in the Homeric poems. The word "rhapsode" does not yet exist; we hear only of the "singer" (ἀοιδός), who does not carry a wand or laurel-branch, but the lyre (φόρμιγξ), with which he accompanies his "song." In the *Iliad* even the epic "singer" is not met with. It is Achilles himself who sings the stories of heroes (κλέα ἀνδρῶν) in his tent, and Patroclus is waiting (*respondere paratus*), to take up the song in his turn (*Il.* ix. 191). Again we do not hear of poetical contests (except in the story of Thamyris already mentioned) or of recitation of epic poetry at festivals. The *Odyssey* gives us pictures of two great houses, and each has its singer. The song is on a subject taken from the Trojan war, at some point chosen by the singer himself, or by his hearers. Phemius pleases the suitors by singing of the calamitous return of the Greeks; Demodocus sings of a quarrel between Ulysses and Achilles, and afterwards of the wooden horse and the capture of Troy.

It may be granted that the author of the *Odyssey* can hardly have been just such a singer as he himself describes. The songs of Phemius and Demodocus are too short, and have too much the character of improvisations. Nor is it necessary to suppose that epic poetry, at the time to which the picture in the *Odyssey* belongs, was confined to the one type represented. Yet in several respects the conditions under which the singer finds himself in the house of a chieftain like Odysseus or Alcinous are more in harmony with the character of Homeric poetry than those of the later rhapsodic contests. The subdivision of a poem like the *Iliad* or *Odyssey* among different and necessarily unequal performers must have been injurious to the effect. The highly theatrical manner of recitation which was fostered by the spirit of competition, and by the example of the stage, cannot have done justice to the even movement of the epic style. It is not certain indeed that the practice of reciting a long poem by the agency of several competitors was ancient, or that it prevailed elsewhere than at Athens; but as rhapsodists were numerous, and popular favour throughout Greece became more and more confined to one or two great works, it must have become almost a necessity. That it was the mode of recitation contemplated by the author of the *Iliad* or *Odyssey* it is impossible to believe.

The difference made by substituting the wand or branch of laurel for the lyre of the Homeric singer is a slighter one, though not without significance. The recitation of the Hesiodic poems was from the first unaccompanied by the lyre, *i.e.* they were confessedly *said*, not *sung*; and it was natural that the example should be extended to Homer. For it is difficult to believe that the Homeric poems were ever "sung" in the strict sense of the word. We can only suppose that the lyre in the hands of the epic poet or reciter was in reality a piece of convention, a "survival" from the stage in which narrative poetry had a lyrical character. Probably the poets of the Homeric school—that which dealt with war and adventure—were the genuine descendants of minstrels whose "lays" or "ballads" were the amusement of the feasts in an earlier heroic age; whereas the Hesiodic compositions were non-lyrical from the first, and were only in verse because that was the universal form of literature.

It seems, then, that if we imagine Homer as a singer in a royal house of the Homeric age, but with more freedom regarding the limits of his subject, and a more tranquil audience than is allowed him in the rapid movement of the *Odyssey*, we shall probably not be far from the truth.

Time and Place of Homer.—The oldest direct references to the *Iliad* and *Odyssey* are in Herodotus, who quotes from both poems (ii. 53). The quotation from the *Iliad* is of interest because it is made in order to show that Homer supported the story of the travels of Paris to Egypt and Sidon (whereas the Cyclic poem called the *Cypria* ignored them), and also because the part of the *Iliad* from which it comes is cited as the "Aristeia of Diomede." This was therefore a recognized part of the poem.

The earliest mention of the name of Homer is found in a fragment of the philosopher Xenophanes (of the 6th century B.C., or possibly earlier), who complains of the false notions implanted through the teaching of Homer. The passage shows, not merely that Homer was well known at Colophon in the time of Xenophanes, but also that the great advance in moral and

SpinSmart Software http://www.spinsmart.com

religious ideas which forced Plato to banish Homer from his republic had made itself felt in the days of the early Ionic philosophers.

Failing external testimony, the time and place of the Homeric poems can only be determined (if at all) by internal evidence. This is of two main kinds: (*a*) evidence of history, consisting in a comparison of the political and social condition, the geography, the institutions, the manners, arts and ideas of Homer with those of other times; (*b*) evidence of language, consisting in a comparison with later dialects, in respect of grammar and vocabulary. To these may be added, as occasionally of value, (*c*) much evidence of the direct influence of Homer upon the subsequent course of literature and art.

(*a*) The political condition of Greece in the earliest times known to history is separated from the Greece of Homer by an interval which can hardly be overestimated. The great national names are different: instead of Achaeans, Argives, Danai, we find Hellenes, subdivided into Dorians, Ionians, Aeolians—names either unknown to Homer, or mentioned in terms more significant than silence. At the dawn of Greek history Mycenae is no longer the seat of empire; new empires, polities and civilizations have grown up—Sparta with its military discipline, Delphi with its religious supremacy, Miletus with its commerce and numberless colonies, Aeolis and Ionia, Sicily and Magna Graecia.

While the political centre of Homeric Greece is at Mycenae, the real centre is rather to be found in Boeotia. The Catalogue of the Ships begins with Boeotia; the list of Boeotian towns is much the longest; and they sail, not from the bay of Argos, but from the Boeotian harbour of Aulis. This position is not due to its chiefs, who are all of inferior rank. The importance of Boeotia for Greek civilization is further shown by the ancient worship of the Muses on Mount Helicon, and the fact that the oldest poet whose birthplace was known was the Boeotian Hesiod. Next to Boeotia and the neighbouring countries, it appears that the Peloponnesus, Crete and Thessaly were the most important seats of Greek population.

In the Peloponnesus the face of things was completely altered by the Dorian conquest, no trace of which is found in Homer. The only Dorians known in Homer are those that the *Odyssey* (xix. 177) places in Crete. It is difficult to connect them with the Dorians of history.

The eastern shores of the Aegean, which the earliest historical records represent to us as the seat of a brilliant civilization, giving way before the advance of the great military empires (Lydia and afterwards Persia), are almost a blank in Homer's map. The line of settlements can be traced in the Catalogue from Crete to Rhodes, and embraces the neighbouring islands of Cos and Calymnos. The colonization of Rhodes by Tlepolemus is related (*Il.* ii. 661 ff.), and seems to mark the farthest point reached in the Homeric age. Between Rhodes and the Troad Homer knows of but one city, Miletus—which is a Carian ally of Troy—and the mouth of one river, the Cayster. Even the Cyclades—Naxos, Paros, Melos—are unknown to the Homeric world. The disposition of the Greeks to look to the west for the centres of religious feeling appears in the mention of Dodona and the Dodonaean Zeus, put in the mouth of the Thessalian Achilles.

To the north we find the Thracians, known from the stories of Thamyris the singer (*Il.* ii. 595), and Lycurgus, the enemy of the young god Dionysus (*Il.* vi. 130). Here the Trojan empire begins. It does not appear, however, that the Trojans are thought of as people of a different language. As this is expressly said of the Carians, and of the Trojan allies who were "summoned from afar," the contrary rather is implied regarding Troy itself.

The mixed type of government described by Homer—consisting of a king guided by a council of elders, and bringing all important resolutions before the assembly of the fighting men—does not seem to have been universal in Indo-European communities, but to have grown up in many different parts of the world under the stress of similar conditions. The king is the commander in war, and the office probably owed its existence to military necessities. It is not surrounded with any special sacredness. There were ruling families, laying claim to divine descent, from whom the king was naturally chosen, but his own fitness is the essence of his title. The aged Laertes is set aside; the young Telemachus does not succeed as a matter of course. Nor are any very definite rights attached to the office. Each tribe in the army before Troy was commanded by its own king (or kings); but Agamemnon was supreme, and was "more a king" (*βασιλείτερος*) than any other. The assembly is summoned on all critical occasions, and its approval is the ultimate sanction. A king therefore stands in almost as much need of oratory as of warlike skill and prowess. Even the division of the spoil is not made in the *Iliad* by Agamemnon, but by "the Achaeans" (*Il.* i. 162, 368). The taking of Briseïs from Achilles was an arbitrary act, and against all rule and custom. The council is more difficult to understand. The "elders" (*γέροντες*) of the *Iliad* are the same as the subordinate "kings"; they are summoned by Agamemnon to his tent, and form a small council of nine or ten persons. In Troy we hear of elders of the people (*δημογέροντες*) who are with Priam, and are men past the military age. So in Ithaca there are elders who have not gone to Troy with the army. It would seem therefore that the meeting in Agamemnon's tent was only a copy or adaptation of the true constitutional "council of elders," which indeed was essentially unfitted for the purposes of military service. The king's palace, if we may judge from Tiryns and Mycenae, was usually in a strong situation on an "acropolis." In the later times of democracy the acropolis was reserved for the temples of the principal gods.

Priesthood in Homer is found in the case of particular temples, where an officer is naturally wanted to take charge of the sacred inclosure and the sacrifices offered within it. It is perhaps an accident that we do not hear of priests in Ithaca. Agamemnon performs sacrifice himself, not because a priestly character was attached to the kingly office, but simply because he was "master in his own house."

The conception of "law" is foreign to Homer. The later words for it (*νόμος*, *ῥήτρα*) are unknown, and the terms which he uses (*δίκη* and *θέμις*) mean merely "custom." Judicial functions are in the hands of the elders, who "have to do with suits" (*δικασπόλοι*), and "uphold judgments" (*θέμισας εἰρύαται*). On such matters as the compensation in cases of homicide, it is evident that there were no rules, but merely a feeling, created by use and wont, that the relatives of the slain man should be willing to accept payment. The sense of anger which follows a violation of custom has the name of "Nemesis"—righteous displeasure.

As there is no law in Homer, so there is no morality. That is to say, there are no general principles of action, and no words which indicate that acts have been classified as good or bad, right or wrong. Moral *feeling*, indeed, existed and was denoted by "Aidos"; but the numerous meanings of this word—shame, veneration, pity—show how rudimentary the idea was. And when we look to practice we find that cruel and even treacherous deeds are spoken of without the least sense that they deserve censure. The heroes of Homer are hardly more moral agents than the giants and enchanters of a fairy tale.

The religious ideas of Homer differ in some important points from those of later Greece. The Apollo of the *Iliad* has the character of a local Asiatic deity—"ruler of Chryse and goodly Cilla and Tenedos." He may be compared with the Clarian and the Lycian god, but he is unlike the Apollo of Dorian times, the "deliverer" and giver of oracles. Again, the worship of Dionysus, and of Demeter and Persephone, is mainly or wholly post-Homeric. The greatest difference, however, lies in the absence of hero-worship from the Homeric order of things. Castor and Polydeuces, for instance, are simply brothers of Helen who died before the expedition to Troy (*Il.* iii. 243.)

The military tactics of Homer belong to the age when the chariot was the principal engine of warfare. Cavalry is unknown, and the battles are mainly decided by the prowess of the chiefs. The use of the trumpet is also later. It has been supposed indeed that the art of riding was known in Homer's own time, because it occurs in comparisons. But the riding which he

SpinSmart Software http://www.spinsmart.com

describes (*Il.* xv. 679) is a mere exhibition of skill, such as we may see in a modern circus. And though he mentions the trumpet (*Il.* xviii. 219), there is nothing to show that it was used, as in historical times, to give the signal for the charge.

The chief industries of Homeric times are those of the carpenter (τέκτων), the worker in leather (σκυτοτόμος), the smith or worker in metal (χαλκεύς)—whose implements are the hammer and pincers—and the potter (κεραμεύς); also spinning and weaving, which were carried on by the women. The fine arts are represented by sculpture in relief, carving in wood and ivory, embroidery. Statuary is later; it appears to have come into existence in the 7th century, about the time when casting in metal was invented by Rhoecus of Samos. In general, as was well shown by A. S. Murray,[1] Homeric art does not rise above the stage of *decoration*, applied to objects in common use; while in point of style it is characterized by a richness and variety of ornament which is in the strongest contrast to the simplicity of the best periods. It is the work, in short, not of artists but of skilled workmen; the ideal artist is "Daedalus," a name which implies mechanical skill and intricate workmanship, not beauty of design.

One art of the highest importance remains. The question whether writing was known in the time of Homer was raised in antiquity, and has been debated with especial eagerness ever since the appearance of Wolf's *Prolegomena*. In this case we have to consider not merely the indications of the poems, but also the external evidence which we possess regarding the use of writing in Greece. This latter kind of evidence is much more considerable now than it was in Wolf's time. (See WRITING elsewhere in these volumes.)

The oldest known stage of the Greek alphabet appears to be represented by inscriptions of the islands of Thera, Melos and Crete, which are referred to the 40th Olympiad (620 B.C.). The oldest specimen of a distinctively Ionian alphabet is the famous inscription of the mercenaries of Psammetichus, in Upper Egypt, as to which the only doubt is whether the Psammetichus in question is the first or the second, and consequently whether the inscription is to be dated Ol. 40 or Ol. 47. Considering that the divergence of two alphabets (like the difference of two dialects) requires both time and familiar use, we may gather from these facts that writing was well known in Greece early in the 7th century B.C.[2]

The rise of prose composition in the 6th century B.C. has been thought to mark the time when memory was practically superseded by writing as a means of preserving literature—the earlier use of letters being confined to short documents, such as lists of names, treaties, laws, &c. This conclusion, however, is by no means necessary. It may be that down to comparatively late times poetry was not commonly read, but was recited from memory. But the question is—From what time are we to suppose that the preservation of long poems was generally secured by the existence of written copies? Now, without counting the Homeric poems—which doubtless had exceptional advantages in their fame and popularity—we find a body of literature dating from the 8th century B.C. to which the theory of oral transmission is surely inapplicable. In the Trojan cycle alone we know of the two epics of Arctinus, the *Little Iliad* of Lesches, the *Cypria*, the *Nostoi*. The Theban cycle is represented by the *Thebaid* (which Callinus, who was of the 7th century, ascribed to Homer) and the *Epigoni*. Other ancient epics—ancient enough to have passed under the name of Homer—are the *Taking of Oechalia*, and the *Phocaïs*. Again, there are the numerous works attributed to Hesiod and other poets of the didactic, mythological and quasi-historical schools—Eumelus of Corinth, Cinaethon of Sparta, Agias of Troezen, and many more. The preservation of this vast mass can only be attributed to writing, which must therefore have been in use for two centuries or more before there was any considerable prose literature. Nor is this in itself improbable.

The further question, whether the *Iliad* and *Odyssey* were originally written, is much more difficult. External evidence does not reach back so far, and the internal evidence is curiously indecisive. The only passage which can be interpreted as a reference to writing occurs in the story of Bellerophon, told by Glaucus in the sixth book of the *Iliad*. Proetus, king of Corinth, sent Bellerophon to his father-in-law the king of Lycia, and gave him "baneful tokens" (σήματα λυγρά, *i.e.* tokens which were messages of death), "scratching on a folded tablet many spirit-destroying things, and bade him show this to his father-in-law, that he might perish." The king of Lycia asked duly (on the tenth day from the guest's coming) for a token (ἤτεε σῆμα ἰδέσθαι), and then knew what Proetus wished to be done. In this account there is nothing to show exactly how the message of Proetus was expressed. The use of writing for the purpose of the token between "guest-friends" (*tessera hospitalis*) is certainly very ancient. Mommsen (*Röm. Forsch.* i. 338 ff.) aptly compares the use in treaties, which are the oldest species of public documents. But we may suppose that tokens of some kind—like the marks which the Greek chiefs make on the lots (*Il.* vii. 175 ff.)—were in use before writing was known. In any system of signs there were doubtless means of recommending a friend, or giving warning of the presence of an enemy. There is no difficulty, therefore, in understanding the message of Proetus without alphabetical writing. But, on the other hand, there is no reason for so understanding it.

If the language of Homer is so ambiguous where the use of writing would naturally be mentioned, we cannot expect to find more decisive references elsewhere. Arguments have been founded upon the descriptions of the blind singers in the *Odyssey*, with their songs inspired directly by the Muse; upon the appeals of the poet to the Muses, especially in such a place as the opening of the Catalogue; upon the Catalogue itself, which is a kind of historical document put into verse to help the memory; upon the shipowner in the *Odyssey*, who has "a good memory for his cargo," &c. It may be answered, however, that much of this is traditional, handed down from the time when all poetry was unwritten. Moreover it is one thing to recognize that a literature is essentially oral in its form, characteristic of an age which was one of hearing rather than of reading, and quite another to hold that the same literature was preserved entirely by oral transmission.

The result of these various considerations seems to be that the age which we may call the Homeric—the age which is brought before us in vivid outlines in the *Iliad* and *Odyssey*—lies beyond the earliest point to which history enables us to penetrate. And so far as we can draw any conclusion as to the author (or authors) of the two poems, it is that the whole debate between the cities of Aeolis and Ionia was wide of the mark. The author of the *Iliad*, at least, was evidently a European Greek who lived before the colonization of Asia Minor; and the claims of the Asiatic cities mean no more than that in the days of their prosperity these were the chief seats of the fame of Homer.

This is perhaps the place to consider whether the poems are to be regarded as possessing in any degree the character of historical record. The question is one which in the absence of satisfactory criteria will generally be decided by taste and predilection. A few suggestions, however, may be made.

1. The events of the *Iliad* take place in a real locality, the general features of which are kept steadily in view. There is no doubt about Sigeum and Rhoeteum, or the river Scamander, or the islands Imbros, Lemnos and Tenedos. It is at least remarkable that a legend of the national interest of the "tale of Troy" should be so definitely localized, and that in a district which was never famous as a seat of Greek population. It may be urged, too, that the story of the *Iliad* is singularly free from the exaggerated and marvellous character which belongs as a rule to the legends of primitive peoples. The apple of discord, the arrows of Philoctetes, the invulnerability of Achilles, and similar fancies, are the additions of later poets. This

[1] *Contemporary Review*, vol. xxiii. p. 218 ff.

[2] The fact that the Phoenician Vau (ϝ) was retained in the Greek alphabets, and the vowel υ added, shows that when the alphabet was introduced the sound denoted by ϝ was still in full vigour. Otherwise ϝ would have been used for the vowel υ, just as the Phoenician consonant Yod became the vowel ι. But in the Ionic dialect the sound of ϝ died out soon after Homer's time, if indeed it was still pronounced then. It seems probable therefore that the introduction of the alphabet is not later than the composition of the Homeric poems.

SpinSmart Software http://www.spinsmart.com

sobriety, however, belongs not to the whole *Iliad*, but to the events and characters of the war. Such figures as Bellerophon, Niobe, the Amazons, which are thought of as traditions from an earlier generation, show the marvellous element at work.

2. Certain persons and events in the story have a distinctly mythical stamp. Helen is a figure of this kind. There was another story according to which she was carried off by Theseus, and recovered by her brothers the Dioscuri. There are even traces of a third version, in which the Messenian twins, Idas and Lynceus, appear.

3. The analogy of the French epic, the *Chanson de Roland*, favours the belief that there was some nucleus of fact. The defeat of Roncevaux was really suffered by a part of Charlemagne's army. But the Saracen army is purely mythical, the true enemy having been the Gascons. If similarly we leave, as historical, the plain of Troy, and the name Agamemnon, we shall perhaps not be far wrong.

(*b*) The dialect of Homer is an early or "primitive" form of the language which we know as that of Attica in the classical age of Greek literature. The proof of this proposition is to be obtained chiefly by comparing the grammatical formation and the syntax of Homer with those of Attic. The comparison of the vocabulary is in the nature of things less conclusive on the question of date. It would be impossible to give the evidence in full without writing a Homeric grammar, but a few specimens may be of interest.

1. The first aorist in Greek being a "weak" tense, *i.e.* formed by a suffix (-σᾰ), whereas the second aorist is a "strong" tense, distinguished by the form of the root-syllable, we expect to find a constant tendency to diminish the number of second aorists in use. No new second aorists, we may be sure, were formed any more than new "strong" tenses, such as *came* or *sang*, can be formed in English. Now in Homer there are upwards of 80 second aorists (not reckoning aorists of "Verbs in μι," such as ἔστην, ἔβην), whereas in all Attic prose not more than 30 are found. In this point therefore the Homeric language is manifestly older. In Attic poets, it is true, the number of such aorists is much larger than in prose. But here again we find that they bear witness to Homer. Of the poetical aorists in Attic the larger part are also Homeric. Others are not really Attic at all, but borrowed from earlier Aeolic and Doric poetry. It is plain, in short, that the later poetical vocabulary was separated from that of prose mainly by the forms which the influence of Homer had saved from being forgotten.

2. While the whole class of "strong" aorists diminished, certain smaller groups in the class disappeared altogether. Thus we find in Homer, but not in the later language:—

(*a*) The second aorist middle without the "thematic" ε or ο: as ἔβλη-το, *was struck*; ἔφθι-το, *perished*; ἄλ-το, *leaped*.

(*b*) The aorist formed by reduplication: as δέδαεν, *taught*; λελαβέσθαι, *to seize*. These constitute a distinct formation, generally with a "causative" meaning; the solitary Attic specimen is ἤγαγον.

3. It had long been known that the subjunctive in Homer often takes a short vowel (*e.g.* in the plural, -ομεν, -ετε instead of -ωμεν, -ητε, and in the Mid. -ομαι, &c. instead of -ωμαι, &c.). This was generally said to be done by "poetic licence," or *metri gratia*. In fact, however, the Homeric subjunctive is almost quite "regular," though the rule which it obeys is a different one from the Attic. It may be summed up by saying that the subjunctive takes ω or η when the indicative has ο or ε, and not otherwise. Thus Homer has ἴ-μεν, *we go*. ἴ-ο-μεν, *let us go*. The later ἴ-ω-μεν was at first a solecism, an attempt to conjugate a "verb in μι" like the "verbs in ω." It will be evident that under this rule the perfect and first aorist subjunctive should always take a short vowel; and this accordingly is the case, with very few exceptions.

4. The article (ὁ, ἡ, τό) in Homer is chiefly used as an independent pronoun (*he, she, it*), a use which in Attic appears only in a few combinations (such as ὁ μὲν . . . ὁ δέ, *the one . . . the other*). This difference is parallel to the relation between the Latin *ille* and the article of the Romance languages.

5. The prepositions offer several points of comparison. What the grammarians called "tmesis," the separation of the preposition from the verb with which it is compounded, is peculiar to Homer. The true account of the matter is that in Homer the place of the preposition is not rigidly fixed, as it was afterwards. Again, "with" is in Homer σύν (with the dative), in Attic prose μετά with the genitive. Here Attic poetry is intermediate; the use of σύν is retained as a piece of poetical tradition.

6. In addition to the particle ἄν, Homer has another, κεν, hardly distinguishable in meaning. The Homeric uses of ἄν and κεν are different in several respects from the Attic, the general result being that the Homeric syntax is more elastic. And yet it is perfectly definite and precise. Homer uses no constructions loosely or without corresponding differences of meaning. His rules are equally strict with those of the later language, but they are not the same rules. And they differ chiefly in this, that the less common combinations of the earlier period were disused altogether in the later.

7. In the vocabulary the most striking difference is that many words appear from the metre to have contained a sound which they afterwards lost, viz. that which is written in some Greek alphabets by the "digamma" ϝ. Thus the words ἄναξ, ἄστυ, ἔργον, ἔπος, and many others must have been written at one time ϝάναξ, ϝάστυ, ϝέργον, ϝέπος. This letter, however, died out earlier in Ionic than in most dialects, and there is no proof that the Homeric poems were ever written with it.

These are not, speaking generally, the differences that are produced by the gradual divergence of dialects in a language. They are rather to be classed with those which we find between the earlier and the later stages of every language which has had a long history. The Homeric dialect has passed into New Ionic and Attic by gradual but ceaseless development of the same kind as that which brought about the change from Vedic to classical Sanskrit, or from old high German to the present dialects of Germany.

The points that have been mentioned, to which many others might be added, make it clear that the Homeric and Attic dialects are separated by differences which affect the whole structure of the language, and require a considerable time for their development. At the same time there is hardly one of these differences which cannot be accounted for by the natural growth of the language. It has been thought indeed that the Homeric dialect was a mixed one, mainly Ionic, but containing Aeolic and even Doric forms; this, however, is a mistaken view of the processes of language. There are doubtless many Homeric forms which were unknown to the later Ionic and Attic, and which are found in Aeolic or other dialects. In general, however, these are *older* forms, which must have existed in Ionic at one time, and may very well have belonged to the Ionic of Homer's time. So too the digamma is called "Aeolic" by grammarians, and is found on Aeolic and Doric inscriptions. But the letter was one of the original alphabet, and was retained universally as a numeral. It can only have fallen into disuse by degrees, as the sound which it denoted ceased to be pronounced. The fact that there are so many traces of it in Homer is a strong proof of the antiquity of the poems, but no proof of admixture with Aeolic.

There is one sense, however, in which an admixture of dialects may be recognized. It is clear that the variety of forms in Homer is too great for any actual spoken dialect. To take a single instance: it is impossible that the genitives in -οιο and in -ου should both have been in everyday use together. The form in -οιο must have been poetical or literary, like the old English forms that survive in the language of the Bible. The origin of such double forms is not far to seek. The effect of dialect on style was always recognized in Greece, and the dialect which had once been adopted by a particular kind of poetry was ever afterwards adhered to. The Epic of Homer was doubtless formed originally from a spoken variety of Greek, but became literary and conventional with time. It is Homer himself who tells us, in a striking passage (*Il.* iv. 437) that all the Greeks spoke the same language—that is to say, that they understood one another, in spite of the inevitable local differences. Experience shows how some one dialect in a country gains a literary supremacy to which the whole nation yields. So Tuscan became the type of Italian, and Anglian of English. But as soon as the dialect is adopted, it begins to diverge from the colloquial form. Just as modern poetical Italian uses many older grammatical forms peculiar to itself, so the language of poetry, even in Homeric times, had formed a deposit (so to speak) of archaic grammar. There were doubtless poets before Homer, as well as brave men before Agamemnon; and indeed the formation of a poetical dialect such as the Homeric must have been the work of several generations. The use of that dialect (instead of Aeolic) by the Boeotian poet Hesiod, in a kind of poetry which was not of the Homeric type, tends to the conclusion that the literary ascendancy of the epic dialect was anterior to the *Iliad* and *Odyssey*, and independent of the influence exercised by these poems.

What then was the original language of Homer? Where and when was it spoken? [The answer given to this question by Aug. Fick (in 1883) and still held, with modifications, by some European scholars can no longer be maintained. Fick's original statement was that in or about the 6th century B.C.

SpinSmart Software http://www.spinsmart.com

the poems, which had originally worn an Aeolic dress, were transposed into Ionic. To this it is easily answered that such an event is not only unique in history, but contrary to all that we know of the Greek genius. At the period in question an Aeolic literature, the lyrics of Sappho and Alcaeus, were in existence. If it was found necessary to transpose the Aeolic Homer, why did the Aeolic lyric verse escape? If, however, as is the view of some of Fick's followers, the transposition took place several centuries earlier, before species of literature had appropriated particular dialects, then the linguistic facts upon which Fick relied to distinguish the "Aeolic" and "Ionic" elements in Homer disappear. We have no means of knowing what the Aeolic and Ionic of say the 9th century were, or if there were such dialects at all. Certain prominent historical differences between Aeolic and Ionic (the digamma and ἀ) are known to be unoriginal. The view that Homer underwent at any time a passage from one dialect to another may be dismissed. The tendency of modern dialectologists is to divide the Greek dialects into Dorian and non-Dorian. The non-Dorian dialects, Ionic, Attic and the various forms of Aeolic, are regarded as relatively closely akin, and go by the common name "Achaean." They formed the common language of Greece before the Doric invasion. As the scene which Homer depicts is prae-Dorian Greece, it is reasonable to call his language Achaean. The historical divergences of Achaean into Aeolian and Ionic were later than the Migration, and were due to the well-known effects of change of soil and air.

To what local variety of Achaean Homeric Greek belonged it is idle to ask. Thessaly, Boeotia and Mycenae have equal claims. It seems clearer that when once this local variety of Achaean had been used by poets of eminence as their vehicle for national history, it established its right to be considered the one poetical language of Hellas. As the dialect of the Arno in Italy, of Castille in Spain, by the virtue of the genius of the singers who used them, became literary "Italian" and "Spanish," so this variety of Achaean elevated itself to the position of the *volgare illustre* of Greece.[1] (T. W. A.)

(*c*) The influence of Homer upon the subsequent course of Greek literature is a large subject, even if we restrict it to the centuries which immediately followed the Homeric age. It will be enough to observe that in the earliest elegiac poets, such as Archilochus, Tyrtaeus and Theognis, reminiscences of Homeric language and thought meet us on every page. If the same cannot be said of the ancient epic poems, that is because of the extreme scantiness of the existing fragments. Much, however, is to be gathered from the arguments of the Trojan part of the Epic Cycle (preserved in the *Codex Venetus* of the *Iliad*, a full discussion of which will be found in the *Journal of Hellenic Studies*, 1884, pp. 1-40). An examination of these arguments throws light on two chief aspects of the relation between Homer and his "cyclic" successors.

1. The later poets sought to complete the story of the Trojan war by supplying the parts which did not fall within the *Iliad* and *Odyssey*—the so-called *ante-homerica* and *post-homerica*. They did so largely from hints and passing references in Homer. Thus the successive episodes of the siege related at length in the *Little Iliad*, and ending with the story of the Wooden Horse, are nearly all taken from passages in the *Odyssey*. Much the same may be said of the *Nosti*.

2. With this process of expansion and development (so to speak) of Homeric themes is combined the addition of new characters. Such, in the *Little Iliad* (*e.g.*), are the story of the Palladium and of the treachery of Sinon. Such, too, in the *Cypria* are the new legendary figures—Palamedes, Iphigenia, Telephus, Laocoon. These new elements in the narrative are evidently due not only to the natural growth of legend in a people highly endowed with imagination, but in a large proportion also to the new races and countries with which the Greeks came into contact, as well as to their own rapid advance in wealth and civilization. It will be observed that the two poems of Arctinus are remarkable for the proportion of new matter of the latter kind. The *Aethiopis* shows us the allies of Troy reinforced by two peoples that are evidently creations of oriental fancy, the Amazons and Memnon with his Aethiopians. The *Iliu Persis*, again, was the oldest authority for the story of Laocoon and of the consequent escape of Aeneas—a story which connected a surviving branch of the house of Priam with the later inhabitants of the Troad. On the other hand the fate of Creusa (*sed me magna deum genetrix his detinet oris*) is a link with the worship of Cybele. The journey of Calchas to Colophon and his death there, as told in the *Nosti*, is another instance of the kind. These facts point to a familiarity with the Greek colonies in Asia which contrasts strongly with the silence of the *Iliad* and *Odyssey*.

Study of Homer.—The Homeric Question.—The critical study of Homer began in Greece almost with the beginning of prose writing. The first name is that of Theagenes of Rhegium, contemporary of Cambyses (525 B.C.), who is said to have founded the "new grammar" (the older "grammar" being the art of reading and writing), and to have been the inventor of the allegorical interpretations by which it was sought to reconcile the Homeric mythology with the morality and speculative ideas of the 6th century B.C. The same attitude in the "ancient quarrel of poetry and philosophy" was soon afterwards taken by Anaxagoras; and after him by his pupil Metrodorus of Lampsacus, who explained away all the gods, and even the heroes, as elementary substances and forces (Agamemnon as the upper air, &c.).

The next writers on Homer of the "grammatical" type were Stesimbrotus of Thasos (contemporary with Cimon) and Antimachus of Colophon, himself an epic poet of mark. The *Thebaid* of Antimachus, however, was not popular, and seems to have been a great storehouse of mythological learning rather than a poem of the Homeric school.

Other names of the pre-Socratic and Socratic times are mentioned by Xenophon, Plato and Aristotle. These were the "ancient Homerics" (οἱ ἀρχαῖοι Ὁμηρικοί), who busied themselves much with the hidden meanings of Homer; of whom Aristotle says, with his profound insight, that they see the small likenesses and overlook the great ones (*Metaph.* xii.).

The text of Homer must have attracted some attention when Antimachus came to be known as the "corrector" (διορθωτής) of a distinct edition (ἔκδοσις). Aristotle is said himself to have made a recension for the use of Alexander the Great. This is unlikely. His remarks on Homer (in the *Poetics* and elsewhere) show that he had made a careful study of the structure and leading ideas of the poems, but do not throw much light on the text.

The real work of criticism became possible only when great collections of manuscripts began to be made by the princes of the generation after Alexander, and when men of learning were employed to sift and arrange these treasures. In this way the great Alexandrian school of Homeric criticism began with Zenodotus, the first chief of the museum, and was continued by Aristophanes and Aristarchus. In Aristarchus ancient philology culminated, as philosophy had done in Socrates. All earlier learning either passed into his writings, or was lost; all subsequent research turned upon his critical and grammatical work.

The means of forming a judgment of the Alexandrine criticism are scanty. The literary form which preserved the works of the great historians was unfortunately wanting, or was not sufficiently valued, in the case of the grammarians. Abridgments and newer treatises soon drove out the writings of Aristarchus and other founders of the science. Moreover, a recension could not be reproduced without new errors soon creeping in. Thus we find that Didymus, writing in the time of Cicero, does not quote the readings of Aristarchus as we should quote a *textus receptus*. Indeed, the object of his work seems to have been to determine what those readings were. Enough, however, remains to show that Aristarchus had a clear notion of the chief problems of philology (except perhaps those concerning etymology). He saw, for example, that it was not enough to find a meaning for the archaic words (the γλῶσσαι, as they were called), but that common words (such as πόνος, φόβος) had their Homeric uses, which were to be gathered by due induction. In the same spirit he looked upon the ideas and beliefs of Homer as a consistent whole, which might be determined from the evidence of the poems. He noticed especially the difference between the stories known to Homer and those given by later poets, and made many comparisons between Homeric and later manners, arts and institutions. Again, he was sensible of the paramount value of manuscript authority, and appears to have introduced no readings from mere conjecture. The frequent mention in the Scholia of "better" and "inferior" texts may indicate a classification made by him or by the general opinion of critics. His use of the "obelus" to distinguish spurious verses, which made so large a part of his fame

[1] See D. B. Monro's *Homer's Odyssey*, books xiii.-xxiv. (Oxford, 1901, p. 455 sqq.), and the abstract of his paper on the Homeric Dialect read to the Congress of Historical Sciences at Rome, 1903: *Atti del Congresso internazionale di scienze storiche*, ii. 152, 153, 1905, "Il Dialetto omerico."

in antiquity, has rather told against him with modern scholars.[1] It is chiefly interesting as a proof of the confusion in which the text must have been before the Alexandrian times; for it is impossible to understand the readiness of Aristarchus to suspect the genuineness of verses unless the state of the copies had pointed to the existence of numerous interpolations. On this matter, however, we are left to conjecture.

Our knowledge of Alexandrian criticism is derived almost wholly from a single document, the famous *Iliad* of the library of St Mark in Venice (*Codex Venetus* 454, or *Ven. A*), first published by the French scholar Villoison in 1788 (*Scholia antiquissima ad Homeri Iliadem*). This manuscript, written in the 10th century, contains (1) the best text of the *Iliad*, (2) the critical marks of Aristarchus and (3) Scholia, consisting mainly of extracts from four grammatical works, viz. Didymus (contemporary of Cicero) on the recension of Aristarchus, Aristonicus (fl. 24 B.C.) on the critical marks of Aristarchus, Herodian (fl. A.D. 160) on the accentuation, and Nicanor (fl. A.D. 127) on the punctuation, of the *Iliad*.

These extracts present themselves in two distinct forms. One series of scholia is written in the usual way, on a margin reserved for the purpose. The other consists of brief scholia, written in very small characters (but of the same period) on the narrow space left vacant round the text. Occasionally a scholium of this kind gives the substance of one of the longer extracts; but as a rule they are distinct. It would seem, therefore, that after the manuscript was finished the "marginal scholia" were discovered to be extremely defective, and a new series of extracts was added in a form which interfered as little as possible with the appearance of the book.[2]

The mention of the Venetian Scholia leads us at once to the Homeric controversy; for the immortal *Prolegomena* of F. A. Wolf [3] appeared a few years after Villoison's publication, and was founded in great measure upon the fresh and abundant materials which it furnished. Not that the "Wolfian theory" of the Homeric poems is directly supported by anything in the Scholia; the immediate object of the *Prolegomena* was not to put forward that theory, but to elucidate the new and remarkable conditions under which the text of Homer had to be settled, viz. the discovery of an *apparatus criticus* of the 2nd century B.C. The questions regarding the original structure and early history of the poems were raised (forced upon him, it may be said) by the critical problem; but they were really originated by facts and ideas of a wholly different order.

The 18th century, in which the spirit of classical correctness had the most absolute dominion, did not come to an end before a powerful reaction set in, which affected not only literature but also speculation and politics. In this movement the leading ideas were concentrated in the word Nature. The natural condition of society, natural law, natural religion, the poetry of nature, gained a singular hold, first on the English philosophers from Hume onwards, and then (through Rousseau chiefly) on the general drift of thought and action in Europe. In literature the effect of these ideas was to set up a false opposition between nature and art. As political writers imagined a patriarchal innocence prior to codes of law, so men of letters sought in popular unwritten poetry the freshness and simplicity which were wanting in the prevailing styles. The blind minstrel was the counterpart of the noble savage. The supposed discovery of the poems of Ossian fell in with this train of sentiment, and created an enthusiasm for the study of early popular poetry. Homer was soon drawn into the circle of inquiry. Blackwell (Professor of Greek at Aberdeen) had insisted, in a book published in 1735, on the "naturalness" of Homer; and Wood (*Essay on the Original Genius of Homer*, London, 1769) was the first who maintained that Homer composed without the help of writing, and supported his thesis by ancient authority, and also by the parallel of Ossian. Both these books were translated into German, and their ideas passed into the popular philosophy of the day. Everything in short was ripe for the reception of a book that brought together, with masterly ease and vigour, the old and the new Homeric learning, and drew from it the historical proof that Homer was no single poet, writing according to art and rule, but a name which stood for a golden age of the true spontaneous poetry of genius and nature.

The part of the *Prolegomena* which deals with the original form of the Homeric poems occupies pp. xl.–clx. (in the first edition). Wolf shows how the question of the date of writing meets us on the threshold of the textual criticism of Homer and accordingly enters into a full discussion, first of the external evidence, then of the indications furnished by the poems. Having satisfied himself that writing was unknown to Homer, he is led to consider the real mode of transmission, and finds this in the Rhapsodists, of whom the Homeridae were an hereditary school. And then comes the conclusion to which all this has been tending: "the die is cast"—the *Iliad* and *Odyssey* cannot have been composed in the form in which we know them without the aid of writing. They must therefore have been, as Bentley had said, "a sequel of songs and rhapsodies," "loose songs not collected together in the form of an epic poem till about 500 years after." This conclusion he then supports by the character attributed to the "Cyclic" poems (whose want of unity showed that the structure of the *Iliad* and *Odyssey* must be the work of a later time), by one or two indications of imperfect connexion, and by the doubts of ancient critics as to the genuineness of certain parts. These, however, are matters of conjecture. "Historia loquitur." The voice of antiquity is unanimous in declaring that "Peisistratus first committed the poems of Homer to writing, and reduced them to the order in which we now read them."

The appeal of Wolf to the "voice of all antiquity" is by no means borne out by the different statements on the subject. According to Heraclides Ponticus (pupil of Plato), the poetry of Homer was first brought to the Peloponnesus by Lycurgus, who obtained it from the descendants of Creophylus (*Polit.* fr. 2). Plutarch in his *Life of Lycurgus* (c. 4) repeats this story, with the addition that there was already a faint report of the poems in Greece, and that certain detached fragments were in the possession of a few persons. Again, the Platonic dialogue *Hipparchus* (which though not genuine is probably earlier than the Alexandrian times) asserts that Hipparchus, son of Peisistratus, first brought the poems to Athens, and obliged the rhapsodists at the Panathenaea to follow the order of the text, "as they still do," instead of reciting portions chosen at will. The earliest authority for attributing any work of the kind to Peisistratus is the well-known passage of Cicero (*De Orat.* 3. 34: "Quis doctior eisdem temporibus illis, aut cujus eloquentia litteris instructior fuisse traditur quam Pisistrati? qui primus Homeri libros, confusos antea, sic disposuisse dicitur ut nunc habemus"). To the same effect Pausanias (vii. p. 594) says that the change of the name Donoessa to Gonoessa (in *Il.* ii. 573) was thought to have been made by "Peisistratus or one of his companions," when he collected the poems, which were then in a fragmentary condition. Finally, Diogenes Laertius (i. 57) says that Solon made a law that the poems should be recited with the help of a prompter so that each rhapsodist should begin where the last left off; and he argues from this that Solon did more than Peisistratus to make Homer known. The argument is directed against a certain Dieuchidas of Megara, who appears to have maintained that the verses about Athens in the Catalogue (*Il.* ii. 546-556) were interpolated by Peisistratus. The passage is unfortunately corrupt, but it is at least clear that in the time of Solon, according to Diogenes, there were complete copies of the poems, such as could be used to control the recitations. Hence the account of Diogenes is quite irreconcilable with the notices on which Wolf relied.

It is needless to examine the attempts which have been made to harmonize these accounts. Such attempts usually start with the tacit assumption that each of the persons concerned—Lycurgus, Solon, Peisistratus, Hipparchus—must have done *something* for the text of Homer, or for the regulation of the rhapsodists. But we have first to consider whether any of the accounts come to us on such evidence that we are bound to consider them as containing a nucleus of truth.

In the first place, the statement that Lycurgus obtained the poems from descendants of Creophylus must be admitted to be purely mythical. But if we reject it, have we any better reason for believing the parallel assertion in the Platonic *Hipparchus*? It is true that Hipparchus is undoubtedly a real person. On the other hand it is evident that the Peisistratidae soon became the subject of many fables. Thucydides notices as a popular mistake the belief that Hipparchus was the eldest son of Peisistratus, and that consequently he was the reigning "tyrant" when he was killed by Aristogiton. The Platonic *Hipparchus* follows this erroneous version, and may therefore be regarded as representing (at best) mere local tradition. We may reasonably go further, and see in this part of the dialogue a piece of historical romance, designed to put the "tyrant" family in a favourable light, as patrons of literature and learning.

Again, the account of the *Hipparchus* is contradicted by Diogenes Laertius, who says that Solon provided for the due recitation of the Homeric poems. The only good authorities as to this point are the orators Lycurgus and Isocrates, who mention the law prescribing the recitation, but do not say when or by whom it was enacted. The inference seems a fair one, that the author of the law was really unknown.

With regard to the statements which attribute some work in connexion with Homer to Peisistratus, it was noticed by Wolf that Cicero, Pausanias and the others who mention the matter do so *nearly in the same words*, and, therefore, appear to have drawn from a common source. This source was in all probability an epigram quoted in two of the short lives of Homer, and there said to have been inscribed on the statue of Peisistratus at Athens. In it Peisistratus is made to say of himself that he "collected Homer, who was formerly sung

[1] See the chapter in Cobet's *Miscellanea critica*, pp. 225-239.

[2] The existence of two groups of the Venetian Scholia was first noticed by Jacob La Roche, and they were first distinguished in the edition of W. Dindorf (Oxford, 1875). There is also a group of Scholia, chiefly exegetical, a collection of which was published by Villoison from a MS. Ven. 453 (s. xi.) in his edition of 1788, and has been again edited by W. Dindorf (Oxford, 1877). The most important collection of this group is contained in the *Codex Townleianus* (Burney 86 s. xi.) of the British Museum, edited by E. Maass, (Oxford, 1887–1888). The vast commentary of Eustathius (of the 12th century) marks a third stage in the progress of ancient Homeric learning.

[3] *Prolegomena ad Homerum, sive de operum Homericorum prisca et genuina forma variisque mutationibus et probabili ratione emendandi.* scripsit Frid. Aug. Wolfius, volumen i. (1795).

in fragments, for the golden poet was a citizen of ours, since we Athenians founded Smyrna." The other statements repeat these words with various minor additions, chiefly intended to explain how the poems had been reduced to this fragmentary condition, and how Peisistratus set to work to restore them. Thus all the authority for the work of Peisistratus "reduces itself to the testimony of a single anonymous inscription" (Nutzhorn p. 40). Now, what is the value of that testimony? It is impossible of course to believe that a statue of Peisistratus was set up at Athens in the time of the free republic. The epigram is almost certainly a mere literary exercise. And what exactly does it say? Only that Homer was *recited in fragments* by the rhapsodists, and that these partial recitations were made into a continuous whole by Peisistratus; which does not necessarily mean more than that Peisistratus did what other authorities ascribe to Solon and Hipparchus, viz. regulated the recitation.

Against the theory which sees in Peisistratus the author of the first complete text of Homer we have to set the absolute silence of Herodotus, Thucydides, the orators and the Alexandrian grammarians. And it can hardly be thought that their silence is accidental. Herodotus and Thucydides seem to tell us all that they know of Peisistratus. The orators Lycurgus and Isocrates make a great deal of the recitation of Homer at the Panathenaea, but know nothing of the poems having been collected and arranged at Athens, a fact which would have redounded still more to the honour of the city. Finally, the Scholia of the *Ven. A* contain no reference or allusion to the story of Peisistratus. As these Scholia are derived in substance from the writings of Aristarchus, it seems impossible to believe that the story was known to him. The circumstance that it is referred to in the *Scholia Townleiana* and in Eustathius, gives additional weight to this argument.

The result of these considerations seems to be that nothing rests on good evidence beyond the fact that Homer was recited by law at the Panathenaic festival. The rest of the story is probably the result of gradual expansion and accretion. It was inevitable that later writers should speculate about the authorship of such a law, and that it should be attributed with more or less confidence to Solon or Peisistratus or Hipparchus. The choice would be determined in great measure by political feeling. It is probably not an accident that Dieuchidas, who attributed so much to Peisistratus, was a Megarian. The author of the *Hipparchus* is evidently influenced by the anti-democratical tendencies in which he only followed Plato. In the times to which the story of Peisistratus can be traced, the 1st century B.C., the substitution of the "tyrant" for the legislator was extremely natural. It was equally natural that the importance of his work as regards the text of Homer should be exaggerated. The splendid patronage of letters by the successors of Alexander, and especially the great institutions which had been founded at Alexandria and Pergamum, had made an impression on the imagination of learned men which was reflected in the current notions of the ancient despots. It may even be suspected that anecdotes in praise of Peisistratus and Hipparchus were a delicate form of flattery addressed to the reigning Ptolemy. Under these influences the older stories of Lycurgus bringing Homer to the Peloponnesus, and Solon providing for the recitation at Athens, were thrown into the shade.

In the later Byzantine times it was believed that Peisistratus was aided by seventy grammarians, of whom Zenodotus and Aristarchus were the chief. The great Alexandrian grammarians had become figures in a new mythology. It is true that Tzetzes, one of the writers from whom we have this story, gives a better version, according to which Peisistratus employed four men, viz. Onomacritus, Zopyrus of Heraclea, Orpheus of Croton, and one whose name is corrupt (written ἐπικόγκυλος). Many scholars (among them Ritschl) accept this account as probable. Yet it rests upon no better evidence than the other.

The effect of Wolf's *Prolegomena* was so overwhelming that, although a few protests were made at the time, the true Homeric controversy did not begin till after Wolf's death (1824). His speculations were thoroughly in harmony with the ideas and sentiment of the time, and his historical arguments, especially his long array of testimonies to the work of Peisistratus, were hardly challenged.

The first considerable antagonist of the Wolfian school was G. W. Nitzsch, whose writings cover the years 1828–1862, and deal with every side of the controversy. In the earlier part of his *Meletemata* (1830) he took up the question of written or unwritten literature, on which Wolf's whole argument turned, and showed that the art of writing must be anterior to Peisistratus. In the later part of the same series of discussions (1837), and in his chief work (*Die Sagenpoesie der Griechen*, 1852), he investigated the structure of the Homeric poems, and their relation to the other epics of the Trojan cycle. These epics had meanwhile been made the subject of a work which for exhaustive learning and delicacy of artistic perception has few rivals in the history of philology, the *Epic Cycle* of F. G. Welcker. The confusion which previous scholars had made between the ancient post-Homeric poets (Arctinus, Lesches, &c.) and the learned mythological writers (such as the "scriptor cyclicus" of Horace) was first cleared up by Welcker. Wolf had argued that if the cyclic writers had known the *Iliad* and *Odyssey* which we possess, they would have imitated the unity of structure which distinguishes these two poems. The result of Welcker's labours was to show that the Homeric poems had influenced both the form and the substance of epic poetry.

In this way there arose a conservative school who admitted more or less freely the absorption of pre-existing lays in the formation of the *Iliad* and *Odyssey*, and also the existence of considerable interpolations, but assigned the main work of formation to prehistoric times, and to the genius of a great poet. Whether the two epics were by the same author remained an open question; the tendency of this group of scholars was decidedly towards separation. Regarding the use of writing, too, they were not unanimous. K. O. Müller, for instance, maintained the view of Wolf on this point, while he strenuously combated the inference which Wolf drew from it.

The *Prolegomena* bore on the title-page the words "Volumen I."; but no second volume ever appeared, nor was any attempt made by Wolf himself to carry his theory further. The first important steps in that direction were taken by Gottfried Hermann, chiefly in two dissertations, *De interpolationibus Homeri* (Leipzig, 1832), and *De iteratis Homeri* (Leipzig, 1840), called forth by the writings of Nitzsch. As the word "interpolation" implies, Hermann did not maintain the hypothesis of a congeries of independent "lays." Feeling the difficulty of supposing that all the ancient minstrels sang of the "wrath of Achilles" or the "return of Ulysses" (leaving out even the capture of Troy itself), he was led to assume that two poems of no great compass dealing with these two themes became so famous at an early period as to throw other parts of the Trojan story into the background, and were then enlarged by successive generations of rhapsodists. Some parts of the *Iliad*, moreover, seemed to him to be older than the poem on the wrath of Achilles; and thus in addition to the "Homeric" and "post-Homeric" matter he distinguished a "pre-Homeric" element.

The conjectures of Hermann, in which the Wolfian theory found a modified and tentative application, were presently thrown into the shade by the more trenchant method of Lachmann, who (in two papers read to the Berlin Academy in 1837 and 1841) sought to show that the *Iliad* was made up of sixteen independent "lays," with various enlargements and interpolations, all finally reduced to order by Peisistratus. The first book, for instance, consists of a lay on the anger of Achilles (1-347), and two continuations, the return of Chryseis (430-492) and the scenes in Olympus (348-429, 493-611). The second book forms a second lay, but several passages, among them the speech of Ulysses (278-332), are interpolated. In the third book the scenes in which Helen and Priam take part (including the making of the truce) are pronounced to be interpolations; and so on. Regarding the evidence on which these sweeping results are founded, opinions will vary. The degree of smoothness or consistency which is to be expected on the hypothesis of a single author will be determined by taste rather than argument. The dissection of the first book, for instance, turns partly on a chronological inaccuracy which might well escape the poet as well as his hearers. In examining such points we are apt to forget that the contradictions by which a story is shown to be untrue are quite different from those by which a confessedly untrue story would be shown to be the work of different authors.

Structure of the Iliad.—The subject of the *Iliad*, as the first line proclaims, is the "anger of Achilles." The manner in which this subject is worked out will appear from the following summary in which we distinguish (1) the plot, *i.e.* the story of the quarrel, (2) the main course of the war, which forms a sort of underplot, and (3) subordinate episodes.

I. Quarrel of Achilles with Agamemnon and the Greek army —Agamemnon, having been compelled to give up his prize Chryseis, takes Briseis from Achilles—Thereupon Achilles appeals to his mother Thetis, who obtains from Zeus a promise that he will give victory to the Trojans until the Greeks pay due honour to her son—Meanwhile Achilles takes no part in the war.

II. Agamemnon is persuaded by a dream sent from Zeus to take the field with all his forces.
His attempt to test the temper of the army nearly leads to their return.
Catalogue of the army (probably a later addition).
Trojan muster—Trojan catalogue.

III. Meeting of the Armies—Paris challenges Menelaus—Truce made.
"Teichoscopy," Helen pointing out to Priam the Greek leaders.
The duel—Paris is saved by Aphrodite.

IV. Truce broken by Pandarus.
Advance of the armies—Battle.

V. Aristeia of Diomede—his combat with Aphrodite

VI. —Meeting with Glaucus—Visit of Hector to the city, and offering of a peplus to Athena.
(1-311)
(312-529) Visit of Hector to Paris—to Andromache.

VII. Return of Hector and Paris to the field.
Duel of Ajax and Hector.
Truce for burial of dead.
The Greeks build a wall round their camp.

VIII. Battle—The Trojans encamp on the field.

SpinSmart Software http://www.spinsmart.com

IX. Agamemnon sends an embassy by night, offering Achilles restitution and full amends—Achilles refuses.
X. Doloneia—Night expedition of Odysseus and Diomede (in all probability added later).
XI. Aristeia of Agamemnon—he is wounded—Wounding of Diomede and Odysseus.
Achilles sends Antilochus to inquire about Machaon.
XII. Storming of the wall—the Trojans reach the ships.
XIII. Zeus ceases to watch the field—Poseidon secretly comes to the aid of the Greeks.
XIV. Sleep of Zeus, by the contrivance of Hera.
XV. Zeus awakened—Restores the advantage to the Trojans—Ajax alone defends the ships.
XVI. Achilles is persuaded to allow Patroclus to take the field. Patroclus drives back the Trojans—kills Sarpedon—is himself killed by Hector.
XVII. Battle for the body of Patroclus–Aristeia of Menelaus.
XVIII. News of the death of Patroclus is brought to Achilles—Thetis comes with the Nereids—promises to obtain new armour for him from Hephaestus.
The shield of Achilles described.
XIX. Reconciliation of Achilles—His grief and desire to avenge Patroclus.
XX. The gods come down to the plain—Combat of Achilles with Aeneas and Hector, who escape.
XXI. The Scamander is choked with slain—rises against Achilles, who is saved by Hephaestus.
XXII. Hector alone stands against Achilles—his flight round the walls—he is slain.
XXIII. Burial of Patroclus—Funeral games.
XXIV. Priam ransoms the body of Hector—his burial.

Such is the "action" (πράξις) which in Aristotle's opinion showed the superiority of Homer to all later epic poets. But the proof that his scheme was the work of a great poet does not depend merely upon the artistic unity which excited the wonder of Aristotle. A number of separate "lays" might conceivably be arranged and connected by a man of poetical taste in a manner that would satisfy all requirements. In such a case, however, the connecting passages would be slight and weak. Now, in the *Iliad* these passages are the finest and most characteristic. The element of connexion and unity is the story of the "wrath of Achilles"; and we have only to look at the books which give the story of the wrath to see how essential they are. Even if the ninth book is rejected (as Grote proposed), there remain the speeches of the first, sixteenth and nineteenth books. These speeches form the cardinal points in the action of the *Iliad* —the framework into which everything else is set; and they have also the best title to the name of Homer.

The further question, however, remains,—What shorter narrative piece fulfilling the conditions of an independent poem has Lachmann succeeded in disengaging from the existing *Iliad*? It must be admitted that when tried by this test his "lays" generally fail. The "quarrel of the chiefs," the "muster of the army," the "duel of Paris and Menelaus," &c., are excellent beginnings, but have no satisfying conclusion. And the reason is not far to seek. The *Iliad* is not a history, nor is it a series of incidents in the history, of the siege. It turns entirely upon a single incident, occupying a few days only. The several episodes of the poem are not so many distinct stories, each with an interest of its own. They are only parts of a single main event. Consequently the type of epic poem which would be produced by an aggregation of shorter lays is not the type which we have in the *Iliad*. Rather the *Iliad* is itself a single lay which has grown with the growth of poetical art to the dimensions of an epic.

But the original nucleus and parts of the incidents may be the work of a single great poet, and yet other episodes may be of different authorship, wrought into the structure of the poem in later times. Various theories have been based on this supposition. Grote in particular held that the original poem, which he called the Achilleïs, did not include books ii.-vii., ix., x., xxiii., xxiv. Such a view may be defended somewhat as follows.

Of the books which relate the events during the absence of Achilles from the Greek ranks (ii.-xv.), the last five are directly related to the main action. They describe the successive steps by which the Greeks are driven back, first from the plain to the rampart, then to their ships. Moreover, three of the chief heroes, Agamemnon, Diomede and Ulysses, are wounded, and this circumstance, as Lachmann himself admitted, is steadily kept in mind throughout. It is otherwise with the earlier books (especially ii.-vii.). The chief incidents in that part of the poem—the panic rush to the ships, the duels of Paris and Menelaus, and of Hector and Ajax, the Aristeia of Diomede—stand in no relation to the mainspring of the poem, the promise made by Zeus to Thetis. It is true that in the thirteenth and fourteenth books the purpose of Zeus is thwarted for a time by other gods; but in books ii.-vii. it is not so much thwarted as ignored. Further, the events follow without sufficient connexion. The truce of the third book is broken by Pandarus, and Agamemnon passes along the Greek ranks with words of encouragement, but without a hint of the treachery just committed. The Aristeia of Diomede ends in the middle of the sixth book; he is uppermost in all thoughts down to ver. 311, but from this point, in the meetings of Hector with Helen and Andromache, and again in the seventh book when Hector challenges the Greek chiefs, his prowess is forgotten. Once more, some of the incidents seem to belong properly to the beginning of the war. The joy of Menelaus on seeing Paris, Priam's ignorance of the Greek leaders, the speeches of Agamemnon in his review of the ranks (in book iv.), the building of the wall—all these are in place after the Greek landing, but hardly in the ninth year of the siege.

On the other hand, it may be said, the second book opens with a direct reference to the events of the first, and the mention of Achilles in the speech of Thersites (ii. 239 sqq.) is sufficient to keep the main course of events in view. The Catalogue is connected with its place in the poem by the lines about Achilles (686-694). When Diomede is at the height of his Aristeia Helenus says (*Il.* vi. 99), "We did not so fear even Achilles." And when in the third book Priam asks Helen about the Greek captains, or when in the seventh book nine champions come forward to contend with Hector, the want of the greatest hero of all is sufficiently felt. If these passages do not belong to the period of the wrath of Achilles, how are we to account for his conspicuous absence?

Further, the want of smoothness and unity which is visible in this part of the *Iliad* may be due to other causes than difference of date or authorship. A national poet such as the author of the *Iliad* cannot always choose or arrange his matter at his own will. He is bound by the traditions of his art, and by the feelings and expectations of his hearers. The poet who brought the exploits of Diomede into the *Iliad* doubtless had his reasons for doing so, which were equally strong whether he was the poet of the Achilleïs or a later Homerid or rhapsodist. And if some of the incidents (those of the third book in particular) seem to belong to the beginning of the war, it must be considered that poetically, and to the hearers of the *Iliad*, the war opens in the third book, and the incidents are of the kind that is required in such a place. The truce makes a pause which heightens the interest of the impending battle; the duel and the scene on the walls are effective in bringing some of the leading characters on the stage, and in making us acquainted with the previous history. The story of Paris and Helen especially, and the general position of affairs in Troy, is put before us in a singularly vivid manner. The book in short forms so good a *prologue* to the action of the war that we can hardly be wrong in attributing it to the genius which devised the rest of the *Iliad*.

The case against the remaining books is of a different kind. The ninth and tenth seem like two independent pictures of the night before the great battle of xi.-xvii. Either is enough to fill the space in Homer's canvas; and the suspicion arises (as when two Platonic dialogues bear the same name) that if either had been genuine, the other would not have come into existence. If one of the two is to be rejected it must be the tenth, which is certainly the less Homeric. It relates a picturesque adventure, conceived in a vein more approaching that of comedy than any other part of the *Iliad*. Moreover, the language in several places exhibits traces of post-Homeric date. The ninth book, on the other hand, was rejected by Grote, chiefly on the grounds that the embassy to Achilles ought to have put an end to the quarrel, and that it is ignored in later passages, especially in the speeches

SpinSmart Software http://www.spinsmart.com

of Achilles (xi. 609; xvi. 72, 85). His argument, however, rests on an assumption which we are apt to bring with us to the reading of the *Iliad*, but which is not borne out by its language, viz. that there was some definite atonement demanded by Achilles, or due to him according to the custom and sentiment of the time. But in the *Iliad* the whole stress is laid on the anger of Achilles, which can only be satisfied by the defeat and extreme peril of the Greeks.[1] He is influenced by his own feeling, and by nothing else. Accordingly, in the ninth book, when they are still protected by the rampart (see 348 sqq.), he rejects gifts and fair words alike; in the sixteenth he is moved by the tears and entreaties of Patroclus, and the sight of the Greek ships on fire; in the nineteenth his anger is quenched in grief. But he makes no conditions, either in rejecting the offers of the embassy or in returning to the Greek army. And this conduct is the result, not only of his fierce and inexorable character, but also (as the silence of Homer shows) of the want of any general rules or principles, any code of morality or of honour, which would have required him to act in a different way.

Finally, Grote objected to the two last books that they prolong the action of the *Iliad* beyond the exigencies of a coherent scheme. Of the two, the twenty-third could more easily be spared. In language, and perhaps in style and manner, it is akin to the tenth; while the twenty-fourth is in the pathetic vein of the ninth, and like it serves to bring out new aspects of the character of Achilles.

Dr E. Kammer has given some strong reasons for doubting the genuineness of the passage in book xx. describing the duel between Achilles and Aeneas (79-352). The incident is certainly very much out of keeping with the vehement action of that part of the poem, and especially with the moment when Achilles returns to the field, eager to meet Hector and avenge the death of his friend. The interpolation (if it is one) is probably due to local interests. It contains the well-known prophecy that the descendants of Aeneas are to rule over the Trojans,—pointing to the existence of an Aenead dynasty in the Troad. So, too, the legend of Anchises in the Hymn to Aphrodite is evidently local; and Aeneas becomes more prominent in the later epics, especially the *Cypria* and the Ἰλίου πέρσις of Arctinus.

Structure of the Odyssey.—In the *Odyssey*, as in the *Iliad*, the events related fall within a short space of time. The difficulty of adapting the long wanderings of Ulysses to a plan of this type is got over by the device—first met with in the *Odyssey*—of making the hero tell the story of his own adventures. In this way the action is made to begin almost immediately before the actual return of Ulysses. Up to the time when he reaches Ithaca it moves on three distinct scenes: we follow the fortunes of Ulysses, of Telemachus on his voyage in the Peloponnesus, and of Penelope with the suitors. The art with which these threads are woven together was recognized by Wolf himself, who admitted the difficulty of applying his theory to the "admirabilis summa et compages" of the poem. Of the comparatively few attempts which have been made to dissect the *Odyssey*, the most moderate and attractive is that of Professor A. Kirchhoff of Berlin.[2]

According to Kirchhoff, the *Odyssey* as we have it is the result of additions made to an original nucleus. There was first of all a "Return of Odysseus," relating chiefly the adventures with the Cyclops, Calypso and the Phaeacians; then a continuation, the scene of which lay in Ithaca, embracing the bulk of books xiii.-xxiii. The poem so formed was enlarged at some time between Ol. 30 and Ol. 50 by the stories of books x.-xii. (Circe, the Sirens, Scylla, &c.), and the adventures of Telemachus. Lastly, a few passages were interpolated in the time of Peisistratus.

The proof that the scenes in Ithaca are by a later hand than the ancient "Return" is found chiefly in a contradiction discussed by Kirchhoff in his sixth dissertation (pp. 135 sqq., ed. 1869). Sometimes Ulysses is represented as aged and worn by toil, so that Penelope, for instance, cannot recognize him; sometimes he is really in the prime of heroic vigour, and his appearing as a beggarly old man is the work of Athena's wand. The first of these representations is evidently natural, considering the twenty eventful years that have passed; but the second, Kirchhoff holds, is the Ulysses of Calypso's island and the Phaeacian court. He concludes that the aged Ulysses belongs to the "continuation" (the change wrought by Athena's wand being a device to reconcile the two views), and hence that the continuation is the work of a different author.

Ingenious as this is, there is really very slender ground for Kirchhoff's thesis. The passages in the second half of the *Odyssey* which describe the appearance of Ulysses do not give *two* well-marked representations of him. Sometimes Athena disguises him as a decrepit beggar, sometimes she bestows on him supernatural beauty and vigour. It must be admitted that we are not told exactly how long in each case the effect of these changes lasted. But neither answers to his natural appearance, or to the appearance which he is imagined to present in the earlier books. In the palace of Alcinous, for instance, it is noticed that he is vigorous but "marred by many ills" (*Od.* viii. 137); and this agrees with the scenes of recognition in the latter part of the poem.

The arguments by which Kirchhoff seeks to prove that the stories of books x.-xii. are much later than those of book ix. are not more convincing. He points out some resemblances between these three books and the Argonautic fables, among them the circumstance that a fountain Artacia occurs in both. In the Argonautic story this fountain is placed in the neighbourhood of Cyzicus, and answers to an actual fountain known in historical times. Kirchhoff argues that the Artacia of the Argonautic story must have been taken from the real Artacia, and the Artacia of the *Odyssey* again from that of the Argonautic story. And as Cyzicus was settled from Miletus, he infers that both sets of stories must be comparatively late. It is more probable, surely, that the name Artacia occurred independently (as most geographical names are found to occur) in more than one place. Or it may be that the Artacia of the *Odyssey* suggested the name to the colonists of Cyzicus, whence it was adopted into the later versions of the Argonautic story. The further argument that the *Nostoi* recognized a son of Calypso by Ulysses but no son of Circe, consequently that Circe was unknown to the poet of the *Nostoi*, rests (in the first place) upon a conjectural alteration of a passage in Eustathius, and, moreover, has all the weakness of an argument from silence, in addition to the uncertainty arising from our very slight knowledge of the author whose silence is in question. Finally, when Kirchhoff finds traces in books x.-xii. of their having been originally told by the poet himself instead of being put in the mouth of his hero, we feel that inaccuracies of this kind are apt to creep in wherever a fictitious story is thrown into the form of an autobiography.

Inquiries conducted with the refinement which characterizes those of Kirchhoff are always instructive, and his book contains very many just observations; but it is impossible to admit his main conclusions. And perhaps we may infer that no similar attempt can be more successful. It does not indeed follow that the *Odyssey* is free from interpolations. The Νεκυία of book xi. may be later (as Lauer maintained), or it may contain additions, which could easily be inserted in a description of the kind. And the last book is probably by a different hand, as the ancient critics believed. But the unity of the *Odyssey* as a whole is apparently beyond the reach of the existing weapons of criticism.

Chorizontes.—When we are satisfied that each of the great Homeric poems is either wholly or mainly the work of a single poet, a question remains which has been matter of controversy in ancient as well as modern times—Are they the work of the same poet? Two ancient grammarians, Xeno and Hellanicus, were known as the "separators" (οἱ χωρίζοντες); and Aristarchus appears to have written a treatise against their heresy. In modern times some of the greatest names have been on the side of the "Chorizontes."

If, as has been maintained in the preceding pages, the external evidence regarding Homer is of no value, the problem now before us may be stated in this form: Given two poems of which nothing is known except that they are of the same school of poetry, what is the probability that they are by the same author? We may find a fair parallel by imagining two plays drawn at hazard from the works of the great tragic writers. It is evident that the burden of proof would rest with those who held them to be by the same hand.

The arguments used in this discussion have been of very various calibre. The ancient Chorizontes observed that the messenger of Zeus is Iris in the *Iliad*, but Hermes in the *Odyssey*; that the wife of Hephaestus is one of the Charites in the *Iliad*, but Aphrodite in the *Odyssey*; that the heroes in the *Iliad* do not eat fish; that Crete has a hundred cities according to the *Iliad*, and only ninety according to the *Odyssey*; that προπάροιθε is used in the *Iliad* of place, in the *Odyssey* of time, &c. Modern scholars have added to the list, especially by making careful comparisons of the two poems in respect of vocabulary and

[1] On this point see a paper by Professor Packard in the *Trans. of the American Philological Association* (1876).

[2] *Die Composition der Odyssee* (Berlin, 1869). A full discussion of this book is given by Dr E. Kammer, *Die Einheit der Odyssee* (Leipzig, 1873).

SpinSmart Software http://www.spinsmart.com

grammatical forms. Nothing is more difficult than to assign the degree of weight to be given to such facts. The difference of subject between the two poems is so great that it leads to the most striking differences of detail, especially in the vocabulary. For instance, the word φόβος, which in Homer means "flight in battle" (not "fear"), occurs thirty-nine times in the *Iliad*, and only once in the *Odyssey*; but then there are no battles in the *Odyssey*. Again, the verb ῥήγνυμι, "to break," occurs forty-eight times in the *Iliad*, and once in the *Odyssey*,—the reason being that it is constantly used of breaking the armour of an enemy, the gate of a city, the hostile ranks, &c. Once more, the word σκότος, "darkness," occurs fourteen times in the *Iliad*, once in the *Odyssey*. But in every one of the fourteen places it is used of "darkness" coming over the sight of a fallen warrior. On the other side, if words such as ἀσάμινθος, "a bath," χέρνιψ, "a basin for the hands," λέσχη, "a place to meet and talk," &c., are peculiar to the *Odyssey*, we have only to remember that the scene in the *Iliad* is hardly ever laid within any walls except those of a tent. These examples will show that mere statistics of the occurrence of words prove little, and that we must begin by looking to the subject and character of each poem. When we do so, we at once find ourselves in the presence of differences of the broadest kind. The *Iliad* is much more historical in tone and character. The scene of the poem is a real place, and the poet sings (as Ulysses says of Demodocus) as though he had been present himself, or had heard from one who had been. The supernatural element is confined to an interference of the gods, which to the common eye hardly disturbs the natural current of affairs. The *Odyssey*, on the contrary, is full of the magical and romantic — "speciosa miracula," as Horace called them. Moreover, these marvels—which in their original form are doubtless as old as anything in the *Iliad*, since in fact they are part of the vast stock of popular tales (*Märchen*) diffused all over the world—are mixed up in the *Odyssey* with the heroes of the Trojan war. This has been especially noticed in the case of the story of Polyphemus, one that is found in many countries, and in versions which cannot all be derived from Homer. W. Grimm has pointed out that the behaviour of Ulysses in that story is senseless and foolhardy, utterly beneath the wise and much-enduring Ulysses of the Trojan war The reason is simple; he is not the Ulysses of the Trojan war, but a being of the same world as Polyphemus himself—the world of giants and ogres. The question then is—How long must the name of Ulysses have been familiar in the legend (*Sage*) of Troy before it made its way into the tales of giants and ogres (*Märchen*), where the poet of the *Odyssey* found it?

Again, the Trojan legend has itself received some extension between the time of the *Iliad* and that of the *Odyssey*. The story of the Wooden Horse is not only unknown to the *Iliad*, but is of a kind which we can hardly imagine the poet of the *Iliad* admitting. The part taken by Neoptolemus seems also to be a later addition. The tendency to amplify and complete the story shows itself still more in the Cyclic poets. Between the *Iliad* and these poets the *Odyssey* often occupies an intermediate position.

This great and significant change in the treatment of the heroic legends is accompanied by numerous minor differences (such as the ancients remarked) in belief, in manners and institutions, and in language These differences bear out the inference that the *Odyssey* is of a later age. The progress of reflection is especially shown in the higher ideas entertained regarding the gods. The turbulent Olympian court has almost disappeared. Zeus has acquired the character of a supreme moral ruler; and although Athena and Poseidon are adverse influences in the poem, the notion of a direct contest between them is scrupulously avoided. The advance of morality is shown in the more frequent use of terms such as "just" (δίκαιος), "piety" (ὁσίη), "insolence" (ὕβρις), "god-fearing" (θεουδής), "pure" (ἁγνός); and also in the plot of the story, which is distinctly a contest between right and wrong. In matters bearing upon the arts of life it is unsafe to press the silence of the *Iliad*. We may note, however, the difference between the house of Priam, surrounded by distinct dwellings for his many sons and daughters, and the houses of Ulysses and Alcinous, with many chambers under a single roof. The singer, too, who is so prominent a figure in the *Odyssey* can hardly be thought to be absent from the *Iliad* merely because the scene is laid in a camp.

Style of Homer.—A few words remain to be said on the style and general character of the Homeric poems, and on the comparisons which may be made between Homer and analogous poetry in other countries.

The cardinal qualities of the style of Homer have been pointed out once for all by Matthew Arnold. "The translator of Homer," he says, "should above all be penetrated by a sense of four qualities of his author—that he is eminently rapid; that he is eminently plain and direct, both in the evolution of his thought and in the expression of it, that is, both in his syntax and in his words; that he is eminently plain and direct in the substance of his thought, that is, in his matter and ideas; and, finally, that he is eminently noble" (*On Translating Homer*, p. 9).

The peculiar rapidity of Homer is due in great measure to his use of the hexameter verse. It is characteristic of early literature that the evolution of the thought—that is, the grammatical form of the sentence—is guided by the structure of the verse; and the correspondence which consequently obtains between the rhythm and the grammar—the thought being given out in lengths, as it were, and these again divided by tolerably uniform pauses—produces a swift flowing movement, such as is rarely found when the periods have been constructed without direct reference to the metre. That Homer possesses this rapidity without falling into the corresponding faults—that is, without becoming either "jerky" or monotonous—is perhaps the best proof of his unequalled poetical skill. The plainness and directness, both of thought and of expression, which characterize Homer were doubtless qualities of his age; but the author of the *Iliad* (like Voltaire, to whom Arnold happily compares him) must have possessed the national gift in a surpassing degree. The *Odyssey* is in this respect perceptibly below the level of the *Iliad*.

Rapidity or ease of movement, plainness of expression and plainness of thought, these are not the distinguishing qualities of the great epic poets—Virgil, Dante, Milton. On the contrary, they belong rather to the humbler epico-lyrical school for which Homer has been so often claimed. The proof that Homer does not belong to that school—that his poetry is not in any true sense "ballad-poetry"—is furnished by the higher artistic structure of his poems (already discussed), and as regards style by the fourth of the qualities distinguished by Arnold—the quality of *nobleness*. It is his noble and powerful style, sustained through every change of idea and subject, that finally separates Homer from all forms of "ballad-poetry" and "popular epic."[1]

But while we are on our guard against a once common error, we may recognize the historical connexion between the *Iliad* and *Odyssey* and the "ballad" literature which undoubtedly preceded them in Greece. It may even be admitted that the swift-flowing movement, and the simplicity of thought and style, which we admire in the *Iliad* are an inheritance from the earlier "lays"—the κλέα ἀνδρῶν such as Achilles and Patroclus sang to the lyre in their tent. Even the metre—the hexameter verse—may be assigned to them. But between these lays and Homer we must place the cultivation of epic poetry as an art.[2] The pre-Homeric lays doubtless furnished the elements of such a poetry—the alphabet, so to speak, of the art; but they must have been refined and transmuted before they formed poems like the *Iliad* and *Odyssey*.

A single example will illustrate this. In the scene on the walls of Troy, in the third book of the *Iliad*, after Helen has pointed out Agamemnon, Ulysses and Ajax in answer to Priam's

[1] "As a poet Homer must be acknowledged to excel Shakespeare in the truth, the harmony, the sustained grandeur, the satisfying completeness of his images" (Shelley, *Essays*, &c., i. 51, ed. 1852).

[2] "The old English balladist may stir Sir Philip Sidney's heart like a trumpet, and this is much; but Homer, but the few artists in the grand style, can do more—they can refine the raw natural man, they can transmute him" (*On Translating Homer*, p. 61).

SpinSmart Software http://www.spinsmart.com

questions, she goes on unasked to name Idomeneus. Lachmann, whose mind is full of the ballad manner, fastens upon this as an irregularity. "The unskilful transition from Ajax to Idomeneus, about whom no question had been asked," he cannnot attribute to the original poet of the lay (*Betrachtungen*, p. 15, ed. 1865). But, as was pointed out by A. Römer [1] this is exactly the variation which a *poet* would introduce to relieve the primitive *ballad-like* sameness of question and answer; and moreover it forms the transition to the lines about the Dioscuri by which the scene is so touchingly brought to a close.

Analogies.—The development of epic poetry (properly so called) out of the oral songs or ballads of a country is a process which in the nature of things can seldom be observed. It seems clear, however, that the hypothesis of epics such as the *Iliad* and *Odyssey* having been formed by putting together or even by working up shorter poems finds no support from analogy.

Narrative poetry of great interest is found in several countries (such as Spain and Servia), in which it has never attained to the epic stage. In Scandinavia, in Lithuania, in Russia, according to Gaston Paris (*Histoire poëtique de Charlemagne*, p. 9), the national songs have been arrested in a form which may be called intermediate between contemporary poetry and the epic. The true epics are those of India, Persia, Greece, Germany, Britain and France. Most of these, however, fail to afford any useful points of comparison, either from their utter unlikeness to Homer, or because there is no evidence of the existence of anterior popular songs. The most instructive, perhaps the only instructive, parallel is to be found in the French "chansons de geste," of which the *Chanson de Roland* is the earliest and best example. These poems are traced back with much probability to the 10th century. They are epic in character, and were recited by professional *jongleurs* (who may be compared to the ἀοιδοί of Homer). But as early as the 7th century we come upon traces of short lays (the so-called cantilènes) which were in the mouths of all and were sung in chorus. It has been held that the chansons de geste were formed by joining together "bunches" of these earlier cantilènes, and this was the view taken by Léon Gautier in the first edition of *Les Épopées françaises* (1865). In the second edition, of which the first volume appeared in 1878, he abandoned this theory. He believes that the epics were generally composed under the influence of earlier songs. "Our first epic poets," he says, "did not actually and materially patch together pre-existent cantilènes. They were only inspired by these popular songs; they only borrowed from them the traditional and legendary elements. In short, they took nothing from them but the ideas, the spirit, the life; they 'found' (ils ont trouvé) all the rest" (p. 80). But he admits that "some of the old poems may have been borrowed from tradition, without any intermediary" (*ibid.*); and when it is considered that the traces of the "cantilènes" are slight, and that the degree in which they inspired the later poetry must be a matter of impression rather than of proof, it does not surprise us to find other scholars (notably Paul Meyer) attaching less importance to them, or even doubting their existence.[2]

When Léon Gautier shows how history passes into legend, and legend again into romance, we are reminded of the difference noticed above between the *Iliad* and the *Odyssey*, and between Homer and the early Cyclic poems. And the peculiar degradation of Homeric characters which appears in some poets (especially Euripides) finds a parallel in the later chansons de geste.[3]

The comparison of Homer with the great literary epics calls for more discursive treatment than would be in place here. Some external differences have been already indicated. Like the French epics, Homeric poetry is indigenous, and is distinguished by this fact, and by the ease of movement and the simplicity which result from it, from poets such as Virgil, Dante and Milton. It is also distinguished from them by the comparative absence of underlying motives or sentiment. In Virgil's poetry a sense of the greatness of Rome and Italy is the leading motive of a passionate rhetoric, partly veiled by the "chosen delicacy" of his language. Dante and Milton are still more faithful exponents of the religion and politics of their time. Even the French epics are pervaded by the sentiment of fear and hatred of the Saracens. But in Homer the interest is purely dramatic. There is no strong antipathy of race or religion; the war turns on no political event; the capture of Troy lies outside the range of the *Iliad*. Even the heroes are not the chief national heroes of Greece. The interest lies wholly (so far as we can see) in the picture of human action and feeling.

BIBLIOGRAPHY.—A complete bibliography of Homer would fill volumes. The following list is intended to include those books only which are of first-rate importance.

The *editio princeps* of Homer, published at Florence in 1488, by Demetrius Chalcondylas, and the Aldine editions of 1504 and 1517, have still some value beyond that of curiosity. The chief modern critical editions are those of Wolf (Halle, 1794–1795; Leipzig, 1804–1807), Spitzner (Gotha, 1832–1836), Bekker (Berlin, 1843; Bonn, 1858), La Roche (*Odyssey*, 1867–1868; *Iliad*, 1873–1876, both at Leipzig); Ludwich (*Odyssey*, Leipzig, 1889–1891; *Iliad*, 2 vols., 1901 and 1907); W. Leaf (*Iliad*, London, 1886–1888; 2nd ed. 1900–1902); Merry and Riddell (*Odyssey* i.-xii., 2nd ed., Oxford, 1886); Monro (*Odyssey* xiii.-xxiv. with appendices, Oxford, 1901); Monro and Allen (*Iliad*), and Allen (*Odyssey*, 1908, Oxford). The commentaries of Barnes, Clarke and Ernesti are practically superseded; but Heyne's *Iliad* (Leipzig, 1802) and Nitzsch's commentary on the *Odyssey* (books i.-xii., Hanover, 1826–1840) are still useful. Nägelbach's *Anmerkungen zur Ilias* (A, B 1-483, Γ) is of great value, especially the third edition (by Autenrieth, Nuremberg, 1864). The unique *Scholia Veneta* on the *Iliad* were first made known by Villoison (*Homeri Ilias ad veteris codicis Veneti fidem recensita, Scholia in eam antiquissima ex eodem codice aliisque nunc primum edidit, cum Asteriscis, Obeliscis, aliisque signis criticis, Joh. Baptista Caspar d'Ansse de Villoison*, Venice, 1788); reprinted, with many additions from other MSS., by Bekker (*Scholia in Homeri Iliadem*, Berlin, 1825–1826). A new edition has been published by the Oxford Press (*Scholia Graeca in Homeri Iliadem*, ed. Gul. Dindorfius); six volumes have appeared (1875–1888), the last two edited by Professor E. Maass. The vast commentary of Eustathius was first printed at Rome in 1542; the last edition is that of Stallbaum (Leipzig, 1827). The Scholia on the *Odyssey* were published by Buttmann (Berlin, 1821), and with greater approach to completeness by W. Dindorf (Oxford, 1855). Although Wolf at once perceived the value of the Venetian Scholia on the *Iliad*, the first scholar who thoroughly explored them was C. Lehrs (*De Aristarchi studiis Homericis*, Königsberg, 1833; 2nd ed. Leipzig, 1865). Of the studies in the same field which have appeared since, the most important are: Aug. Nauck, *Aristophanis Byzantii fragmenta* (Halle, 1848); L. Friedländer, *Aristonici περὶ σημείων Ἰλιάδος reliquiae* (Göttingen, 1853); M. Schmidt, *Didymi Chalcenteri fragmenta* (Leipzig, 1854); L. Friedländer, *Nicanoris περὶ Ἰλιακῆς στιγμῆς reliquiae* (Berlin, 1857); Aug. Lentz, *Herodiani Technici reliquiae* (Leipzig, 1867); J. La Roche, *Die homerische Textkritik im Alterthum* (Leipzig, 1866) and *Homerische Untersuchungen* (Leipzig, 1869); Ad. Römer, *Die Werke der Aristarcheer im Cod. Venet. A.* (Munich, 1875); A. Ludwich, *Aristarch's Homerische Textkritik* (2 vols. Leipzig, 1884–1885); and *Die Homervulgata als vor-Alexandrinisch erwiesen* (Leipzig, 1898).

The literature of the "Homeric Question" begins practically with Wolf's *Prolegomena* (Halle, 1795). Of the earlier books Wood's *Essay on the Original Genius and Writings of Homer* is the most interesting. Wolf's views were skilfully popularized in W. Müller's *Homerische Vorschule* (2nd ed., Leipzig, 1836). G. Hermann's dissertations *De interpolationibus Homeri* (1832) and *De iteratis apud Homerum* (1840) are reprinted in his *Opuscula*. Lachmann's two papers (*Betrachtungen über Homer's Ilias*) were edited together by M. Haupt (2nd ed., Berlin, 1865). Besides the somewhat voluminous writings of Nitzsch, and the discussions contained in the histories of Greek literature by K. O. Müller, Bernhardy, Ulrici and Th. Bergk, and in Grote's *History of Greece*, see Welcker, *Der epische*

[1] *Die exegetischen Scholien der Ilias*, p. vii.

[2] "On comprend que des chants populaires nés d'un événement éclatant, victoire ou défaite, puissent contribuer à former la tradition, à en arrêter les traits; ils peuvent aussi devenir le centre de légendes qui se forment pour les expliquer; et de la sorte leur substance au moins arrive au poëte épique qui l'introduit dans sa composition. Voilà ce qui a pu se produire pour de chants très-courts, dont il est d'ailleurs aussi difficile d'affirmer que de nier l'existence. Mais on peut expliquer la formation des chansons de geste par une autre hypothèse" (Meyer, *Recherches sur l'épopée française*, p. 65). "Ce qui a fait naître la théorie des chants 'lyrico-épiques' ou des cantilènes, c'est le système de Wolf sur les poëmes homériques, et de Lachmann sur les *Nibelungen*. Mais, au moins en ce qui concerne ce dernier poëme, le système est détruit. . . . On tire encore argument des romances espagnoles, qui, dit-on, sont des 'cantilènes' non encore arrivées à l'épopée. . . . Et c'est le malheur de cette théorie: faute de preuves directes, elle cherche des analogies au dehors; en Espagne, elle trouve des 'cantilènes,' mais pas d'épopée; en Allemagne, une épopée, mais pas de cantilènes!" (*Ibid.* p. 66).

Cyclus oder die homerischen Dichter (Bonn, 1835–1849); on Proclus and the Cycle reference may also be made to Wilamowitz-Möllendorf p. 328 seq.; E. Bethe, *Rhein. Mus.* (1891), xxvi. p. 593 seq.; O. Immisch, *Festschrift Th. Gomperz dargebracht* (1902), p. 237 sq.; Lauer, *Geschichte der homerischen Poesie* (Berlin, 1851); Sengebusch, two dissertations prefixed to the two volumes of W. Dindorf's *Homer* in the Teubner series (1855–1856); Friedländer, *Die homerische Kritik von Wolf bis Grote* (Berlin, 1853); Nutzhorn, *Die Entstehungsweise der homerischen Gedichte, mit Vorwort von J. N. Madvig* (Leipzig, 1869); E. Kammer, *Zur homerischen Frage* (Königsberg, 1870); and *Die Einheit der Odyssee* (Leipzig, 1873); A. Kirchhoff, *Die Composition der Odyssee* (Berlin, 1869); Volkmann, *Geschichte und Kritik der Wolf'schen Prolegomena* (Leipzig, 1874); K. Sittl, *Die Wiederholungen in der Odyssee* (München, 1882); U. v. Wilamowitz-Möllendorf, *Homerische Untersuchungen* (Berlin, 1884); O. Seeck, *Die Quellen der Odyssee* (Berlin, 1887); F. Blass, *Die Interpolationen in der Odyssee* (Leipzig, 1905). The interest taken in the question by English students is sufficiently shown in the writings of W. E. Gladstone, F. A. Paley, Henry Hayman (in the Introduction to his *Odyssey*), P. Geddes, R. C. Jebb and A. Lang (see especially the latter's *Homer and his Age*, 1907).

The Homeric dialect must be studied in the books (such as those of G. Curtius) that deal with Greek on the comparative method. The best special work is the brief *Griechische Formenlehre* of H. L. Ahrens (Göttingen, 1852). Other important works are those of Aug. Fick: *Die homerische Odyssee in der ursprünglichen Sprachform wiederhergestellt* (Göttingen, 1883); *Die homerische Ilias* (*ibid.*, 1886); W. Schulze, *Quaestiones epicae* (Gütersloh, 1892). On Homeric syntax the chief book is B. Delbrück's *Syntactische Forschungen* (Halle, 1871–1879), especially vols. i. and iv.; on metre, &c., Hartel's *Homerische Studien* (i.-iii., Vienna); Knös, *De digamma Homerico quaestiones* (Upsala, 1872–1873–1878); Thumb, *Zur Geschichte des griech. Digamma*, *Indogermanische Forschungen* (1898), ix. 294 seq. The papers reprinted in Bekker's *Homerische Blätter* (Bonn, 1863–1872) and Cobet's *Miscellanea Critica* (Leiden, 1876) are of the highest value. Hoffmann's *Quaestiones Homericae* (Clausthal, 1842) is a useful collection of facts. Buttmann's *Lexilogus*, as an example of method, is still worth study.

The antiquities of Homer—using the word in a wide sense—may be studied in the following books: Völcker, *Über homerische Geographie und Weltkunde* (Hanover, 1830); Nägelsbach's *Homerische Theologie* (2nd ed., Nuremberg, 1861); H. Brunn, *Die Kunst bei Homer* (Munich, 1868); W. W. Lloyd, *On the Homeric Design of the Shield of Achilles* (London, 1854); Buchholz, *Die homerischen Realien* (Leipzig, 1871–1873); W. Helbig, *Das homerische Epos aus den Denkmalern erläutert* (Leipzig, 1884; 2nd ed., ibid., 1887); W. Reichel, *Über homerische Waffen* (Vienna, 1894); C. Robert, *Studien zur Ilias* (Berlin, 1901); W. Ridgeway, *The Early Age of Greece* (Cambridge, 1901); V. Bérard, *Les Phéniciens et l'Odyssée* (Paris, 1902–1903); C. Robert, "Topographische Probleme der Ilias," in *Hermes*, xlii., 1907, pp. 78-112.

Among other aids should be mentioned the *Index Homericus* of Seber (Oxford, 1780); Prendergast's *Concordance to the Iliad* (London, 1875); Dunbar's *id.* to the *Odyssey* and *Hymns* (Oxford, 1880); Frohwein, *Verbum Homericum*, (Leipzig, 1881); Gehring, *Index Homericus* (Leipzig, 1891); the *Lexicon Homericum*, edited by H. Ebeling (Leipzig, 1880–1885) and the facsimile of the cod. Ven. A (Sijthoff; Leiden, 1901), with an introduction by D. Comparetti. (D. B. M.)

HOMER, WINSLOW (1836–1910), American painter, was born in Boston, U.S.A., on the 24th of February 1836. At the age of nineteen he was apprenticed to a lithographer. Two years later he opened a studio in Boston, and devoted much of his time to making drawings for wood-engravers. In 1859 he removed to New York, where he studied in the night-school of the National Academy of Design. During the American Civil War he was with the troops at the front, and contributed sketches to *Harper's Weekly*. The war also furnished him with the subjects for the first two pictures which he exhibited (1863), one of which was "Home, Sweet Home." His "Prisoners from the Front"—perhaps his most generally popular picture—was exhibited in New York in 1865, and also in Paris in 1867, where he was spending the year in study. Among his other paintings in oil are "Snap the Whip" (which was exhibited at the Philadelphia Centennial Exhibition of 1876, and, in company with "The Country Schoolroom," at the Paris Salon the following year), "Eating Water melon," "The Cotton Pickers," "Visit from the Old Mistress, Sunday Morning," "The Life-Line" and "The Coming of the Gale." His genius, however, has perhaps shown better in his works in water-colour, among which are his marine studies painted at Gloucester, Mass., and his "Inside the Bar," "The Voice from the Cliffs" (pictures of English fisherwomen), "Tynemouth," "Wrecking of a Vessel" and "Lost on the Grand Banks." His work, which principally consists of *genre* pictures, is characterized by strength, rugged directness and unmistakable freshness and originality, rather than by technical excellence, grace of line or beauty of colour. He was little affected by European influences. His types and scenes, apart from his few English pictures, are distinctly American—soldiers in blue, New England children, negroes in the land of cotton, Gloucester fishermen and stormy Atlantic seas. Besides being a member of the Society of Painters in Water-color, New York, he was elected in 1864 an associate and the following year a member of the National Academy of Design.

HOMESTEAD, a borough of Allegheny county, Pennsylvania, U.S.A., on the Monongahela river, 8 m. S.E. of Pittsburg. Pop. (1890) 7911; (1900) 12,554, of whom 3604 were foreign-born and 640 were negroes; (U.S. census, 1910) 18,713. It is served by the Pennsylvania and the Pittsburg & Lake Erie railways, and by the short Union Railroad, which connects with the Bessemer & Lake Erie and the Wabash railways. The borough has a Carnegie library and the C.M. Schwab Manual Training School. Partly in Homestead but chiefly in the adjoining borough of Munhall (and therefore not reported as in Homestead by the U.S. Census) is one of the largest plants in the United States for the manufacture of steel used in the construction of bridges and steel-frame buildings and of steel armour-plate, and this is its chief industry; among Homestead's other manufactures are glass and fire-bricks. The water-works are owned and operated by the municipality. Homestead was first settled in 1871, and it was incorporated in 1880. In 1892 a labour strike lasting 143 days and one of the most serious in the history of the United States was carried on here by the National Amalgamated Association of Iron and Steel Workers of the United States against the Carnegie Steel Company. The arrival (on the 6th of July) of a force of about 200 Pinkerton detectives from New York and Chicago resulted in a fight in which about 10 men were killed, and to restore order two brigades of the state militia were called out. See STRIKES AND LOCKOUTS.

HOMESTEAD AND EXEMPTION LAWS, laws (principally in the United States) designed primarily either to aid the head of a family to acquire title to a place of residence or to protect the owner against loss of that title through seizure for debt. These laws have all been enacted in America since about the middle of the 19th century, and owe their origin to the demand for a population of the right sort in a new country, to the conviction that the freeholder rather than the tenant is the natural supporter of popular government, to the effort to prevent insolvent debtors from becoming useless members of society, and to the belief that such laws encourage the stability of the family.

By the cessions of several of the older states, and by various treaties with foreign countries, public lands have been acquired for the United States in every state and territory of the Union except the original thirteen, and Maine, Vermont, Kentucky, Tennessee and Texas. For a time they were regarded chiefly as a source of revenue, but about 1820, as the need of revenue for the payment of the national debt decreased and the inhabitants of an increasing number of new states became eager to have the vacant lands within their bounds occupied, the demand that the public lands should be disposed of more in the interest of the settler became increasingly strong, and the homestead idea originated. Until the advent of railways, however, the older states of the North were opposed to promoting the development of the West in this manner, and soon afterwards the Southern representatives in Congress opposed the general homestead bills in the interests of slavery, so that except in isolated cases where settlers were desired to protect some frontier, as in Florida and Oregon, and to a limited extent in the case of the Pre-emption Act of 1841 (see below), the homestead principle was not applied by the national government until the Civil War had begun. A general homestead bill was passed by Congress in 1860, but this was vetoed by President James Buchanan; two years later, however, a similar bill became a law. The act of 1862 originally provided that any citizen of the United States, or applicant for citizenship, who was the head of a family, or

SpinSmart Software http://www.spinsmart.com

twenty-one years of age, or, if younger, had served not less than fourteen days in the army or navy of the United States during an actual war, might apply for 160 acres or less of unappropriated public lands, and might acquire title to this amount of land by residing upon and cultivating it for five years immediately following, and paying such fees as were necessary to cover the cost of administration; a homestead acquired in this manner was exempted from seizure for any debt contracted prior to the date of issuing the patent. A commutation clause of this act permitted title to be acquired after only six months of residence by paying $1.25 per acre, as provided in the Pre-emption Act of 1841. Act of 1872, amended in 1901, allows any soldier or seaman, who has served at least ninety days in the army or navy of the United States during the Civil War, the Spanish-American War or in the suppression of the insurrection in the Philippines, and was honourably discharged, to apply for a homestead, and permits the deduction of the time of such service, or, if discharged on account of wounds or other disability incurred in the line of duty, the full term of his enlistment, from the five years otherwise required for perfecting title, except that in any case he shall have resided upon and cultivated the land at least one year before the passing of title. Since 1866 mineral lands have been for the most part excluded from entry as homesteads.

In accordance with the provisions of the homestead law, 718,930 homesteads, containing 96,495,414 acres, were established in forty-two years, and besides this principal act, Congress has passed several minor ones of a like nature, that is, acts designed to benefit the actual settler who improves the land. Thus the Pre-emption Act of 1841 gave to any head of a family or any single person over twenty-one years of age, who was a citizen of the United States or had declared his intention to become one, permission to purchase not to exceed 160 acres of public lands after he had resided upon and improved the same for six months; the Timber-Culture Act of 1873 allowed title to 160 acres of public prairie-land to be given to any one who should plant upon it 40 acres of timber, and keep the same in good growing condition for ten years; and the Desert-Land Act of 1877 gave to any citizen of the United States, or to any person who had declared his intention to become one, the privilege of acquiring title to 640 acres of such public land as was not included in mineral or timber lands, and would not without irrigation produce an agricultural crop, by paying twenty-five cents an acre and creating for the tract an artificial water-supply. These several land acts, however, invited fraud to such an extent that in time they promoted the establishment of large land holdings by ranchmen and others quite as much as they encouraged settlement and cultivation, and so great was this evil that in 1891 the Timber-Culture and Pre-emption Acts were repealed, the total amount of land that could be acquired by any one person under the several land laws was limited to 320 acres, the Desert-Land Act was so amended as to require an expenditure of at least three dollars an acre for irrigation, and the original Homestead Act was so amended as to disqualify any person who was already proprietor of more than 160 acres in any state or Territory of the Union for acquiring any more land under its provisions; and in 1896 a residence of fourteen months was required before permitting commutation or the purchase of title. But even these measures were inadequate to prevent fraud. In 1894 Congress, in what is known as the Carey Act, donated to California, Oregon, Nevada, Washington, Idaho, Montana, Utah, Wyoming, Arizona, New Mexico and the Dakotas so much of 1,000,000 acres each of desert-lands as each should cause to be irrigated, reclaimed and occupied within ten years,[1] not less than 20 acres of each 160 acres to be cultivated by actual settlers; and in several of these states and territories irrigating companies have been formed and land offered to settlers in amounts not exceeding 160 acres to each, on terms requiring the settler to purchase ample and perpetual water-rights. In 1902, Congress appropriated the proceeds of the sales of public lands in these states and territories to form a reclamation fund to be used for the construction and maintenance of irrigation works, and lands reclaimed by this means are open to homestead entries, the entryman being required to pay for the cost of reclamation in ten equal annual instalments without interest. When Texas was admitted to the Union the disposal of its public lands was reserved to the state, and under its laws every person who is the head of a family and without a homestead may acquire title to 160 acres of land by residing upon and improving it for three years; every unmarried man eighteen years of age or over may acquire title to 80 acres in the same way.

A short time before the National Homestead Act for aiding citizens to acquire homesteads went into operation, some of the state legislatures had passed homestead and exemption laws designed to protect homesteads or a certain amount of property against loss to the owners in case they should become insolvent debtors, and by the close of the century the legislature of nearly every state in the Union had passed a law of this nature. These laws vary greatly. In most states the exemption of a homestead or other property from liability for debts can be claimed only by the head of a family, but in Georgia it may be claimed by any aged or infirm person, by any trustee of a family of minor children, or by any person on whom any woman or girls are dependent for support; and in California, although the head of a family may claim exemption for a homestead valued at $5000, any other person may claim exemption for a homestead valued at $1000. In some states exemptions may be claimed either for a farm limited to 40, 80, 160 or 200 acres, or for a house and one or more lots, usually limited in size, in a town, village or city; in other states the homestead for which exemption may be claimed is limited in value, and this value varies from $500 to $5000. With the homestead are usually included the appurtenances thereto, and the courts invariably interpret the law liberally; but many states also exempt a specified amount of personal property, including wearing apparel, furniture, provisions, tools, libraries and in some cases domestic animals and stock in trade. A few states exempt no homestead and only a small amount of personal property; Maryland, for example, exempts only $100 worth of property besides money payable in the nature of insurance, or for relief, in the event of sickness, injury or death. To some debts the exemption does not usually apply; the most common of these are taxes, purchase money, a debt secured by mortgage on the homestead and debts contracted in making improvements upon it; in Maryland the only exception is a judgment for breach of promise to marry or in case of seduction. If the homestead belongs to a married person, the consent of both husband and wife is usually required to mortgage it. Finally, some states require that the homestead for which exemption is to be claimed shall be previously entered upon record, others require only occupancy, and still others permit the homestead to be designated whenever a claim is presented.

Following the example of either the United States Congress or the state legislatures, the governments of several British colonial states and provinces have passed homestead laws. In Quebec every settler on public lands is allowed, after receiving a patent, an exemption of not to exceed 200 acres from that of his widow, of his, her or their children and descendants in the direct line. In Ontario an applicant for a homestead may have not to exceed 200 acres of unappropriated public land for farming purposes by building a house thereon, occupying it for five years, and bringing at least fifteen acres under cultivation; the exemption of such a homestead from liability to seizure for debts is, however, limited to twenty years from the date of application for the land, and does not extend even during that period to rates or taxes. Manitoba, British Columbia, Queensland, New South Wales, South Australia, West Australia and New Zealand also have liberal homestead and exemption laws.

[1] In 1901 it was provided that the ten years should date from the segregation of the lands from the public domain.

HOMEYER, KARL GUSTAV (1795–1874), German jurist, was born on the 13th of August 1795 at Wolgast in Pomerania. After studying law at the universities of Berlin, Göttingen and Heidelberg (1813–1817), he settled as a *Privatdocent*, in 1821, at the university of Berlin, where he became ordinary professor of law in 1827. His principal works are his edition of the *Sachsenspiegel* (in 3 vols., 1827, 3rd ed., 1861, containing also some other important sources of Saxon or Low German law), which is still unsurpassed in accuracy and sagacity of research, and his book on *Die Haus- und Hofmarken* (1870), in which he has given a history of the use of trade-marks among all the Teutonic nations of Europe, and which is full of important elucidations of the history of law and also contains valuable contributions to the history of art and civilization. In 1850 Homeyer was elected a member of the Berlin Academy of Sciences, in the *Transactions* of which he published various papers exhibiting profound learning (*Über die Heimat*, 1852; *Genealogie der Handschriften des Sachsenspiegels*, 1859; *Die Stadtbücher des Mittelalters*, 1860; *Der Dreissigste*, 1864, &c.). He died on the 20th of October 1874.

HOMICIDE (Lat. *homicidium*), the general and neutral term for the killing of one human being by another. The nature of the responsibility of the slayer to the state and to the relatives of the slain has been one of the chief concerns of all systems of law from the earliest times, and it has been variously considered from the points of view of the sanctity of human life, the interests of the sovereign, the injury to the family of the slain and the moral guilt, *i.e.* the motives and intentions, of the slayer.

The earliest recorded laws (those of Khammurabi) do not contain any sweeping general provision as to the punishment of homicide. The death penalty is freely imposed but not for homicide. "If a man strike a gentleman's daughter that she dies, his own daughter is to be put to death, if a poor man's the slayer pays ½ mina." In the Mosaic law the general command "Thou shalt not kill" of the Decalogue is in terms absolute. In primitive law homicide, however innocent, subjected the slayer to the lawful vengeance of the kindred of the slain, unless he could make some composition with him. This *lex talionis* (a life for a life) resulted: (1) in a course of private justice which still survives in the vendetta of Corsica and Albania, and the blood feuds arising out of "difficulties" in the southern and western parts of the United States; (2) in the recognition of sanctuaries and cities of refuge within which the avenger of blood might not penetrate to kill an innocent manslayer; and (3) in the system of wite, bote and wer, by which the life of every man had its assessed price payable to his chief and his next of kin.

It took long to induce the relatives of the slain to appreciate anything beyond the fact of the death of their kinsman or to discriminate between intentional and accidental homicide. By the laws of Khammurabi (206, 208) striking a man in a quarrel without deadly intent but with fatal effect was treated as a matter for compensation according to the rank of the slain. The Pentateuch discriminates between the man "who lieth in wait for" or "cometh presumptuously" on "his neighbour to slay him with guile" (Exodus xxi. 13, 14), and the man "who killeth his neighbour ignorantly whom he hated not in time past" (Deut. xix. 4). But even killing by misadventure exposed the slayer to the avenger of blood. "As a man goeth into the wood with his neighbour to hew wood, and his hand fetcheth a stroke with the axe to cut down a tree and the head slippeth from the helve and lighteth upon his neighbour that he die: he shall flee into one of these cities (of refuge) and live" (Deut. xix. 5).

Under the early laws of Teutonic and Celtic communities the inconveniences of the blood feud were gradually mitigated (see CRIMINAL LAW) by the system of wite and wer (or eric), but the blood feud continued long in Friesland and Lower Saxony, and in parts of Switzerland until the 16th century. In England under the Norman system homicide became a plea of the crown, and the rights of the kindred to private vengeance and to compensation were gradually superseded in favour of the right of the king to forfeitures where the homicide amounted to a crime (felony).

Though homicide was thus made a public offence and not a matter for private vengeance, it took long to discriminate between those forms of homicide which should and those which should not be punished.

The terms of act in English law used to describe *criminal* homicide are murder (*mord, meurtre, murdrum*), manslaughter and *felo de se* (or suicide by a person of sound mind).

The original meaning of the word "murder" seems to have been secret homicide,—"*Murdrum proprie dicitur mors alicujus occulta cujus interfector ignoratur*" (*Dialogus de Scaccario* i. x.); and Glanville says: *Duo sunt genera homicidii. unum est quod dicitur murdrum quod nullo vidente nullo sciente clam perpetratur, ita quod non assignatur clamor popularis* (hue and cry). *est et aliud homicidium quod diciter simplex homicidium.* After the Conquest, and for the protection of the ruling race, a fine (also called *murdrum*) was levied for the king on the hundred or other district in which a stranger was found dead, if the slayer was not brought to justice and the blood kin of the slain did not present Englishry, there being a presumption (in favour of the Exchequer) that the deceased was a Frenchman. After the assize of Clarendon (1166) the distinction between the killing of Normans and Englishmen gradually evaporated and the term murder came to acquire its present meaning of deliberate as distinct from secret homicide. In 1267 it was provided that the murder fine should not be levied in cases of death by "misadventure" (*per infortunium*).[1] But at that date and for long afterwards homicide in self-defence or by misadventure or even while of unsound mind involved at the least a forfeiture of goods, and required a pardon. These pardons, and restitution of the goods, became a matter of course, and the judges appear at a later date to have been in the habit of directing an acquittal in such cases. But it was not until 1828 that the innocence of excusable homicide was expressly declared. The rule is now expressed in s. 7 of the Offences against the Person Act 1861: "No punishment or forfeiture shall be incurred by any person who shall kill another by misfortune, or in his own defence, or in any other manner without felony."

The further differentiation between different degrees of criminal homicide was marked by legislation of Henry VIII. (1531) taking away benefit of clergy in the case of "wilful murder with malice prepensed" (aforethought), and that phrase is still the essential element in the definition of "wilful murder," which is committed "when a person of sound memory and discretion unlawfully killeth any reasonable creature or being and under the king's peace with malice aforethought either express or implied" (3 Co. Inst. 47). The whole development of the substantive law as to murder rests on judicial rulings as to the meaning of malice prepense coupled with the extrajudicial commentaries of Coke, Hale and Foster; for parliament, though often tempted by bills and codes, has never ventured on a legislative definition. Much discussion has ranged round the phrase "malice aforethought," and it has undoubtedly been expanded by judicial decision so as to create what is described as "constructive" murder. According to the view of the criminal code commissioners of 1879 (*Parl. Pap.*, 1879, c. 23, 45, p. 23) the term "malice aforethought" is now a common name for all the following states of mind:—

1. An intent, preceding the act, to kill or do grievous bodily harm to the person or to any other person:
2. Knowledge that the act done is *likely* to produce such consequences, whether coupled with an intention to produce them or not:
3. An intent to commit any felony: or
4. An intent to resist an officer of police in the execution of his duty.

[1] See Select Pleas of Crown, 1 (Selden Society Publ.); Pollock and Maitland, *Hist. Eng. Law*, ii. 458, 476, 478.

SpinSmart Software http://www.spinsmart.com

The third form of malice aforethought has been much controverted. When it was first recognized as creating a liability for wilful murder almost all felonies were capital offences: but even at the end of the 17th century Lord Holt expressed a view that it should be limited to felonies involving violence or danger to life, *e.g.* assault with intent to rob, or setting fire to a dwelling-house. And Sir James Stephen's opinion is that, to justify conviction of murder by an act done with intent to commit a felony, the act done must be one dangerous to life or known to be likely to cause death.

Starting with the definition above given, English law still retains so much of its medieval character as to presume all homicide to be "malicious, and therefore murder, unless it is either *justified* by the command or permission of the law, *excused* on the ground of accident or self-preservation, or *alleviated* into manslaughter by being the involuntary consequence of some act not strictly lawful or occasioned by some sudden and sufficiently violent provocation." The truth of the facts alleged in justification, excuse or alleviation, is for the jury to determine: the question whether if true they support the plea for which they are put forward is for the court.

In the administration of the English criminal law as to homicide the consequences of too strict an adherence to the technical definitions of the offences are avoided (*a*) by the exercise of the jury of their powers to convict of manslaughter only even in cases where they are directed that the offence is murder or nothing; (*b*) by the report of the judge as to the particular circumstances of each case in which a conviction of murder has been followed by the statutory sentence of death; (*c*) by the examination of all the evidence in the case by the Home Office in order to enable the secretary of state to determine whether the prerogative of mercy should be exercised.

Homicide is justifiable and not criminal when the killing is done in the execution of the law. The most important case of justifiable homicide is the execution of a criminal in due course of public justice. This condition is most stringently interpreted. "To kill the greatest of malefactors deliberately, uncompelled, and extrajudicially is murder. . . . And further, if judgment of death be given by a judge not authorized by lawful commission, and execution is done accordingly, the judge is guilty of murder" (Stephen's *Commentaries*, book vi. c. iv.). The execution must be carried out by the proper officer or his deputy: any person executing the sentence without such authority, were it the judge himself, would be guilty of murder. And the sentence must be strictly pursued: to execute a criminal by a kind of death other than that to which he has been judicially condemned is murder.

Homicide committed by an officer of justice in the course of carrying out his duty, as such, is also justifiable; *e.g.* where a felon resists a legal arrest and is killed in the effort to arrest him (see 2 Pollock and Maitland, 476); where officers in dispersing a riotous assemblage kill any of the mob, &c. (see RIOT). In these cases the homicide must be shown to have been absolutely necessary. Again, homicide is justifiable if committed in the defence of person or property against forcible and heinous crime, such as murder, violent robbery, rape or burglary. In this connexion there has been much discussion as to whether the person attacked is under a duty to retreat: and in substance the justification depends on the continuous necessity of attack or defence in order to prevent the commission by the deceased of the crime threatened.

Homicide is excusable and not criminal at all when committed either by misadventure or in self-defence. In the former case the homicide is excused; where a man in the course of doing some lawful work, accidentally and without intention kills another, *e.g.* shooting at a mark and undesignedly hitting and killing a man. The act must be strictly lawful, and death by misadventure in unlawful sports is not a case of excusable homicide. Homicide in self-defence is excusable when the slayer is himself in immediate danger of death, and has done all he could to avoid the assault. Accordingly, if he strikes and kills his assailant after the assault is over, this is not excusable homicide. But if the assault has been premeditated, as in the case of a duel, the death of either antagonist has under English law always been held to be murder and not excusable homicide. The excuse of self-defence covers the case in which a person in defence of others whom it is his duty to protect—children, wife, master, &c.—kills an assailant. It has been considered doubtful whether the plea of self-defence is available to one who has himself provoked a fray, in the course of which he is so pressed by his antagonist that his only resource is to kill him.

In English law the term "manslaughter" is applied to those forms of homicide which though neither justifiable nor excusable are attended by alleviating circumstances which bring them short of wilful murder. The offence is not defined by statute, but only by judicial rulings. Its punishment is as a maximum penal servitude for life, and as a minimum a fine or recognizances to be of good behaviour. The quantum of punishment between the limits above stated is in the discretion of the court, and not, as under continental codes, with fixed minima; and the offence includes acts and omissions of very varying gravity, from acts which only by the charitable appreciation of a jury fall short of wilful murder, to acts or omissions which can only technically be described as criminal, *e.g.* where one of two persons engaged in poaching, by pure accident gets caught in a hedge so that his gun goes off and kills his fellow-poacher. This may be described as an extreme instance of "constructive crime."

There are two main forms of "manslaughter":—

1. "Voluntary" homicide under grave and sudden provocation or on a sudden quarrel in the heat of passion, without the slayer taking undue advantage or acting in an unusual manner. The substance of the alleviation of guilt lies in the absence of time for cool reflection or the formation of a premeditated design to kill. Under English law the provocation must be by acts and not by words or gestures, and must be serious and not trivial, and the killing must be immediately after provocation and while the slayer has lost his self-control in consequence of the provocation. The provocation need not be by assault or violence, and perhaps the best-recognized example is the slaying by a husband of a man found committing adultery with the slayer's wife. In the case of a sudden quarrel it does not matter who began or provoked the quarrel. This used to be called "chance medley."

2. "Involuntary" homicide as a result of great rashness or gross negligence in respect of matters involving danger to human life, *e.g.* in driving trains or vehicles, or in dealing with dangerous weapons, or in performing surgical operations, or in taking care of the helpless.

The innumerable modes in which criminal liability for killing others has been adjudged under the English definitions of murder and manslaughter cannot be here stated, and can only be studied by reference to the judicial decisions collected and discussed in *Russell on Crimes* and other English text-books, and in the valuable work by Mr J. D. Mayne on the criminal law of India, in which the English common law rulings are stated side by side with the terms and interpretations of the Indian penal code. Much labour has been expended by many jurists in efforts to create a scientific and acceptable classification of the various forms of unlawful homicide which shall properly define the cases which should be punishable by law and the appropriate punishment. Their efforts have resulted in the establishment in almost every state except the United Kingdom of statutory definitions of the crime, beginning with the French penal code and going down to the criminal code of Japan. In the case of England, as a result of the labours of Sir James Stephen, a code bill was submitted to parliament in 1878. In 1879 a draft code was prepared by Blackburn, Lush and Barry, and was presented to parliament. It was founded on and prepared with Sir J. Stephen, and is a revision of his digest of the criminal law.

After defining homicide and culpable homicide, the draft code (cl. 174) declares culpable homicide to be murder in the following cases: (*a*) if the offender means to cause the death of the person killed; (*b*) if the offender means to cause to the person killed any bodily injury which is known to the offender to be likely to cause death, and if the offender, whether he does

SpinSmart Software http://www.spinsmart.com

or does not mean to cause death, is reckless whether death ensues or not; (*c*) if the offender means to cause death or such bodily injury as aforesaid to one person, so that if that person be killed the offender would be guilty of murder, and by accident or mistake the offender kills another person though he does not mean to hurt the person killed; (*d*) if the offender for any unlawful object does an act which he knows or ought to have known to be likely to cause death, and thereby kills any person, though he may have desired that his object should be effected without hurting any one.

Further (cl. 175), it is murder (whether the offender means or not death to ensue, or knows or not that death is likely to ensue) in the following cases:—"(*a*) if he means to inflict grievous bodily injury for the purpose of facilitating the commission of any of the offences hereinafter mentioned, or the flight of the offender upon the commission or attempted commission thereof, and death ensues from his violence; (*b*) if he administers any stupefying thing for either of the purposes aforesaid and death ensues from the effects thereof; (*c*) if he by any means wilfully stops the breath of any person for either of the purposes aforesaid and death ensues from such stopping of the breath." The following are the offences referred to:—"high treason and other offences against the king's authority, piracy and offences deemed to be piracy, escape or rescue from prison or lawful custody, resisting lawful apprehension, murder, rape, forcible abduction, robbery, burglary, arson." Cl. 176 reduces culpable homicide to manslaughter if the person who causes death does so "in the heat of passion caused by sudden provocation"; and "any *wrongful act or insult* of such a nature as to be sufficient to deprive any ordinary person of the power of self-control may be provocation if the offender acts upon it on the sudden, and before there has been time for his passion to cool. Whether any particular wrongful act or insult amounts to provocation and whether the offender was deprived of self-control shall be questions of fact; but no one shall be deemed to give provocation by doing that which he had a legal right to do, or which the offender incited him to do in order to provide an excuse for killing him or doing grievous bodily harm to any person." Further, "an arrest shall not necessarily reduce the offence from murder to manslaughter because an arrest was illegal, but if the illegality was known to the offender it may be evidence of provocation"; (cl. 177) "culpable homicide not amounting to murder is manslaughter."

The definitions embodied in these clauses though not yet accepted by the British legislature, have in substance been embodied in the criminal codes of Canada (1892 ss. 227-230), New Zealand (1893, ss. 163-166), Queensland (1899, ss. 300-305), and Western Australia (1901, ss. 275-280).

From the point of view of civil as distinct from criminal responsibility homicide does not by the common law give any cause of action against the person causing the death of another in favour of the wife or blood relations of the deceased. In early law this was otherwise; and the wer or eric of the deceased came historically before the right of chief or state. But under English law the rights of relations, except by way of appeal for felony,[1] were swept aside in favour of the crown, on the principle that every homicide is presumed felonious (murder) unless the contrary is proved, and that in all cases of homicide not justifiable by law a forfeiture was incurred. The rights of the relatives were also defeated by application of the maxim "*actio personalis moritur cum personâ*" ("a personal action dies with the person") to all proceedings for injury to the person or to reputation. In Scotland the old theory was preserved in the law as to assythement.

In England the law was altered at the instance of Lord Campbell in 1846 (9 & 10 V. c. 93) so as to give a right of a claim by the husband, wife, parent or child of a person killed by a wrongful (or even criminal) act, neglect or default by another which would have given the deceased if he had survived a cause of action against the wrongdoer. The compensation payable is what the surviving relative has lost by the death, and under the Workmen's Compensation Act 1906 (in all cases to which it applies) the employer is liable even without negligence to compensate the dependants of an employee killed by an accident arising out of and in the course of the employment; and in such cases even if the death was due to serious and wilful misconduct by the employee, compensation is payable.

In the Indian penal code the definitions of murder are so drawn as to limit the offences to cases where it was actually intended to cause death or bodily injury by the acts or omissions of the slayer, and the definition of culpable homicide short of murder is so drawn as to exclude the forms of unintentional manslaughter due to neglect of duty, *e.g.* in the conduct of trains or ships or vehicles. This last omission was supplied in 1870. The Indian code does not treat as murder either duelling or helping Hindu widows to commit *suttee* (s. 301, exception 5). In most of the British possessions in Asia and in east Africa the Indian definitions of homicide have been adopted. In the rest of the colonies, except South Africa, the law of homicide depends on the English common law as modified by colonial codes or statutes. In South Africa it rests mainly on the Roman Dutch law.

Europe.—In European codes distinctions corresponding to those of the English law are drawn between premeditated and other forms of criminal homicide; but more elaborate distinctions are drawn between the degrees of deliberation or criminality manifested in the slaying, and the minimum or maximum penalty is varied accordingly.

In the French penal code voluntary homicide is called murder (*meurtre*, art. 295): but if committed with premeditation or lying in wait is styled *assassinat* (*guet-apens*) (296-298). Poisoning (even if the poison is not fatal), is specially punished, as is parricide (on the lines of the obsolete English offence of petty treason), and infanticide, *i.e.* the killing of newly-born infants. Assassination, poisoning and parricide are at present capital offences; but a bill to abolish the death sentence has been laid before the French parliament.

The German code distinguishes between voluntary homicide which is done with deliberation and such homicide committed without deliberation (ss. 211, 212), and provides for mitigation of punishment where the slaying was provoked without fault in the slayer by any wrongful act or serious insult upon the slayer or his relatives by the slain (213). Parricide and infanticide are specially punished (214, 215), as is killing another person at his express and earnest request (216)—an offence which would in England be murder—and it is a separate offence to cause the death of another, the penalty being increased if the offender was peculiarly bound by office, calling or trade to use a care which he did not use (222).

The Italian code punishes as homicide those who with intention to kill cause the death of another (364). The death penalty is not imposed, but scales of punishment are provided to deal with aggravated forms of the offence. Thus *ergastolo* (penal servitude for life) is the punishment in the case of homicide of ascendants and descendants, or with premeditation, or under the sole impulse of brutal ferocity or with gross cruelty (*gravi sevizie*), or by means of arson, inundation, drowning and certain other crimes, or to secure the gains or conceal the commission, or to secure immunity from the consequences, of another crime (366). Personal violence resulting in death inflicted without intention to kill is punishable *minore poenâ* (368), and it is criminal to cause the death of another by imprudence, negligence or lack of skill in an art or profession (*imperitia nella propria arte o professione*), or by non-observance of regulations, orders or instructions.

The Spanish code has like those of Italy and France special punishments for parricide (417) and for assassination, in which are included killing for reward or promise of reward or by inundation (418), and for aiding another to commit suicide (421). Both the Italian and the Spanish codes afford a special mitigation

[1] Appeals remained in the law till 1819, but were long before this disused. In the middle ages they were used as a means of getting compensation.

SpinSmart Software http://www.spinsmart.com

to infanticide committed to avoid dishonour to the mother of the infant or her family.

America.—The most notable difference between England and the United States in regard to the law on this subject is the recognition by state legislation of degrees in murder. English law treats all unlawful killing not reducible to manslaughter as of the same degree of guilt in law. American statutes seek to discriminate for purposes of punishment between the graver and the less culpable forms of murder. Thus an act of the legislature of Pennsylvania (22nd of April 1794) declares "all murder which shall be perpetrated by means of poison or by lying in wait or by any other kind of wilful, deliberate and premeditated killing, or which shall be committed in the perpetration of or attempt to perpetrate any arson, rape, robbery or burglary shall be deemed murder of the first degree; and all other kinds of murder shall be deemed murder of the second degree." This legislation has been copied or adopted in many if not most of the other states. There are also statutory degrees of manslaughter in the legislation of some of the states. The differences of legislation, coupled with the power of the jury in some states to determine the sentence, and the limitations on the right of the judges to comment on the testimony adduced, lead to very great differences between the administration of the law as to homicide in the two countries.

HOMILETICS (Gr. ὁμιλητικός, from ὁμιλεῖν, to assemble together), in theology the application of the general principles of rhetoric to the specific department of public preaching. It may be further defined as the science that treats of the analysis, classification, preparation, composition and delivery of sermons. The formation during recent years of such lectureships as the "Lyman Beecher" course at Yale University has resulted in increased attention being given to homiletics, and the published volumes of this series are the best contribution to the subject.

The older literature is cited exhaustively in W. G. Blaikie, *For the Work of the Ministry* (1873); and D. P. Kidder, *Treatise on Homiletics* (1864).

HOMILY, a simple religious address, less elaborate than a sermon, and confining itself to the practical exposition of some ethical topic or some passage of Scripture. The word ὁμιλία from ὁμιλεῖν (ὁμοῦ, εἶλω), meaning communion, intercourse, and especially interchange of thought and feeling by means of words (conversation), was early employed in classical Greek to denote the instruction which a philosopher gave to his pupils in familiar talk (Xenophon, *Memorabilia*, I. ii. 6. 15). This usage of the word was long preserved (Aelian, *Varia Historia*, iii. 19); and the ὁμιλήσας of Acts xx. 11 may safely be taken to assign not only a free and informal but also a didactic character to the apostle Paul's discourse in the upper chamber of Troas, when "he talked a long while, even till break of day." That the "talk" on that occasion partook of the nature of the "exposition" (דְּרָשָׁה) of Scripture, which, undertaken by a priest, elder or other competent person, had become a regular part of the service of the Jewish synagogue,[1] may also with much probability be assumed. The custom of delivering expositions or comments more or less extemporaneous on the lessons of the day at all events passed over soon and readily into the Christian Church, as may be gathered from the first *Apology* (c. 67) of Justin Martyr, where we read that, in connexion with the practice of reading portions from the collected writings of the prophets and from the memoirs of the apostles, it had by that time become usual for the presiding minister to deliver a discourse in which "he admonishes the people, stirring them up to an imitation of the good works which have been brought before their notice." This discourse, from its explanatory character, and from the easy conversational manner of its delivery, was for a long time called ὁμιλία rather than λόγος: it was regarded as part of the regular duty of the bishop, but he could devolve it, if he thought fit, on a presbyter or deacon, or even on a layman. An early and well-known instance of such delegation is that mentioned by Eusebius (*Hist. Eccl.* vi. 19) in the case of Origen (216 A.D.).[2] In course of time the exposition of the lesson for the day came more frequently to assume a more elaborate character, and to pass into the category of a λόγος or even φιλοσοφία or φιλοσόφημα; but when it did so the fact was as far as possible denoted by a change of name, the word ὁμιλία being reserved for the expository or exegetical lecture as distinguished from the pulpit oration or sermon.[3] While the church of the 3rd and 4th centuries could point to a brilliant succession of great preachers, whose discourses were wont to be taken down in shorthand and circulated among the Christian public as edifying reading, it does not appear that the supply of ordinary homiletical talent kept pace with the rapidity of church extension throughout the Roman empire. In the smaller and remoter communities it not uncommonly happened that the minister was totally unqualified to undertake the work of preaching; and though, as is curiously shown by the case of Rome (Sozomen, *Hist. Eccl.* vii. 19), the regular exposition of the appointed lessons was by no means regarded as part of the necessary business of a church, it was generally felt to be advisable that some provision should be made for the public instruction of congregations. Even in Jerome's time (*De Vir. Ill.* c. 115), accordingly, it had become usual to read, in the regular meetings of the churches which were not so fortunate as to possess a competent preacher, the written discourses of celebrated fathers; and at a considerably later period we have on record the canon of at least one provincial council (that of Vaux, probably the third, held in 529 A.D.), positively enjoining that if the presbyter through any infirmity is unable himself to preach, "homilies of the holy fathers" (homiliae sanctorum patrum) are to be read by the deacons. Thus the finally fixed meaning of the word homily as an ecclesiastical term came to be a written discourse (generally possessing the sanction of some great name) read in church by or for the officiating clergyman when from any cause he was unable to deliver a sermon of his own. As the standard of clerical education sank during the dark ages, the habit of using the sermons of others became almost universal. Among the authors whose works were found specially serviceable in this way may be mentioned the Venerable Bede, who is credited with no fewer than 140 homilies in the Basel and Cologne editions of his works, and who certainly was the author of many *Homiliae de Tempore* which were much in vogue during the 8th and following centuries. Prior to Charlemagne it is probable that several other collections of homilies had obtained considerable popularity, but in the time of that emperor these had suffered so many mutilations and corruptions that an authoritative revision was felt to be imperatively necessary. The result was the well-known *Homiliarium*, prepared by Paul Warnefrid, otherwise known as Paulus Diaconus (*q.v.*).[4] It consists of

[1] See Philo, *Quod omnis probus liber*, sec. 12 (ed. Mangey ii. 458; cf. ii. 630).

[2] Sozomen (*Hist. Eccl.* vii. 19) mentions that in Alexandria in his day the bishop alone was in the custom of preaching; but this, he implies, was a very exceptional state of matters, dating only from the time of Arius.

[3] To the more strictly exegetical lectures the names ἐξηγήσεις, ἐξηγήματα, ἐξηγητικά, ἐκθέσεις, were sometimes applied. But as no popular discourse delivered from the pulpit could ever be exclusively expository and as on the other hand every sermon professing to be based on Scripture required to be more or less "exegetical" and "textual," it would obviously be sometimes very hard to draw the line of distinction between ὁμιλία and λόγος. It would be difficult to define very precisely the difference in French between a "conférence" and a "sermon"; and the same difficulty seems to have been experienced in Greek by Photius, who says of the eloquent pulpit orations of Chrysostom, that they were ὁμιλίαι rather than λόγοι.

[4] Manuscript copies are preserved at Heidelberg, Darmstadt, Frankfort, Giessen, Cassel and other places. It was first printed at Spires in 1482. In the Cologne edition of 1530 the title runs—*Homiliae seu mavis sermones sive conciones ad populum, praestantissimorum ecclesiae doctorum Hieronymi, Augustini, Ambrosii, Gregorii, Origenis, Chrysostomi, Bedae, &c., in hunc ordinem digestae per Alchuinum levitam, idque injungente ei Carolo M. Rom. Imp. cui a secretis fuit.* Though thus attributed here to Alcuin, who is known to have revised the Lectionary or *Comes Hieronymi*, the compilation

176 homilies arranged in order for all the Sundays and festivals of the ecclesiastical year; and probably was completed before the year 780. Though written in Latin, its discourses were doubtless intended to be delivered in the vulgar tongue; the clergy, however, were often too indolent or too ignorant for this, although by more than one provincial council they were enjoined to exert themselves so that they might be able to do so.[1] Hence an important form of literary activity came to be the translation of the homilies approved by the church into the vernacular. Thus we find Alfred the Great translating the homilies of Bede; and in a similar manner arose Ælfric's Anglo-Saxon *Homilies* and the German *Homiliarium* of Ottfried of Weissenburg. Such *Homiliaria* as were in use in England down to the end of the 15th century were at the time of the Reformation eagerly sought for and destroyed, so that they are now extremely rare, and the few copies which have been preserved are generally in a mutilated or imperfect form.[2]

The *Books of Homilies* referred to in the 35th article of the Church of England originated at a convocation in 1542, at which it was agreed "to make certain homilies for stay of such errors as were then by ignorant preachers sparkled among the people." Certain homilies, accordingly, composed by dignitaries of the lower house, were in the following year produced by the prolocutor; and after some delay a volume was published in 1547 entitled *Certain sermons or homilies appointed by the King's Majesty to be declared and read by all parsons, vicars, or curates every Sunday in their churches where they have cure.* In 1563 a second *Book of Homilies* was submitted along with the 39 Articles to convocation; it was issued the same year under the title *The second Tome of Homilies of such matters as were promised and instituted in the former part of Homilies, set out by the authority of the Queen's Majesty, and to be read in every Parish Church agreeably.* Of the twelve homilies contained in the first book, four (the 1st, 2nd, 3rd and 4th) are probably to be attributed to Cranmer, and one (the 12th) possibly to Latimer; one (the 6th) is by Bonner; another (the 5th) is by John Harpsfield, archdeacon of London, and another (the 11th) by Thomas Becon, one of Cranmer's chaplains. The authorship of the others is unknown. The second book consists of twenty-one homilies, of which the 1st, 2nd, 3rd, 7th, 8th, 9th, 16th and 17th have been assigned to Jewel, the 4th to Grindal, the 5th and 6th to Pilkington and the 18th to Parker. See the critical edition by Griffiths, Oxford, 1869. The homilies are not now read publicly, though they are sometimes appealed to in controversies affecting the doctrines of the Anglican Church.

HOMOEOPATHY (from the Greek ὅμοιος, like, and πάθος, feeling). The distinctive system of therapeutics which bears the name of homoeopathy is based upon the law *similia similibus curentur*,[3] the originator of which was S. C. F. Hahnemann, a native of Meissen in Germany, who discovered his new principle while he was experimenting with cinchona bark in 1790, and announced it in 1796.[4] The essential tenets of homoeopathy—with which is contrasted the "allopathy" (ἄλλος, other) of the "orthodox" therapeutics—are that the cure of disease is effected by drugs that are capable of producing in a healthy individual symptoms similar to those of the disease to be treated, and that to ascertain the curative virtues of any drug it must be "proved" upon healthy persons—that is, taken by individuals of both sexes in a state of health in gradually increasing doses. The manifestations of drug action thus produced are carefully recorded, and this record of "drug-diseases," after being verified by repetition on many "provers," constitutes the distinguishing feature of the homoeopathic materia medica, which, while it embraces the sources, preparation and uses of drugs as known to the orthodox pharmacopoeia, contains, in addition, the various "provings" obtained in the manner above described.

Besides the promulgation of the doctrine of similars, Hahnemann also enunciated a theory to account for the origin of all chronic diseases, which he asserted were derived either directly or remotely from psora (the itch), syphilis (venereal disease) or sycosis (fig-wart disease). This doctrine, although at first adopted by some of the enthusiastic followers of Hahnemann, was almost immediately discarded by very many who had a firm belief in his law of cure. In the light of advancing science such theories are entirely untenable, and it was unfortunate for the system of medicine which he founded that Hahnemann should have promulgated such an hypothesis. It served as a target for the shafts of ridicule showered upon the system by those who were its opponents, and even at the present time there still exists in the minds of many misinformed persons the conviction that homoeopathy is a system of medicine that bases the origin of all chronic disease on the itch or on syphilis or fig-warts.

Another peculiar feature of homoeopathy is its posology or theory of dose. It may be asserted that homoeopathic posology has nothing more to do with the original law of cure than the psora (itch) theory has, and that it was one of the later creations of Hahnemann's mind. Most homoeopathists believe more or less in the action of minute doses of medicine, but it must not be considered as an integral part of the system. The dose is the corollary, not the principle. Yet in the minds of many, infinitesimal doses of medicine stand for homoeopathy itself, the real law of cure being completely put into the background. The question of dose has also divided the members of the homoeopathic school into bitter factions, and is therefore a matter for careful consideration. Many employ low potencies,[5] *i.e.* mother

of the *Homiliarium* is in the emperor's own commission entrusted to Paul, to whom it is assigned in the earlier printed editions also. A comparison of different editions shows that the contents increased with the ever-growing number of saints' days and festivals, new discourses by later preachers like Bernard being constantly added.

[1] Neander, *Church History*, v. 174 (Eng. trans. of 1851).

[2] An ancient English metrical homiliarium is preserved in the library of the university of Cambridge. Earlier versions of it have existed, and a portion of perhaps the earliest copy, dating from about the middle of the 13th century, was published in 1862 by Mr J. Small, librarian to the university of Edinburgh.

[3] An interesting controversy has been carried on between the members of the homoeopathic school as to the proper construction of the Latin motto which constitutes its acknowledged basis. For many years the verb at the conclusion of the sentence was used in the indicative mood, *curantur*, thus making the sentence a positive one. After extended research it has been discovered that Hahnemann himself never employed the word *curantur* as descriptive of his law of cure, but always wrote *curentur*, which greatly modifies the meaning of the phrase. If the subjunctive mood be used, the motto reads, "Let similars be treated by similars," or "similars should be treated by similars." The reading *similia similibus curentur* was officially adopted as the correct reading of the sentence by the American Institute of Homoeopathy at its session held in Atlantic City, N.J., on the 20th of June 1899; and the words are so inscribed on the monument erected to the memory of Hahnemann and unveiled in Washington, D.C., on the 23rd of June 1900, and also are those carved upon the tomb of Hahnemann in Père-la-Chaise, Paris.

[4] Some points of Hahnemann's system were borrowed from previous writers—as he himself, though imperfectly, admits. Not to mention others, he was anticipated by Hippocrates, and especially by Paracelsus (1495–1541). The identical words *similia similibus curantur* occur in the Geneva edition (1658) of the works of Paracelsus, as a marginal heading of one of the paragraphs; and in the "Fragmenta Medica," *Op. Omnia*, i. 168, 169, occurs the following passage:

Simile similis cura; non contrarium.

"Quisquis enim cum laude agere Medicum volet, is has nugas longe valere jubeat. Nec enim ullus unquam morbus calidus per frigida sanatus fuit, nec frigidus per calida. Simile autem suum simile frequenter curavit, scilicet Mercurius sulphur, et sulphur Mercurium; et sal illa, velut et illa sal. Interdum quidem cum proprietate junctum frigidum sanavit calidum; sed id non factum est ratione frigidi, verum ratione naturae alterius, quam a primo illo omnino diversam facimus."

It is very remarkable that in Hahnemann's enumeration of authors who anticipated him in regard to the doctrine of *Similia*, he makes no mention of the views of Paracelsus, though the very words seem to be taken from the works of that physician. The other point in Hahnemann's doctrine—that medicines should be tried first on healthy persons—he admits to have been enunciated by Haller. Roughly it has been acted on by physicians in all ages, but certainly more systematically since Hahnemann's time. In the most characteristic feature of Hahnemann's practice—"the potentizing," "dynamizing," of medicinal substances—he appears to have been original.

[5] Two methods of preparing medicines are recognized, one on the decimal, the other on the centesimal scale. The pure tinctures are denominated "mother tinctures," and represented by the Greek ϕ. To

SpinSmart Software http://www.spinsmart.com

tinctures, first, second, sixth dilutions, &c., while others use hundred-thousandths and millionths.

Some homoeopathists of the present day still believe with Hahnemann that, even after the material medicinal particles of a drug have been subdivided to the fullest extent, the continuation of the dynamization or trituration or succussion develops a spiritual acurative agency, and that the higher the potency, the more subtle and more powerful is the curative action. Hahnemann says (*Organon*, 3rd American edition, p. 101), "It is only by means of the spiritual influence of a morbific agent that our spiritual vital power can be diseased, and in like manner only by the spiritual operation of medicine can health be restored." This is absolutely denied by others. Thus there exist two schools among the adherents of homoeopathy. On the one hand there are the Hahnemannians, the "Purists" or "High Potency" men, who still profess to regard the *Organon* as their Bible, who believe in all the teachings of Hahnemann, who adhere in their prescriptions to the single dose, the single medicine, and the highest possible potency, and regard the doctrine of the spiritual dynamization acquired by trituration and succussion as indubitable. On the other side there are the "Rational" or "Low Potency" men, who believe in the universality of the law of cure, but think that it cannot always be applied, on account of an imperfect materia medica and a lack of knowledge on the part of the physician. They believe that in many cases of severe and acute pain palliatives are required, and that they are free to use all the adjuvants at present known to science for the relief of suffering humanity—massage, balneology, electricity, hygiene, &c. The American Institute of Homoeopathy, the national body of the United States, has adopted the following resolution and ordered it to be published conspicuously in each number of the *Transactions* of the society: "A homoeopathic physician is one who adds to his knowledge of medicine a special knowledge of homoeopathic therapeutics. All that pertains to the great field of medical learning is his by tradition, by inheritance, by right."

It is claimed that the effect produced upon both the laity and the general profession of medicine by the introduction of homoeopathy was salutary in many ways. It diminished the quantity of medicine that was formerly considered necessary for the eradication of disease, and thus revealed the fact that the *vis medicatrix naturae* is often sufficient, with occasional and gentle assistance, to cure many diseases, especially those fevers that run a definite and regular course. Corroboration of the law *similia similibus curentur* is seen, according to homoeopathists, in the adoption of the serum therapy, which consists in the treatment of the most malignant diseases (diphtheria, lock-jaw, typhoid fever, tuberculosis, bubonic plague) by introducing into the system a modified form (similar) of those poisons that produce them in the healthy individual. Hahnemann undoubtedly deserves the credit of being the first to break decidedly with the old school of medical practice, in which, forgetful of the teachings of Hippocrates, nature was either overlooked or rudely opposed by wrong and ungentle methods. We can scarcely now estimate the force of character and of courage which was implied in his abandoning the common lines of medicine. More than this, he and his followers showed results in the treatment of disease which compared very favourably with the results of contemporary orthodox practice.

make a first decimal dilution or first decimal trituration, 10 drops of the mother tincture, or 10 grains of a crude substance, are mixed with 90 drops of alcohol, or 90 grains of *saccharum lactis* (sugar of milk) respectively. The liquid is thoroughly shaken, or the powder carefully triturated, and the bottles containing them marked 1 X, meaning first decimal dilution or trituration. To make the 2 X potency, 10 drops or 10 grains of this first dilution or trituration are mixed with 90 drops of pure alcohol, or 90 grains of milk sugar, and are succussed or triturated as above described, and marked 2 X dilution or trituration. This subdivision of particles may be continued to an indefinite degree. On the Hahnemannian or centesimal scale the medicines are prepared in the same manner, the difference being that 1 drop or grain is mixed with 99 drops or grains, to make the first centesimal, which is marked 1 c or 1 simply, and so on for the second and higher dilutions.

Homoeopathy has given prominence to the therapeutical side of medicine, and has done much to stimulate the study of the physiological action of drugs. It has done service in directing more special attention to various powerful drugs, such as aconite, nux vomica, belladonna, and to the advantage of giving them in simpler forms than were common before the days of Hahnemann. But in the medical profession homoeopathy nevertheless remains under the stigma of being a dissenting sect. It has been publicly announced that if the homocopathists would abolish the name "homoeopathy," and remove it from their periodicals, colleges, hospitals, dispensaries and asylums, they would be received within the fold of the regular profession These conditions have been accepted by a few homoeopathists who have become members of the most prominent medical association in the United States.

Homoeopathy as it exists to-day can, in the opinion of its adherents, stand by itself, and its progress for a century in face of prolonged and determined opposition appears to its upholders to be evidence of its truth. There are still, indeed, in both schools of medical thought, men who stand fast by their old principles. There are homoeopathists who can see nothing but evil in the practice of their brothers of the orthodox school, as there are allopathists who still regard homoeopathy as a humbug and a sham. There are, however, liberal-minded men in both schools, who look upon the adoption of any safe and efficient method of curing disease as the birthright of the true physician, and who allow every man to prescribe for his patients as his conscience may dictate, and, provided he be educated in all the collateral branches of medical science, are ready to exchange views for the good of suffering humanity.

Great Britain.—Homoeopathy is not rapidly extending in Great Britain, and its recognition has been slow. The first notice taken of the new system of therapeutics was by the Medical Society of London in 1826. In 1827 the physician of Prince Leopold of Saxe-Coburg, Dr F. H. F. Quin (1799–1878), who had previously studied homoeopathy in Germany and practised it in Italy, came to England, and it was through his efforts that the system was introduced. Three other physicians, Dr Belluomini, Dr Romani and Dr Tagliani, claimed priority, but careful research established Dr Quin's title. Quin was a successful man professionally and socially, and brought upon himself in a short time the anathema of the Royal College of Physicians. In 1844 Dr William Henderson, professor of pathology in the university of Edinburgh, embraced the Hahnemannian system. A storm of opposition arose, and Professor J. Y. Simpson (the discoverer of chloroform anaesthesia) published a volume, with the alliterative title, *Homoeopathy, its Tenets and Tendencies, Theoretical, Theological, and Therapeutical.* This brochure was answered by Professor Henderson, the title of his book being *Homoeopathy Fairly Represented.* From 1827 to 1837 there were but a dozen practitioners of homoeopathy in London, but during 1837 to 1847 the number increased to between seventy and eighty. In 1857 there were upwards of two hundred practitioners in the kingdom, with thirty-three institutions in which the law of similars was used as a basis of practice. In 1867 the increase was not so rapid, the number being 261. A society was formed about this period for "the protection of homoeopathic practitioners and students," which proved of great value in binding the sect together. In 1870 congresses were established, and annual meetings held, which have continued to the present time. In 1901 there were over three hundred homoeopathic physicians in the British Isles, of whom between seventy and eighty were in London alone. There were seventy-nine chemists, of whom seventeen were located in London, and eighty-two towns and cities in the country contained from one to ten homoeopathic practitioners each, together with many established chemists for dispensing homoeopathic medicines. The British Homoeopathic Society was founded by Quin in 1844, and has numerous members and fellows, besides corresponding members in all portions of the world, including Australia, India and Tasmania. The London Homoeopathic Hospital was founded in 1850, also largely through the efforts of Quin, and a few years afterwards moved to Great Ormond Street. During the cholera epidemic of 1854 the statistics of this hospital showed a mortality of 16·4 %, against 51·8 % of other metropolitan charities. The London Homoeopathic Hospital has a convalescent home under its management at Eastbourne. There are also dispensaries in Ealing and West Middlesex, Kensington, Notting Hill and Bayswater. Similar institutions are located in Bath, Birkenhead, Birmingham, Bootle, Bournemouth, Brighton, Bristol, Bromley, Cheltenham, Cheshire, Croydon, Dublin, Eastbourne, Edinburgh, Folkestone, Hastings and St Leonards, Ipswich, Leeds, Leicester, Liverpool, Newcastle, Northampton, Norwich, Oxford, Plymouth, Torquay, Tunbridge Wells, Weston-super-Mare. The homoeopathic journals include the *Homoeopathic World*, the *London Homoeopathic Hospital*

SpinSmart Software http://www.spinsmart.com

Reports, the *Journal of the British Homoeopathic Society*, and the *British Homoeopathic Review*, the last being issued by the British Homoeopathic Association, which was founded in 1902 for the purpose of developing and extending homoeopathy in Great Britain. The *British Journal of Homoeopathy* was first published in 1843, and was edited by Drs Drysdale, Russell and Black. For many years it was the foremost homoeopathic journal in the world. Its motto was *In certis unitas, in dubiis libertas, in omnibus charitas*. One reason why homoeopathy has not advanced as rapidly in the British Isles as in America is said to be the discrimination exercised against it by the General Medical Council, and another is want of cohesion amongst the homoeopaths themselves.

United States.—Homoeopathy was introduced into the United States by Dr Hans Birch Gram, who was born in Boston. His father being Danish, Gram in his eighteenth year went to Copenhagen, where he graduated in 1814. In 1823 he became acquainted with homoeopathy, and brought a knowledge of it to America in 1825 when he settled in New York. The first homoeopathic association was formed in 1833 in Philadelphia, the second in New York, 1834, and homoeopathy became known in the different states somewhat in the following order: New York, 1825; Pennsylvania, 1828; Louisiana, 1836; Connecticut, 1837; Massachusetts, 1837–1838; Maryland, 1837; Delaware, 1837; Kentucky, 1837; Vermont, 1838; Rhode Island, 1839; Ohio, 1839; New Jersey, 1840; Maine, 1840; New Hampshire, 1840; Michigan, 1841; Georgia, 1842; Wisconsin, 1842; Alabama, 1843; Illinois, 1843; Tennessee, 1844; Missouri, 1844; Texas, 1848; Minnesota, 1852; Nebraska, 1862; Colorado, 1863; Iowa, 1871. After 1871 the spread of the system was rapid throughout every state in the Union, and it is in the United States that homoeopathy principally flourishes. There are thousands of homoeopathic physicians, and their clients number several millions. It may be noted that departments of homoeopathy are connected with the universities of Boston, Michigan, Iowa, Minnesota and Kansas City.

Canada.—The early history of homoeopathy can be traced back nearly to 1850 in the province of Quebec. In the Dominion of Canada the various provinces control the licensing of physicians, excepting in Quebec, which is the only province having a separate homoeopathic board of examiners. This is under the control of the Montreal homoeopathic Association, and is known as the College of Homoeopathic Physicians and Surgeons of Montreal. Three examiners are annually appointed by the association. Successful candidates receive the diploma of the college, and are entitled to add to their degree the letters M.C.H.P.S. A certificate of successful examination is forwarded to the lieutenant-governor at Quebec, who, "if satisfied of the loyalty, integrity and good morals of the applicant, may grant him a license to practise surgery, physic and midwifery, or either of them, in the province of Quebec." The word "loyalty" has been decided by the provincial secretary to mean a British subject. This is the only government medical license now issued in the British empire, the others being by provincial boards or colleges of physicians and surgeons. In 1894 there was no homoeopathic institution in the province; at present the Montreal Homoeopathic Hospital is in active operation. Two homoeopathic papers are published monthly—the *Homoeopathic Record* in Montreal, and the *Homoeopathic Messenger* in Toronto. In 1870, in the province of Ontario, the three schools, allopathic, homoeopathic and eclectic, united for examining purposes into one board called the medical council, seventeen members representing the old school and five the other two systems. Finally the eclectics were merged in the old school, the board appointing five of Hahnemann's followers for examining purposes. Grace Hospital at Toronto (erected 1892) was begun as a dispensary in 1887.

Germany.—In 1810 Hahnemann published his *Organon*, which was the starting-point of homoeopathy in Germany. In 1811 an endeavour was made to found an institution in Leipzig in which practitioners might learn the new method of treatment theoretically and practically, but it was not a success, as the entire tide of professional opinion was against the system. In 1829, at the celebration of the fiftieth anniversary of Hahnemann's doctorate, the German Central Society was organized, holding its first meeting in 1830. In the university hospital of Munich some experiments were made to test the efficacy of homoeopathic medicines, but these were not successful. In 1831 the government prohibited homoeopathists from dispensing their own medicines; this was a severe blow to the system. In 1834 there was a division among the homoeopathists themselves, which much retarded the progress of the school. A homoeopathic hospital was established about this time (January 1833) in Leipzig, but there was such constant wrangling among the physicians connected with it that its sphere of usefulness was curtailed, and it was finally converted into a dispensary. The Baden Homoeopathic Society was established in 1834. The homoeopathic hospital in Munich was established in 1836, but suffered a similar fate to that of Leipzig, and was converted into a dispensary. The rather equivocal success of these hospitals in Saxony and Bavaria was in direct contrast to the fate of two newly established hospitals in Austria, one in Vienna and the other in Linz, which were very successful, and aroused great interest both among physicians and laymen. During the political confusion of 1846 and 1849 there was complete stagnation of everything medical in Germany. But during all these years, though the public institutions were few, the literature on homoeopathic subjects became very extensive, and exercised a significant influence upon the system in all parts of the world. Hahnemann died in 1843, and on the 10th of August 1851 a bronze monument to him was unveiled at Leipzig. The Leipzig dispensary lived thirty-three years. From 1842 to 1874 there were treated in this institution 65,106 patients. In 1901 there were about 250 homoeopathic physicians in Germany; they appeared to be strongest at Berlin, in the province of Brandenburg, in Pomerania and Westphalia, Saxony, Hessen and in Württemberg.

Austria-Hungary.—Homoeopathy was introduced into Austria about 1817, and in 1819 its practice was forbidden by law. Shortly afterwards the physician attending the archduke John became a homoeopath. In 1825 the doctrine was introduced into Vienna. To test the efficacy of the system Francis I. ordered that experiments be made with homoeopathic medicines, and for this purpose a ward furnished with twelve beds was allotted. The results were satisfactory to the new system, and it made gigantic strides in Vienna. During the cholera epidemic of 1836 an increased impetus was given to the new school by the reported brilliant successes of the treatment. Societies were founded and journals published. In 1846 a second hospital was founded. In 1850 a third hospital was opened, and clinical lectures upon the system were delivered. In 1873 the Society of Homoeopathic Physicians was formed. Between the years 1873 and 1893 homoeopathy declined. In 1901, in thirty-seven cities and towns there were to be found about fifty physicians and two hospitals, and it was estimated that about seventy-five more were scattered in Moravia, Bohemia, Tirol, Salzburg and the coast provinces. There is a professorship of homoeopathy at the University of Budapest, and homoeopathic clinics are held at the new Rochus Hospital in Üllöi Street, and also in the homoeopathic department of the Hospital Bethesda of the Reformed Community. The Elizabeth Hospital, exclusively homoeopathic, has existed for many years.

Russia.—The homoeopathic system was introduced into Russia in 1823. In 1825 great impetus was given to the new doctrine by the conversion of Dr Bigel, physician to the grand duke Constantine. In 1829 the grand duke ordered a series of experiments to be conducted to prove the truth or fallacy of homoeopathy, and they demonstrated the success of the new school. In 1841 a hospital was established in Moscow, and in 1849 similar institutions were founded in Nizhniy-Novgorod. Since then homoeopathy has been steadily practised, and has penetrated to the remotest parts of Russia. In 1881 the civil engineers proposed to commemorate the virtues of the emperor Alexander II. by the erection of a hospital; a committee for collecting funds was created, and 58,064 roubles were handed to the Charity Society of the followers of homoeopathy at St Petersburg for the erection and founding of a homoeopathic hospital. The foundation stone of the edifice was laid on 19th June 1893, the emperor Alexander III. giving 5000 roubles. The inauguration of a new dispensary and a pharmacy took place on the 19th of April 1898, and the hospital itself, intended originally for fifty beds, was opened on the 1st of November 1898. There are sixteen free beds, three of them being in the name of the emperor Nicholas, the empress Maria Feodorovna, and the emperor Alexander III. On the 28th of January 1899 an imperial edict was issued granting the rights of public service to the doctors of the hospital and dispensaries of the Charity Society, thus placing them on an equality with the doctors of the prevailing medical school.

France.—Homoeopathy was first introduced into France in 1830 by Count de Guidi, doctor of medicine, doctor of science, and inspector of the university, who practised in Lyons. About the same year Dr Antoine Petroz, widely known by his *Grand dictionnaire des sciences médicales*, began practising homoeopathy in Paris, and his establishment became the headquarters of the new system there. In 1835 Hahnemann himself came to the capital. In 1832 the homoeopathic method of treating disease was introduced into the Hospice de Choisy, and in 1842 into the hospital of Carentan. Tessier practised the new doctrine in his wards in the Hospital St Marguérite, and in the Children's Hospital up to the year 1862, when he retired. The first homoeopathic society was established in 1832 (the Société Gallicain), Hahnemann becoming president in 1835; in 1845 the Société de Médecine Homéopathique was organized; and in 1860 the two were united for the better interests of the school. In 1901 there were at Paris three hospitals—the Hospital St Jacques with fifty-five beds, the Hahnemann Hospital with thirty-five beds, and the new Protestant Hospital for Children with twenty-five beds. At Lyons there is the Hospital St Luc. The medical journals include *L'Art médical, La Revue homéopathique belge, Journal belge d'homéopathie, La Thérapeutique Intégrale, La Revue homéopathique française*. In the year 1900 the medical officers of the republic having supervision over the medical department of the International Exhibition officially recognized the members of the homoeopathic school, and arranged for the proper accommodation and reception of the International Congress of Homoeopathic Physicians held in June. On the 30th of that month, with appropriate ceremonies, the remains of Hahnemann were removed from the cemetery of Montmartre and deposited in Père-la-Chaise, and a monument bearing a suitable inscription was erected to the memory of the founder of homoeopathy.

Italy.—The Austrians when they entered Naples in 1821 brought homoeopathy into Italy, the general in command of the army being

SpinSmart Software http://www.spinsmart.com

a devoted friend of Hahnemann. In 1828 Dr Count Sebastian de Guidi came from Lyons and assisted in spreading the doctrine. During the period from 1830 to 1860 many physicians practised homoeopathy, and the literature on the subject became extensive. A homoeopathic clinic was established and a ward opened in Trinity Hospital at Naples, and a homoeopathic physician was appointed to the count of Syracuse. During the severe cholera epidemics of 1854, 1855, 1865 the success of homoeopathic treatment of that disease was so marked under the care of Dr Rubini that the attention of the authorities was directed to the system. In 1860 the homoeopathic practice was introduced into the Spedale della Cesarea, and since that period homoeopathy has been recognized with more or less favour in most of the cities. The Italian Homoeopathic Institute is recognized by royal warrant as an established institution, and its regulations are approved by the government. In Turin the legal seat of the Homoeopathic Institute, there is a hospital under the management of the State Association. The homoeopathic medical press consists of the *Revista Omiopatica*, established in 1855, and *L'Omiopatico in Italia*, the organ of the Italian Homoeopathic Institute, which first appeared in 1884.

Spain.—Homoeopathy was introduced into Spain in 1829 by a physician to the Royal Commission sent by the king of Naples to attend the marriage of Maria Christina with Don Ferdinand VII. Shortly after this, a merchant of Cadiz visited Hahnemann in Coethen, and was cured of a serious disorder; he returned to Spain with a supply of homoeopathic literature, and immediately sent a medical student to Leipzig to study the new system. In 1843 many cases of cholera were treated homoeopathically in Madrid. The civil war, which did not terminate until 1840, arrested all medical investigation in Spain, but in 1843 there still existed in Madrid five pharmacies and a number of homoeopathic physicians. About this time Dr Tosi Nuñez returned from an investigation of the new system with Hahnemann, and owing to his success in the treatment of disease was created one of the physicians of the bed-chamber to the queen, who soon afterwards conferred upon him the title of marquis, with the grand crosses of the Charles III. and of the Civil Order of Beneficiencia. This recognition by high authority gave an impetus to homoeopathy which has continued ever since.

Denmark.—Homoeopathy was unknown in Denmark until the year 1821, when Hans Christian Lund, a medical practitioner, adopted it. Hahnemann, however, had been both before and after that time consulted by Danes, and consequently homoeopathic therapeutics was recognized in different parts of the country. Lund translated many of Hahnemann's works into Danish, as well as those of other eminent members of the new school. (W. T. H.)

HOMONYM (Gr. ὁμώνομος, having the same name, from ὅμος, same, alike, and ὄνομα, name), a term in philology for those words which differ in sense but are alike either in sound or spelling or both. Words alike only in spelling but not in sound, *e.g.* "bow," are sometimes called *homographs*; and words alike only in sound but not in spelling, *e.g.* "meat," "meet," *homophones*. Skeat (*Etymol. Dict.*) gives a list of English homonyms.

HOMS, or HUMS (anc. *Emesa* or *Emessa*, near the Hittite *Kadesh*), a town of Syria, on the right bank of the Orontes, and capital of a sanjak in the vilayet of Syria (Damascus). Pop. 30,000 (20,000 Moslem, 10,000 Christian). The importance of the place arises from its command of the great north road from Egypt, Palestine and Damascus by the Orontes valley. Invading armies from the south have often been opposed near Homs, from the time of Rameses II., who had to fight the battle of Kadesh, to that of Ibrahim Pasha, who broke the first line of Ottoman defence in 1831 by his victory there. Ancient Emesa, in the district of Apamea, was a very old Syrian city, devoted to the worship of Baal, the sun god, of whose great temple the emperor Heliogabalus was originally a priest (A.D. 218). As a centre of native influences it was overawed by the Seleucid foundation of Apamea; but it opposed the Roman advance. There Aurelian crushed, in A.D. 272, the Syrian national movement led by Zenobia. Caracalla made it a Roman colony, and later it became the capital of a small province, *Phoenicia Libanesia* or *ad Libanum*. About 630 it was captured by the Moslem leader, Khalid ibn Walid, who is buried there. It now became the capital of a *jund*, or military district, which under the Omayyad Caliphs extended from Palmyra to the sea. Under the Arabs it was one of the largest cities in Syria, with walls and a strong citadel, which stood on a hill, occupying perhaps the site of the great sun temple. The ruins of this castle, blown up by Ibrahim Pasha, are still the most conspicuous feature of Homs, and contain many remains of ancient buildings. Its men were noted for their courage in war, and its women for their beauty. The climate was extolled for its excellence, and the land for its fertility. A succession of gardens bordered the Orontes, and the vineyards were remarkable for their abundant yield of grapes. When the place capitulated the great church of St John was divided between the Christians and Moslems, an arrangement which apparently lasted until the arrival of the Turks. At the end of the 11th century it fell into crusading hands, but was recovered by the Moslems under Saladin in 1187. Its decay probably dates from the invasion of the Mongols (1260), who fought two important battles with the Egyptians (1281 and 1299) in its vicinity. The construction of a carriage road to Tripoli led to a partial revival of prosperity and to an export of cereals and fruit, and this growth has, in turn, been accentuated by the railway, which now connects it with Aleppo and the Damascus-Beirut line. The district is well planted with mulberries and produces much silk, most of which is worked up on the spot. (D. G. H.)

HO-NAN, a central province of China, bounded N. partly by the Hwang-ho (which it crosses to the west of Ho-nan Fu, forming an arm northwards between the provinces of Shan-si and Chih-li), on the W. by Shen-si, on the S. by Hu-peh, and on the E. by Ngan-hui. It occupies an area of 81,000 sq. m., with a population of about 22,100,000, and contains nine prefectural cities. Its capital is K'ai-fêng Fu. The prefecture of Hwai-k'ing, north of the Hwang-ho, consists of a fertile plain, "rendered park-like by numerous plantations of trees and shrubs, among which thick bosquets of bamboo contrast with the gloomy groves of cypress." All kinds of cereals grow luxuriantly, and the general productiveness of the district is indicated by the extreme denseness of the population. The most noticeable feature in that portion of the province which is properly called Ho-nan is the Fu-niu Shan range, which runs east and west across this part of the province. Coal is found on the south of the Hwang-ho in the districts of Ho-nan Fu, the ancient capital, Lushan and Ju Chow. The chief products of the province are, however, agricultural, especially in the valley of the Tang-ho and Pai-ho, which is an extensive and densely populated plain running north and south from the Fu-niu Shan. Cotton is also grown extensively and forms the principal article of export, and a considerable quantity of wild silk is produced from the Fu-niu Shan. Three roads from the east and south unite at Ho-nan Fu, and one from the west. The southern road leads to Ju Chow, where it forks, one branch going to Shi-ki-chên, connecting the trade from Fan-cheng, Han-kow, and the Han river generally, and the other to Chow-kia-k'ow near the city of Ch'ên-chow Fu, at the confluence of the three rivers which unite to form the Sha-ho; the second road runs parallel with the Hwang-ho to K'ai-fêng Fu; the third crosses the Hwang-ho at Mêngching Hien, and passes thence in a north-easterly direction to Hwai-k'ing Fu, Sew-wu Hien and Wei-hui Fu, at which place it joins the high road from Peking to Fan-cheng; and the western road follows the southern bank of the Hwang-ho for 250 m. to its great bend at the fortified pass known as the Tung-kwan, where it joins the great wagon road leading through Shan-si from Peking to Si-gan Fu. Ho-nan is now traversed north to south by the Peking-Hankow railway (completed 1905). The line crosses the Hwang-ho by Yung-tse and runs east of the Fu-niu Shan. Branch lines serve Ho-nan Fu and K'ai-fêng Fu.

HONAVAR, or ONORE, a seaport of British India, in the North Kanara district of Bombay. Pop. (1901) 6929. It is mentioned as a place of trade as early as the 16th century, and is associated with two interesting incidents in Anglo-Indian history. In 1670, the English factors here had a bull-dog which unfortunately killed a sacred bull, in revenge for which they were all murdered, to the number of eighteen persons, by an enraged mob. In 1784 it was bravely defended for three months by Captain Torriano and a detachment of sepoys against the army of Tippoo Sultan.

HONDA, or SAN BARTOLOMEO DE HONDA, a town of the department of Tolima, Colombia, on the W. bank of the Magdalena river, 580 m. above its mouth. In 1906 Mr F. Loraine Petre

SpinSmart Software http://www.spinsmart.com

estimated the population at 7000. It is about 650 ft. above sea-level and stands at the entrance to a narrow valley formed by spurs of the Central Cordillera, through which a picturesque little stream, called the Guali, flows into the Magdalena. The town overlooks the rapids of the Magdalena, and is shut in closely by spurs of the Eastern and Central Cordilleras. The climate is hot and damp and the temperature frequently rises to 102° F. in the shade. Honda dates back to the beginning of the 17th century, and has been one of the important centres of traffic in South America for three hundred years. Within the city there is an iron bridge across the Guali, and there is a suspension bridge across the Magdalena at the head of the rapids. A railway 18 m. long connects with the landing place of La Dorada, or Las Yeguas, where the steamers of the lower Magdalena discharge and receive their cargoes (the old landing at Carocali nearer the rapids having been abandoned), and with Arrancaplumas, 1½ m. above, where navigation of the upper river begins. Up to 1908 the greater part of the traffic for Bogotá crossed the river at this point, and was carried on mule-back over the old *camino real*, which was at best only a rough bridle-path over which transportation to Bogotá (67 m. distant) was laborious and highly expensive; now the transshipment is made to smaller steamboats on the upper river for carriage to Girardot, 93 m. distant, from which place a railway runs to the Bogotá plateau. Honda was nearly destroyed by an earthquake in 1808.

HONDECOETER, MELCHIOR D' (*c.* 1636–1695), Dutch painter, was born at Utrecht, it is said, about 1636, and died at Amsterdam on the 3rd of April 1695. Old historians say that, being the grandson of Gillis and son of Gisbert d'Hondecoeter, as well as nephew of J. B. Weenix, he was brought up by the last two to the profession of painting. Of Weenix we know that he married one Josina d'Hondecoeter in 1638. Melchior was, therefore, related to Weenix, who certainly influenced his style. As to Gillis and Gisbert some points still remain obscure, and it is difficult to accept the statement that they stood towards each other in the relation of father and son, since both were registered as painters at Utrecht in 1637. Both it appears had practised art before coming to Utrecht, but where they resided or what they painted is uncertain. Unhappily pictures scarcely help us to clear up the mystery. In the Fürstenberg collection at Donaueschingen there is a "Concert of Birds" dated 1620, and signed with the monogram G. D. H.; and we may presume that G. D. H. is the man whose "Hen and Chickens in a Landscape" in the gallery of Rotterdam is inscribed "G. D. Hondecoeter, 1652"; but is the first letter of the monogram to stand for Gillis or Gisbert? In the museums of Dresden and Cassel landscapes with sportsmen are catalogued under the name of Gabriel de Heusch (?), one of them dated 1529, and certified with the monogram G. D. H., challenging attention by resemblance to a canvas of the same class inscribed G. D. Hond. in the Berlin Museum. The question here is also whether G. means Gillis or Gisbert. Obviously there are two artists to consider, one of whom paints birds, the other landscapes and sportsmen. Perhaps the first is Gisbert, whose son Melchior also chose birds as his peculiar subject. Weenix too would naturally teach his nephew to study the feathered tribe. Melchior, however, began his career with a different speciality from that by which he is usually known. Mr de Stuers affirms that he produced sea-pieces. One of his earliest works is a "Tub with Fish," dated 1655, in the gallery of Brunswick. But Melchior soon abandoned fish or fowl. He acquired celebrity as a painter of birds only, which he represented not exclusively, like Fyt, as the gamekeeper's perquisite after a day's shooting, or stock of a poulterer's shop, but as living beings with passions, joys, fears and quarrels, to which naturalists will tell us that birds are subject. Without the brilliant tone and high finish of Fyt, his Dutch rival's birds are full of action; and, as Bürger truly says, Hondecoeter displays the maternity of the hen with as much tenderness and feeling as Raphael the maternity of Madonnas. But Fyt was at home in depicting the coat of deer and dogs as well as plumage. Hondecoeter cultivates a narrower field, and seldom goes beyond a cock-fight or a display of mere bird life. Very few of his pictures are dated, though more are signed. Amongst the former we should note the "Jackdaw deprived of his Borrowed Plumes" (1671), at the Hague, of which Earl Cadogan has a variety; or "Game and Poultry" and "A Spaniel hunting a Partridge" (1672), in the gallery of Brussels; or "A Park with Poultry" (1686) at the Hermitage of St Petersburg. Hondecoeter, in great favour with the magnates of the Netherlands, became a member of the painters' academy at the Hague in 1659. William III. employed him to paint his menagerie at Loo, and the picture, now at the Hague museum, shows that he could at a pinch overcome the difficulty of representing India's cattle, elephants and gazelles. But he is better in homelier works, with which he adorned the royal chateaux of Bensberg and Oranienstein at different periods of his life (Hague and Amsterdam). In 1688 Hondecoeter took the freedom of the city of Amsterdam, where he resided till his death. His earliest works are more conscientious, lighter and more transparent than his later ones. At all times he is bold of touch and sure of eye, giving the motion of birds with great spirit and accuracy. His masterpieces are at the Hague and at Amsterdam. But there are fine examples in private collections in England, and in the public galleries of Berlin, Caen, Carlsruhe, Cassel, Cologne, Copenhagen, Dresden, Dublin, Florence, Glasgow, Hanover, London, Lyons, Montpellier, Munich, Paris, Rotterdam, Rouen, St Petersburg, Stuttgart and Vienna.

HONDURAS, a republic of Central America, bounded on the N. by the Caribbean Sea, E. by Nicaragua, S. by Nicaragua, the Pacific Ocean and Salvador, and W. by Guatemala. (For map see CENTRAL AMERICA.) Pop. (1905) 500,136; area, about 46,500 sq. m. Honduras is said to owe its name, meaning in Spanish "depths," to the difficulty experienced by its original Spanish explorers in finding anchorage off its shores; Cape Gracias à Dios (Cape "Thanks to God") is the name bestowed, for analogous reasons, on its easternmost headland, which shelters a small harbour, now included in Nicaragua. Modern navigators are not confronted by the same difficulty; for, although the north coast is unbroken by any remarkable inlet except the Carataska Lagoon, a land-locked lake on the east, with a narrow entrance from the sea, there are many small bays and estuaries, such as those of Puerto Cortes, Omoa, Ulua, La Ceiba and Trujillo, which serve as harbours. The broad basin of the Caribbean Sea, bounded by Honduras, Guatemala and British Honduras, is known as the bay or gulf of Honduras. Several islets and the important group of the Bay Islands (*q.v.*) belong to the republic. On the Pacific the Hondurian littoral is short but of great commercial value; for it consists of a frontage of some 60 m. on the Bay of Fonseca (*q.v.*), one of the finest natural harbours in the world. The islands of Tigre, Sacate Grande and Gueguensi, in the bay, belong to Honduras.

The frontier which separates the republic from Nicaragua extends across the continent from E.N.E to W.S.W. It is defined by the river Segovia, Wanks or Coco, for about one-third of the distance; it then deflects across the watershed on the east and south of the river Choluteca, crosses the main Nicaraguan Cordillera (mountain chain) and follows the river Negro to the Bay of Fonseca. The line of separation from Salvador is irregularly drawn, first in a northerly and then in a westerly direction; beginning at the mouth of the river Goascoran, in the Bay of Fonseca, it ends 12 m. W. of San Francisco city. At this point begins the Guatemalan frontier, the largest section of which is delimited along the crests of the Sierra de Merendon. On the Caribbean seaboard the estuary of the Motagua forms the boundary between Honduras and Guatemala.

Physical Features.—The general aspect of the country is mountainous; its southern half is traversed by a continuation of the main Nicaraguan Cordillera. The chain does not, in this republic, approach within 50 or 60 m. of the Pacific; nor does it throughout maintain its general character of an unbroken range, but sometimes turns back on itself, forming interior basins or valleys, within which are collected the headwaters of the streams that traverse the country in the direction of the Atlantic Ocean. Nevertheless, viewed from the

SpinSmart Software http://www.spinsmart.com

Pacific, it presents the appearance of a great natural wall, with many volcanic peaks towering above it and with a lower range of mountains intervening between it and the sea. It would almost seem that at one time the Pacific broke at the foot of the great mountain barrier, and that the subordinate coast range was subsequently thrust up by volcanic forces. At one point the main range is interrupted by a great transverse valley or plain known as the plain of Comayagua, which has an extreme length of about 40 m., with a width of from 5 to 15 m. From this plain the valley of the river Humuya extends north to the Atlantic, and the valley of the Goascoran extends south to the Pacific. These three depressions collectively constitute a great transverse valley reaching from sea to sea, which was pointed out soon after the conquest as an appropriate course for inter-oceanic communication. The mountains of the northern half of Honduras are not volcanic in character and are inferior in altitude to those of the south, which sometimes exceed 10,000 ft. The relief of all the highlands of the Atlantic watershed is extremely varied; its culminating points are probably in the mountain mass about the sources of the Choluteca, Sulaco and Roman, and in the Sierra de Pija, near the coast. Farther eastward the different ranges are less clearly marked and the surface of the country resembles a plateau intersected by numerous watercourses.

The rivers of the Atlantic slope of Honduras are numerous and some of them of large size and navigable. The largest is the Ulua, with its tributary the Humuya. It rises in the plain of Comayagua and flows north to the Atlantic; it drains a wide expanse of territory, comprehending nearly one-third of the entire state, and probably discharges a greater amount of water into the sea than any other river of Central America, the Segovia excepted. It may be navigated by steamers of light draught for the greater part of its course. The Rio Roman or Aguan is a large stream falling into the Atlantic near Trujillo, with a total length of about 120 m. Its largest tributary is the Rio Mangualil, celebrated for its gold washings, and it may be ascended by boats of light draft for 80 m. Rio Tinto, Negro or Black River, called also Poyer or Poyas, is a considerable stream, navigable by small vessels for about 60 m. Some English settlements were made on its banks during the 18th century. The Patuca rises near the frontier of Nicaragua, and enters the Atlantic east of the Brus or Brewer lagoon. The Segovia is the longest river in Central America, rising within 50 m. of the Bay of Fonseca, and flowing into the Caribbean Sea at Cape Gracias à Dios (see NICARAGUA). Three considerable rivers flow into the Pacific—the Goascoran, Nacaome and Choluteca, the last named having a length of about 150 m. The Goascoran, which almost interlocks with the Humuya, in the plain of Comayagua, has a length of about 80 m. The lake of Yojoa or Taulébe is the only large inland lake in Honduras, and is about 25 m. in length, by 6 to 8 in breadth. Its surface is 2050 ft. above the sea. It has two outlets on the south, the rivers Jaitique and Sacapa, which unite about 15 m. from the lake; and it is drained on the north by the Rio Blanco, a narrow, deep stream falling into the Ulua. It has also a feeder on the north, in the form of a subterranean stream of beautiful clear water, which here comes to the surface. The Caratasca or Caratasca lagoon is a shallow salt-water lake connected by a narrow channel with the Atlantic, and near the mouth of the Segovia. It contains several large sandy islands.

Honduras resembles the neighbouring countries in the general character of its geological formations, fauna and flora. Here, as in other Central American states, there are but two seasons, the wet, from May to November, and the dry, from November to May. On the moist lowlands of the Atlantic coast the climate is oppressive, but on the highlands of the interior it is delightful. At Tegucigalpa, on the uplands, a year's observations showed the maximum temperature to be 96° F. in May, and the minimum to be 50° F. in December, the range of variation during the whole year being within 40° F.

Inhabitants.—The inhabitants of Honduras are in many cases of the Indian or aboriginal type, and the European element is very small, although it shares in the social, political and economic preponderance of the Spanish-speaking half-castes (*Ladinos* or *Mestizos*), who are the most numerous section of the population. Throughout the country there are many interesting relics of the native civilization which was destroyed by the Spanish invaders in the 16th century. In the eastern portion of the state, between the Rio Roman, Cape Gracias à Dios, and the Segovia river, the country is almost exclusively occupied by native Indian tribes, known under the general names of Xicaques and Poyas. In many districts the Indians are known as Lencas, a generic name which includes several tribes akin to the Mayans of Guatemala. Portions of all of these tribes have accepted the Roman Catholic religion, and live in peaceful neighbourhood and good understanding with the white inhabitants. There are, however, considerable numbers, probably about 90,000 in all, who live among the mountains and still conform closely to the aboriginal modes of life. They all cultivate the soil, and are good and industrious labourers. A small portion of the coast, above Cape Gracias, is occupied by the Sambos, a mixed race of Indians and negroes, which, however, is fast disappearing. Spreading along the entire north coast are the Caribs, a vigorous race, descendants of the Caribs of St Vincent, one of the Windward Islands. These, to the number of 5000, were deported in 1796 by the English and landed on the island of Roatan. They still retain their native language, although it tends to disappear and be replaced by Spanish and a bastard dialect of English; they are active, industrious and provident, forming the chief reliance of the mahogany cutters on the coast. A portion of them, who have a mixture of negro blood, are called the Black Caribs. They profess the Roman Catholic religion, but retain many of their native rites and superstitions. In the departments of Gracias, Comayagua and Choluteca are many purely Indian towns.

The aggregate population, according to an official estimate made in 1905, is 500,136, but a complete and satisfactory census cannot be taken throughout the country, since the ignorant masses of the people, and especially the Indians, avoid a census as in some way connected with military conscription or taxation. The bulk of the Spanish population exists on the Pacific slope of the continent, while on the Atlantic declivity the country is uninhabited or but sparsely occupied by Indian tribes, of which the number is wholly unknown. In 1905 there were fewer than 11 inhabitants per sq. m., but all the available data tend to show that the population increases rapidly, owing to the continuous excess of births over deaths. The first census, taken in 1791, gave the total population as only 95,500. There is little emigration or immigration.

Chief Towns.—The capital is Tegucigalpa (pop. 1905, about 35,000); other important towns are Jutigalpa (18,000), Comayagua (8000), and the seaports of Amapala (4000), Trujillo (4000), and Puerto Cortes (2500). These are described in separate articles. The towns of Nacaome, La Esperanza, Choluteca and Santa Rosa have upwards of 10,000 inhabitants.

Communications.—Means of communication are very defective. In 1905 the only railway in the country was that from Puerto Cortes to La Pimienta, a distance of 57 m. This is a section of the proposed inter-oceanic railway for which the external debt of the republic was incurred. For the completion of the line concessions, one after another, were granted, and expired or were revoked. Other railways are projected, including one along the Atlantic coast, an extension from La Pimienta to La Brea on the Pacific, and a line from Tegucigalpa to the port of San Lorenzo. The capital is connected with other towns by fairly well made roads, which, however, are not kept in good repair. In the interior generally, all travelling and transport are by mules and ox-carts over roads which defy description.

Honduras joined the Postal Union in 1879. The telegraph service is conducted by the government and is inefficient. Telephones are in use in Tegucigalpa and a few of the more important towns.

Commerce and Industry.—Although grants of land for mining and agricultural purposes are readily made by the state to companies and individual capitalists, the economic development of Honduras has been a very slow process, impeded as it has been by political disturbances and in modern times by national bankruptcy, heavy import and export duties, and the scarcity of both labour and capital. The natural wealth of the country is great and consists especially in its vegetable products. The mahogany and cedar of Honduras are unsurpassed, but reckless destruction of these and of other valuable cabinet-woods and dye-woods has much reduced the supply available for export. Rubber-planting, a comparatively modern industry, has proved successful, and tends to supplement the almost exhausted stock of wild rubber. Of still greater importance are the plantations of bananas, especially in the northern maritime province of Atlantida, where coco-nuts are also grown. Coffee, tobacco, sugar, oranges, lemons, maize and beans are produced in all parts, rice, cocoa, indigo and wheat over more limited areas. Cattle and pigs are bred extensively; cattle are exported to Cuba, and dairy-farming is carried on with success. Sheep-farming is almost an unknown industry. Turtle and fish are obtained in large quantities off the Atlantic seaboard. In its mineral resources Honduras ranks first among the states of Central America. Silver is worked by a British company, gold by an American company. Gold-washing was practised in a primitive manner even before the Spanish conquest, and in the 18th century immense quantities of gold and silver were obtained by the Spaniards from mines near Tegucigalpa. Opals, platinum, copper, lead, zinc, nickel, antimony, iron, lignite and coal have been found, but the causes already enumerated have

SpinSmart Software http://www.spinsmart.com

prevented the exploitation of any of these minerals on a large scale, and the total value of the ores exported was only £174,800 in 1904 and £239,426 in 1905. The total value of the exports in a normal year ranges from about £500,000 to £600,000, and that of the imports from £450,000 to £550,000. Apart from minerals the most valuable commodity exported is bananas (£209,263 in 1905); coco-nuts, timber, hides, deer-skins, feathers, coffee, sarsaparilla and rubber are items of minor importance. Nearly 90 % of the exports are shipped to the United States, which also send to Honduras more than half of its imports. These chiefly consist of cotton goods, hardware and provisions. The manufacturing industries of Honduras include the plaiting of straw hats, cigar-making, brick-making and the distillation of spirits.

Finance.—Owing to the greater variety of its products and the possession of a metallic currency, Honduras is less affected by fluctuations of exchange than the neighbouring republics, in which little except paper money circulates. The monetary unit is the silver *peso* or dollar of 100 cents, which weighs 25 grammes, ·900 fine, and is worth about 1s. 8d.; the gold dollar is worth about 4s. The principal coins in circulation are the 1-cent copper piece, 5, 10, 20, 25 and 50 cents, and 1 peso silver pieces, and 1, 5, 10 and 20 dollar gold pieces. The metric system of weights and measures, adopted officially on the 1st of April 1897, has not supplanted the older Spanish standards in general use. There is only one bank in the republic, the *Banco de Honduras*, with its head office at Tegucigalpa. Its bills are legal tender for all debts due to the state.

In July 1909 the foreign debt of Honduras, with arrears of interest, amounted to £22,470,510, of which more than £17,000,000 were for arrears of interest. The principal was borrowed between 1867 and 1870, chiefly for railway construction; but it was mainly devoted to other purposes and no interest has been paid since 1872. The republic is thus practically bankrupt. The revenue, derived chiefly from customs and from the spirit, gunpowder and tobacco monopolies reached an average of about £265,000 during the five years 1901–1905; the expenditure in normal years is about £250,000. The principal spending departments are those of war, finance, public works and education.

Constitution and Government.—The constitution of Honduras, promulgated in 1839 and frequently amended, was to a great extent recast in 1880. It was again remodelled in 1894, when a new charter was proclaimed. This instrument gives the legislative power to a congress of deputies elected for four years by popular vote, in the ratio of one member for every 10,000 imhabitants. Congress meets on the 1st of January and sits for sixty consecutive days. The executive is entrusted to the president, who is nominated and elected for four years by popular vote, and is re-eligible for a second but not for a third consecutive term. He is assisted by a council of ministers representing the departments of the interior, war, finance, public works, education and justice. For purposes of local administration the republic is divided into sixteen departments. The highest judicial power is vested in the Supreme Court, which consists of five popularly elected judges; there are also four Courts of Appeal, besides subordinate departmental and district tribunals. The active army consists of about 500 regular soldiers and 20,000 militia, recruited by conscription from all able-bodied males between the ages of twenty and thirty. Service in the reserve is obligatory for a further period of ten years.

Religion and Education.—Roman Catholicism is the creed of a very large majority of the population; but the constitution grants complete liberty to all religious communities, and no Church is supported by public funds or receives any other special privilege. Education is free, secular and compulsory for children between the ages of seven and fifteen. There are primary schools in every convenient centre, but the percentage of illiterates is high, especially among the Indians. The state maintains a central institute and a university at Tegucigalpa, a school of jurisprudence at Comayagua, and colleges for secondary education, with special schools for teachers, in each department. The annual cost of primary education is about £11,000.

History.—It was at Cape Honduras that Columbus first landed on the American continent in 1502, and took possession of the country on behalf of Spain. The first settlement was made in 1524 by order of Hernando Cortes, who had heard rumours of rich and populous empires in this region, and sent his lieutenant Christobal de Olid to found a Spanish colony. Olid endeavoured to establish an independent principality, and, in order to resume control of the settlers, Cortes was compelled to undertake the long and arduous march across the mountains of southern Mexico and Guatemala. In the spring of 1525 he reached the colony and founded the city which is now Puerto Cortes. He entrusted the administration to a new governor, whose successors were to be nominated by the king, and returned to Mexico in 1526. By 1539, when Honduras was incorporated in the captaincy-general of Guatemala, the mines of the province had proved to be the richest as yet discovered in the New World and several large cities had come into existence. The system under which Honduras was administered from 1539 to 1821, when it repudiated the authority of the Spanish crown, the effects of that system, the part subsequently played by Honduras in the protracted struggle for Central American unity, and the invasion by William Walker and his fellow-adventurers (1856–1860), are fully described under CENTRAL AMERICA.

War and revolution had stunted the economic growth of the country and retarded every attempt at social or political reform; its future was mortgaged by the assumption of an enormous burden of debt in 1869 and 1870. A renewal of war with Guatemala in 1871, and a revolution three years later in the interests of the ex-president Medina, brought about the intervention of the neighbouring states and the provisional appointment to the presidency of Marco Aurelio Soto, a nominee of Guatemala. This appointment proved successful and was confirmed by popular vote in 1877 and 1880, when a new constitution was issued and the seat of government fixed at Tegucigalpa. Fresh outbreaks of civil war occurred frequently between 1883 and 1903; the republic was bankrupt and progress again at a standstill. In 1903 Manuel Bonilla, an able, popular and experienced general, gained the presidency and seemed likely to repeat the success of Soto in maintaining order. As his term of office drew to a close, and his re-election appeared certain, the supporters of rival candidates and some of his own dissatisfied adherents intrigued to secure the co-operation of Nicaragua for his overthrow. Bonilla welcomed the opportunity of consolidating his own position which a successful war would offer; José Santos Zelaya, the president of Nicaragua, was equally ambitious; and several alleged violations of territory had embittered popular feeling on both sides. The United States and Mexican governments endeavoured to secure a peaceful settlement without intervention, but failed. At the outbreak of hostilities in February 1907 the Honduran forces were commanded by Bonilla in person and by General Sotero Barahona his minister of war. One of their chief subordinates was Lee Christmas, an adventurer from Memphis, Tennessee, who had previously been a locomotive-driver. Honduras received active support from his ally, Salvador, and was favoured by public opinion throughout Central America. But from the outset the Nicaraguans proved victorious, largely owing to their remarkable mobility. Their superior naval force enabled them to capture Puerto Cortes and La Ceiba, and to threaten other cities on the Caribbean coast; on land they were aided by a body of Hondurian rebels, who also established a provisional government. Zelaya captured Tegucigalpa after severe fighting, and besieged Bonilla in Amapala. Lee Christmas was killed. The surrender of Amapala on the 11th of April practically ended the war. Bonilla took refuge on board the United States cruiser "Chicago." A noteworthy feature of the war was the attitude of the American naval officers, who landed marines, arranged the surrender of Amapala, and prevented Nicaragua prolonging hostilities. Honduras was now evacuated by the Nicaraguans and her provisional government was recognized by Zelaya. Miguel R. Davila was president in 1908 and 1909.

BIBLIOGRAPHY.—Official documents such as the annual presidential message and the reports of the ministries are published in Spanish at Tegucigalpa. Other periodical publications which throw much light on the movement of trade and politics are the British Foreign Office reports (London, annual), United States consular reports (Washington, monthly), bulletins of the Bureau of American Republics (Washington), and reports of the Council of the Corporation of Foreign Bondholders (London, annual). For a more comprehensive account of the country and its history, the works of K. Sapper, E. G. Squier, A. H. Keane and T. Child, cited under CENTRAL AMERICA, are important. See also E. Pelletier, *Honduras et ses ports: documents officiels sur le chemin-de-fer interocéanique* (Paris, 1869); E. G. Squier, *Honduras: Descriptive, Historical and Statistical* (London, 1870); C. Charles, *Honduras* (Chicago, 1890); *Handbook of Honduras*, published by the Bureau of American

Republics (1892); T. R. Lombard, *The New Honduras* (New York, 1887); H. Jalhay, *La République de Honduras* (Antwerp, 1898); Perry, *Directorio nacional de Honduras* (New York, 1899); H. G. Bourgeois, *Breve noticia sobre Honduras* (Tegucigalpa, 1900).

HONE, NATHANIEL (1718–1784), British painter, was the son of a merchant at Dublin, and without any regular training acquired in his youth much skill as a portrait-painter. Early in his career he left Dublin for England and worked first in various provincial towns, but ultimately settled in London, where he soon made a considerable reputation. His oil-paintings were decidedly popular, but he gained his chief success by his miniatures and enamels, which he executed with masterly capacity. He became a member of the Incorporated Society of Artists and afterwards a foundation member of the Royal Academy; but he had several disagreements with his fellow-members of that institution, and on one occasion they rejected two of his pictures, one of which was regarded as a satire on Reynolds and the other on Angelica Kauffman. Most of his contributions to the Academy exhibitions were portraits. The quality of his work varied greatly, but the merit of his miniatures and enamels entitles him to a place among the ablest artists of the British school. He executed also a few mezzo-tint plates of reasonable importance, and some etchings. His portrait, painted by himself two years before his death, is in the possession of the Royal Academy.

HONE, WILLIAM (1780–1842), English writer and bookseller, was born at Bath on the 3rd of June 1780. His father brought up his children with the sectarian narrowness that so frequently produces reaction. Hone received no systematic education, and was taught to read from the Bible only. His father having removed to London in 1783, he was in 1790 placed in an attorney's office. After two and a half years spent in the office of a solicitor at Chatham he returned to London to become clerk to a solicitor in Gray's Inn. But he disliked the law, and had already acquired a taste for free-thought and political agitation. Hone married in 1800, and started a book and print shop with a circulating library in Lambeth Walk. He soon removed to St Martin's Churchyard, where he brought out his first publication, Shaw's *Gardener* (1806). It was at this time that he and his friend, John Bone, tried to realize a plan for the establishment of popular savings banks, and even had an interview on the subject with the president of the Board of Trade. This scheme, however, failed. Bone joined him next in a bookseller's business; but Hone's habits were not those of a tradesman, and bankruptcy was the result. He was in 1811 chosen by the booksellers as auctioneer to the trade, and had an office in Ivy Lane. Independent investigations carried on by him into the condition of lunatic asylums led again to business difficulties and failure, but he took a small lodging in the Old Bailey, keeping himself and his now large family by contributions to magazines and reviews. He hired a small shop, or rather box, in Fleet Street but this was on two separate nights broken into, and valuable books lent for show were stolen. In 1815 he started the *Traveller* newspaper, and endeavoured vainly to exculpate Eliza Fenning, a poor girl, apparently quite guiltless, who was executed on a charge of poisoning. From February 1 to October 25, 1817, he published the *Reformer's Register*, writing in it as the serious critic of the state abuses, which he soon after attacked in the famous political squibs and parodies, illustrated by George Cruikshank. In April 1817 three *ex-officio* informations were filed against him by the attorney-general, Sir William Garrow. Three separate trials took place in the Guildhall before special juries on the 18th, 19th and 20th of December 1817. The first, for publishing Wilkes's *Catechism of a Ministerial Member* (1817), was before Mr Justice Abbot (afterwards Lord Tenterden); the second, for parodying the litany and libelling the prince regent, and the third, for publishing the *Sinecurist's Creed* (1817), a parody on the Athanasian creed, were before Lord Ellenborough (*q.v.*). The prosecution took the ground that the prints were calculated to injure public morals, and to bring the prayer-book and even religion itself into contempt. But there can be no doubt that the real motives of the prosecution were political; Hone had ridiculed the habits and exposed the corruption of the prince regent and of other persons in power. He went to the root of the matter when he wished the jury "to understand that, had he been a publisher of ministerial parodies, he would not then have been defending himself on the floor of that court." In spite of illness and exhaustion Hone displayed great courage and ability, speaking on each of the three days for about seven hours. Although his judges were biassed against him he was acquitted on each count, and the result was received with enthusiastic cheers by immense crowds within and without the court. Soon after the trials a subscription was begun which enabled Hone to get over the difficulties caused by his prosecution. Among Hone's most successful political satires were *The Political House that Jack built* (1819), *The Queen's Matrimonial Ladder* (1820), in favour of Queen Caroline, *The Man in the Moon* (1820), *The Political Showman* (1821), all illustrated by Cruikshank. Many of his squibs are directed against a certain "Dr Slop," a nickname given by him to Dr (afterwards Sir John) Stoddart, of *The Times*. In researches for his defence he had come upon some curious and at that time little trodden literary ground, and the results were shown by his publication in 1820 of his *Apocryphal New Testament*. and in 1823 of his *Ancient Mysteries Explained*. In 1826 he published the *Every-day Book*, in 1827–1828 the *Table-Book*, and in 1829 the *Year-Book*; all three were collections of curious information on manners, antiquities and various other subjects. These are the works by which Hone is best remembered. In preparing them he had the approval of Southey and the assistance of Charles Lamb, but pecuniarily they were not successful, and Hone was lodged in King's Bench prison for debt. Friends, however, again came to his assistance, and he was established in a coffee-house in Gracechurch Street; but this, like most of his enterprises, ended in failure. Hone's attitude of mind had gradually changed to that of extreme devoutness, and during the latter years of his life he frequently preached in Weigh House Chapel, Eastcheap. In 1830 he edited Strutt's *Sports and Pastimes*, and he contributed to the first number of the *Penny Magazine*. He was also for some years sub-editor of the *Patriot*. He died at Tottenham on the 6th of November 1842.

HONE (in O. Eng. *hân*, cognate with Swed. *hen*; the root appears in Skt. *çâna*, *ço* to sharpen), a variety of finely siliceous stone employed for whetting or sharpening edge tools, and for abrading steel and other hard surfaces. Synonyms are hone-stone, whetstone, oilstone and sharpening stone. Hones are generally prepared in the form of flat slabs or small pencils or rods, but some are made with the outline of the special instrument they are designed to sharpen. Their abrading action is due to the quartz or silica which is always present in predominating proportion, some kinds consisting of almost pure quartz, while in others the siliceous element is very intimately mixed with aluminous or calcareous matter, forming a uniform compact stone, the extremely fine siliceous particles of which impart a remarkably keen edge to the instruments for the sharpening of which they are applied. In some cases the presence of minute garnets or magnetite assists in the cutting action. Hones are used either dry, with water, or with oil, and generally the object to be sharpened is drawn with hand pressure backward and forward over the surface of the hone; but sometimes the stone is moved over the cutting edge.

The coarsest type of stone which can be included among hones is the bat or scythe stone, a porous fine-grained sandstone used for sharpening scythes and cutters of mowing machines, and for other like purposes. Next come the ragstones, which consist of quartzose mica-schist, and give a finer edge than any sandstone. Under the head of oilstones or hones proper the most famous and best-known qualities are the German razor hone, the Turkey oilstone, and the Arkansas stone. The German razor hone, used, as its name implies, chiefly for razors, is obtained from the slate mountains near Ratisbon, where it forms a yellow vein of from 1 to 18 in. in the blue slate. It is sawn into thin slabs, and these are cemented to slabs of slate which serve as a support. Turkey oilstone is a close-grained bluish stone

SpinSmart Software http://www.spinsmart.com

containing from 70 to 75% of silica in a state of very fine division, intimately blended with about 20 to 25% of calcite. It is obtained only in small pieces, frequently flawed and not tough, so that the slabs must have a backing of slate or wood. It is one of the most valuable of all whetstones, abrading the hardest steel, and possessing sufficient compactness to resist the pressure required for sharpening gravers. The stone comes from the interior of Asia Minor, whence it is carried to Smyrna. Of Arkansas stones there are two varieties, both found in the same district, Garland and Saline counties, Arkansas, United States. The finer kind, known as Arkansas hone, is obtained in small pieces at the Hot Springs, and the second quality, distinguished as Washita stone, comes from Washita or Ouachita river. The hones yield on analysis 98% of silica, with small proportions of alumina, potash and soda, and mere traces of iron, lime, magnesia and fluorine. They are white in colour, extremely hard and keen in grit, and not easily worn down or broken. Geologically the materials are called novaculites, and are supposed to be metamorphosed sandstone silt, chert or limestone resulting from the permeation through the mass of heated alkaline siliceous waters. The finer kind is employed for fine cutting instruments, and also for polishing steel pivots of watch-wheels and similar minute work, the second and coarser quality being used for common tools. Both varieties are largely exported from the United States in the form of blocks, slips, pencils, rods and wheels. Other honestones are obtained in the United States from New York, New Hampshire, Vermont, Ohio (Deerlick stone) and Indiana (Hindostan or Orange stone). Among hones of less importance in general use may be noted the Charley Forest stone—or Whittle Hill honestone—a good substitute for Turkey oilstone; Water of Ayr stone, Scotch stone, or snake stone, a pale grey carboniferous shale hardened by igneous action, used for tools and for polishing marble and copper-plates; Idwal or Welsh oilstone, used for small articles; and cutlers' greenstone from Snowdon, very hard and close in texture, used for giving the last edge to lancets.

HONEY (Chin. *mē* ; Sansk. *madhu*, mead, honey; cf. A.S. *medo*, *medu*, mead; Gr. μέλι, in which θ or δ is changed into λ; Lat. *mel* ; Fr. *miel* ; A.S. *hunig* ; Ger. *Honig*),[1] a sweet viscid liquid, obtained by bees (see BEE, *Bee-keeping*) chiefly from the nectaries of flowers, *i.e.* those parts of flowers specially constructed for the elaboration of honey, and, after transportation to the hive in the proventriculus or crop of the insects, discharged by them into the cells prepared for its reception. Whether the nectar undergoes any alteration within the crop of the bee is a point on which authors have differed. Some wasps, *e.g.* *Myrapetra scutellaris*[2] and the genus *Nectarina*, collect honey. A honey-like fluid, which consists of a nearly pure solution of uncrystallizable sugar having the formula $C_6H_{14}O_7$ after drying in vacuo, and which is used by the Mexicans in the preparation of a beverage, is yielded by certain inactive individuals of *Myrmecocystus mexicanus*, Wesmael, the honey-ants or pouched ants (*hormigas mieleras* or *mochileras*) of Mexico.[3] The abdomen in these insects, owing to the distensibility of the membrane connecting its segments, becomes converted into a globular thin-walled sac by the accumulation within it of the nectar supplied to them by their working comrades (Wesmael, *Bull. de l'Acad. Roy. de Brux.* v. 766, 1838). By the Rev. H. C. M'Cook, who discovered the insect in the Garden of the Gods, Colorado, the honey-bearers were found hanging by their feet, in groups of about thirty, to the roofs of special chambers in their underground nests, their large globular abdomens causing them to resemble "bunches of small Delaware grapes" (*Proc. Acad. Nat. Sci. Philad.*, 1879, p. 197). A bladder-like formation on the metathorax of another ant, *Crematogaster inflatus* (F. Smith, *Cat. of Hymenoptera*, pt. vi. pp. 136 and 200, pl. ix. fig. 1), which has a small circular orifice at each posterior lateral angle, appears to possess a function similar to that of the abdomen in the honey-ant.

It is a popular saying that where is the best honey there also is the best wool; and a pastoral district, since it affords a greater profusion of flowers, is superior for the production of honey to one under tillage.[4] Dry warm weather is that most favourable to the secretion of nectar by flowers. This they protect from rain by various internal structures, such as papillae, cushions of hairs and spurs, or by virtue of their position (in the raspberry, drooping), or the arrangement of their constituent parts. Dr A. W. Bennett (*How Flowers are Fertilized*, p. 31, 1873) has remarked that the perfume of flowers is generally derived from their nectar; the blossoms of some plants, however, as ivy and holly, though almost scentless, are highly nectariferous. The exudation of a honey-like or saccharine fluid, as has frequently been attested, is not a function exclusively of the flowers in all plants. A sweet material, the manna of pharmacy, *e.g.* is produced by the leaves and stems of a species of ash, *Fraxinus Ornus* ; and honey-secreting glands are to be met with on the leaves, petioles, phyllodes, stipules (as in *Vicia sativa*), or bracteae (as in the *Marcgraviaceae*) of a considerable number of different vegetable forms. The origin of the honey-yielding properties manifested specially by flowers among the several parts of plants has been carefully considered by Darwin, who regards the saccharine matter in nectar as a waste product of chemical changes in the sap, which, when it happened to be excreted within the envelopes of flowers, was utilized for the important object of cross-fertilization, and subsequently was much increased in quantity, and stored in various ways (see *Cross and Self Fertilization of Plants*, pp. 402 sq., 1876). It has been noted with respect to the nectar of the fuchsia that it is most abundant when the anthers are about to dehisce, and absent in the unexpanded flower.

Pettigrew is of opinion that few bees go more than 2 m. from home in search of honey. The number of blossoms visited in order to meet the requirements of a single hive of bees must be very great; for it has been found by A. S. Wilson ("On the Nectar of Flowers," *Brit. Assoc. Rep.*, 1878, p. 567) that 125 heads of common red clover, which is a plant comparatively abundant in nectar, yield but one gramme (15·432 grains) of sugar; and as each head contains about 60 florets, 7,500,000 distinct flower-tubes must on this estimate be exhausted for each kilogramme (2·204 lb) of sugar collected. Among the richer sources of honey are reckoned the apple, asparagus, asters, barberry, basswood (*Tilia americana*), and the European lime or linden (*T. europaea*), beans, bonesets (*Eupatorium*), borage, broom, buckwheat, catnip, or catmint (*Nepeta Cataria*), cherry, cleome, clover, cotton, crocus, currant, dandelion, eucalyptus, figwort (*Scrophularia*), furze, golden-rod (*Solidago*), gooseberry, hawthorn, heather, hepatica, horehound, hyacinth, lucerne, maple, mignonette, mint, motherwort (*Leonurus*), mustard, onion, peach, pear, poplar, quince, rape, raspberry, sage, silver maple, snapdragon, sour-wood (*Oxydendron arboreum*, D.C.), strawberry, sycamore, teasel, thyme, tulip-tree (more especially rich in pollen), turnip, violet and willows, and the "honey-dew" of the leaves of the whitethorn (Bonner), oak, linden, beech and some other trees.

Honey contains dextroglucose and laevoglucose (the former practically insoluble, the latter soluble in ⅛ pt. of cold strong alcohol), cane-sugar (according to some), mucilage, water, wax, essential oil, colouring bodies, a minute quantity of mineral matter and pollen. By a species of fermentation, the cane-sugar is said to be gradually transformed into inverted sugar (laevoglucose with dextroglucose). The pollen, as a source of nitrogen, is of importance to the bees feeding on the honey. It may be obtained for examination as a sediment from a mixture of honey and water. Other substances which have been discovered in honey are mannite (Guibourt), a free acid which precipitates the salts of silver and of lead, and is soluble in water and alcohol (Calloux), and an uncrystallizable sugar, nearly related to inverted sugar (Soubeiran, *Compt. Rend.* xxviii. 774-775, 1849). Brittany honey contains *couvain*, a ferment which determines its active decomposition (Wurtz, *Dict. de Chem.* ii. 430). In the honey of *Polybia apicipennis*, a wasp

[1] The term honey in its various forms is peculiar to the Teutonic group of languages, and in the Gothic New Testament is wanting, the Greek word being there translated *melith*.

[2] See A. White, in *Ann. and Mag. Nat. Hist.* vii. 315, pl. 4.

[3] Wetherill (*Chem. Gaz.* xi. 72, 1853) calculates that the average weight of the honey is 8·2 times that of the body of the ant, or 0·3942 grammes.

[4] Compare Isa. vii. 15, 22, where curdled milk (A.V. "butter") and honey as exclusive articles of diet are indicative of foreign invasion, which turns rich agricultural districts into pasture lands or uncultivated wastes.

SpinSmart Software http://www.spinsmart.com

of tropical America, cane-sugar occurs in crystals of large size (Karsten, *Pogg. Ann.*, C. 550). Dr J. Campbell Brown ("On the Composition of Honey," *Analyst* iii. 267, 1878) is doubtful as to the presence of cane-sugar in any one of nine samples, from various sources, examined by him. The following average percentage numbers are afforded by his analyses: laevulose, 36·45; dextrose, 36·57; mineral matter, ·15; water expelled at 100° C., 18·5, and at a much higher temperature, with loss, 7·81: the wax, pollen and insoluble matter vary from a trace to 2·1%. The specific gravity of honey is about 1·41. The rotation of a polarized ray by a solution of 16·26 grammes of crude honey in 100 c.c. of water is generally from −3·2° to −5° at 60° F.; in the case of Greek honey it is nearly −5·5°. Almost all pure honey, when exposed for some time to light and cold, becomes more or less granular in consistency. Any liquid portion can be readily separated by straining through linen. Honey sold out of the comb is commonly clarified by heating and skimmimg; but according to Bonner it is always best in its natural state. The *mel depuratum* of British pharmacy is prepared by heating honey in a water-bath, and straining through flannel previously moistened with warm water.

The term "virgin-honey" (A.-S., *hunigtear*) is applied to the honey of young bees which have never swarmed, or to that which flows spontaneously from honeycomb with or without the application of heat. The honey obtained from old hives, considered inferior to it in quality, is ordinarily darker, thicker and less pleasant in taste and odour. The yield of honey is less in proportion to weight in old than in young or virgin combs. The far-famed honey of Narbonne is white, very granular and highly aromatic; and still finer honey is that procured from the Corbières Mountains, 6 to 9 m. to the south-west. The honey of Gâtinais is usually white, and is less odorous and granulates less readily than that of Narbonne. Honey from white clover has a greenish-white, and that from heather a rich golden-yellow hue. What is made from honey-dew is dark in colour, and disagreeable to the palate, and does not candy like good honey. "We have seen aphide honey from sycamores," says F. Cheshire (*Pract. Bee-keeping*, p. 74), "as deep in tone as walnut liquor, and where much of it is stored the value of the whole crop is practically *nil*." The honey of the stingless bees (*Meliponia* and *Trigona*) of Brazil varies greatly in quality according to the species of flowers from which it is collected, some kinds being black and sour, and others excellent (F. Smith, *Trans. Ent. Soc.*, 3d ser., i. pt. vi., 1863). That of *Apis Peronii*, of India and Timor, is yellow, and of very agreeable flavour and is more liquid than the British sorts. *A. unicolor*, a bee indigenous to Madagascar, and naturalized in Mauritius and the island of Réunion, furnishes a thick and syrupy, peculiarly scented green honey, highly esteemed in Western India. A rose-coloured honey is stated (*Gard. Chron.*, 1870, p. 1698) to have been procured by artificial feeding. The fine aroma of Maltese honey is due to its collection from orange blossoms. Narbonne honey being harvested chiefly from Labiate plants, as rosemary, an imitation of it is sometimes prepared by flavouring ordinary honey with infusion of rosemary flowers.

Adulterations of honey are starch, detectable by the microscope, and by its blue reaction with iodine, also wheaten flour, gelatin, chalk, gypsum, pipe-clay, added water, cane-sugar and common syrup, and the different varieties of manufactured glucose. Honey sophisticated with glucose containing copperas as an impurity is turned of an inky colour by liquids containing tannin, as tea. Elm leaves have been used in America for the flavouring of imitation honey. Stone jars should be employed in preference to common earthenware for the storage of honey, which acts upon the lead glaze of the latter.

Honey is mildly laxative in properties. Some few kinds are poisonous, as frequently the reddish honey stored by the Brazilian wasp *Nectarina* (*Polistes*, Latr.[1]) *Lecheguana*, Shuck., the effects of which have been vividly described by Aug. de Saint-Hilaire,[2] the spring honey of the wild bees of East Nepaul, said to be rendered noxious by collection from rhododendron flowers (Hooker, *Himalayan Journals*, i. 190, ed. 1855), and the honey of Trebizond, which from its source, the blossoms, it is stated, of *Azalea pontica* and *Rhododendron ponticum* (perhaps to be identified with Pliny's *Aegolethron*), acquires the qualities of an irritant and intoxicant narcotic, as described by Xenophon (*Anab.* iv. 8). Pliny (*Nat. Hist.* xxi. 45) describes as noxious a livid-coloured honey found in Persia and Gaetulia. Honey obtained from *Kalmia latifolia*, L., the calico bush, mountain laurel or spoon-wood of the northern United States, and allied species, is reputed deleterious; also that of the sour-wood is by some good authorities considered to possess undeniable griping properties; and G. Bidie (*Madras Quart. Journ. Med. Sci.*, Oct, 1861, p. 399) mentions urtication, headache, extreme prostration and nausea, and intense thirst among the symptoms produced by a small quantity only of a honey from Coorg jungle. A South African species of *Euphorbia*, as was experienced by the missionary Moffat (*Miss. Lab.* p. 32, 1849), yields a poisonous honey. The nectar of certain flowers is asserted to cause even in bees a fatal kind of vertigo. As a demulcent and flavouring agent, honey is employed in the *oxymel*, *oxymel scillae*, *mel boracis*, *confectio piperis*, *conf. scammonii* and *conf. terebinthinae* of the *British Pharmacopoeia*. To the ancients honey was of very great importance as an article of diet, being almost their only available source of sugar. It was valued by them also for its medicinal virtues; and in recipes of the Saxon and later periods it is a common ingredient.[3] Of the eight kinds of honey mentioned by the great Indian surgical writer Susruta, four are not described by recent authors, viz. *argha* or wild honey, collected by a sort of yellow bee; *chhatra*, made by tawny or yellow wasps; *audâlaka*, a bitter and acrid honey-like substance found in the nest of white ants; and *dâla* or unprepared honey occurring on flowers. According to Hindu medical writers, honey when new is laxative, and when more than a year old astringent (U. C. Dutt, *Mat. Med. of the Hindus*, p. 277, 1877). Ceromel, formed by mixing at a gentle heat one part by weight of yellow wax with four of clarified honey, and straining, is used in India and other tropical countries as a mild stimulant for ulcers in the place of animal fats, which there rapidly become rancid and unfit for medicinal purposes. The *Koran*, in the chapter entitled "The Bee," remarks with reference to bees and their honey: "There proceedeth from their bellies a liquor of various colour, wherein is a medicine for men" (Sale's *Koran*, chap. xvi.). Pills prepared with honey as an excipient are said to remain unindurated, however long they may be kept (*Med. Times*, 1857, i. 269). Mead, of yore a favourite beverage in England (vol. iv. p. 264), is made by fermentation of the liquor obtained by boiling in water combs from which the honey has been drained. In the preparation of sack-mead, an ounce of hops is added to each gallon of the liquor, and after the fermentation a small quantity of brandy. Metheglin, or hydromel, is maufactured by fermenting with yeast a solution of honey flavoured with boiled hops (see Cooley, *Cyclop.*). A kind of mead is largely consumed in Abyssinia (vol. i. p. 64), where it is carried on journeys in large horns (Stern, *Wanderings*, p. 317, 1862). In Russia a drink termed *lipez* is made from the delicious honey of the linden. The *mulsum* of the ancient Romans consisted of honey, wine and water boiled together. The *clarre*, or *piment*, of Chaucer's time was wine mixed with honey and spices, and strained till clear; a similar drink was *bracket*, made with wort of ale instead of wine. L. Maurial (*L'Insectologie Agricole* for 1868, p. 206) reports unfavourably as to the use of honey for the production of alcohol; he recommends it, however, as superior to sugar for the thickening of liqueurs, and also as a means of sweetening imperfectly ripened vintages. It is occasionally employed for giving strength and flavour to ale. In ancient Egypt it was valued as an embalming material; and in the East, for the preservation of fruit, and the making of cakes, sweetmeats,

[1] *Mémoires du Muséum*, xi. 313 (1824).

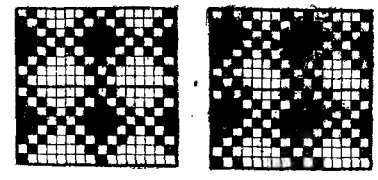
[2] *Ib.* xii. 293, pl. xii. fig. B (1825). The honey, according to Lassaigne (*ib.* ix. 319), is almost entirely soluble in alcohol.

[3] For a list of fifteen treatises concerning honey, dating from 1625 to 1868, see Waring, *Bibl. Therap.* ii. 559, New Syd. Soc. (1879). On sundry ancient uses for honey, see Beckmann, *Hist. of Invent.* i. 287 (1846).

SpinSmart Software http://www.spinsmart.com

and other articles of food, it is largely consumed. Grafts, seeds and birds' eggs, for transmission to great distances, are sometimes packed in honey. In India a mixture of honey and milk, or of equal parts of curds, honey and clarified butter (Sansk., *madhu-parka*), is a respectful offering to a guest, or to a bridegroom on his arrival at the door of the bride's father; and one of the purificatory ceremonies of the Hindus (Sansk., *madhu-prāsana*) is the placing of a little honey in the mouth of a newborn male infant. Honey is frequently alluded to by the writers of antiquity as food for children; it is not to this, however, as already mentioned, that Isa. vii. 15 refers. Cream or fresh butter together with honey, and with or without bread, is a favourite dish with the Arabs.

Among the observances at the Fandròana or New Year's Festival, in Madagascar, is the eating of mingled rice and honey by the queen and her guests; in the same country honey is placed in the sacred water of sprinkling used at the blessing of the children previous to circumcision (Sibree, *The Great African Is.* pp. 219, 314, 1880). Honey was frequently employed in the ancient religious ceremonies of the heathen, but was forbidden as a sacrifice in the Jewish ritual (Lev. ii. 11). With milk or water it was presented by the Greeks as a libation to the dead (*Odyss.* xi. 27; Eurip. *Orest.* 115). A honey-cake was the monthly food of the fabled serpent-guardian of the Acropolis (Herod. viii. 41). By the aborigines of Peru honey was offered to the sun.



The Hebrew word translated "honey" in the authorized version of the English Bible is *debash*, practically synonymous with which are *ja'ar* or *ja'arith had-debash* (1 Sam. xix. 25-27; cf. Cant. v. 1) and *nopheth* (Ps. xix. 10, &c.), rendered "honey-comb." *Debash* denotes bee-honey (as in Deut. xxxii. 13 and Jud. xiv. 8); the manna of trees, by some writers considered to have been the "wild honey" eaten by John the Baptist (Matt. iii. 4); the syrup of dates or the fruits themselves; and probably in some passages (as Gen. xliii. 11 and Ez. xxvii. 17) the syrupy boiled juice of the grape, resembling thin molasses, in use in Palestine, especially at Hebron, under the name of *dibs* (see Kitto, *Cyclop.*, and E. Robinson, *Bibl. Res.* ii. 81). Josephus (*B.J.*, iv. 8, 3) speaks highly of a honey produced at Jericho, consisting of the expressed juice of the fruit of palm trees; and Herodotus (iv. 194) mentions a similar preparation made by the Gyzantians in North Africa, where it is still in use. The honey most esteemed by the ancients was that of Mount Hybla in Sicily, and of Mount Hymettus in Attica (iii. 59). Mahaffy (*Rambles in Greece*, p. 148, 2nd ed., 1878) describes the honey of Hymettus as by no means so good as the produce of other parts of Greece—not to say of the heather hills of Scotland and Ireland. That of Thebes, and more especially that of Corinth, which is made in the thymy hills towards Cleonae, he found much better (cf. xi. 88). Honey and wax, still largely obtained in Corsica (vi. 440), were in olden times the chief productions of the island. In England, in the 13th and 14th centuries, honey sold at from about 7d. to 1s. 2d. a gallon, and occasionally was disposed of by the swarm or hive, or *ruscha* (Rogers, *Hist. of Agric. and Prices in Eng.*, i. 418). At Wrexham, Denbigh, Wales, two honey fairs are annually held, one on the Thursday next after the 1st of September, and the other—the more recently instituted and by far the larger—on the Thursday following the first Wednesday in October. In Hungary the amounts of honey and of wax are in favourable years respectively about 190,000 and 12,000 cwt., and in unfavourable years, as, *e.g.* 1874, about 12,000 and 3000 cwt. The hives there in 1870 numbered 617,407 (or 40 per 1000 of the population, against 45 in Austria). Of these 365,711 were in Hungary Proper, and 91,348 (87 per 1000 persons) in the Military Frontier (Keleti, *Übersicht der Bevölk. Ungarns*, 1871; Schwicker, *Statistik d. K. Ungarn*, 1877). In Poland the system of bee-keeping introduced by Dolinowski has been found to afford an average of 40 lb of honey and wax and two new swarms per hive, the common peasant's hive yielding, with two swarms, only 3 lb of honey and wax. In forests and places remote from villages in Podolia and parts of Volhynia, as many as 1000 hives may be seen in one apiary. In the district of Ostrolenka, in the government of Plock, and in the woody region of Polesia, in Lithuania, a method is practised of rearing bees in excavated trunks of trees (Stanton, "On the Treatment of Bees in Poland," *Technologist*, vi. 45, 1866). When, in August, in the loftier valleys of Bormio, Italy, flowering ceases, the bees in their wooden hives are by means of spring-carts transported at night to lower regions, where they obtain from the buckwheat crops the inferior honey which serves them for winter consumption (*Ib.* p. 38).

In Palestine, "the land flowing with milk and honey"[1] (Ex. iii. 17; Numb. xiii. 27), wild bees are very numerous, especially in the wilderness of Judaea, and the selling of their produce, obtained from crevices in rocks, hollows in trees and elsewhere, is with many of the inhabitants a means of subsistence. Commenting on 1 Sam. xiv. 26, J. Roberts (*Oriental Illust.*) remarks that in the East "the forests literally flow with honey; large combs may be seen hanging on the trees, as you pass along, full of honey." In Galilee, and at Bethlehem and other places in Palestine, bee-keeping is extensively carried on. The hives are sun-burnt tubes of mud, about 4 ft. in length and 8 in. in diameter, and, with the exception of a small central aperture for the passage of the bees, closed at each end with mud. These are laid together in long rows, or piled pyramidally, and are protected from the sun by a covering of mud and of boughs. The honey is extracted, when the ends have been removed, by means of an iron hook. (See Tristram, *Nat. Hist. of the Bible*, pp. 322 sqq., 2nd ed., 1868). Apiculture in Turkey is in a very rude condition. The Bali-dagh, or "Honey Mount," in the plain of Troy, is so called on account of the numerous wild bees tenanting the caves in its precipitous rocks to the south. In various regions of Africa, as on the west, near the Gambia, bees abound. Cameron was informed by his guides that the large quantities of honey at the cliffs by the river Makanyazi were under the protection of an evil spirit, and not one of his men could be persuaded to gather any (*Across Africa*, i. 266). On the precipitous slopes of the Teesta valley, in India, the procuring of honey from the pendulous bees'-nests, which are sometimes large enough to be conspicuous features at a mile's distance, is the only means by which the idle poor raise their annual rent (Hooker, *Him. Journ.* ii. 41).

To reach the large combs of *Apis dorsata* and *A. testacea*, the natives of Timor, by whom both the honey and young bees are esteemed delicacies, ascend the trunks of lofty forest trees by the use of a loop of creeper. Protected from the myriads of angry insects by a small torch only, they detach the combs from the under surface of the branches, and lower them by slender cords to the ground (Wallace, *Journ. Linn. Soc.*, Zool., vol. xi.). (F. H. B.)

HONEYCOMB, a cloth, so called because of the particular arrangement of the crossing of the warp and weft threads which form cells somewhat similar to those of the real honeycomb. They differ from the latter in that they are rectangular instead of hexagonal. The bottom of the cell is formed by those threads and picks which weave "plain," while the ascending sides of the figure are formed by the gradually increasing length of float of the warp and weft yarns.

The figure shows two of the commonest designs which are used for these cloths, design A being what is often termed the "perfect honeycomb"; in the figure it will be seen that the highest number of successive white squares is seven, while the corresponding highest number of successive black squares is five. Two of each of these maximum floats form the top or highest edges of the cell, and the number of successive like squares decreases as the bottom of the cell is reached when the floats are one of black and one of white (see middle of design, &c.). The weave produces a reversible cloth, and it is extensively used for the embellishment of quilts and other fancy goods. It is also largely used in the manufacture of cotton and linen towels. B is, for certain purposes, a more suitable weave than A, but both are very largely used for the latter class of goods.

A B

HONEY-EATER, or HONEY-SUCKER, names applied by many writers in a very loose way to a large number of birds, some of which, perhaps, have no intimate affinity; here they are used in a more restricted sense for what, in the opinion of a good many recent authorities,[2] should really be deemed the family *Meliphagidae*—excluding therefrom the *Nectariniidae* or SUN-BIRDS (*q.v.*) as well as the genera *Promerops* and *Zosterops* with whatever allies they may possess. Even with this restriction, the extent of the family must be regarded as very indefinite, owing to the absence of materials sufficient for arriving at a satisfactory conclusion, though the existence of such a family is probably indisputable. Making allowance, then, for the imperfect light in which they must at present be viewed, what are here called *Meliphagidae* include some of the most characteristic forms of the ornithology of the great Australian region—members of the family inhabiting almost every part of it, and a single species only, *Ptilotis limbata*, being said to occur outside its limits. They all possess, or are supposed to possess, a long

[1] In Sanskrit, *madhu-kulyā*, a stream of honey, is sometimes used to express an overflowing abundance of good things (Monier Williams, *Sansk.-Eng. Dict.*, p. 736, 1872).

[2] Among them especially A. R. Wallace, *Geogr. Distr. Animals*, ii 275.

SpinSmart Software http://www.spinsmart.com

protrusible tongue with a brush-like tip, differing, it is believed, in structure from that found in any other bird—*Promerops* perhaps excepted—and capable of being formed into a suctorial tube, by means of which honey is absorbed from the nectary of flowers, though it would seem that insects attracted by the honey furnish the chief nourishment of many species, while others undoubtedly feed to a greater or less extent on fruits. The *Meliphagidae*, as now considered, are for the most part small birds, never exceeding the size of a missel thrush; and they have been divided into more than 20 genera, containing above 200 species, of which only a few can here be particularized. Most of these species have a very confined range, being found perhaps only on a single island or group of islands in the region, but there are a few which are more widely distributed—such as *Glycyphila rufifrons*, the white-throated[1] honey-eater, found over the greater part of Australia and Tasmania. In plumage they vary much. Most of the species of *Ptilotis* are characterized by a tuft of white, or in others of yellow, feathers springing from behind the ear. In the greater number of the genus *Myzomela*[2] the males are recognizable by a gorgeous display of crimson or scarlet, which has caused one species, *M. sanguinolenta*, to be known as the soldier-bird to Australian colonists; but in others no brilliant colour appears, and those of several genera have no special ornamentation, while some have a particularly plain appearance. One of the most curious forms is *Prosthemadera*—the tui or parson-bird of New Zealand, so called from the two tufts of white feathers which hang beneath its chin in great contrast to its dark silky plumage, and suggest a likeness to the bands worn by ministers of several religious denominations when officiating.[3] The bell-bird of the same island, *Anthornis melanura*—whose melody excited the admiration of Cook the morning after he had anchored in Queen Charlotte's Sound—is another member of this family, and unfortunately seems to be fast becoming extinct. But it would be impossible here to enter much further into detail, though the wattle-birds, *Anthochaera*, of Australia have at least to be named. Mention, however, must be made of the friar-birds, *Tropidorhynchus*, of which nearly a score of species, five of them belonging to Australia, have been described. With their stout bills, mostly surmounted by an excrescence, they seem to be the most abnormal forms of the family, and most of them are besides remarkable for the baldness of some part at least of their head. They assemble in troops, sitting on dead trees, with a loud call, and are very pugnacious, frequently driving away hawks and crows. A. R. Wallace (*Malay Archipelago*, ii. 150-153) discovered the curious fact that two species of this genus—*T. bourensis* and *T. subcornutus*—respectively inhabiting the islands of Bouru and Ceram, were the object of natural "mimicry" on the part of two species of oriole of the genus *Mimeta*, *M. bourouensis* and *M. forsteni*, inhabiting the same islands, so as to be on a superficial examination identical in appearance—the honey-eater and the oriole of each island presenting exactly the same tints—the black patch of bare skin round the eyes of the former, for instance, being copied in the latter by a patch of black feathers, and even the protuberance on the beak of the *Tropidorhynchus* being imitated by a similar enlargement of the beak of the *Mimeta*. The very reasonable explanation which Wallace offers is that the pugnacity of the former has led the smaller birds of prey to respect it, and it is therefore an advantage for the latter, being weaker and less courageous, to be mistaken for it. (A. N.)

[1] The young of this species has the throat yellow.

[2] W. A. Forbes published a careful monograph of this genus in the *Proceedings of the Zoological Society* for 1879, pp. 256-279.

[3] This bird, according to Sir Walter Buller (*Birds of New Zealand*, p. 88), while uttering its wild notes, indulges in much gesticulation, which adds to the suggested resemblance. It has great power of mimicry, and is a favourite cage-bird both with the natives and colonists. On one occasion, says Buller, he had addressed a large meeting of Maories on a matter of considerable political importance, when "immediately on the conclusion of my speech, and before the old chief to whom my arguments were chiefly addressed had time to reply, a tui, whose netted cage hung to a rafter overhead, responded in a clear, emphatic way, 'Tito!' (false). The circumstance naturally caused much merriment among my audience, and quite upset the gravity of the venerable old chief, Nepia Taratoa. 'Friend,' said he, laughing, 'your arguments are very good; but my *mokai* is a very wise bird, and he is not yet convinced!'"

HONEY-GUIDE, a bird so called from its habit of pointing out to man and to the ratel (*Mellivora capensis*) the nests of bees. Stories to this effect have been often told, and may be found in the narratives of many African travellers, from Bruce to Livingstone. But Layard says (*B. South Africa*, p. 242) that the birds will not infrequently lead any one to a leopard or a snake, and will follow a dog with vociferations, though its noisy cry and antics unquestionably have in many cases the effect signified by its English name. If not its first discoverer, Sparrman, in 1777, was the first who described and figured this bird, which he met with in the Cape Colony (*Phil. Trans.*, lxvii. 42-47, pl. i.), giving it the name of *Culculus indicator*, its zygodactylous feet with the toes placed in pairs—two before and two behind—inducing the belief that it must be referred to that genus. Vieillot in 1816 elevated it to the rank of a genus, *Indicator*; but it was still considered to belong to the family *Cuculidae* (its asserted parasitical habits lending force to that belief) by all systematists except Blyth and Jerdon, until it was shown by Blanford (*Obs. Geol. and Zool. Abyssinia*, pp. 308, 309) and Sclater (*Ibis*, 1870, pp. 176-180) that it was more allied to the barbets, *Capitonidae*, and, in consequence, was then made the type of a distinct family, *Indicatoridae*. In the meanwhile other species had been discovered, some of them differing sufficiently to warrant Sundevall's foundation of a second genus, *Prodotiscus*, of the group. The honey-guides are small birds, the largest hardly exceeding a lark in size, and of plain plumage, with what appears to be a very sparrow-like bill. Bowdler Sharpe, in a revision of the family published in 1876 (*Orn. Miscellany*, i. 192-209), recognizes ten species of the genus *Indicator*, to which another was added by Dr Reichenow (*Journ. für Ornithologie*, 1877, p. 110), and two of *Prodotiscus*. Four species of the former, including *I. sparrmani*, which was the first made known, are found in South Africa, and one of the latter. The rest inhabit other parts of the same continent, except *I. archipelagicus*, which seems to be peculiar to Borneo, and *I. xanthonotus*, which occurs on the Himalayas from the borders of Afghanistan to Bhutan. The interrupted geographical distribution of this genus is a very curious fact, no species having been found in the Indian or Malayan peninsula to connect the outlying forms with those of Africa, which must be regarded as their metropolis. (A. N.)

HONEY LOCUST, the popular name of a tree, *Gleditsia triacanthos*, a member of the natural order Leguminosae, and a native of the more eastern United States of North America. It reaches from 75 to 140 ft. in height with a trunk 2 or 3, or sometimes 5 or 6 ft. in diameter, and slender spreading branches which form a broad, flattish crown. The branchlets bear numerous simple or three-forked (whence the species-name *triacanthos*) sharp stiff spines, 3 to 4 in. long, at first red in colour, then chestnut brown; they are borne above the leaf-axils and represent undeveloped branchlets; sometimes they are borne also on the trunk and main branches. The long-stalked leaves are 7 to 8 in. long with eight to fourteen pairs of narrowly oblong leaflets. The flowers, which are of two kinds, are borne in racemes in the leaf-axils; the staminate flowers in larger numbers. The brown pods are often 12 to 18 in. long, have thin, tough walls, and contain a quantity of pulp between the seeds; they contract spirally when drying. The tree was first cultivated in Europe towards the end of the 17th century by Bishop Compton in his garden at Fulham, near London, and is now extensively planted as an ornamental tree. The name of the genus commemorates Johann Gottlieb Gleditsch (1714–1786), a friend of Linnaeus, and the author of one of the earliest works on scientific forestry.

HONEYMOON, the first month after marriage. Lord Avebury in his *Origin of Civilization* suggests that the seclusion usually associated with this period is a survival of marriage by capture, and answers to the period during which the husband kept his wife in retirement, to prevent her from appealing to her relatives

SpinSmart Software http://www.spinsmart.com

for release. Others suggest that as the moon commences to wane as soon as it is at its full, so does the mutual affection of the wedded pair, the "honeymoon" (with this derivation) not necessarily referring to any definite period of time.

HONEYSUCKLE (Mid. Eng., *honysocle, i.e.* any plant from which honey may be sucked,—cf. A.-S. *huni-suge*, privet; Ger. *Geissblatt*; Fr. *chèvrefeuille*), botanical name *Lonicera*, a genus of climbing, erect or prostrate shrubs, of the natural order *Caprifoliaceae*, so named after the 16th-century German botanist Adam Lonicer. The British species is *L. Periclymenum*, the woodbine; *L. Caprifolium* and *L. Xylosteum* are naturalized in a few counties in the south and east of England. Some of the garden varieties of the woodbine are very beautiful, and are held in high esteem for their delicious fragrance, even the wild plant, with its pale flowers, compensating for its sickly looks "with never-cloying odours." The North American sub-evergreen *L. sempervirens*, with its fine heads of blossoms, commonly called the trumpet honeysuckle, the most handsome of all the cultivated honeysuckles, is a distinct and beautiful species producing both scarlet and yellow flowered varieties, and the Japanese *L. flexuosa* var. *aureo-reticulata* is esteemed for its charmingly variegated leaves netted with golden yellow. The fly honeysuckle, *L. Xylosteum*, a hardy shrub of dwarfish, erect habit, and *L. tatarica*, of similar habit, both European, are amongst the oldest English garden shrubs, and bear axillary flowers of various colours, occurring two on a peduncle. There are numerous other species, many of them introduced to our gardens, and well worth cultivating in shrubberies or as climbers on walls and bowers, either for their beauty or the fragrance of their blossoms.

Honeysuckle.—(*a*) Flowering branch; (*b*) flower, nat. size; (*c*) fruit, slightly reduced.

In the western counties of England, and generally by agriculturists, the name honeysuckle is applied to the meadow clover, *Trifolium pratense*. Another plant of the same family (Leguminosae) *Hedysarum coronarium*, a very handsome hardy biennial often seen in old-fashioned collections of garden plants, is commonly called the French honeysuckle. The name is moreover applied with various affixes to several other totally different plants. Thus white honeysuckle and false honeysuckle are names for the North American *Azalea viscosa*; Australian or heath honeysuckle is the Australian *Banksia serrata*, Jamaica honeysuckle, *Passiflora laurifolia*, dwarf honeysuckle the widely spread *Cornus suecica*, Virgin Mary's honeysuckle the European *Pulmonaria officinalis*, while West Indian honeysuckle is *Tecoma capensis*, and is also a name applied to *Desmodium*.

The wood of the fly honeysuckle is extremely hard, and the clear portions between the joints of the stems, when their pith has been removed, were stated by Linnaeus to be utilized in Sweden for making tobacco-pipes. The wood is also employed to make teeth for rakes; and, like that of *L. tatarica*, it is a favourite material for walking-sticks.

Honeysuckles (*Lonicera*) flourish in any ordinary garden soil, but are usually sadly neglected in regard to pruning. This should be done about March, cutting out some of the old wood, and shortening back some of the younger growths of the preceding year. (J. Ws.)

HONFLEUR, a seaport of north-western France, in the department of Calvados, 57 m. N.E. of Caen by rail. Pop. (1906) 8735. The town is situated at the foot of a semicircle of hills, on the south shore of the Seine estuary, opposite Havre, with which it communicates by steamboat. Honfleur, with its dark narrow lanes and old houses, has the typical aspect of an old-fashioned seaport. The most noteworthy of its buildings is the church of St Catherine, constructed entirely of timber work, with the exception of the façade added in the 18th century, and consisting of two parallel naves, of which the more ancient is supposed to date from the end of the 15th century. Within the church are several antique statues and a painting by J. Jordaens—"Jesus in the Garden of Gethsemane." The church tower stands on the other side of a street. St Leonard's dates from the 17th century, with the exception of its fine ogival portal and rose-window belonging to the 16th, and its octagonal tower erected in the 18th. The ruins of a 16th-century castle known as the Lieutenance and several houses of the same period are also of antiquarian interest. The hôtel de ville contains a library and a museum. On the rising ground above the town is the chapel of Nôtre-Dame-de-Grâce, a shrine much resorted to by pilgrim sailors, which is said to have been founded in 1034 by Robert the Magnificent of Normandy and rebuilt in 1606. The town has a tribunal and a chamber of commerce and a communal college. The port, which is protected from the west winds by the height known as the Côte de Grâce, consists of the tidal harbour and four floating basins—The West basin, dating from the 17th century, and the Centre, East and Carnot basins. A reservoir affords the means of sluicing the channel and supplying the basins. The surface available for vessels is about 27 acres. Numerous fishing and coasting vessels frequent the harbour. In 1907 there entered 375 vessels, of 133,872 tons, more than half this tonnage being British. The exports go mainly to England and include poultry, butter, eggs, cheese, chocolate, vegetables, fruit, seeds and purple ore. There is regular communication by steamer with Southampton. Timber from Scandinavia, English coal and artificial manures form the bulk of the imports. There are important saw-mills, as well as shipbuilding yards, manufactories of chemical manures and iron foundries.

Honfleur dates from the 11th century and is thus four or five hundred years older than its rival Havre, by which it was supplanted during the 18th century. During the Hundred Years' War it was frequently taken and re-taken, the last occupation by the English ending in 1440. In 1562 the Protestant forces got possession of it only after a regular siege of the suburb of St Léonard; and though Henry IV. effected its capture in 1590 he had again to invest it in 1594 after all the rest of Normandy had submitted to his arms. In the earlier years of the 17th century Honfleur colonists founded Quebec, and Honfleur traders established factories in Java and Sumatra and a fishing establishment in Newfoundland.

HONG-KONG (properly HIANG-KIANG, the place of "sweet lagoons"), an important British island-possession, situated off the south-east coast of China, opposite the province of Kwang-tung, on the east side of the estuary of the Si-kiang, 38 m. E. of Macao and 75 S.E. of Canton, between 22° 9′ and 22° 1′ N., and 114° 5′ and 114° 18′ E. It is one of a small cluster named by the Portuguese "Ladrones" or Thieves, on account of the notorious habits of their old inhabitants. Extremely irregular in outline, it has an area of 29 sq. m., measuring 10½ m. in extreme length from N.E. to S.W., and varying in breadth from 2 to 5 m. A good military road about 22 m. long encircles the island. From the mainland it is separated by a narrow channel, which at Hong-Kong roads, between Victoria, the island capital, and Kowloon Point, is about 1 m. broad, and which narrows at Ly-ee-mun Pass to little over a ¼ m. The southern coast in particular is deeply indented; and there two bold peninsulas, extending for several miles into the sea, form two capacious natural harbours, namely, Deep Water Bay, with the village of Stanley to the east, and Tytam Bay, which has a safe, well-protected entrance showing a depth of

SpinSmart Software http://www.spinsmart.com

10 to 16 fathoms. An in-shore island on the west coast, called Aberdeen, or Taplishan, affords protection to the Shekpywan or Aberdeen harbour, an inlet provided with a granite graving dock, the caisson gate of which is 60 ft. wide, and the Hope dock, opened in 1867, with a length of 425 ft. and a depth of 24 ft. Opposite the same part of the coast, but nearly 2 m. distant, rises the largest of the surrounding islands, Lamma, whose conspicuous peak, Mount Stenhouse, attains a height of 1140 ft. and is a landmark for local navigation. On the northern shore of Hong-Kong there is a patent slip at East or Matheson Point, which is serviceable during the north-east monsoon, when sailing vessels frequently approach Victoria through the Ly-ee-mun Pass. The ordinary course for such vessels is from the westward, on which side they are sheltered by Green Island and Kellett Bank. There is good anchorage throughout the entire channel separating the island from the mainland, except in the Ly-ee-mun Pass, where the water is deep; the best anchorage is in Hong-Kong roads, in front of Victoria, where, over good holding ground, the depth is 5 to 9 fathoms. The inner anchorage of Victoria Bay, about ½ m. off shore and out of the strength of the tide, is 6 to 7 fathoms. Victoria, the seat of government and of trade, is the chief centre of population, but a tract on the mainland is covered with public buildings and villa residences. Practically an outlying suburb of Victoria, Kowloon or (Nine Dragons) is free from the extreme heat of the capital, being exposed to the south-west monsoon. Numerous villas have also been erected along the beautiful western coast of the island, while Stanley, in the south, is favoured as a watering-place.

The island is mountainous throughout, the low granite ridges, parted by bleak, tortuous valleys, leaving in some places a narrow strip of level coast-land, and in others overhanging the sea in lofty precipices. From the sea, and especially from the magnificent harbour which faces the capital, the general aspect of Hong-Kong is one of singular beauty. Inland the prospect is wild, dreary and monotonous. The hills have a painfully bare appearance from the want of trees. The streams, which are plentiful, are traced through the uplands and glens by a line of straggling brushwood and rank herbage. Nowhere is the eye relieved by the evidences of cultivation or fertility. The hills, which are mainly composed of granite, serpentine and syenite, rise in irregular masses to considerable heights, the loftiest point, Victoria Peak, reaching an altitude of 1825 ft. The Peak lies immediately to the south-west of the capital, in the extreme north-west corner of the island, and is used as a station for signalling the approach of vessels. Patches of land, chiefly around the coast, have been laid under rice, sweet potatoes and yams, but the island is hardly able to raise a home-supply of vegetables. The mango, lichen, pear and orange are indigenous, and several fruits and esculents have been introduced. One of the chief products is building-stone, which is quarried by the Chinese. The animals are few, comprising a land tortoise, the armadillo, a species of boa, sevéral poisonous snakes and some woodcock. The public works suffer from the ravages of white ants. Water everywhere abounds, and is supplied to the shipping by means of tanks.

Under the Peking Treaty of 1860 the peninsula of Kowloon (about 5 m. in area) was added to Hong-Kong. The population is about 27,000. There are several docks and warehouses, and manufactures are being developed. Granite is quarried in the peninsula. An agreement was entered into in 1898 whereby China leased to Great Britain for ninety-nine years the territory behind Kowloon peninsula up to a line drawn from Mirs Bay to Deep Bay and the adjoining islands, including Lantao. The new district, which extends to 376 sq. m. in area, is mountainous, with extensive cultivated valleys of great fertility, and the coast-line is deeply indented by bays. The alluvial soil of the valleys yields two crops of rice in the year. Sugar-cane, indigo, hemp, peanuts, potatoes of different varieties, yam, taro, beans, sesamum, pumpkins and vegetables of all kinds are also grown. The mineral resources are as yet unknown. The population is estimated at about 100,000. It consists of Puntis (or Cantonese), Hakkas ("strangers") and Tankas. The Puntis are agricultural and inhabit the valleys, and they make excellent traders. The Hakkas are a hardy and frugal race, belonging mainly to the hill districts. The Tankas are the boat people or floating population. In the government of the new territory the existing organization is as far as possible utilized.

Mainland territory.

Hong-Kong or Victoria harbour constantly presents an animated appearance, as many as 240 guns having been fired as salutes in a single day. Its approaches are strongly fortified. The steaming distance from Singapore is 1520 m. Victoria, the capital, often spoken of as Hong-Kong (population over 166,000, of whom about 6000 are European or American), stretches for about 4 m. along the north coast. Its breadth varies from ½ m. in the central portions to 200 or 300 yds. in the eastern and western portions. The town is built in three layers. The "Praya" or esplanade, 50 ft. wide, is given up to shipping. The Praya reclamation scheme provided for the extension of the land frontage of 250 ft. and a depth of 20 ft. at all states of the tide. A further extension of the naval dockyard was begun in 1902, and a new commercial pier was opened in 1900. The main commercial street runs inland parallel with the Praya. Beyond the commercial portion, on each side, lie the Chinese quarters, wherein there is a closely packed population. In 1888, 1600 people were living in the space of a single acre, and over 100,000 were believed to be living within an area not exceeding ½ m.; and the overcrowding does not tend to diminish, for in one district, in 1900, it was estimated that there were at the rate of 640,000 persons on the sq. m. The average, however, for the whole of the city is 126 per acre, or 80,640 per sq. m. The second stratum of the town lies ten minutes' climb up the side of the island. Government house and other public buildings are in this quarter. There abound "beautifully laid out gardens, public and private, and solidly constructed roads, some of them bordered with bamboos and other delicately-fronded trees, and fringed with the luxuriant growth of semi-tropical vegetation." Finally, the third layer, known as "the Peak," and reached by a cable tramway, is dotted over with private houses and bungalows, the summer health resort of those who can afford them; here a new residence for the governor was begun in 1900. Excellent water is supplied to the town from the Pokfolum and Tytam reservoirs, the former containing 68 million gallons, the latter 390 millions.

Victoria.

Climate.—The temperature has a yearly range of from 45° to 99°, but it occasionally falls below 40°, and ice occurs on the Peak. In January 1893 ice was found at sea-level. The wet season begins in May, after showers in March and April, and continues until the beginning of August. During this period rain falls almost without intermission. The rainfall varies greatly, but the mean is about 90 in. In 1898 only 57·025 in. fell, while in 1897 there were 100·03 in.; in 1899, 72·7 in. and in 1900, 73·7 in. The damp is extremely penetrating. During the dry season the climate is healthy, but dysentery and intermittent fever are not uncommon. Bilious remittent fever occurs in the summer months, and smallpox prevails from November to March. The annual death-rate per 1000 for the whole population in 1902 was 21·70.

Population, &c.—The following table shows the increase of population: –

Year.	Europe and American Civil.	Chinese Civil.	Total (including Military and Naval Establishments and Indians, &c.).
1881	3,040	148,850	160,402
1891	4,195	208,383	221,441
1901	3,860	274,543	283,978
1906	12,174	306,130	326,961

Education is provided by a few government schools and by a large number receiving grants-in-aid. The foundation-stone of Hong-Kong University was laid in March 1910, the buildings being the gift of Sir Hormusjee Mody, a colonial broker. The Queen's College provides secondary education for boys. There are several hospitals, one of which is a government institution. The Hong-Kong savings bank has deposits amounting to about $1,100,000. There is a police force composed of Europeans, Indian Sikhs and Chinese; and a strong military garrison.

SpinSmart Software http://www.spinsmart.com

Industries.—Beyond the cultivation of vegetable gardens there is practically no agricultural industry in the colony. But although only 400 acres are cultivated on Hong-Kong island, and the same number of acres in Kowloon, there are 90,000 acres under cultivation in the new territory, of which over 7000 acres were in 1900 planted with sugar-cane. Granite quarries are worked. The chief industries are sugar-refining, the manufacture of cement, paper, bamboo and rattan ware, carving in wood and ivory, working in copper and iron, gold-beating and the production of gold, silver and sandal-wood ware, furniture making, umbrella and jinricksha making, and industries connected with kerosene oil and matches. The manufacture of cotton has been introduced. Ship and boat building, together with subsidiary industries, such as rope and sail making, appear less subject to periods of depression than other industries.

Trade.—Hong-Kong being a free port, there are no official figures as to the amount of trade; but the value of the exports and imports is estimated as about £50,000,000 in the year. Among the principal goods dealt with are tea, silk, opium, sugar, flax, salt, earthenware, oil, amber, cotton and cotton goods, sandal-wood, ivory, betel, vegetables, live stock and granite. There is an extensive Chinese passenger trade. The following are the figures of ships cleared and entered:—

Year.	Tonnage.	British.
1880	8,359,994	3,758,160
1890	13,676,293	6,994,919
1898	17,265,780	8,705,648
1902	19,709,451	8,945,976

The Chinese ships rank next to British ships in the amount of trade. German and Japanese ships follow next.

Finance.—The revenue and expenditure are given below:—

Year.	Revenue.	Expenditure.
1880	$1,069,948	$ 948,014
1890	1,995,220	1,915,350
1898	2,918,159	2,841,805
1902	4,901,073	4,752,444

The main sources of revenue are licences, rent of government property, the post-office and land sales. The light dues were reduced in 1898 from 2½ cents to 1 cent per ton. There is a public debt of about £340,000, borrowed for public works, which is being paid off by a sinking fund. The only legal tender is the Mexican dollar, and the British and Hong-Kong dollar, or other silver dollars of equivalent value duly authorized by the governor. There are small silver and copper coins, which are legal tenders for amounts not exceeding two dollars and one dollar respectively. There is also a large paper currency in the form of notes issued by the Chartered Bank of India, Australia and China, the Hong-Kong and Shanghai Banking Corporation and the National Bank of China, Limited. The foundation of new law courts was laid in 1900.

Administration.—Formerly an integral part of China, the island of Hong-Kong was first ceded to Great Britain in 1841, and the cession was confirmed by the treaty of Nanking in 1842, the charter bearing the date 5th of April 1843. The colony is administered by a governor, executive council and legislative council. The executive council consists of the holders of certain offices and of such other members as the crown may nominate. In 1890 there were nine members. The legislative council consists of the same officials and of six unofficial members. Of these, three are appointed by the governor (of whom one must be, and two at present are, members of the Chinese community); one is elected from the chamber of commerce, and one from the justices of the peace.

HONITON, a market town and municipal borough in the Honiton parliamentary division of Devonshire, England, pleasantly situated on rising ground on the left bank of the Otter, 16½ m. E.N.E. of Exeter by the London & South-Western railway. Pop. (1901) 3271. The town consists of one wide street, down which a stream of water runs, extending for about 1 m., and crossed at right angles by a lesser street. The restored church of St Michael, formerly a parish church, but standing on a hill about ½ m. from the town, was built by Courtenay, bishop of Exeter, about 1482. It retains a curiously carved screen, and the black marble tomb of Queen Elizabeth's physician, Marwood, who attained the age of 105. Allhallows Grammar School, founded in 1614, was enlarged in 1893; St Margaret's hospital, founded as a lazar-house in the 14th century, is converted into almshouses. Honiton is famous for its lace industry, established by refugees from Flanders under Queen Elizabeth. The delicate fabric made by hand on the pillow was long in demand; its sale was, however, greatly diminished by the competition of cheaper machine-made goods, and a school of lace-making was opened to promote its recovery. The town possesses breweries, tanneries, malthouses, flour-mills, saw-mills, brick and tile works, potteries and an iron foundry; its trade in butter is considerable. It is governed by a mayor, 6 aldermen and 18 councillors. Area, 3134 acres.

Honiton (*Honetona*, *Huneton*) is situated on the British Icknield Street, and was probably the site of an early settlement, but it does not appear in history before the Domesday Survey, when it was a considerable manor, held by Drew (Drogo) under the count of Mortain, who had succeeded Elmer the Saxon, with a subject population of 33, a flock of 80 sheep, a mill and 2 salt-workers. The borough was founded before 1217 by William de Vernon, earl of Devon, whose ancestor Richard de Redvers had received the manor from Henry I. In the 14th century it passed to the Courtenays, and in 1698 Sir William Courtenay was confirmed in the right of holding court leet, view of frankpledge and the nomination of a portreeve, these privileges having been surrendered to James II. The borough was represented by two members in parliament in 1300 and 1311, and then not again till 1640, from which date it returned two members until disfranchised by the act of 1868, the returning officer being the portreeve, who was also the chief magistrate of the borough until its incorporation by charter of 1846. In 1221 Falkes de Breauté, then custodian of the borough, rendered a palfrey for holding a three days' fair at the feast of All Saints, transferred in 1247 to the feast of St Margaret, and still held under that grant. A great market for corn and other produce is still held on Saturday by prescription. The wool manufacture flourished at Honiton in the reign of Henry VII., and it is said to have been the first town at which serges were made, but the industry entirely declined during the 19th century. The lace manufacture was introduced by Flemish refugees, and was flourishing in the reign of Charles I.

See *Victoria County History, Devonshire*; A. Farquharson, *History of Honiton* (Exeter, 1868).

HONNEF, a town and climatic health resort of Germany, beautifully situated on the right bank of the Rhine, at the foot of the Siebengebirge, 8 m. above Bonn by the railway Cologne-Königswinter-Horchheim. Pop. (1905) 6183. It has an Evangelical and a Roman Catholic church, a sanatorium for consumptives, and does a considerable trade in wine. The town is surrounded by vineyards and orchards, and has annually a large number of visitors. A mineral spring called the Drachenquelle is used both for drinking and bathing.

HONOLULU, a city, port of entry, and the capital of Hawaii, situated in the "city and county of Honolulu," on the S. coast of the island of Oahu, at the mouth of Nuuanu Valley, 2100 m. S.W. of San Francisco. Pop. (1890) 22,907; (1900) 39,306, of whom 24,746 were males, 14,560 were females; about 10,000 were Hawaiians, 15,000 Asiatics, and 5000 Portuguese; (1910) 52,183. Honolulu is served by the Oahu railway, by electric lines to the principal suburbs, and by steamship lines to San Francisco, Seattle, Vancouver, Manila, Salina Cruz (Mexico), Victoria, Sydney, and Chinese and Japanese ports. The business section and the older residence quarters occupy low ground, but many of the newer residences are built on the sides of neighbouring hills and mountains, of which there are several from 500 to 2000 ft. in height. The Punch Bowl (behind the city), a hill rising about 500 ft. above the sea, Diamond Head, a crater about 760 ft. in height, 4 m. to the S.E., and the Nuuanu Pali, a lofty and picturesque precipice 6 m. up the valley, are especially known for their commanding views. In front of the city is the small harbour, well protected from all winds except those from the S.; in and after 1892 the Hawaiian government

SpinSmart Software http://www.spinsmart.com

deepened its entrance from 21 ft. to 30 ft. Six miles to the W. is the much more spacious Pearl Harbor (a U. S. Naval Station), the bar at the entrance of which was removed (1903) by the U.S. government. Pearl Harbor and the harbour of Honolulu are the only safe ports in the archipelago. The streets of Honolulu are wide, and are macadamized with crushed or broken lava. The business houses are mostly of brick or stone, and range from two to six storeys in height. About most of the residences there are many tropical trees, flowering shrubs and plants. Wood is the most common material of which the residences are built; a large portion of these residences are one-storey cottages; broad verandahs are common; and of the more pretentious residences the *lanai*, a semi-outdoor drawing-room with conservatories adjoining, is a notable feature. Throughout the city there is a marked absence of poverty and squalor. There are good hotels in the city and its suburbs. The government buildings are extensive and have a pleasing appearance; that of the executive, in a beautiful park, was formerly the royal palace and still contains many relics of royalty. Facing the judiciary building is an heroic statue in bronze of Kamehameha the Great. About 2 m. W. of the business centre of the city is the Bernice Pauahi Bishop Museum, a fine stone building on a commanding site, and containing a large collection of Hawaiian and Polynesian relics and curios, especially Hawaiian feather-work, and notable collections of fish and of Hawaiian land shells and birds. Four miles S.E. of the business centre, at the foot of Diamond Head, is Waikiki sea-beach, noted for its surf-riding, boating and bathing, and Kapiolani Park, a pleasure resort, near which is a famous aquarium of tropical fishes. Honolulu has other parks, a fine Botanical Garden, created by the Bureau of Agriculture, several public squares, several hospitals, a maternity home, the Lunalilo Home for aged Hawaiians, an asylum for the insane, several schools of high rank both public and private—notably Oahu College on the E. edge of the city, first founded as a school for the children of missionaries in 1841; the Honolulu High School, founded in 1833 as the Oahu Charity School, to teach English to the half whites; the Royal School, which was founded in 1840 for the sons of chiefs; and the Normal School, housed in what was in 1906 the most expensive building on the island of Oahu—a library containing about 14,000 volumes and the collections of the Hawaiian Historical Society, a number of benevolent, literary, social and political societies, and an art league, and is the see of both an Anglican and a Roman Catholic bishop. In 1907 the Pacific Scientific Institution for the advancement of scientific knowledge of the Pacific, its islands and their people, was established here. Among the clubs of the city are the Pacific Club, founded in 1853 as the British Club; the Scottish Thistle Club (1891), of which Robert Louis Stevenson was a member; the Hawaii Yacht Club, and the Polo, Country and University Clubs. There are various journals and periodicals, five languages being represented. The chief industries are the manufacture of machinery (especially machinery for sugar-refineries) and carriages, rice-milling and ship-building. Honolulu's total exports for the fiscal year 1908 were valued at $42,238,455, and its imports at $19,985,724. There is a privately owned electric street car service in the city. The water-works and electric-lighting plant are owned and operated by the Territorial government, and to the plentiful water-supply is partly due the luxuriant vegetation of the city. Honolulu's safe harbour, discovered in 1794, made it a place of resort for vessels (especially whalers) and traders from the beginning of the 19th century. Kamehameha I. (the Great) lived here from 1803 until 1811. In 1816 was built a fort which stood until 1857. In 1820 the city became the principal residence of the sovereign and soon afterwards of foreign consuls, and thus practically the seat of government. In 1907 an act was passed by which the former county of Oahu, including the island of Oahu and the small islands adjacent, was made a municipal corporation under the name of the "city and county of Honolulu"; this act came into effect on the 1st of January 1909.

HONORIUS, the name of four popes and one antipope (Honorius II.; *i.e.* 2 below).

1. HONORIUS I., pope from 625 to 638, was of a noble Roman family, his father Petronius having been consul. He was very active in carrying on the work of Gregory the Great, especially in England; Bede (*Hist. Eccl.* ii. 17) gives a letter of his to King Edwin of Northumbria, in which he admonishes him diligently to study Gregory's writings; and it was at Edwin's request that Honorius conferred the pallium on the bishops of Canterbury and York (*ib.* ii. 18). He also admonished the Irish for not following the custom of the Catholic Church in the celebration of Easter (*ib.* ii. 19), and commissioned Birinus to preach Christianity in Wessex (*ib.* iii. 7). It is, however, in connexion with the Monothelite heresy that Honorius is most remembered, his attitude in this matter having acquired fresh importance during the controversy raised by the promulgation of the dogma of papal infallibility in 1870. In his efforts to consolidate the papal power in Italy, Honorius had been hampered by the schism of "the three chapters" in Istria and Venetia, a schism that was ended by the deposition in 628 of the schismatic patriarch Fortunatus of Aquileia-Grado and the elevation of a Roman sub-deacon to the patriarchate. It is suggested that help rendered to him in this matter by the emperor Heraclius, or by the Greek exarch, may have inclined the pope to take the emperor's side in the Monothelite controversy, which broke out shortly afterwards in consequence of the formula proposed by the emperor with a view to reconciling the Monophysites and the Catholics. However that may be, he joined the patriarchs of Constantinople and Alexandria in supporting the doctrine of "one will" in Christ, and expounded this view forcibly, if somewhat obscurely, in two letters to the patriarch Sergius (Epist. 4 and 5 in Migne, *Patrologia. Ser. Lat.* lxxx. 470, 474). For this he was, more than forty years after his death (October 638), anathematized by name along with the Monothelite heretics by the council of Constantinople (First Trullan) in 681; and this condemnation was subsequently confirmed by more than one pope, particularly by Leo II. See Hefele, *Die Irrlehre des Honorius u. die vaticanische Lehre der Unfehlbarkeit* (1871), who, however, modified his view in his *Conciliengeschichte* (1877). Honorius I. was succeeded by Severinus.

See the articles by R. Zöpffel and G. Krüger in Herzog-Hauck, *Realencyklopädie* (ed. 1900), and by T. Grisar in Wetzer and Welte's *Kirchenlexikon* (Freiburg, 1889). In addition to the bibliographies there given see also U. Chevalier, *Répertoire des sources hist.*, &c., Bio-bibliographie, s. "Honorius I." (Paris, 1905). (W. A. P.)

2. HONORIUS II. (d. 1072), antipope, was the name taken by Peter Cadalus, who was born at Verona and became bishop of Parma in 1046. After the death of Pope Nicholas II. in July 1061 he was chosen pope by some German and Lombard bishops at Basel in opposition to Alexander II., who had been elected by the party led by Hildebrand, afterwards Pope Gregory VII. Taking the name of Honorius II., Cadalus was thus the representative of those who were opposed to reforms in the Church. Early in 1062 he advanced towards Rome, and though his supporters defeated the forces of his rival outside the city, he soon returned to Parma to await the decision of the advisers of the young German king, Henry IV., whose mother Agnes had supported his election. About this time, however, Agnes was deprived of her power, and the chief authority in Germany passed to Anno, archbishop of Cologne, who was hostile to Cadalus. Under these circumstances the antipope again marched towards Rome in 1063 and entered the city, but was soon forced to take refuge in the castle of St Angelo. The ensuing war between the rival popes lasted for about a year, and then Cadalus left Rome as a fugitive. Refusing to attend a council held at Mantua in May 1064, he was deposed, and he died in 1072, without having abandoned his claim to the papal chair.

See the article on Honorius II. in Hauck's *Realencyklopädie*, Band viii. (Leipzig, 1900). (A. W. H.*)

3. HONORIUS II. (Lamberto Scannabecchi), pope from the 15th of December 1124 to the 13th of February 1130, a native of Fagnano near Imola, of considerable learning and great religious zeal, successively archdeacon at Bologna, cardinal-priest of Sta Prassede under Urban II., cardinal-bishop of Ostia and Velletri under Paschal II., shared the exile of Gelasius II.

in France, and helped Calixtus II. to conclude the Concordat of Worms (1122), which settled the investiture contest. He owed his election in large measure to force employed by the Frangipani, but was consecrated with general consent on the 21st of December 1124. By means of a close alliance with that powerful family, he was enabled to maintain peace at Rome, and the death of Emperor Henry V. (1125) further strengthened the papal position. He recognized the Saxon Lothair III. as king of the Romans and later as emperor, and excommunicated his rival, Conrad of Hohenstaufen. He sanctioned the Praemonstratensian order and that of the Knights Templars. He excommunicated Count William of Normandy for marriage in prohibited degree; brought to an end, through the influence of Bernard of Clairvaux, the struggle with Louis VI. of France; and arranged with Henry I. for the reception of papal legates in England. He laid claim as feudal overlord to the Norman possessions in southern Italy (July 1127), and excommunicated the claimant, Duke Roger of Sicily, but was unable to prevent the foundation of the Neapolitan monarchy, for Duke Roger defeated the papal army and forced recognition in August 1128. Honorius appealed to Lothair for assistance, but died before it arrived. His successor was Innocent II.

The chief sources for the life of Honorius II. are his "Epistolae et Privilegia," in J. P. Migne, *Patrol. Lat.* vol. 166, and the *Vitae* of Cardinals Pandulf and Boso in J. M. Watterich, *Pontif. Roman. vitae*, vol. 2 (Leipzig, 1862); also "Codice diplomatico e bollario di Onorio II." in *Fr. Liverani opere*, vol. 4 (Macerata, 1859), and Jaffé-Wattenbach, *Regesta pontif. Roman.* (1885–1888).

Milman, *Latin Christianity*, vol. 4 (London, 1899); Fr. Liverani, "Lamberto da Fiagnano" in *Opere*, vol. 3 (Macerata, 1859); A. Wagner, *Die unteritalischen Normannen und das Papsttum 1086–1150* (Breslau, 1885); E. Bernheim, *Zur Geschichte des Wormser Concordats* (Göttingen, 1878); Volkmar, "Das Verhältnis Lothars III. zur Investiturfrage," in *Forschungen zur deutschen Geschichte*, vol. 26. (C. H. Ha.)

4. Honorius III. (Cencio Savelli), pope from the 18th of July 1216 to the 18th of March 1227, a highly-educated and pious Roman, successively canon of Sta Maria Maggiore, cardinal-deacon of Sta Lucia in Silice, vice-chancellor, chamberlain and cardinal-priest of Sti Giovanni e Paolo, was the successor of Innocent III. He made peace with Frederick II., in accordance with which the emperor was crowned with his wife Constance in St Peter's on the 22nd of November 1220, and swore to accord full liberty to the church and to undertake a crusade. Honorius was eager to carry out the decrees of the Lateran Council of 1215 against the Albigenses and to further the crusade proclaimed by his predecessor. He crowned Peter of Courtenay emperor of Byzantium in April 1217; espoused the cause of the young Henry III. of England against the barons; accepted the Isle of Man as a perpetual fief; arbitrated differences between Philip II. of France and James of Aragon; and made special ecclesiastical regulations for the Scandinavian countries. He sanctioned the Dominican order (22nd of November 1216), making St Dominic papal major-domo in 1218; approved the Franciscan order by bull of the 29th of November 1223; and authorized many of the tertiary orders. He maintained, on the whole, a tranquil rule at Rome; but Frederick II.'s refusal to interrupt his reforms in Sicily in order to go on the crusade gave the pope much trouble. Honorius died in 1227, before the emperor had fulfilled his oath, and was succeeded by Gregory IX.

Honorius III. left many writings which have been collected and published by Abbé Horoy in the *Medii aevi bibliotheca patristica*, vols. i.-ii. (Paris, 1879–1883). Among them are five books of decretals, compiled about 1226; a continuation of the *Liber Pontificalis*; a life of Gregory VII.; a coronation form; and a large number of sermons. His most important work is the *Liber censuum Romanae ecclesiae*, written in 1192 and containing a record of the income of the Roman Church and of its relations with secular authorities. The last named is admirably edited by P. Fabre in *Bibliothèque des écoles françaises d'Athènes et de Rome* (Paris, 1892). The letters of Honorius are in F. Liverani, *Spicilegium Liberianum* (1863). There are good *Regesta* in Latin and Italian, edited by P. Pressutti (Rome, 1888, &c.).

See J. Clausen, *Papst Honorius III.* (1895); P. T. Masetti, *I Pontefici Onorio III. ed Innocenzo IV. a fronte dell' Imperatore Federico II. nel secolo XIII.* (1884); F. Gregorovius, *Rome in the Middle Ages*, vol. 5, trans. by Mrs G. W. Hamilton (London, 1900–1902); K. J. von Hefele, *Conciliengeschichte*, vol. 5, 2nd ed.; H. H. Byzanz* (Berlin, 1903); M. Tangl, *Die päpstlichen Kanzleiordungen von 1200–1500* (Innsbruck, 1894); Caillemer, *Le Pape Honorius III. et le droit civil* (Lyons, 1881); F. Vernet, *Études sur les sermons d' Honorius III.* (Lyons, 1888). There is an excellent article, with exhaustive bibliography, by H. Schulz in Hauck's *Realencyklopädie*, 3rd edition. (C. H. Ha.)

5. Honorius IV. (Jacopo Savelli), pope from the 2nd of April 1285 to the 3rd of April 1287, a member of a prominent Roman family and grand-nephew of Honorius III., had studied at the university of Paris, been made cardinal-deacon of Sta Maria in Cosmedin, and succeeded Martin IV. Though aged and so crippled that he could not stand alone he displayed remarkable energy as pope. He maintained peace in the states of the Church and friendly relations with Rudolph of Habsburg, and his policy in the Sicilian question was more liberal than that of his predecessor. He showed special favours to the mendicant orders and formally sanctioned the Carmelites and Augustinian Eremites. He was the first pope to employ the great banking houses in northern Italy for the collection of papal dues. He died at Rome and was succeeded by Nicholas IV.
